His critical material comprised many mss. *κατὰ πόλεις* and several *κατ' ἄνδρα*. The latter were the work of individual scholars, the former apparently those used by certain cities for the public official recitations. He never mentions the Athenian

recension, evidently because he assumes it as his basic text. He speaks of the "better" or "more careful" texts, and the "common," "ordinary," and of one as *ἡ πολυστίχος* ("of many lines"). He evidently had no access to any text or fragment of text earlier than the Athenian recension, and shows no sign of having any which went back to the sixth or even the fifth century. With this imperfect material and the help of Zenodotus' pioneer work Aristarchus produced a text which immediately won recognition as the classical recension of Homer in antiquity and was probably, though the point is still disputed, the foundation of our present vulgate. Certainly, of our existing papyri, those written before the time of Aristarchus (150 B.C.) differ widely, while those later are almost uniform.

Aristarchus did even more remarkable work in exegesis. He not only corrected the errors of the glossographi in explaining the obsolete words, he observed with great acuteness the peculiar Homeric uses of common words (see above). He distinguished dual and plural; he saw that in Homer *ὁ ἦ τό* was a pronoun, and he rejected the theories of Homer's allegory of universal knowledge. On the other hand his grammatical explanations often betray the infancy of the science (the first Greek grammar was the work of his disciple Dionysius Thrax). For example he uses freely the theory of "enallage" or "change of case": *Ἰπποτα* is "the vocative instead of the nominative"; in *τὸν δὲ σκότος* *ὅσσε κάλυπεν*, *τὸν* is "instead of *τοῦ*."

The Heroic Age.—The poems, even as they stand now, approximately in the form fixed for them by Aristarchus, nearly a thousand years later than the events they profess to describe, have an almost entirely consistent style and phraseology and give an almost entirely consistent description of the age about which they write. Of course "consistent" is by no means the same as "true." Yet, though we have practically no direct information about the Homeric age, we can, by analogy from other literatures better supplied with contemporary history, understand its general character and see that the description seems to be based on fact. The poets described a society which they did not themselves know and could not well have invented, but which corresponds closely to a type known to have existed elsewhere under given conditions. It was easy, of course, for a romantic Greek bard to make his ancient heroes ignorant of iron weapons and the art of writing, or to imagine an idyllic princess washing the royal clothes in the river.

But there are other characteristics of the age which can hardly be inventions. The heroes of Homer belong to a *Wanderzeit*. The kings had, in general, no national territories and no strong ties of kindred; they depended on their "companions" (*ἑταῖροι*, *comites*) or personal followers, who were largely adventurers like themselves. They are untroubled by the sanctities and duties attaching to the tribe or to the buried tribal ancestors. They practise no arts but song and war. They carry their wealth about with them in the form of brooches, belts, rich armour, necklets and caparisons. They burn their dead, they build no temples but worship at altars in the open air: and they worship a collection of gods who are just like themselves, gods who feast and sing and conquer and utter judgments, but who never work, have never created a world—only conquered and divided it—and who are to an extraordinary degree rootless and international. They stand or fall by their personal qualities; their strength and courage, their faithfulness and military honour, and the fact that since they fear no one they never tell a lie.

The above picture needs qualification if we take account of details; e.g. the *Odyssey* is a romance of the return of the wanderer, and implies the existence of a real home; the catalogue of ships in *Iliad* ii. gives geographical kingdoms to all the heroes. But in the main it is true, and it corresponds to the type of society that we find in many parts of the world under particular historical conditions. It occurs where an old and rich civilization is in process of being broken up by barbarian conquerors. It is the type called by Professor Chadwick a "heroic age," and can be traced in northern Europe during the break-up of the Roman

empire, in the Balkans during that of the Greek empire, and in other parts of the world that have produced heroic poetry. The description of Attila's camp by the Byzantine historian Priscus is curiously Homeric in its details. (See Gibbon, ch. xxxiv.)

Discoveries.—This discovery has changed the character of the problem of the Homeric age. We saw above that the poets were consciously describing an age long past and notably different from their own. We now see that they were not merely describing a sort of "youth of the world," remarkable chiefly for a rude idyllic simplicity in which the contrast is between "Homer" and *οἱ νεώτεροι*. Nor yet were they, as Schliemann's great discoveries first suggested, depicting the great age of Troy, Mycenae and Cnossus. It was a particular period in history, to be contrasted both with the rich decadent civilization that went before and the peculiar classic Hellenism which came after.

The first palaces of Crete must have been built about 2000 B.C., and not long after there are signs of that movement of the Aryan tribes which was to have such incalculable effects on human history. The second town of Troy was laid under seven feet of ashes; at Orchomenos, Corinth and Argos citadels were destroyed and rebuilt, apparently by Northern conquerors. The northern "megaron," or hall with a porch and central hearth, begins to be found in Greece. Hitherto the "Kefti" or Men of the Isles have been in close connection with Egypt, but about 1700, when the Hyksos dynasty largely cut that country off from civilized commerce, the Cretan cities begin to turn more to Greece. Argos learns to grow the vine and olive; it adopts the Cretan woman's dress and the Cretan frescoes, while it still keeps its northern beard and tunic and *megaron*. A century or so later perhaps the Aryan invaders, or Achaei(?), take to the sea. They had first called the sea by an "Aegean" or pre-Hellenic word, *θάλασσα*; then they called it *ἄλς*, "the salt"; it may be significant that at last they used the name *πόντος*, a good Greek word meaning "path." It was a path that led both to Crete and to Egypt. About 1450, Phaestus and other Cretan palaces were destroyed. For some 50 years Cnossus ruled alone: then comes the destruction of Cnossus itself—a sudden attack, it would seem, in the midst of some great court ceremony—and the end of the Minoan empires. After about 1400 B.C. only Mycenaean work is found in Egypt, not Cretan.

Achaei from Mycenae seem to take the vacant place. In Crete the royal tomb becomes a common pit; portraits of chieftains wear the northern beard and moustache. New towns are called by Achaeian names; there is a decline in art and a cessation of wall-painting. It is significant, too, that after this date there is no further mention of the Kefti in Egyptian records.

Civilization has gone back but is by no means destroyed. Writing remains and there are signs of abundant wealth and mass production for commercial purposes. Speculative historians have fancied that in the Tell-el-Amarna letters and other records of this period they find some of the great names of Greek saga, an Alaksandus of Uilusa who reminds them of Alexandros of Iliou, an Attarissyas of Ahhia or Ahhijava who sounds remotely like Atreus the Achaeian. With much more probability we begin now to identify names of various peoples, or at least hordes of men, who are known to Greek tradition.

At the battle of Kadesh in 1290 the Hittites had in their motley host Iliouna, Dardanoui, Masa, Pedasa, Kerkisha, Loukki and Danaouna. If the terminations -na and -sha denote "peoples" or "hosts," as Egyptologists suggest, we can hardly be wrong in recognising at least the people of Iliou, the Dardanoi, Lukioi and Danaoi. About 1230 and 1225 Merneptah of Egypt defeats in the Delta "uncircumcised Akhaiusha" "from the sea-lands," "who fight to fill their belly daily." With them are Toursha, Shardina, Loukki and Shakalasha, wanderers who may have given their names afterwards to the Tyrseni, the Sardinians, Lycia and Sagalassus. About 1194 Rameses defeated a similar locust-like multitude advancing "by sea and land, with women and children in ox-carts." They had destroyed the Hittite empire and "no people had stood before them."

Troy.—Most of the cities they destroyed have perished without

record, but Greek tradition tells us that the great sixth city of Troy, Homer's Troy, was sacked about this date. It was sacked, after a long siege perhaps, by a host that may be called indifferently Akhaiu-sha or Danaou-na—Homer has also a third name, Argeioi—and who are led by a "king of men" who is "lord of many islands" and has doubtless gathered in his thousand or twelve-hundred ships a great force of "the peoples of the sea." (Greek legend also makes Agamemnon and Menelaus joint kings of Sparta, or one of Mycenae and one of Sparta; it also involves them in some ritual king myths; but it is perhaps not rash to detect an element of real history in the Homeric picture.) The fall of Troy seems to be the sign or cause of the final crash. About 1200 the infiltration of further West-Greek tribes becomes a regular invasion. The pirates, or "peoples of the sea" receive an increase both from new "Dorian" invaders and from the broken men of the old Minoan or Achaian kingdoms, but by now there is little rich plunder left. It is a time of *συνεχὲς στρατεῖαι καὶ μεταναστώσεις*, "constant warfarings and uprootings" (Diodorus v. 80: cf. Thuc. i., 2).

Homer's narrative of the siege of Troy is doubtless related to the real siege much as the Norse or German or French poems are related to the actual brutalities of the age they describe. The facts have been idealised and transfigured by memory, and confused with abundant myth, folklore and fiction; but some of the truth can be descried, as in a palimpsest, beneath the poetry. We can see in the first book of the *Iliad* a plague-stricken army, or mob of mixed peoples under diverse leaders, pinned to the barren sea shore, the narrow space choked with dead dogs and mules, the piles of burning corpses, the best fighting force in mutiny because of a quarrel about a captured woman; and the various bands "fighting to fill their bellies daily" by raids on the exhausted neighbourhood. At the end of Book VII., on the arrival of a wine-ship, we see the soldiers selling all they have, bronze, iron, shields, cattle and captives, for liquor and lying all night long on the beach under a thunderous sky.

We can also see, not from direct statements in the Homeric poems, but from implications there and direct statements in the rest of the poetic tradition, that the fall of Troy was the beginning of a dark age. If Troy fell the rest of Achaian Greece fell with it, including Thebes, Argos and Mycenae. The great kingly houses disappear. The *epos* knows little of the after history of the Homeric heroes except a disastrous series of so-called "returns"; the conception belongs to a later age which conceived these wandering hordes as the armies of regular Greek cities. The sons of Agamemnon, Achilles and Ajax and Odysseus are just remembered, but after them there is darkness.

We are justified therefore in recognising the siege and destruction of the sixth city of Troy, about the year 1200 B.C., as forming the historical nucleus of the poems, just as the defeat of Charlemagne's rearguard by the Basques in the valley of Roncesveaux is the historical nucleus of the *Chanson de Roland*. The real Hrodland, count of the march of Brittany was killed in that battle on Aug. 15, 778; our existing *Chanson de Roland* was written soon after 1066, three hundred years later. But we know that songs or lays on the subject were soon composed: they are mentioned as widely known (*vulgata*) in a book written less than 60 years after the battle (Life of Louis I., in Pertz SS. ii. 608). And an analysis of the existing *Chanson* shows, beyond question, that it is a re-treatment (*remaniement*) in large part built up out of previous poetic treatments of the same subject.

Using this comparison as it stands, we may observe that the gap between the fall of Troy and the earliest text of Homer known to us is much greater than 300 years: our present text probably dates from Aristarchus about 150 B.C., and even if we assume that that is in the main identical with the text of Peisistratus we only get back to the latter part of the sixth century B.C. and Troy fell at the beginning of the twelfth. There must have been, during those centuries of oral transmission, uncontrolled by any fixed record or any learned class, much reshaping of the poetry and much transformation of the historical facts.

Date of Composition.—Innumerable attempts have been made

to fix some time and place at which "Homer" may have lived, or at which the *Iliad* or the *Odyssey* or both, in more or less their present form, may have been composed. All have failed, and it is well to consider the reasons for their failure.

In the first place, we do not yet know what question to ask, and until we do we can hardly expect the right answer. Yet, from the nature of the case, to know the right question implies an understanding of the whole problem which is at present beyond us.

Next, we have no contemporary record to guide us. Even the political history of Greece between 1200 and 600 B.C. is extremely scanty and unreliable; and the history of literature before the time of Peisistratus is practically non-existent. Callinus in the early seventh century is said to have mentioned the *Thebais*, an epic now lost, as the work of Homer. Herodotus (v. 67) tells us that, in the early sixth century, Cleisthenes the tyrant of Sicyon put a stop to the contests of rhapsodes because the Homeric poems "glorified Argos and the Argives."

This shows that there were recitations of Homeric poetry in Sicyon before the time of Peisistratus, but nothing of what that poetry was. Our extant *Iliad* and *Odyssey* do not glorify the Argives in any special sense, but they do use the word "Argives" for the Greeks as a whole, which may have been enough to disturb Cleisthenes. There is a general reference by Xenophanes, an early contemporary of Peisistratus, to the immoral stories about the gods in Homer and Hesiod. There is no other pre-Peisistratan evidence. It is indeed conjectured that the Simonides who quotes a line of the *Iliad* (vi. 126) as the work of "a man of Chios" was perhaps the old seventh-century poet from Amorgos; but both Plutarch and Stobaeus, who are our sources for the information, clearly meant the famous Simonides of Ceos, who belongs to the fifth century. One would like to know whether by "a man of Chios" he really meant the traditional Homer or was merely referring to some contemporary Homeric rhapsode, such as Cynaethus of Chios.

The Homeric Tradition.—The other early references chiefly use the name "Homer" as covering the whole heroic or epic tradition. Aeschylus is reported to have described his plays as "slices from the great banquets of Homer"—which is true if "Homer" means the heroic tradition, markedly untrue if it means the *Iliad* and *Odyssey*. Simonides refers to Homer as telling how "Meleager surpassed all the youths in spear-throwing across the wild Anairos"—which is not in our Homer: Pindar (Nem. vii.) says that Homer praised Odysseus—which may mean, but does not by any means prove, that Pindar read the *Odyssey* as we have it. He makes two other references to Homer, neither of them quite irreconcilable with our poems but certainly not sufficing to prove that he knew them. A late schoolmaster, Theodorus (see *infra*), made a sort of wall-picture which he called *τάξιν Ὁμήρου*—an arrangement of the events of the whole early heroic tradition, in which the *Iliad* and *Odyssey* form only a fragment. An "arrangement of Homer" of a different kind was needed for the great Panathenaic recitation, and took the form—so we have definite evidence—of our present *Iliad* and *Odyssey*.

The effect of the recitation and the published text which seems to have accompanied it was quickly seen. By the latter part of the fifth century, especially among Attic writers, the *Iliad* and *Odyssey* are well-known and often mentioned: they are accepted as the only canonical works of Homer, though other poems—epics, hymns, epigrams and the like—are occasionally mentioned. Herodotus for instance is doubtful about the *Epigoni* and is against the authenticity of the *Cypria* because in his time it differed from the *Iliad* in its account of the travels of Paris. (It was altered later and made to agree: see Proclus' epitome.) Aristotle treated the comic *Margites* as genuine. It may be noted, also, that Attic tragedy, which drew its material from the heroic saga, *i.e.*, from "Homer" in the old sense, carefully avoided the "Homer" that was recited at the Panathenaea. It never trespassed on the *Iliad* and *Odyssey*.

Lastly it is worth remarking that, while all early quotations from Homer are apt to vary considerably from our texts, the

non-Attic writers vary much more than the Attic. Hippocrates, the Coan physician, who lived chiefly in Ionia, has many quotations which do not occur at all in our Homer, including one which he says is "frequent"; the same is true of Aristotle, born in Stageira and trained in the Ionic tradition. And it is noteworthy that a speech of Syagrus the Spartan in Hdt. (vii. 159) not only quotes a hexameter line which is not in our Homer, but seems to quote a Homer who made Agamemnon a king of Sparta. In our Homer he is king of Mycenae, though traces of Sparta seem occasionally to cling to him (e.g., *Od.* iv., 514ff.). The "Homer" that was "sung in scattered bits" about Greece before the time of Peisistratus may well have been very different from the *Iliad* and *Odyssey*.

Thus one may be fairly sure from the external record that there existed before the time of Peisistratus masses of heroic poetry, reputed to be very old and to be in general the work of "Homer." As to its form we can say little. It probably consisted normally of lays, of a length suitable for recitation; the length perhaps of the Catalogue or the Doloneia (400-600 lines). Whether there were already any great epics, too long for ordinary recitation but suitable for some great "panegyris" such as the Panionia or the four-yearly gathering of the Ionians at Delos, we have no evidence. Many scholars have concluded that the Peisistratean recension provided the first written text of the Homeric poems. Certainly there is no record of any written text of the *Iliad* and *Odyssey* previous to that; yet it seems almost impossible that no lays at all should have been written down, and the composition of the two great poems does at times seem to suggest the use of written sources.

A Crystallization of Tradition.—Thus while it seems probable that songs or lays about the siege of Troy and other achievements of the heroic age came into existence very soon after the events themselves, the first long epics in written form of which we have any knowledge appear in Athens in the sixth century, some 600 years later. The poems that we possess represent the last stage of epic creation, though, as far as we know, the most perfect. The history of epic poetry between 1200 and 550 is entirely obscure, and conjecturable only by indirect internal evidence. Some conclusions, however, can be drawn from the language, metre, subject matter and composition of the two poems. For example (1) it is clear from the composition that each poem is a unity, but a unity imposed on a variety of sources. The unity is made up by combining different lays or parts of lays and smoothing away the discrepancies. It is clear also that in the last shaping of the poems Athenian influence counted for much.

(2) The subject matter shows that the poems cannot be explained as creations of some one age midway between Troy and Athens. Some elements of custom, story and diction go back to remote antiquity, and some again are not earlier than Athens of the sixth century.

(3) The language shows traces of Attic, not only on the surface but also a little below; a great body of Ionic; traces of a definitely Aeolic dialect; and remains also of some very ancient Greek, not definitely assignable to any particular dialect and already unintelligible in classical Athens.

(4) The metre shows signs of long development, and has, to a degree perhaps unexampled in the history of literature, conditioned and almost created the Epic dialect. Many centuries of hexametric or at least dactylic composition must have preceded the present form of Homeric verse.

To take these points in detail: the old explanation of the poems (Hermann and Grote) as an original nucleus *plus* interpolations or late additions, and of the occasional discrepancies as due to the interpolators, must by now be given up. For example, there is the discrepancy between books ix. and xvi. of the *Iliad*, the Embassy and the Patrocleia. In xvi. Achilles, seeing the defeat of the Greeks, breaks into a splendid complaint that if only Agamemnon would seek his friendship and offer atonement, the Trojans would soon fly and choke the trenches with their dead. Yet the whole of book ix. has been occupied by Agamemnon's offers of princely atonement and Achilles' rejection

of them. The discrepancy is manifest; but it is not well explained by supposing that a late poet invented Bk. ix. and interpolated it.

Why should he so upset the story? It is explained at once if we suppose that a poet engaged in building up the great epic out of old material found both the Embassy and the Patrocleia in existence, and, not liking to sacrifice either, wove them both in and smoothed out the more alarming difficulties. Similarly he found—so the Scholia tell us—Bk. x., the Doloneia, as a separate lay. It is somewhat foreign in style and it makes some little trouble, but it was too good to throw away. So again some parts of the *Iliad* imply the existence of a wall round the ships while others ignore it. It is much easier to suppose that the poet-editor found some lays with a wall and some without, and chose to combine them, than to imagine an "interpolator" who made gratuitous trouble by putting in a wall here and there.

Just so in the *Odyssey*, there is much confusion as to Odysseus' disguise: he is sometimes disguised and sometimes not. Also there are three incidents in which something is thrown at the disguised Odysseus by one of the suitors. The three do not form a climax or show any relation to one another (*p* 462, *σ* 394, *v* 299). He is twice insulted by one of his own servants. In one place the offender is Melantho, daughter of Dolios (*σ*, *τ*), in the other it is Melanthios, son of Dolios (*ρ*, *υ*, *φ*, *χ*). The Melantho part never mentions Melanthios, nor the other part Melantho—though it speaks of other wicked maidservants. Again, in the long story of adventure which Odysseus relates in the first person we find one interruption of third-person verbs (*ι*, 54, 55), and some passages which perhaps show traces of having been once written in the third person. In all such cases the hypothesis of "interpolations" or "late additions" is of little help. The probable explanation is that two or more different sources have been combined by the—shall we call him poet or editor? He is both; but the Greeks called him *ῥαψῳδός*, or "a stitcher of songs."

So far the divergent sources that we have considered have been merely different versions of the same body of saga. The Embassy was always an incident in the Wrath of Achilles—or some similar Wrath; both Melantho and Melanthios had a part in the adventures of Odysseus, or somebody very like Odysseus. But we also find in both poems lays or long passages of quite extraneous origin.

For example, the Catalogue of Snips in *Iliad* ii. is, by general agreement, an old document originally composed for a different context. It describes the mustering of the ships at Aulis, not their stations on the coast of Troy, and in various ways it shows signs of adaptation, and imperfect adaptation, to its present place. Further there are passages in *Odyssey* iii. and iv. which give abbreviated accounts of the Homecomings, or *Nostoi*, of various Greek heroes. Presumably they are derived from the Epic (or collection of lays) called *The Nostoi*. There are fragments derived from some *Heracleia*, or poem on Heracles, and it seems likely that some of the *Androktasíai* or "slayings of men" by various heroes may contain faded memories of real fighting in different parts of the Aegean world. If this is so, we must not reject the possibility of further "liftings"; notably a strong case has been made out for the suggestion that the exploits of Diomedes in the *Iliad* are in part taken from those of his father Tydeus in the *Thebais*, and that Hector himself, whose grave was shown in Thebes, was originally the defender of Thebes, not of Troy. The business of the song-stitcher was to make a great epic for the Panathenaea or some similar great occasion, and he had all the riches of "Homer" to draw upon.

Subject Matter.—Most of the typical Minoan or Mycenaean objects seem to have disappeared from the mainland of Greece by 1400 B.C., some 200 years before the fall of Troy. Some of these Homer does not mention (e.g., figure-of-eight shields, inlaid sword-blades, long rapiers), but he mentions elaborate palaces with bath-rooms (*ἀσάμυνθος*, a pre-Greek word), Nestor's cup with the doves drinking (*Il.* xi. 633), a helmet with boar's tusks (*x*. 261-5) and the inlaid metal-work on the shield of Achilles. These are very ancient indeed but may be explained by traditional knowl-

edge helped out by actual relics. If we ourselves have seen a Mycenaean cup like Nestor's presumably a classical Greek may have done so. Even Euripides describes a Mycenaean inlaid swordblade (*Electra* 476, cf. *Heracles* 418). The big shield which took the place of body armour and is often called Mycenaean remained in use, as Herodotus tells us, till about 650. It is found in Tyrtaeus and in a relief representing Ionian or Carian mercenaries approaching Sennacherib (705-680). A rather similar problem is presented by the discovery among Minoan remains of thirteen rings from Thisbe; the genuineness is avouched by Sir Arthur Evans. These are engraved with scenes or motives which are prominent in the poems or in later Greek saga: a man clinging under the body of a woolly ram, like Odysseus in *Od.* ix., a young prince slaying a king in a chariot in a narrow defile, as Oedipus slew Laius; a creature like Scylla with many heads attacking a ship, as in *Od.* xii. 245; a young prince, like Orestes, killing two guilty lovers. In Cnossus itself we find repeatedly the motive of a siege of a city, the hardest work of ancient warfare, which took poetic shape in the *Thebais* and the *Iliad*.

The existence of such motives in very early pre-Homeric times gives no evidence as to the date of any particular treatment of them in poetry. On the other hand the *Iliad*, though not the *Odyssey*, also clothes the heroes in the bronze panoply which came in not long before the time of Peisistratus, and often refers to the hoplite tactics which go with the panoply. More than that, Homer dresses both men and women, not in Mycenaean bathing drawers nor flounces, but in the "old-fashioned Attic style." He describes—in a book remarkable both for "lateness" and for beauty—a procession taking a peplos to Athena in exactly the manner of the Panathenaean peplos; he makes Athena leave Odysseus and go home to the "strong house of Erechtheus," or Erechtheum, on the Athenian acropolis. It also seems significant that the adventures of Odysseus in the *Odyssey* are turned into a contest between Poseidon and Athena, with the latter victorious, one of the most characteristic local Athenian myths, while a sympathetic character who protects and helps Telemachus is called "Peisistratus" and made the son of Nestor, from whom Peisistratus of Athens claimed descent. One need not dwell on the supposed "Athenian interpolations" which were noted in antiquity. The omissions are equally significant. In the Catalogue, for instance, Thebes, Aegina, Megara are omitted entirely; Salamis is suppressed and Corinth belittled. Athens, and no other city but Athens, has reasons for just these suppressions. Of course, the symptoms are never gross. The poems are as far removed from flattery or boastfulness as the rest of classical Greek literature.

Language.—Apart from problems of local dialect, the dialect of Homer is an early or "primitive" form of the language which we know as Greek in the classical age. This can be shown by comparing the grammatical formation and syntax of Homer with those of Attic. (The comparison of the vocabulary is in the nature of things less conclusive.)

1. The first aorist in Greek being a "weak" tense, *i.e.*, formed by a suffix (-σα), whereas the second aorist is a "strong" tense, distinguished by the form of the root-syllable, we expect to find a constant tendency to diminish the number of second aorists in use. No new second aorists, we may be sure, were formed any more than new "strong" tenses, such as *came* or *sang*, can be formed in English. Now in Homer there are upwards of 80 second aorists (not reckoning aorists of "verbs in μ ," such as $\xi\sigma\tau\eta\nu$, $\xi\beta\eta\nu$), whereas in all Attic prose not more than 30 are found. In this point therefore the Homeric language is manifestly older.

2. While the whole class of "strong" aorists diminished, certain smaller groups in the class disappeared altogether. Thus we find in Homer, but not in the later language:

(a) The second aorist middle without the "thematic" ϵ or \omicron : as $\xi\beta\lambda\eta\text{-}\tau\omicron$, was struck; $\xi\phi\theta\iota\text{-}\tau\omicron$, perished; $\alpha\lambda\text{-}\tau\omicron$, leaped.

(b) The aorist formed by reduplication: as $\delta\acute{\epsilon}\delta\alpha\epsilon\nu$, taught; $\lambda\epsilon\lambda\alpha\beta\acute{\epsilon}\sigma\theta\alpha\iota$, to seize. These constitute a distinct formation, generally with a "causative" meaning; the solitary Attic specimen is $\eta\gamma\alpha\gamma\omicron\nu$.

3. It had long been known that the subjunctive in Homer often takes a short vowel (*e.g.*, in the plural, -ομεν, -ετε instead of -ωμεν, -ητε, and in the Mid. -ομαι, etc. instead of -ωμαι, etc.). This was generally said to be done by "poetic licence," or *metri gratia*. In fact, however, the Homeric subjunctive is almost quite "regular," though the rule which it obeys is a different one from the Attic. It may be summed up by saying that the subjunctive takes ω or η when the indicative has \omicron or ϵ , and not otherwise. Thus Homer has $\lambda\text{-}\mu\epsilon\nu$, we go, $\lambda\text{-}\omicron\text{-}\mu\epsilon\nu$, let us go. The later $\lambda\text{-}\omega\text{-}\mu\epsilon\nu$ was at first a solecism, an attempt to conjugate a "verb in μ " like the "verbs in ω ." It will be evident that under this rule the perfect and first aorist subjunctive should always take a short vowel; and this is the case, with very few exceptions.

4. The article (δ , η , $\tau\omicron$) in Homer is chiefly used as an independent pronoun (he, she, it), a use which in Attic appears only in a few combinations (such as $\delta\ \mu\acute{\epsilon}\nu$. . . $\delta\ \delta\acute{\epsilon}$, the one . . . the other). This difference is parallel to the relation between the Latin *ille* and the article of the Romance languages.

5. The prepositions offer several points of comparison. What the grammarians called "tmesis," the separation of the preposition from the verb with which it is compounded, is peculiar to Homer. The true account of the matter is that in Homer the place of the preposition is not rigidly fixed, as it was afterwards. Again, "with" is in Homer $\sigma\acute{\upsilon}\nu$ (with the dative), in Attic prose $\mu\epsilon\tau\acute{\alpha}$ with the genitive. Here Attic poetry is intermediate; the use of $\sigma\acute{\upsilon}\nu$ is retained as a piece of poetical tradition.

6. In addition to the particle $\alpha\upsilon$, Homer has another, $\kappa\epsilon\nu$, hardly distinguishable in meaning. The Homeric uses of $\alpha\upsilon$ and $\kappa\epsilon\nu$ are different in several respects from the Attic, the general result being that the Homeric syntax is more elastic, and that the less common combinations of the earlier period were disused altogether in the later.

7. In the vocabulary the most striking difference is that many words appear from the metre to have contained a sound which they afterwards lost, *viz.*, English *W*, written in some Greek alphabets by the "digamma." This letter, however, died out earlier in Ionic than in most dialects, and there is no proof that the Homeric poems were ever written with it.

In many epics the nationality of the author, or of both author and scribe, can be fixed by the dialect. Thus the author of the *Chanson de Roland* was probably a native of the Ile de France, while the scribe was an Anglo-Norman. Similar conclusions may be drawn about many of the medieval German poems. But Homer's is no definite spoken dialect—it is a traditional dialect, regularly used for epic, shaped and twisted to an extent probably without parallel in literature by the needs and conveniences of the epic hexameter. In the main the poems are Ionic, with an Aeolic under-current. That suits the tradition, almost universal in antiquity, that the poems came from Ionia, and that "Homer was born" in Smyrna, Chios or Colophon, in regions where an Ionic population had superseded an Aeolic. We cannot however answer simply that the dialect is that of Smyrna or Chios at a given date; for it is clear that some process of transmutation has taken place. In general, Aeolic forms are left ($\text{Ἀρπείδαο, κεν, ῥοάων, Μυρμιδόνεσσι}$) where the Ionic form was not metrically equivalent; wherever the two are metrically equivalent, the Ionic is preferred. An exception like $\theta\epsilon\acute{\alpha}$ is left because there was no Ionic $\theta\epsilon\acute{\eta}$; $\theta\epsilon\acute{\omicron}\varsigma$ was the form used. Νῆος has always its Ionic form because the older poetry did not, apparently, mention temples, but only altars. Other exceptions are due to various accidental causes. The attempt has been made to argue that these "aeolic" forms were not really dialectic at all, but merely belonged to an older form of the Greek language from which both Aeolic and Ionic afterwards developed. The digamma, for instance, f , a w-sound which gradually disappeared from the Greek language like h in French or w in *whom, wrong*, in English, is practically a living letter in Homer. (Roughly 3,354 places imply the f while 617 ignore it.) By the sixth century f was dead in Ionic though alive in both Doric and Aeolic, and the ancients actually called it "the Aeolic letter"; but two centuries earlier it may well have been current in all forms of Greek.

This view however is disproved by the presence of new formations, which occur in Aeolic and in Homer, but are certainly not "Old Greek." There seems to have been some definitely Aeolic period in the development of the epic. On the other hand there is abundant evidence of "Old Greek," dating from a time prior to any Aeolic or Ionic of which we have written record. There are many phrases which were not understood in classical times, or at least had to be taught in school: ἀμέννα κάρηνα, διάκτορος ἀργειφόντης, νήδυμος, τοῖος (cf. Ar. Fr. 222 *Daitales*). And, equally significant, there are words which, in ordinary speech, only occur in Cyprian and Arcadian, such as φάναξ, πτόλις, κέραμος (a prison). Arcadia, isolated in the mountains of the Peloponnese, and Cyprus, isolated among the Semites of the eastern Aegean, preserved in common fragments of the very oldest Greek, which had perished elsewhere.

We have here phenomena corresponding to the Mycenaean cups and primaevaeal motives; while on the other hand the Attic influence on the language is equally conspicuous. It occurs in two forms. First, there are numerous Atticisms which are shown to be wrong by the metre, and must therefore be simply mistakes by the Attic scribe. Some are unmistakable like Ἔως ὁ ταῦθ' ὄρμαινε, where ἔως must be a mistake for ἦος. Others are almost certain but not quite: Τοῖς δ' Ἀγέλεως μετέειπεν offends against Homeric idiom and has probably supplanted τοῖσ' Ἀγέλαος ἔειπεν; ἦν που ἐφεύρηι is pure Attic and is more likely to be the mistake of an Attic copyist or reciter for αἶ κεν ἐφεύρηι than an original un-Homeric effort of a poet. But beyond a few clear cases we cannot be sure. If we remove drastically all the obvious "surface corruption" there remains a more deep-seated Attic element: ἦλιος, ἀμοθεν γε, βεβῶσα, ἦντο, εἴσφορος (as a dactyl *Il.* xxiii.) are isolated, but ὅπως (for Aeolic ὅππως, Ionic ὅκως), ἔπεισθαι (for ὀπάζειν) are common; and one has to remember that these Atticisms represent merely what has been left after generations of grammarians have gone over the text carefully to remove all that was not "Homeric."

Metre.—Lastly, this dialect has been re-shaped by the needs of the metre. To mention only a few of the instances: wherever three or more short syllables came together, or where a short came between two long, the word had to be changed before it could get into the hexameter; hence forms like γευόμενος, Τειρεσίας, εἰν ἀγροῇ, εἰνὶ θύρῃσι, with *ει* for *ε*; ἀπειρέσιος or else ἀπερείσιος; ἰστίη, προθυμίησι, Ἀπὸλλωνα, εἰλήλουθα. Analogy of course plays a part in these changes, e.g. τιθέμενος in place of τιθέμενος because of τίθημι, μαχεόμενος from the rhythm of μαχισόμενος, contrasted with ἡεὶ περὶ πτόλιος μαχεούμενος ἦδὲ γυναικῶν (*ω* 113, *λ* 403) because of Σ 265 ἀλλὰ περὶ πτόλιος τε μαχίσεται ἦδὲ γυναικῶν. Liberties are taken both with accidence and with syntax in order to obtain forms that are metrically convenient; especially conspicuous is the effort to obtain words or phrases which fill the final dactyl-spondee after the Bucolic diaeresis: ἡνιοχῆα acc. of ἡνίοχος, Αἰθιοπῆας of Αἰθίοπες, Σαρπηδόντος for Σαρπηδόνας, εὐρέα πόντον (from εὐρεῖ πόντω); the alternation of singular and plural in such words as ἵπποσύνης ἵπποσυνῶν, νηπιῆ νηπιήσι, κονίη κονίησι, that of active and middle in εἰσορόωντες εἰσορόωνται, μητιώωντες μητιάσθαι are to be explained thus. Similarly the gen. in *οιο* is prevalent in choriambic words Ἀντιμάχοιο, ἡνίοχοιο, ἀτρυγέτοιο, whereas for obvious reasons we always have Ἀξίου, εὐξέου, ἐταίρου, κελεύθου, and also Μεγέλαου, ἐνιαντοῦ, μεγαθύμου. In spondaic words (ἀγροῦ, οἴκου, σίτου) *-ου* is much commoner than *οιο*.

Thus the metre both preserves ancient forms and invents new forms. As to contraction of vowels, Epic prefers the old uncontracted forms but admits the shorter forms, usual no doubt in contemporary speech, for special reasons. Metrical necessity produces πελάγει, ἐφίλει (and φίλει), ἀγαπᾷς, φοβεῖται, πειρώμενος, etc.: the convenience of having all the cases of a noun metrically identical has some effect (Τυδείδω, ἀπασέων, ἡμέας, ὑμέας); while analogy also plays its part (ἀναβῆμι for ἀναβήμι from ἀναβάς, ὑπέρθυμον Διομήδεα from ὑπέρθυμος Διομήδης), sometimes assisted by an actual mistake: πῶν μεγ' οἶων must have come from some rhapsode who pronounced Γ 198 ὅς τ' οἶων

μέγα πῶν wrong. Similarly a bard who said τρεῖτ' in νίκην ἀλλ' αὐτοὶ τρεῖτ' ἄσπετον (*Il.* xvii. 332) proceeded to say τρεῖν μ' οὐκ ἐὰ Παλλὰς Ἀθήνη (*Il.* v. 256). The fact that the Greek language had thus to be stretched and twisted in order to satisfy the needs of the hexameter has led to the suggestion that the hexameter must be a foreign metre, made to suit a language other than Greek (Meillet, *Origines Indo-Européennes des Mètres Grecs*, 1923). The conclusion is not probable. After all no known language suits the hexameter half as well as Greek, and the variety of forms of words was satisfactorily explained by the ancients as due to the "singing" of early epic verse (Athenaeus xiv. p. 632d.), and Greek was spoken in the Aegean by 1400 B.C. (Buck, in *Class. Phil.* xxi.).

The misuses of the old language by rhapsodes who were accustomed to something much later may be compared with στέυτο for "stood" in *Od.* xi. 584 of δεδουπότος Οἰδιποδοῖο for "having died" (*Il.* xxiii. 679), of the misunderstanding of ἔδνα "bride-price" as if it meant "dowry" in *Od.* i. 278, ii. 194, or the introduction of the proverb "iron itself draws a man on" (*Od.* xvi. 294, xix. 13).

The Homeric Style.—These considerations may be thought to lead to a rather chaotic result, if not a purely negative one. Yet, though they do not encourage attempts to discover the age or birthplace of "Homer," they do help us to understand the great qualities of the Homeric style. If we compare the Homeric poems with the *Aeneid* or *Paradise Lost* we feel in them much more directness and vital force. They have the quality of the heroic age, of the Volsunga saga or of Beowulf. If we compare them with these latter, we feel them to be far richer in language, larger and closer in construction, nobler in artistic form. They unite, to a degree that is perhaps unique in literature, primitive force with artistic dignity and accomplishment. Poems like *Iliad* vi. and xxiv., for example, are hardly conceivable except as the work of minds as civilized as that of Aeschylus on material as rude and fierce as the End of the Niblungs.

The same considerations throw light on another quality of Homer, which persists all through the higher Greek poetry. The grand style concentrates on the main subject, not on detail. It is not precise or realistic. It deals in types more than individuals. The main characteristics of the main characters, the main interest of the main story, are intensely clear, but the mass of not strictly relevant detail which contributes so much to the lifelikeness of modern fiction is mostly omitted. There are many ships described in Homer, and described vividly, but no one is ever distinguished from another. They are merely "black," "hollow," "swift," "well-balanced," "red-cheeked" or the like.

There are two quite distinct styles of fighting and of armour: first the classical battle of hoplites in phalanx with small bronze shield, breastplate and backplate, which has been introduced into many parts of the *Iliad*; and second, below this, the fighting of particular champions (πρόμαχοι) in Mycenaean style with the great leather shield, reaching from neck to ankles and making body armour unnecessary, while an ill-armed mob behind, with little protection beyond goat-skins (λαισῆα) help with stones, darts and arrows. Yet the epithets seldom make clear what sort of shield is meant; the general descriptions often leave obscure what style of fighting. The same with the topography.

This quality enabled the bards freely to compose poetry about times and places of which they had no personal knowledge, provided only that they observed the traditional epic manner and were permeated by its spirit. A modern artist, especially a novelist, generally has two aims which seem to us normal, but which are entirely alien to the spirit of Homeric poetry. First, he aims at detailed descriptions of phenomena; while "Homer" aims straight at the emotional effect with a minimum of detail. For example, the similes taken from lions in the *Iliad* might always have been written by one who had never seen a lion, but never by one who had not been imaginatively thrilled by poetry about lions. Secondly, the modern artist is generally conscious of himself as opposed to his audience, and aims at producing something "original." The book he writes is printed

and preserves its sharp edges, whatever the taste of the reader may be.

But the ancient bard was, in the main, performing things already well known, the common possession of himself and his audience. An ancient bard could not be eccentric or go against the prevailing taste. A poem so written would simply not live. It would not fit its environment, and the next reciter would alter it. It is essential, in trying to understand ancient oral poetry, to realize this fact: the successful oral poem, like the speech of a popular orator nowadays, must be the joint product of the artist and his public. Thus a rhapsode describing Ithaca or Troy or Achilles must avoid any sharp clash with the public conception of those subjects. He must not contradict people's expectations and memories. The real facts, as they would appear in a modern book of reference, do not much matter, though, in order no doubt to avoid awkward clashes, he does generally abstain from precise detail. When there is detail it is still generic.

There is an oak on the plain of Troy; oaks are common on plains. There is a fig-tree growing in or beside the wall, making a place where the wall is climbable (*Il.* vi. 433). That may well be evidence for the existence of a poem describing the scaling of the wall by help of the fig-tree; it is no evidence that there was actually a fig-tree in the wall of historical Troy. The one detailed statement about the rivers of the plain of Troy, viz. that they meet (*Il.* v. 774), is rejected as geographically impossible even by those scholars, like Leaf and Robert, who try to identify the local details. In the descriptions of Ithaca, some points can be found on the island, and doubtless could on other islands also; some seem to suit Leucas but not Ithaca, while in some again the detail seems to be the remnant of a myth. The isle of Odysseus is described as "low down, farthest away in the sea toward the darkness: the others are separate, toward the dawn and the sunlight." That description is utterly unsuitable to the real geography, but sounds like a description of a mythical Isle of the Setting Sun, in the far west, which possibly lingered in the minds of poets and audiences from an older poem.

It is worth observing that this vagueness of detail, this use of the generic and typical rather than the hard particular, is characteristic of the higher Greek poetry in general, and is probably due to the same cause—the dependence of the poet on the tradition as known to, or accepted by, his audience. Thus Aeschylus in the *Agamemnon* makes his beacon-signals start from Mt. Ida, though in fact the top of Mt. Ida is some 30 miles in the wrong direction. He does so because Mt. Ida is always in tradition the mountain of Troy. Both audience and poet take it for granted. For somewhat similar reasons, the tragedians give no names to their subordinate characters: they are merely Servant, Messenger, or Nurse.

Historicity.—Far more precarious than the geographical identifications are attempts to extract history from the Homeric narrative. It is quite likely that there are hard nuggets of history preserved unchanged in the poems, but it is impossible to distinguish history from myth, folk-lore and fiction in such a slowly grown and beautifully welded whole. If Odysseus burns out the eye of a one-eyed giant, if he escapes from the cave by clinging under the belly of a ram while the Cyclops stops and feels the ram's back, one cannot say that such things never happened, but one should not forget that they occur in dozens of folk-tales. If Odysseus had 360 boars, one of whom died every night, one cannot but think of the sun or the year, as described in ancient riddles: one cannot help noticing with interest that the day on which Odysseus and Penelope met was the exact day in which ancient astronomers considered that the sun cycle and moon cycle coincided: the day called "the meeting of sun and moon" in Meton's *Eikosieteris* or 20 year cycle. Such solar material may quite well be blended with a story of real life. One must simply wait for the evidence.

Again, there is nothing at all impossible in the story that the cause or pretext of the Trojan War was the rape of a princess. Yet the fact that a statement is possible is no proof that it is true; and one must remember that Helen was, in historical times

a marriage goddess in Sparta, and as such must herself go through the marriage ceremony, which comprised in Sparta the carrying off of the bride. Hence Helen in saga is constantly "carried off"—to Sidon or Troy by Paris, to Egypt by Hermes, to Deceleia by Theseus or the Apharetidae, to Parmon by "a robber." There is ritual significance also in the fact that she is generally restored by twins, either her brothers, the Dioscuri, or the *gemini Atridae*; and that, as with other marriage-goddesses, the story sometimes explains that it was not the true goddess but only an "image" that the ravisher seized.

There will be little difference of opinion as to the existence in Homer of real history, mixed up with fiction, folk-lore and myth; it is also clear that we have not at present any body of evidence by which to sift out the history. It would moreover be a great error of method to suppose that in such a combination there is always, or usually, a true nucleus and a fictional or mythical penumbra. In the *Niebelunglied*, for example, the myth seems to be the nucleus, which has attracted into it some historical figures like Atli and Dieterich of Berne (Attila and Theodoric). The same would hold of most historical novels.

Nor should much weight be attached to the fact that the incidents of the *Iliad* are generally of the possible sort; marvels and monsters are kept outside the story. That is purely a question of style. The *Iliad* is tragic, and serious. The *Odyssey* veers towards the fairy-tale in the Story of Odysseus (ix. to xii.) and comes back to reality in the later books. The *Argonautica* was *τετραῶδης*, "full of marvels," throughout. On the other hand the actual names borne by the chief heroes may well be historical or at least derived from history. Atreus, Paris, Helene, Odysseus (or Olytseus) do not seem to be Greek words; Achilleus, Agamemnon, Menelaus look like non-Greek words twisted into a semblance of Greek. If so, they are probably not invented but derived from real persons who bore names more or less like them, while Diomedes (Zeus-counsel), Neoptolemus (War-new), Hector (Holder) and perhaps Priam (King) seem like pure Greek names which anyone could invent.

HOMERIC MORALITY

It is strange to read in old books that Homer has "no law and no morality." It seems so very contrary to the truth. Homeric law is the law of the heroic age: there is no code, but the king delivers judgments (*θέμωρες*), based no doubt on custom and public opinion. If they are unjust there is a general Nemesis, or Indignation, of men, and probably a punishment of all the land by the gods. In times of peace, as in the *Odyssey*, there is praise for "some blameless king, who in the fear of God rules among men many and strong, and upholds righteous judgments; to him the black soil bears wheat and barley, the trees are heavy with fruit, the flocks bring forth unfailingly and the sea provides its fish, because of his good leading; and the peoples prosper under him." (*Od.* xix. 111.) So Odysseus "had no evil thoughts, but was kind as a father to his people" (*Od.* ii. 230 sqq., v. 8 sqq., etc.) In war, of course, such as we have in the *Iliad*, there is not so much question of law or justice, though it is noteworthy that the *gerontes*, or elders, have some influence beside the king. In Troy this is natural, since the Trojans are still living at home among their native sanctities. But even in the Achaean camp Nestor carries weight in the council of chiefs on the ground of his age and experience.

In the main, as in other heroic ages, morality has gone back to first principles, to what Homer calls *aidôs* and *nemesis*. *Aidôs* is generally interpreted as "shame" or "sense of honour," *nemesis* as "righteous indignation." *Aidôs* is what you feel about your own actions: the honour that compels you, the shame that deters you, the ruth or remorse that haunts you. *Nemesis*, or "the *nemesis* of men," is what is felt by the onlooker about the act of another, done or contemplated. If you feel disposed to run away in battle, or if you continue to be angry after receiving atonement, think of the "*nemesis* of men"! When Helen is asked to go and let Paris make love to her when he has emerged with doubtful honour from a battle with Menelaus, she says roundly: "I will

not go. Νέμεσις γὰρ δὲ κεν εἴη; it would be a thing to feel *nemesis* at." The word *nemesis* soon passes away from the sphere of ordinary human blame. It becomes the haunting impalpable wrath of the earth and sun, the "innumerable *Keres*," the gods and the dead. The deeds that rouse it fall mainly into three categories; first, actions that imply cowardice. "*Aidōs*, ye Argives . . . will ye not stand? . . . I have *nemesis* against you in my heart." Secondly, perjury and lying. This never occurs in Homer, because the heroes never commit the action, except perhaps Pandarus, who is killed. But it is the most typical source of shame in the rest of the heroic tradition.

Thirdly, and much the most important, any wrong or treachery towards the helpless, the stranger, the suppliant, and the aged. The feeling often occurs in Homer, but the doctrine is most clearly expressed by a passage in Hesiod (*Works and Days* 327 sqq.). "It is all as one thing—the man who wrongs a suppliant or a stranger, the man who violates his brother's bed; the man who in heartlessness sins against orphan children; the man who reviles his old father on the bitter threshold of age: with that man Zeus himself is wroth." The parable of the prayers, Daughters of Zeus, in *Il.* ix. 502 illustrates the same feeling. They are prayers for mercy or forgiveness. Lame, and wrinkled and half-blind, they stagger after the footsteps of Ate (Blindness, or Evil) trying to heal the harm she has done. . . . And woe to the man who rejects them, for the daughters of God speak to their Father. Such a man would be *Ἀναίδης*.

Expurgations.—A saga, or a body of poetry, which lasts on in tradition from one age to another is almost certain to be altered to suit changes of taste, particularly if the standard is rising. The Northern epics were modified as their people became Christian. The books of the primitive polytheistic Hebrews were modified as the religion of Jehovah prevailed. The acting texts of Shakespeare changed most sensitively in the 18th and 19th century. In Homer, as Plato explains in the *Republic*, there are occasional passages which hurt the moral sense of a later age, and "we must beg Homer not to be angry if we delete them" (*Rep.* iii. p. 387b). Zenodotus and Aristarchus are recorded as having acted in this spirit after Plato, and other critics and poets had evidently done so before. Zenodotus mostly deleted what was *ἀπρεπές*, "unseemly"—abusive language, attribution of fear to the Gods or heroes, of a mean motive to Achilles or Agamemnon, of a list of amours to Zeus, and the like. These expurgations are recorded in the Scholia. So is the meditated parricide of Phoenix and a suggestion, by Ajax, of all people, that the Achaeans should "pray silently, so that Trojans should not hear."

There has been a complete expurgation of certain primitive vices, which were current in most parts of later Greece (Schol. on *Il.* xvi. 97 sqq., xx. 231 sqq. v. 266). The brother-and-sister marriage of Alcinous and Arete is turned into one between uncle and niece. (Schol. *Od.* vii. 55 sqq.) The torture of Hector before death has been turned into an insult to his body after death. In general, mutilation, stripping of the dead, torture and beheading have been either removed or softened down. Poisoned arrows are condemned, though it is clear that Homer's arrows, like those of Heracles in Hesiod, originally "had death on the tip and wept in drops" (*Aspis* 132). There has also been a vigorous and almost complete excision of human sacrifice. Homer says nothing of the sacrifice of Iphigeneia or Polyxena; "rightly," says Pausanias, "he omitted such a cruel and unlawful deed." The one human sacrifice which seems to have been too firmly fixed in the legend to admit of expurgation, viz., the sacrifice of twelve noble Trojans by Achilles at the pyre of Patroclus, is hurried over in a shamefaced line and a half, without even a principal verb, and is followed by the words: "Yea, he devised evil things in his heart." The *Odyssey*, which is in many ways less a mirror of chivalry than the *Iliad*, admits something very like torture for Melanthios and the treacherous bondmaids. After all, they were only slaves!

Each case needs separate consideration, but the fact of expurgation can hardly be denied. The real Akhaiusha who took Troy were probably a horde of savages. We can see the un-

expurgated account of their doings in the fragments of the Epics that were considered "non-Homeric," i.e., which never passed through the furnace of the Panathenaic recitation. But the "godlike Achaioi" of Homer have been made into ideals of manly chivalry, held up to the imitation of the young, and must not be described as practising the "beastly devices of the heathen." The true spirit of Homeric chivalry comes out in the parting of Hector and Andromache in *Il.* vi., the reconciliation of Achilles and Priam in *Il.* xxiv., or the words of Odysseus over his dead enemies: "Unholy it is to vaunt over slain men."

BIBLIOGRAPHY.—(1.) Editions of text: *Editio princeps* by Demetrius Chalcondylas, Florence (1488); Aldines (1504, 1517). *Modern Critical Texts.* La Roche, *Odyssey* (1867–68), *Iliad* (1873–76); Ludwich, improvement on La Roche, *Odyssey* (1889–91), *Iliad* (1901, 1907); Allen (Oxford, 5 vols., 1908 and after); based on fullest examination of mss. and papyri. (2.) Editions which attempt to restore the text to some pre-Aristarchean form:—Payne Knight (1820, after *Prolegomena*, 1816), a curiosity of wild restoration; Brandreth, *Ilias* (1841); Fick, text restored to "the original Aeolic," *Odyssey* (1883), *Iliad* (1886); Less adventurous, Van Leeuwen and Mendez da Costa, several editions (1889–1912), with *prolegomena* and notes, and restoration into supposed "original Ionic"; Platt (Cambridge 1892, 1894) removes surface corruption and restores the digamma where the case is clear. (3.) Commentaries:—Van Leeuwen (as above); Leaf, *Iliad* (2nd ed. 1900–1902) the best commentary in English; Ameis, afterwards continued by Hentze and (7th ed.) by Paul Cauer (1913), probably the best in German; a remarkable edition of the *Odyssey* in six vols., treated dramatically, by V. Bérard (Paris 1924); *Odyssey* I.–XII., Merry and Riddell, XIII.–XXIV., Monro (1886, 1901), with valuable appendices. (4.) Scholia. The Venetian Scholia, first pub. by Villoison (1788); Best Edition, *Iliad* (4 vols.) and *Odyssey* (2 vols.) by Dindorf; Townley, *Scholia to Iliad* (2 vols.) by Maas (1855–88); Eustathius' vast commentary, pub. Rome 1542, reprinted Stallbaum (Leipzig, 1827). Books on the Scholia:—Lehrs, *De Aristarchi Studiis Homericis* (1833, 1865), very interesting; more elaborate, Ludwich, *Aristarchs Hom. Textkritik* (2 vols. 1884, 1885); Roemer, *Homerezege Aristarchs* (ed. Belzner 1924); Wecklein, *Über Zenodotus und Aristarch* (1919). (5.) Books on the Text:—La Roche, *Hom. Textkritik* (1866) and *Hom. Untersuchungen* (1869); Ludwich, *Die Homerische Vulgata als voraristarchisch erwiesen*; Agar, *Homeric* (1908); Bolling, *External Evidence for Interpolation in Homer* (1925).

(6.) General:—Wolf, *Prolegomena ad Homerum* (1795, ed. Volkman 1844). Wolf was to some extent preceded by Wood, *Essay on the Original Genius of Homer* (1769); and the Abbé d'Aubignac, *Conjectures Académiques* (pub. 1715 but written about 1669). Compare also Vico, *Il vero Homero*, 1744. Hermann, *De Interpolationibus et De Imitatis apud Homerum*, in his *Opuscula* (5 vols.); Lachmann, *Betrachtungen über Homers Ilias* (1837–41, ed. Moritz Haupt 1865, 1874); Erhardt, *Entstehung der Hom. Gedichte* (1894); Jebb, *Introduction to Homeric Study* (1887), still useful; Browne, *Handbook of Homeric Study* (1908); Seymour, *Life in the Homeric Age* (1907); Cauer, *Grundprobleme der Homerischen Kritik* (3rd ed. 1921–23) gives the best conspectus of the whole problem. Chadwick, *The Heroic Age* (1912) brought new light on the Homeric question by a study of "heroic ages" as a type. Rothe, *Ilias als Dichtung* (1910), *Odyssee als Dichtung* (1924), a good restatement of the old "unitarian" point of view; cf. M. Stawell, *Homer and the Iliad* (1909). Drerup, *Homeric Poesie* (5 vols. 1921); the first gives a valuable conspectus, specially devoted to correcting Cauer, learning great, but standpoint somewhat uncritical. G. Murray, *Rise of the Greek Epic* (1907, 3rd ed. 1925); T. W. Allen, *The Homeric Catalogue of Ships* (1921) and *Origin and Transmission of the Homeric Poems* (1926); U. von Wilamowitz-Moellendorf, *Homeric Untersuchungen* (1884) and *Homer und die Ilias* (1920) and *Heimkehr des Odysseus* (1926); Eric Bethe, *Homer und die Heldensage* (1902), valuable on the nuclei of historical fact, transmuted, in the poems, and *Homer, Dichtung und Saga* (3 vols. 1914–27). Seck, *Quellen der Odyssee* (1887), struck out a new line of inquiry; vigorously followed up by Müller, *Ilias und ihre Quellen* (1910). J. A. K. Thomson, *Studies in the Odyssey* (1914), emphasizes tradition and attempts imaginative understanding; E. Schwartz, *Odyssee* (1924); Finsler, *Homer in der Neuzeit* (1912) and *Homer* (1908), very wide reading; Bédier, *Les Légendes Épiques* (1908–13). Ingenious are:—Butler, *The Authoress of the Odyssey* (identified as Nausicaa 1897); Shewan, *The Lay of Dolon* (1911); Smyth, *A Numerical Law in the Homeric Poems* (1914). (7.) Among older books Welcker's *Epische Cychus* (1835–49), is still valuable; also Sengenbusch, *Introduction to Dindorf's text of Homer* (1855–56); Friedlaender, *Wolf bis Grote* (1853); Kirchhoff, *Homeric Odyssee* (1869); and Paley, articles cited in Sayce's Appendix to vol. 1 of Mahaffy's *Greek Literature*. Andrew Lang's books, though injured by their polemical tone, are still useful:—*Homer and his Age* (1906), *Homer and the Epic* (1895) and *The World of Homer* (1910). Gladstone's *Studies on Homer* (1858). *Juventus Mundi* (1869) contain some brilliant suggestions; Hayman's *Odyssey* (1866), has useful notes. Geddes, *Problem of Homeric Poems* (1878); Nitzsch's voluminous writings, *Erläuternde Anmerkungen zu*

Homer's Odyssee (1826-40), etc., have lost most of their value; Nägelsbachs, *Anmerkungen zur Ilias* (first three books) much praised (1864).

(8.) Archaeology:—All books are dependent on the discoveries of Schliemann at Troy and Mycenae, between 1869 and 1896, summed up in Schuchhardt, *Schliemann's Excavations* (1891, Eng. tr. 1891), and later on those of Sir Arthur Evans and others in Crete, summed up in Evans, *The Palace of Minos at Knossos* (3 vols. 1921-28); cf. W. Leaf, *Troy* (1912), *Homer and History* (1915) and *Strabo on the Troad* (1923); Robert, *Studien zur Ilias* (1901); Helbig, *Das H. Epos durch die Denkmäler erklärt* (1884, 1887); Buchholtz, *H. Realien* (1871-73); Reichel, *H. Waffen* (epochmaking); V. Bérard, *Les Phéniciens et l'Odyssee* (1902-03), fascinating rather than convincing; Noack, *H. Paläste* (1903); cf. Dörpfeld in *Mitth. Arch. Inst. Ath.* (1905); Ridgeway, *Early Age of Greece* (1901), first emphasized the northern invasions. Wace and Thompson, *Prehistoric Thessaly*; Sartiaux, *Troie* (1915); Macurdy, *Troy and Paonia* (1925); Hall, *Oldest Civilization of Greece* (1901), and *Ancient History of Near East* (1913), and *Aegean Archaeology* (1915); Dussaud, *Les Civilisations Pré-helléniques* (2nd ed. 1914); Glotz, *Civilisation égéenne* (1924); Heusey, *Histoire du Costume antique* (1922).

(9.) Language:—Buttmann, *Lexilogus* (1818-25), still interesting; Monro, *Homeric Grammar* (2nd ed. 1891); van Leeuwen and Mendez da Costa, *Euheiridion Dictionis Epicae* (2nd ed. 1918); Dieltz, *H. Formenlehre* (1908); Freund, *Formenlehre d. H. Mundart* (1906); Schulze, *Quaestiones Epicae* (1902); Delbrück, *Syntaktische Forschungen* (1871-72); Thumb, *Das Digamma* (1898) and *Die Gr. Dialekte* (3rd ed. 1928); Bekker, *Homeric Blätter* (1863-72); Cobet, *Miscellanea Critica* (1876); Bechtel, *Vokalkontraktion bei H.* (1908); Meillet, *Aperçu d'une Histoire de la Langue Grecque* (1920), very good; Wackernagel, *Sprachliche Untersuchungen zu Homer* (1916). (10.) Metre:—Hartel, *Homeric Studien*; Solmsen, *Untersuchungen zur Gr. Laut- und Verslehre* (1901); Danielsson, *Zur Lehre vom H. Digamma*, *Ind. Forsch. XXV.*; Witte in Pauly-Wissowa's *Realencyclopädie*, "Homeros"; Drewitt, "Scansion in H. Verse," in *Class. Quarterly* (April 1908); Usener, *Altgriechischer Versbau* (1886); Schröder, *Vorgeschichte des H. Hexameters* (1908). (11.) Lexica, etc.:—*Concordance to Iliad* by Prendergast (1875) and *to Odyssey* by Dunbar; *Lexicon Homericum* by Ebeling (1880-85); Gehring, *Index Homericus* (1891); *Facsimile of codex Venetus A.*, Sijthoff (1901), with introduction by Comparetti. The chief classical periodicals (such as, in England, *Journal of Hellenic Studies*, *Classical Quarterly*, *Classical Review*, *Liverpool Annals of Archaeology*, and in America *Classical Philology*, *American Journal of Archaeology*) contain *passim* articles on Homer, e.g., many on mss. by T. W. Allen in the *Class. Review*; the literature is summarized from time to time in Bursian's *Jahresberichte*: esp. vols. CLXVI. (text), CLXXXII. (general and archaeological). The histories of Greece and of Greek Literature all treat of Homer.

For a summary of the plots of the *Odyssey* and *Iliad* see HOMERIC POEMS.

HOMER, WINSLOW (1836-1910), American painter, was born in Boston (Mass.), on Feb. 24, 1836. At the age of 19 he was apprenticed to a lithographer. Two years later he opened a studio in Boston, and devoted much of his time to making drawings for wood-engravers. In 1859 he removed to New York, where he studied in the night-school of the National academy of design. During the American Civil War he was with the troops at the front, and contributed sketches to *Harper's Weekly*. The war also furnished him with the subjects for the first two pictures which he exhibited (1863), one of which was "Home, Sweet Home." His "Prisoners from the Front"—perhaps his most generally popular picture—was exhibited in New York in 1865, and also in Paris in 1867, where he was spending the year in study. Among his other paintings in oil are "Snap the Whip," "Eating Water-melon," "The Cotton Pickers," "Visit from the Old Mistress, Sunday Morning," "The Life-Line" and "The Coming of the Gale."

His genius, however, has perhaps shown better in his works in water-colour, among which are his marine studies painted at Gloucester (Mass.), and his "Inside the Bar," "The Voice from the Cliffs" (pictures of English fisherwomen), "Tynemouth," "Wrecking of a Vessel," and "Lost on the Grand Banks." His work, which principally consists of *genre* pictures, is characterized by strength, rugged directness and unmistakable freshness and originality, rather than by technical excellence, grace of line or beauty of colour. He was little affected by European influences. His types and scenes, apart from his few English pictures, are distinctly American—soldiers in blue, New England children, negroes in the land of cotton, Gloucester fishermen and stormy Atlantic seas. Besides being a member of the Society of painters in water-colour, New York, he was elected in 1864 an

associate and the following year a member of the National academy of design.

HOMERIC POEMS. This title is commonly given to the whole cycle of the early Greek epics, including the *Odyssey* and the *Iliad* as well as the rejected epics. In the article HOMER a full discussion is given of the "Homeric question." For bibliographical information also the reader is referred to the article HOMER. In the present article will be found merely (1) a discussion of the cyclic poems other than the *Iliad* and the *Odyssey*, (2) an analysis of the plots of the *Iliad* and the *Odyssey*.

The Rejected Epics.—As soon as the two great wholes, *Iliad* and *Odyssey*, were given exclusive rank as "Homer" at the Panathenaea the rest of the heroic *epos* fell, it would seem, quickly into neglect. The subject matter indeed was used freely by the tragedians, who carefully avoid the *Iliad* and *Odyssey*, but though the names of many epics or groups of story are preserved, the poems themselves have perished utterly except for a few meagre fragments (about 120 scattered lines altogether) and those in a very rough and unscholarly form. The Homeric rules of metre, language and subject matter are carelessly ignored, presumably because the attention of scholars was concentrated on the two great poems. We hear much in later times of various "cycles," "the Trojan cycle," "the Theban cycle," and "the Epic cycle" as a whole. The epic cycle is a "ring" or collection, covering the whole epic saga; the Trojan or Theban is that part of it which deals with Troy or Thebes. Thus a certain Proclus (presumably the Neo-Platonic philosopher, 5th century A.D.) in his *Chrestomatheia Grammatike*, or *Compendium of Literature*, included "an account of the so-called Epic cycle, beginning with the Marriage of Heaven and Earth, and . . . made complete out of various poets" till it ends with the death of Odysseus at the hands of his son Telegonus.

Among the *Tabulae Iliacae* in Jahn's *Bilderchroniken* (1873) there is a large relief (No. 1) illustrating scenes in the history of the Trojan War, drawn up for school use by the grammarian Theodorus, probably in the 1st century B.C. It is called *τάξις Ὀμήρου*, "an arrangement of Homer," and is duly "made up out of various poets." Thus the post-Homeric part of the "Trojan Cycle" is taken from "the *Aethiopis* according to Arctinus, the so-called *Little Iliad* according to Lesches of Pyrrha and the *Sack of Ilium* according to Stesichorus." Elsewhere we hear of the *Sack of Ilium* by (or "according to") Arctinus of Miletus. Evidently the *Sack of Ilium* is a fixed mass of legend, a traditional subject, which the cycle-maker could tell "according to" the version of any one of its successive composers, even at times preferring a lyric poet like Stesichorus to any of the epic writers.

The *Tabulae Iliacae* refer to a large number of these ancient poems, more indeed than we can identify from the fragments (cf. Jahn, No. VI.). Those poems whose names are known are attributed by Athenaeus and Pausanias, our earliest authorities, to various authors. Athenaeus refers to "him who made the *Titanomachy*, whether Eumelus or Arctinus or whatever name he prefers"; "him who made the *Cypria*, Hegesias or Stasinus or Cyprius"; but he generally leaves the author anonymous: *Ὁ τὴν Ἀλκμαιωνίδα ποιήσας, ὁ τοὺς Νόστους ποιήσας*. Occasionally we find a plural: *οἱ τὴν Ἡρακλείαν ποιήσαντες, οἱ τῶν Κυπρίων ποιηταί* (Eratosthenes ap. Strabo 638: Schol. v. on *Od.* xvi. 57). This means, not of course "the committee which composed the *Heracleia*," but "the various poets or 'makers' who made versions of the *Heracleia*."

An epitome of Proclus' account of the poems which formed the sources of his Epic cycle is given partly in Photius' *Bibliotheca* (c. 850 A.D.), partly in the Venetian scholia. The epitome gives a definite list of poems each with a definite author: the *Iliad* by Homer, *Aethiopis* by Arctinus of Miletus, *Little Iliad* by Lesches of Mitylene, *Sack of Ilium* by Arctinus, *Nostoi* or *Homecomings* by Agias of Troezen, *Odyssey* by Homer and *Telegonia* by Eucammon of Cyrene. This definiteness is apparently the result of epitomizing the longer and more doubtful accounts given by earlier authorities; and references to these same poems elsewhere show that they were far from definite wholes. The same incidents are quoted now from the *Sack* and now from the *Little Iliad*. Simi-

larly an attempt to give definite dates to the separate poets breaks down on examination.

It is noteworthy that the poems about the *Sack of Troy* seem to be pro-Trojan or at least anti-Greek in sympathy. As in Euripides' *Trojan Women*, all possible cruelties and crimes are attributed to the conquerors. This may be due merely to the nature of the theme. Any poet telling of the sack of a town, whether he takes the romantic tone of the *Little Iliad* or the tragic tone of the *Sack of Ilium*, is fairly sure to make the most of the sufferings of the conquered women and children; but we may observe also that the alleged authors are mostly drawn from towns outside the traditional Homeric birthplaces; and that Miletus, for instance, the city of Ionian science and commerce, may have regarded with some feeling of opposition the barbarous glories of the old towns which it had outstripped.

It is not to be supposed that these poems of the Trojan cycle, in their late versions, were true representatives of the rejected epic literature. The true rock from which the *Iliad* was hewn is lost. The Theban epics, especially the *Thebais*, seem to have come nearest to the *Iliad* in general esteem, and to have been largely used in the final make-up of that poem; next to them in importance, perhaps, were Thessalian lays about the ship Argo (πᾶσι μέλουσα, *Od.* xii. 70) and Argive lays about Heracles. The *Titanomachies* and poems about the origin of the world belong to the Hesiodic group rather than the Homeric.

Plot of the Iliad.—I. (Λοιμός. Μῆνις.) Chryses, priest of Apollo, comes to the Greek camp with ransom, to buy back from Agamemnon his captive daughter, Chryseis. Scornfully refused, he prays to Apollo to avenge his daughter's wrong. Apollo sends pestilence on the host. After nine days Achilles calls an assembly, discovers the cause of the pestilence, and demands that Chryseis be restored to her father. Agamemnon consents, but takes instead Achilles' own prize, Briseis. Achilles renounces his allegiance. His mother Thetis persuades Zeus to make the Greeks rue the wrong done to her son.

II. (Ὀνειρος. Βοιωτία, ἡ κατάλογος τῶν νεῶν.) Zeus thereupon beguiles Agamemnon with a dream to begin a pitched battle. Agamemnon, to try the temper of his men, proposes to abandon the expedition; they, led by a demagogue, Thersites, are only too ready to do so; but Odysseus beats Thersites and rallies them. There follows a Catalogue of the Greek ships as they were marshalled at Aulis before starting to Troy (484-760), and of the Trojans and their allies (816-877).

III. (Ὅρκου. Τειχοσκοπία. Μενελάου καὶ Πάριδος μονομαχία.) Paris challenges Menelaus to single combat for Helen; a truce is proclaimed. Helen and Priam watch the Greek army from the Walls of Troy. Paris is nearly slain, but saved by Aphrodite.

IV. (Ὅρκιον σύγχυσις. Ἀγαμέμνονος ἐπιπώλησις.) Athena, to injure the Trojans, persuades Pandarus, son of Lycaon, to break the truce by treacherously shooting Menelaus. Wrath of Agamemnon: he marshals the host and the armies join battle, the Trojans now involved in a curse.

V. (Διομήδους ἀριστεία.) Diomedes' day: he makes great slaughter of the Trojans, especially of the traitor Pandarus by a wound through the mouth (290-296). He wounds Aphrodite, who is protecting her son Aeneas, and sends her weeping to Olympus. He is beaten back from Troy by Apollo. Ares helps the Trojans; the Greeks are failing, when Athena mounts in Diomedes' chariot and they charge and wound Ares, who flies with a shout like ten thousand men.

VI. (Ἐκτορος καὶ Ἀνδρομάχης ὁμιλία.) Hector goes back to Troy to bid the women make a great procession and prayer to Athena. Meanwhile Diomedes and the Lycian Glaucus are about to fight, when they recognize one another as hereditary guest-friends, and part with gifts. Hector gives his message, says farewell to his wife Andromache and their child, who is frightened of his father's plume; he collects Paris and goes back to the battle never to return.

VII. (Ἐκτορος καὶ Αἴαντος μονομαχία. Νεκρῶν ἀναίρεσις.) Hector challenges all the Greeks; the lot falls on Ajax; the fight is indecisive and they part with gifts. In Troy Antenor urges that, since they now fight with a curse upon them, they give back

Helen and her treasure and ask for peace. Paris will not give up Helen, but offers to restore the treasure and add more. This offer is sent next day to the Greeks and refused; a truce is made for the burial of the dead; the Greeks build a wall round the ships. A wine ship comes from Lemnos and the Greeks lie on the shore drinking.

VIII. (Κόλος μάχη.) Zeus, to fulfill his promise, commands the gods to keep away from the battle and himself comes to the top of Mt. Ida. He weighs the fates of Greeks and Trojans and drives the Greeks back with thunderbolts. Agamemnon and Teucer resist desperately; Poseidon, and then Hera and Athena, try again to help the Greeks, but are warned back. The Trojans bivouac on the field and their fires surround the Greek camp.

IX. (Πρεσβεία πρὸς Ἀχιλλέα. Δίται.) At a secret meeting of the chiefs, Agamemnon again offers to abandon the expedition and set his followers free; Diomedes and Nestor insist on continuing. Watches are set lest the Trojans attack by night. Agamemnon next offers to make atonement to Achilles and implore his forgiveness, to return Briseis untouched, and splendid gifts with her. Odysseus, Ajax and Achilles' old tutor Phoenix go to beseech Achilles, who passionately refuses all their offers and declares he will sail for home on the morrow. Phoenix stays with him; the other envoys return.

X. (Δολωνεία.) Agamemnon and Menelaus call the chiefs to watch by the trench. Odysseus and Diomedes go out as spies. They capture and kill a Trojan spy, Dolon; by his information they surprise the camp of the Thracians, kill Rhesus, take his horses and escape.

XI. (Ἀγαμέμνονος ἀριστεία.) Agamemnon by desperate valour beats back the Trojans until he is wounded. Diomedes and Odysseus, rallying the Greeks, are both wounded; then Machaon and Eurypylus. Achilles, seeing the wounded Machaon pass, sends Patroclus to enquire. Nestor urges on Patroclus that Achilles should either return to the war or send Patroclus with the Myrmidons.

XII. (Τεχομαχία.) The Trojans assault the Greek wall. Asius' chariot charge is defeated; Sarpedon tears down a turret; at last Hector breaks through one of the gates, and the Trojans rush in.

XIII. (Μάχη ἐπὶ ταῖς ναυσίν.) Poseidon, hidden from Zeus, encourages the Greeks. The two Ajaces and, above all, the grey-haired Idomeneus uphold the battle. The Trojans waver but rally.

XIV. (Διὸς ἀπάτη.) Nestor and the wounded chiefs throw themselves again into the battle. Meantime Hera, having borrowed the magic girdle of Aphrodite and persuaded Sleep to help her, beguiles Zeus from his watch and sends him to sleep. Poseidon openly aids the Greeks; Hector is felled by a great stone and the Trojans driven back.

XV. (Παλιῶξις παρὰ τῶν νεῶν.) Zeus awakes. At his bidding Poseidon retires, Apollo puts new strength into Hector and, bearing his aegis, leads the Trojans on past the wall and up to the ships. Patroclus returns to Achilles and implores him with tears to help the Greeks. Ajax with a great naval ramming-pole, leaping from ship to ship, is holding the Trojans back, when Hector brings fire to burn the ship of Protesilaus.

XVI. (Πατροκλεία.) At Patroclus' entreaty Achilles, though he will not himself fight till Agamemnon offers atonement, gives his chariot and armour to Patroclus and bids him drive the Trojans back but not go further, when once the camp is clear. Patroclus with the Myrmidons routs the Trojans, kills Sarpedon and many others, and pursues right up to the wall of Troy, where he is stopped by Apollo. He kills Hector's charioteer; then, dazed by Apollo, and wounded by Euphorbus, he is slain by Hector, while Automedon with the immortal horses of Peleus flies to the ships.

XVII. (Μενελάου ἀριστεία.) Hector strips Achilles' armour from the corpse of Patroclus. A desperate battle arises about the body. Antilochus is sent to bear the news to Achilles. The immortal horses stand weeping for Patroclus and then return to the battle. At last Menelaus recovers the body, and bears it back to the ships while the Ajaces cover his retreat.

XVIII. (Ὀπλοποιία.) Antilochus gives the news: despair of Achilles. His mother Thetis rises from the sea to help. "Give me armour that I may slay Hector." "My son, it is written, that when

Hector dies you die." "Would I were dead now, who failed to save my friend." So Thetis goes to beg Hephaestus to make her son new armour. The Trojans are pressing on to recover the body of Patroclus, when Achilles shouts his war cry from the trench and they stop. They encamp on the plain. The Greeks bring the body to Achilles' tent and prepare it for burial. The Shield of Achilles is described (356-617).

XIX. Achilles receives the arms. He calls an assembly, renounces his wrath and demands instant battle. Agamemnon confesses his fault and offers gifts of atonement. The army eat before battle, but Achilles will not eat till Hector is slain. He mounts his chariot and calls to the immortal horses: "Bear me safe through this battle; do not leave me dead as you left Patroclus." And the horse Xanthus speaks: "Yes, this one time; but never again. Your death is close." "I know it," he answers and drives with a shout into the battle.

XX. (Θεομαχία.) His promise fulfilled, Zeus now allows the gods to mix in the battle as they choose, while he watches from Olympus. Hera, Athena, Poseidon, Hermes, Hephaestus help the Greeks; Ares, Apollo, Artemis, Leto, Aphrodite and the river Xanthus the Trojans. Achilles on foot fights with Aeneas, who is saved by Poseidon to be hereafter king and father of kings to the Trojans; with Polydorus, whom he kills, and with Hector, who is saved by Apollo. He puts the Trojans to flight.

XXI. (Μάχη παραποτάμιος.) Achilles drives the Trojans, part into the city, part into the River Xanthus. He kills Lycaon, though a suppliant, and takes twelve youths to be sacrificed at the pyre of Patroclus. He kills Asteropaeus, and mocks at his River-ancestor. The river Xanthus, choked with dead, rises in flood against Achilles to beat down his shield and drown him. There is a battle of water and fire. The gods are again in strife on the plain. Then all vanish except Apollo who tempts Achilles away from the city till the fugitives are safe within the gates.

XXII. (Ἐκτορος ἀναιρέσις.) Hector alone stays outside, awaiting Achilles, while his parents implore him to come in. As Achilles comes he turns to fly, and is pursued three times round the city; then he stands. Zeus weighs the fates of the two men in his scales, and Hector's fate falls. Apollo deserts him, while Athena, taking the shape of his brother Deiphobus, betrays him. When both have thrown their spears she sends that of Achilles back to him. Achilles kills Hector and refuses his dying prayer for burial. He drags the dead body behind his chariot to the ships, while Hector's parents and wife make lamentation on the city wall.

XXIII. (Ἀθλα ἐπὶ Πατρόκλῳ.) The Myrmidons make a procession round the bier of Patroclus, and hold a funeral feast. That night the ghost of Patroclus appears to Achilles: "Bury me quickly that I may cross the river; and let your bones lie with mine in the golden jar." Next morning a great pyre is built and the body burnt, with many victims, among them the twelve Trojan youths. "an evil deed." Funeral games in honour of the dead (257-397).

XXIV. (Ἐκτορος λύτρα.) For many nights Achilles has neither sleep nor food. Each day he drags the dead Hector behind his chariot round Patroclus' grave, but Apollo preserves the body from decay. By command of Zeus Thetis warns Achilles of the wrath of the gods. "My son, take food and sleep. Remember your own death is close. Fear the gods, and give back Hector's body for burial." Iris sent from Zeus bids Priam rise from the dust, go to Achilles with ransom and ask for Hector's body. The old king starts by night with a chariot laden with gold, and guided by Hermes finds his way unseen to Achilles' tent. "Achilles, remember your own father; I am more wretched than he, and I have done what no man on earth has done before, lifted to my lips the hand that killed my son." Then the two enemies weep together in their common misery, and at dawn Priam takes back the dead Hector to Troy, where Andromache, Hecuba and Helen lament over him, and a very great funeral is made.

Plot of the Odyssey.—I. (Θεὸν ἀγορά. Ἀθηναῖς παραίνεσις πρὸς Τηλέμαχον.) It is the tenth year after the fall of Troy. Athena reminds the Gods in council of Odysseus, whom Poseidon—now absent—has plagued so long. He is now detained in the Isle of Calypso, while suitors beset his wife and plunder his substance. Zeus agrees that Hermes shall be sent to Calypso, while

Athena goes to Ithaca and, in the form of Mentor, stirs up Telemachus to call a gathering of the people in protest against the suitors and himself to go in search for his father. In the hall Phemius sings of the sad homecoming of the Greeks from Troy.

II. (Ἰθακησίων ἀγορά. Τηλεμάχου ἀποδημία.) In the gathering Telemachus demands the help of the people against the suitors. Antinous answers that as soon as Penelope gives her hand to one of them they will go. Telemachus demands a ship in which to search for his father, but Leiocritus, a suitor, dismisses the assembly. Athena, disguised as Mentor, gets him a ship. He collects provisions and, without Penelope's knowledge, starts at night.

III. (Τὰ ἐν Πύλῳ.) They come to Pylos and are welcomed by the aged Nestor. He knows nothing of Odysseus, but tells of the homecomings of various chiefs, and the death of Agamemnon. Menelaus, who has just returned from great wanderings, may know of Odysseus. At evening the disguised Mentor vanishes and is recognized as divine by Nestor. Telemachus spends the night with Nestor, and starts next day with Peisistratus, son of Nestor, for Sparta. The first night is spent at Pherae.

IV. (Τὰ ἐν Λακεδαίμονι.) They find Menelaus celebrating the double wedding of a son and a daughter, and are led to his splendid palace. A mention of Odysseus reveals Telemachus to Menelaus, while Helen recognizes him at sight. They talk of Odysseus and are filled with grief till Helen gives them a nepenthe from Egypt. Next day Menelaus relates how Proteus the sea-god told him of the fates of Agamemnon and Ajax the Locrian, and how Odysseus was in the isle of Calypso. Meantime the suitors have learned of Telemachus' expedition and send a ship to ambush him at the isle of Asteris. Penelope hears of her son's voyage and of the plot against him, and weeps till Athena comforts her with a dream.

V. (Καλψίδος ἄντρον. Ὀδυσσεὺς σχεδία.) Hermes arrives at the isle of Calypso and gives the message of the gods. Calypso weeps but obeys, and helps Odysseus to build a flat-bottomed boat. The parting of Odysseus and Calypso. On the 18th day he is in sight of Scheria, the land of the Phaeacians, when Poseidon, returning from the Aethiopians, sees him and wrecks his boat. The sea-goddess Ino gives him a veil which bears him up till, naked and half-dead, he reaches a river mouth and, covering himself with leaves, falls asleep.

VI. (Ὀδυσσεὺς ἀφιξίς εἰς Φαίακας.) Nausicaa, daughter of King Alcinoos, comes with her maidens to wash clothes at the river mouth. While the clothes are drying they play ball, and their voices wake Odysseus, who comes out and begs for protection. They all run away except Nausicaa, who receives him and gives him food and raiment, and tells him the way to her father's house. As she returns he follows at a distance and at evening comes to a grove of Athena outside the walls.

VII. (Ὀδυσσεὺς εἰσοδος πρὸς Ἀλκίνοον.) Athena, disguised as a girl, leads Odysseus unseen into Alcinoos' splendid hall, where he supplicates the queen, Arête. The king and queen accept him, and promise him gifts and a ship to take him home. He tells of his voyage from Calypso's Isle.

VIII. (Ὀδυσσεὺς σύστασις πρὸς Φαίακας.) A feast is held and games, in which Odysseus, being taunted, wins the discus throwing, though he will not otherwise compete. The bard, Demodocus, sings the loves of Ares and Aphrodite. In the evening gifts are brought to Odysseus. Demodocus sings of the taking of Troy at which Odysseus silently sheds tears, but Alcinoos marks him and asks his name and race.

IX. (Ἀλκίνοον ἀπόλογοι. Κυκλώπεια.) "I am Odysseus, son of Laertes. From Troy we came first to the Cicones, where in raiding I lost 72 men; thence to the land of the Lotus-eaters; then to the isle of the Cyclops, who killed and ate six of my men, but we blinded his one eye as he lay drunk. So we escaped.

X. (Τὰ περὶ Αἰόλου καὶ Λαιστρηνῶν καὶ Κίρκης.) "Thence to the isle of Aeolus, king of the winds, who gave me the winds, all tied up in bags, except the west-wind, which blew me homewards. But my men thought the bags held treasure, and opened them, so the winds rushed out and drove us away to the land of the Laestrygonians, giants and cannibals, where I lost 11 ships out of 12. Thence to a beautiful wooded island, where we heard a

goddess singing in the forest. She was Circe, and she turned into swine the men I sent out; but Hermes gave me a magic root, and when she struck me with her wand I defied her, and she was subdued to me. There we stayed a year. She told me that before reaching home I must go to the land of the dead beyond the ocean and consult the spirit of the seer Teiresias."

XI. (Νέκυια.) "I came to the dark land of the Cimmerians and made sacrifice. The ghosts gathered about the blood, but I would suffer none to drink till Teiresias came. The first ghost I saw was my comrade Elpenor, who had been killed by an accident just as we started; then came my mother, Anticleia. Teiresias told me of my future fates; my mother, who had died of grief for me, told me of home. Then I saw the beautiful women of the past, and the heroes; Ajax would not speak to me. Then Minos and Orion, and those punished for sin, Tityus, Tantalus, Sisyphus and the shadow of Heracles."

XII. (Σειρήνες, Σκύλλα, Χάρυβδις, βόες Ἡλίου.) "I returned to Circe, who told me of my future voyage, and warned me above all not to kill the oxen of the Sun. Thus I stopped my men's ears when we passed the sirens; though I listened myself, tied to the mast. Then we passed the Wandering Rocks and Charybdis the whirlpool, though Scylla took six of my men. Then a tempest held us on shore in Thrinacia for a month, and my companions, starving, at last killed the oxen of the Sun while I was asleep. Then, when we put to sea, came storm and thunderbolt; my ship and all my men were destroyed; I was driven back through Charybdis, and escaped clinging to the mast and keel to the isle of Calypso."

XIII. (Ὀδυσσεὺς ἀνάπλους παρὰ Φαιάκων καὶ ἀφίξις εἰς Ἰθάκην.) The story over, the Phaeacians give Odysseus their gifts, and the next evening the ship starts. It arrives before dawn at the harbour of Phorcys, near a cave of the Nymphs; and Odysseus is left asleep on the shore. The ship on its way back is turned by Poseidon into a rock. Odysseus wakes and does not know his own land, till Athena, disguised as a youth, explains to him. She disguises him as an old beggar.

XIV. (Ὀδυσσεὺς πρὸς Εὐμαῖον Ὀμιλία.) He finds the hut of his old swineherd, Eumaeus, and is welcomed as a stranger. They talk of Odysseus. He tells false stories, how he is a Cretan, and how he has seen Odysseus, who will soon return. Eumaeus thinks both Odysseus and Telemachus are dead, but remains true to them. The night is very cold, and Odysseus borrows a cloak.

XV. (Τηλεμάχου πρὸς Εὐμαῖον ἀφίξις.) Telemachus in Sparta is warned by Athena of the suitors' ambush. He returns with Peisistratus to Menelaus and to Nestor. There he leaves Peisistratus and takes with him Theoclymenus, an Argive seer now in exile. He escapes the ambush and lands in Ithaca far from the city. Meantime Eumaeus, the child of a prince, taken by slavers, has told Odysseus the story of his life, and discussed how Odysseus is to go to the city safely.

XVI. (Ἀναγνωρισμὸς Ὀδυσσεὺς ὑπὸ Τηλεμάχου.) Telemachus arrives at the hut, and sends Eumaeus to the city to tell his mother of his safe return. Alone with Telemachus, Odysseus—retransformed by Athena—reveals himself, and they discuss the battle against the suitors. The suitors' ambush-ship returns baffled. Eumaeus comes back to the hut.

XVII. (Τηλεμάχου ἐπάνοδος εἰς Ἰθάκην.) Telemachus returns to the palace and brings Theoclymenus as a guest. He tells Penelope what he has heard from Menelaus. Theoclymenus prophesies that Odysseus is alive. Odysseus arrives, disguised as a beggar; only the old dog Argus, lying neglected on the dunghill, recognizes him and dies. Odysseus is insulted by the goatherd Melanthius. At the feast he receives food from the suitors, though Antinous throws a stool at him. He promises to speak to Penelope at nightfall.

XVIII. (Ὀδυσσεὺς καὶ Ἴρου πυγμή.) The suitors incite another beggar, Irus, to drive Odysseus off the threshold. Odysseus almost kills him with a blow. Penelope rebukes the suitors for their unkindness to the beggar, and makes them bring her gifts, as suitors should. The handmaid Melantho insults Odysseus and Eurymachus throws a footstool at him.

XIX. (Ὀδυσσεὺς καὶ Πηνελόπεια ὁμιλία. Τὰ νύκτρα.) Odys-

seus, with Telemachus, removes the weapons from the Hall. Melantho girds at him but Penelope calls him to her, and tells how she made the suitors agree to wait till she should have finished her web; but now they have found her undoing it during the night, and will wait no more. Odysseus tells her he is a Cretan: he says that Odysseus—whom he describes exactly—will return this very year on the day that ends one month and begins another (*i.e.*, on the morrow). The old nurse Eurycleia washes his feet and recognizes him by a scar on the knee; but he warns her to silence. Penelope arranges that she will agree to wed the suitor who can bend Odysseus' bow and shoot through the sockets of twelve axe-heads.

XX. (Τὰ πρὸ τῆς μνηστηροφονίας.) Odysseus lies sleepless, listening to the weeping of Penelope, till Athena comforts him. The palace is prepared for the feast of Apollo and the new moon (the winter solstice at the end of the 19th year). The suitors conspire in the agora against Telemachus, but are deterred by bad omens, and return to feast. One throws a cow's foot at Odysseus. Theoclymenus the seer feels that there is sudden darkness on the hall, and blood and a sound of weeping, and ghosts hurrying toward the darkness. The suitors mock him, but he goes from them.

XXI. (Τόξον θέσις.) Penelope brings out Odysseus' old bow, and proposes the trial to the suitors. Eumaeus and the cowerd Philoetius weep at the thought of their master. First Leiodes the bard tries the bow in vain; then many others. Antinous bids the goatherd grease and warm it. Meantime Odysseus outside reveals himself to the swineherd and cowerd. Eurymachus tries the bow. Antinous puts off further trial till after the feast. Then Odysseus begs to be allowed to try; the suitors refuse, but Penelope insists. Eumaeus gives him the bow; Eurycleia shuts the postern and Philoetius the other door of the hall. Odysseus bends the bow and shoots straight through the holes in twelve axe-heads. Telemachus, fully armed, leaps up beside him on the threshold.

XXII. (Μνηστηροφονία.) "Now for another target that none has ever struck!" He shoots Antinous through the throat, then Eurymachus, then others till he has no arrows left. Telemachus has brought spears and armour for four; and Odysseus, Telemachus, Eumaeus and Philoetius arm. Meantime the suitors have sent the goatherd, Melanthius, to bring arms for them; he has brought twelve sets, when the other herds catch him and tie him to a post. There is a great fight with spears, while Athena watches in the shape of a swallow, and all the suitors are slain except the bard and the herald, who were innocent. Odysseus has the corpses removed, twelve guilty bondmaids hanged, and Melanthius mutilated and slain. Then he burns sulphur and purifies the hall.

XXIII. (Ὀδυσσεὺς ὑπὸ Πηνελόπεια ἀναγνωρισμὸς.) Penelope is awakened from sleep by Eurycleia with the news. She comes down to the hall, sees what has been done, but she cannot believe: "her eyes stay like horn or iron." Odysseus, much hurt, makes the men and the faithful handmaids dance and make merry, so that the slaying may not be known outside. When he comes back to Penelope she tests him by ordering that his bed be brought outside the chamber. "Now who has moved my bed, which I built on a stump of olive?" At that she knows him, and throws herself in tears into his arms. "Forgive me. All these years I have schooled myself not to be deceived by some stranger who should pretend to be you!" So they were rejoined, and came again to their ancient marriage-bed. Through the long night they lay and Odysseus told his story. In the morning he set off with his son and the herdsmen to see his father Laertes.

XXIV. (Νέκυια δευτέρα. Σπονδαί.) The souls of the suitors, guided by Hermes to the shades, meet Agamemnon and Achilles, and tell their story. Odysseus meantime finds Laertes working in his orchard, in much poverty, and reveals himself. In the city the news of the slaying is known, and the kindred of the suitors come out to Laertes' farm for vengeance, led by Eupheithes, father of Antinous. A battle begins and Laertes slays Eupheithes, but Athena stops the strife and makes an oath of peace between Odysseus and his enemies.

HOME SEWING. The sewing actually done in the home to-day centres in darning, repairing, remodelling, and making children's clothing and simple adult garments. To acquire skill in hand sewing, attention must be given to the correct position of

FIG. 1.—CORRECT POSITION OF THE HANDS FOR THE RUNNING STITCH
the hands. For general use, cotton thread No. 70 in an 18 in. length, and needle No. 7 sharp give satisfactory results. The point of the needle should be held in the right hand between the

FIG. 2.—CORRECT NEEDLE POSITIONS, (A) BACK-STITCH, (B) OVERCASTING STITCH, (C) HEMMING STITCH

thumb and forefinger. The hand must be so spread that the needle's eye rests on the upper side of the thimble, on the sharply bent second finger. The needle points diagonally over the left

FIG. 3.—PIPING AND BINDING: (A) EDGE TO BE PIPED, (B AND C) FINISHED EDGE FROM RIGHT AND WRONG SIDES; (D AND E) METHODS OF BINDING WITH BIAS-FOLD TAPE

shoulder and the work progresses from right to left, except in embroidery, which usually progresses from left to right.

The following stitches are helpful for constructing garments by hand. However, the sewing machine gives added strength to garment construction and saves much time and effort; hence, it should be used wherever feasible.

The running stitch is a succession of small, even stitches used to join two pieces of cloth, as in tucking or seaming. It is made

FIG. 4.—(A) EVEN BLANKET STITCH, (B) LONG AND SHORT BLANKET STITCH, (C) OUTLINE STITCH, (D) CHAIN STITCH, (E) FRENCH SEAM

by holding the cloth between the forefinger and thumb of both hands; the left keeps the cloth taut and permits it to slip forward as needed; the right holds the point of the needle as well as the cloth and makes the stitch by twisting the wrist as the needle is pushed forward. The needle should be taken from the cloth only when it has travelled the entire length. Slight variations are used for basting or gathering an edge.

Backstitching is a reinforced running stitch. The needle is brought out of the cloth at every third stitch and re-entered at the beginning of it.

In overcasting, a small slanting stitch is repeated on a raw edge to prevent its ravelling.

The hemming stitch is a small slanting stitch beginning in the cloth and ending in the folded edge it should hold in position.

Simple embroidery stitches give charm. The blanket stitch protects the raw edge as well as decorates it. The outline and chain stitches outline a design or hold a hem in place.

FIG. 5.—(A) FRENCH FELL SEAM, (B) FLAT FELL SEAM, (C) STITCHED FELL SEAM

The use is suggested also of cross-stitching, feather or coral stitching, hemstitching, smocking and French embroidery—based on the use of the French knot, satin, bullion and wheat stitches.

Commercial patterns for garment construction are carefully designed and charted. Hence, with care in selecting the size and style, and in following the directions given, the novice may get excellent results. Attention to the following suggestions may save errors: Buy the pattern by measurements; study the chart for

placing and cutting thoroughly before cutting any pieces; test the pattern before cutting; cut pieces for the right and left side of the body with the right or the wrong sides of the cloth together if the material has a right and wrong side in order to avoid constructing both pieces for the same side; when the material has a decided design, each piece should be cut with consideration for its relation to pieces in juxtaposition on the finished garment. The inexperienced sewer should first make lingerie, sleeping garments, aprons or house-dresses. Woolens and silks are more difficult to make up than cottons or linens.

Seams vary in kind with their position on the garment and the weight of the cloth. A French seam is used on sheer cloth. Baste the seam so that the edges match and the wrong sides of the cloth meet; stitch it $\frac{1}{8}$ in. from the edge, crease the seam flat and turn it so the right sides meet; crease sharply on the line of stitching and baste and stitch $\frac{1}{4}$ in. from the crease.

The stitched fell seam is used on heavy material and gives a tailored finish. Baste the seam so that the wrong sides of the material meet and stitch $\frac{1}{2}$ to $\frac{5}{8}$ in. from the edge. Trim one piece to within $\frac{1}{8}$ in. of the stitching and crease the other edge towards the trimmed one. Lay the seam flat on the garment and baste and stitch $\frac{1}{8}$ in. from the creased edge. This leaves a double row of stitching on the right and makes a smooth seam.

A plain seam is used on heavy material that does not readily ravel. Baste the seam so that the right sides of the material meet; stitch it $\frac{1}{2}$ in. from the edge; trim and bind or overcast the edges separately or together. On wool, they may be pinked with a pinking machine or shears. They may be creased towards each other and stitched or run together.

A hem, used to finish a straight raw edge, is made by two turns of the cloth to the wrong side. It is held in position by machine stitching or hand hemming. One-quarter inch is an average measurement for the depth of the first turn. This may be creased with the thumb nail, pressed with an iron or basted into position. The depth of the second turning depends upon the location and purpose of the hem. It may have a decorative function and should be studied carefully. Three or four inches is a popular depth for a skirt hem. On bulky material the edge may be turned but once and bound before hemming. A bias facing or binding may finish a shaped edge.

Set-in pockets and bound buttonholes do much to give a tailored dress a professional look. A worked buttonhole should be made in at least two thicknesses of cloth. Mark and cut a slit on a thread of the cloth slightly longer than the diameter of the button. Hold the buttonhole along the first finger of the left

FIG. 6.—STEPS IN MAKING BUTTON-HOLE:

hand and box the slit; overcast the edges, making two stitches on either side and tying stitches across either end. Buttonhole stitch along the first side to the tying stitches and put in two more "ties"; turn it half around and work a bar of fine blanket stitches across the end covering the tying stitches. Give the buttonhole a second half turn and continue the buttonhole stitch along the second side; bar the second end. One end may be made fan-shaped if preferred, omitting the bar and carrying the buttonhole stitches around the end.

HOMESTEAD, a borough of Allegheny county, Pa., U.S.A., on the south bank of the Monongahela river, 6.5m. from the heart of Pittsburgh. It is served directly by the Pennsylvania, the Pittsburgh and Lake Erie, and the Union railways, and has connections with several others; the river is used largely for the transportation of coal, and recently also for shipments of steel. The population in 1920 was 20,452, of whom 5,945 were foreign-born white, largely from eastern Europe. The "Homestead District," including the contiguous boroughs of Munhall, West Homestead, Hays and Whitaker, and Mifflin township (of which all these boroughs were originally a part) had in 1928 a population of over 50,000. In the Homestead District are more than 30 large industrial plants, employing between 15,000 and 20,000 men, and producing annually goods valued at over \$200,000,000. The principal products are iron, steel, engines, mill machinery, castings, car-wheels, valves, axles, brick, tile, concrete blocks, ornamental iron, ice, cigars and aeroplane propellers. The great steel works covers 290ac. (lying chiefly in Munhall); has 100m. of railroad track within the plant, over which in a year move some 400,000 cars, carrying millions of tons of incoming materials and outgoing products. In West Homestead is a 20ac. plant where machinery for iron and steel works is made.

Homestead was planned as a residential centre in the beautiful Monongahela valley. The first lots were laid out in 1870, and the borough was incorporated in 1881. In 1879 appeared the first manufacturing plant, a glass factory; and in 1880-81 the original steel works was built, which in 1883 was bought by Carnegie, Phipps and company. In 1892 Homestead was the scene of one of the most serious strikes in the history of the United States, carried on by the National Amalgamated Association of Iron and Steel Workers against the Carnegie Steel company. It lasted 143 days and ended in a victory for the company. The arrival of 200 Pinkerton detectives on July 6 resulted in a riot in which 7 men were killed and 20 or more wounded. To restore order the governor sent the entire militia of the State. (See STRIKES AND LOCK-OUTS.)

HOMESTEAD: see FARM.

HOMESTEAD AND EXEMPTION LAWS, laws (principally in the United States) designed primarily either to aid the head of a family to acquire title to a place of residence or to protect the owner against loss of that title through seizure for debt. These laws have all been enacted in America since about

the middle of the 19th century, and owe their origin to the demand for a population of the right sort in a new country, to the conviction that the freeholder rather than the tenant is the natural supporter of popular government, to the effort to prevent insolvent debtors from becoming useless members of society, and to the belief that such laws encourage the stability of the family.

Public Land Policies.—By the cessions of several of the older States, and by various treaties with foreign countries, public lands have been acquired for the United States in every State and Territory of the Union except the original 13, and Maine, Vermont, Kentucky, Tennessee and Texas. For a time they were regarded chiefly as a source of revenue, but about 1820, as the need of revenue for the payment of the national debt decreased and the inhabitants of an increasing number of new States became eager to have the vacant lands within their bounds occupied, the demand that the public lands should be disposed of more in the interest of the settler became increasingly strong, and the homestead idea originated. Until the advent of railways, however, the older States of the north were opposed to promoting the development of the West in this manner, and soon afterwards the Southern representatives in Congress opposed the general homestead bills in the interests of slavery, so that except in isolated cases where settlers were desired to protect some frontier, as in Florida and Oregon, and to a limited extent in the case of the Pre-emption Act of 1841 (*see below*), the homestead principle was not applied by Washington until the Civil War had begun.

Early Homestead Laws.—A general homestead bill was passed by Congress in 1860, but this was vetoed by President James Buchanan; two years later, however, a similar bill became a law. The act of 1862 originally provided that any citizen of the United States, or applicant for citizenship, who was the head of a family, or 21 years of age, or who, if younger, had served not less than 14 days in the army or navy of the United States during an actual war, might apply for 160 ac. or less of unappropriated public lands, and might acquire title to this amount of land by residing upon and cultivating it for five years immediately following, and paying such fees as were necessary to cover the cost of administration; a homestead acquired in this manner was exempted from seizure for any debt contracted prior to the date of issuing the patent. A commutation clause of this act permitted title to be acquired after only six months of residence by paying \$1.25 per acre, as provided in the Pre-emption Act of 1841. The act of 1872, amended in 1901, allowed any soldier or seaman, who had served at least 90 days in the army or navy of the United States during the Civil War, in the Spanish-American War or in the suppression of the insurrection in the Philippines, and who was honourably discharged, to apply for a homestead, and permitted deduction of the time of such service, or, if discharged on account of wounds or other disability incurred in the line of duty, the full term of his enlistment, from the five years otherwise required for perfecting title, except that in any case he shall have resided upon and cultivated the land at least one year before the passing of title.

Post-World War Homesteads.—Pursuant to legislation enacted during and since the World War, ex-service men of that war are granted privileges in connection with homestead entries made by them similar to those conferred upon veterans of the Civil and Spanish wars, and in addition a preference over the general public in the entry of lands opened to entry by restoration from withdrawal or reservation, or by the filing of plots of survey of lands formerly unsurveyed. In the meantime, by an act of June 6, 1912, the period of residence required to perfect a homestead entry was reduced from five years to three, and a specific area to be cultivated substituted for the former indefinite provisions. After the more desirable and easily cultivable public land had passed into private ownership and that remaining was either chiefly valuable for grazing or generally cultivable only by dry farm methods, the need for a greater area to sustain a family was met by the Enlarged Homestead Act of Feb. 19, 1909, and the stock-raising act of Dec. 29, 1916, granting a maximum area of 640 acres. More than 250,000,000 ac. have been patented to individuals under the various homestead laws.

Exemption Features.—The principle of protecting the home against involuntary loss by reason of debt was recognized as a public policy by the original Homestead Act of 1862, which provided that no lands acquired thereunder should in any event become liable to the satisfaction of a debt contracted prior to the issuance of patent, and by a public resolution of Congress, approved on April 28, 1922, the provision was made applicable to all homesteads acquired under the later homestead laws. A short time before the original homestead law, providing for the acquirement of homesteads on the public domain, went into operation, some of the State legislatures had passed homestead and exemption laws designed to protect homesteads or a certain amount of property against loss to the owners in case they should become insolvent debtors, and by the close of the century the legislature of nearly every State in the Union had passed a law of this nature. At the present time every State has some sort of exemption law. These laws vary greatly, but with few exceptions exempt the home property, country or city, as well as certain personal property such as moneys, household effects, tools of trade and the like. The value of exempted real property ranges in the several States from \$5,000 downward. To some debts the exemption does not usually apply; the most common of these are taxes, purchase money, a debt secured by mortgage on the homestead and debts contracted in making improvements upon it. If the homestead belongs to a married person, the consent of both husband and wife is usually required to mortgage it. Some States require that the homestead for which exemption is to be claimed shall be previously entered upon record, others require only occupancy and still others permit the homestead to be designated whenever a claim is presented. Exemption laws have also been enacted by the insular possessions of the United States.

Canadian Laws.—Canada has provided for the acquisition of homesteads on its public lands, and the several provinces have exemption laws similar to those of the United States. The same is true of other British possessions.

HOMEYER, KARL GUSTAV (1795–1874). German jurist, born on Aug. 13, 1795 at Wolgast in Pomerania. He became professor of law (1827) at Berlin, and in 1854 a member of the council and of the upper house of the Prussian diet. He died on Oct. 20, 1874. His principal works are his edition of the *Sachsenspiegel* (in 3 vols., 1827, 3rd ed., 1861, containing also some other important sources of Saxon or Low German law), which is still unsurpassed in accuracy and sagacity of research; *Die Haus- und Hofmarken* (1870); and many papers contributed to the *Transactions of the Berlin Academy: Über die Heimat* (1852); *Genealogie der Handschriften des Sachsenspiegels* (1859); *Die Stadtbücher des Mittelalters* (1860); *Der Dreissigste* (1864), etc.

HOMICIDE, the general and neutral term for the killing of one human being by another. The nature of the responsibility of the slayer to the State and to the relatives of the slain has been one of the chief concerns of all systems of law from the earliest times, and it has been variously considered from the points of view of the sanctity of human life, the interests of the sovereign, the injury to the family of the slain and the moral guilt, *i.e.*, the motives and intentions of the slayer.

In England under the Norman system homicide became a plea of the Crown, and the rights of the kindred to private vengeance and to compensation were gradually superseded in favour of the right of the king to forfeitures where the homicide amounted to a crime (felony). Though homicide was thus made a public offence and not a matter for private vengeance, it took long to discriminate between those forms of homicide which should and those which should not be punished. The terms in English law used to describe criminal homicide are murder, manslaughter and *felo de se* (or suicide by a person of sound mind).

After the Conquest, and for the protection of the ruling race,

a fine (also called *murdrum*) was levied for the king on the hundred or other district in which a stranger was found dead, if the slayer was not brought to justice and the blood kin of the slain did not present Englishry, there being a presumption (in favour of the Exchequer) that the deceased was a Frenchman. After the assize of Clarendon (1166) the distinction between the killing of Normans and Englishmen gradually evaporated and the term murder came to acquire its present meaning of deliberate as distinct from secret homicide. In 1267 it was provided that the murder fine should not be levied in cases of death by "misadventure" (*per infortunium*). But at that date and for long afterwards homicide in self-defence or by misadventure or even while of unsound mind involved at the least a forfeiture of goods, and required a pardon. These pardons, and restitution of the goods, became a matter of course, and the judges appear at a later date to have been in the habit of directing an acquittal in such cases. But it was not until 1828 that the innocence of excusable homicide was expressly declared. The rule is now expressed in s. 7 of the Offences against the Person Act 1861: "No punishment or forfeiture shall be incurred by any person who shall kill another by misfortune, or in his own defence, or in any other manner without felony."

The further differentiation between different degrees of criminal homicide was marked by legislation of Henry VIII. (1531) taking away benefit of clergy in the case of "wilful murder with malice prepensed" (aforethought). That phrase is still the essential element in the definition of "wilful murder," which is committed "when a person of sound memory and discretion unlawfully killeth any reasonable creature in being and under the king's peace with malice aforethought either express or implied" (3 Co. Inst. 47), and the penalty is death (Offences Against the Person Act 1861, s. 1). Attempted murder is a felony and the penalty penal servitude for life. In the case of conspiracy and incitement to murder, a misdemeanour, the penalty is penal servitude for ten years. The whole development of the substantive law as to murder rests on judicial rulings as to the meaning of malice prepense coupled with the extrajudicial commentaries of Coke, Hale and Foster; for parliament, though often tempted by bills and codes, has never ventured on a legislative definition.

The expression "malice prepense" or "aforethought" has given rise to much discussion, especially when used to include so-called "constructive" murder. It implies an intent preceding the act intended. Express malice is the positive possession of an intention, and implied malice the possession of an intention shown by the acts of the accused. And so malice is implied where knowledge exists that the act is likely to kill or do grievous bodily harm to any person; where a police officer is resisted in the execution of his duty; where a felony is attempted or committed and death results, certainly if death were likely to result.

As in the case of other crime, infancy and insanity are excuses for homicide. A child under seven years of age is absolutely presumed to be *doli incapax*, and between seven and 14 there is a presumption but it may be rebutted. Now by the Children Act 1908 a sentence of death may not be pronounced or recorded against a child under 16. A person who satisfies the rules in *McNaghten's Case* (10 Cl. and F. 200) must be found guilty but insane. Drunkenness which produces insanity may be an excuse within *McNaghten's Case*, but drunkenness which falls short of this is no excuse, as in *Beard's Case* (26 Cox, C.C. 573) where the accused, under the influence of drink, while ravishing a girl inadvertently suffocated her. That was held to be murder. Again, in cases of homicide, the death must occur within a year and a day after the act of the accused.

Justification and Excuse.—English law still retains so much of its mediaeval character as to presume all homicide to be "malicious, and therefore murder, unless it is either justified by the command or permission of the law, excused on the ground of accident or self-preservation, or alleviated into manslaughter by being the involuntary consequence of some act not strictly lawful or occasioned by some sudden and sufficiently violent provocation." The truth of the facts alleged in justification, excuse or alleviation, is for the jury to determine: the question whether if

true they support the plea for which they are put forward is for the court.

In the administration of the English criminal law as to homicide the consequences of too strict an adherence to the technical definitions of the offences are avoided (a) by the exercise by the jury of their powers to convict of manslaughter only even in cases where they are directed that the offence is murder or nothing; (b) by the report of the judge as to the particular circumstances of each case in which a conviction of murder has been followed by the statutory sentence of death; (c) by the examination of all the evidence in the case by the Home Office in order to enable the secretary of State to determine whether the prerogative of mercy should be exercised.

Homicide is *justifiable* and not criminal when the killing is done in the execution of the law. The most important case of justifiable homicide is the execution of a criminal in due course of public justice. This condition is most stringently interpreted. The execution must be carried out by the proper officer or his deputy: any person executing the sentence without such authority, were it the judge himself, would be guilty of murder. And the sentence must be strictly pursued: to execute a criminal by a kind of death other than that to which he has been judicially condemned is murder.

Homicide committed by an officer of justice in the course of carrying out his duty, as such, is also justifiable; e.g., where a felon resists a legal arrest and is killed in the effort to arrest him; where officers in dispersing a riotous assemblage kill any of the mob, if the riot cannot be otherwise suppressed. In these cases the homicide must be shown to have been absolutely necessary. Again, homicide is justifiable if committed in the defence of person or property against forcible and heinous crime, such as murder, violent robbery, rape or burglary.

Homicide is *excusable* and not criminal at all when committed either by misadventure or in self-defence. In the former case the homicide is excused; where a man in the course of doing some lawful work, accidentally and without intention kills another, e.g., shooting at a mark and undesignedly hitting and killing a man. The act must be strictly lawful, and death by misadventure in unlawful sports is not a case of excusable homicide. Homicide in self-defence is excusable when the slayer is himself in immediate danger of death, and has done all he could to avoid the assault. Accordingly, if he strikes and kills his assailant after the assault is over, this is not excusable homicide. But if the assault has been premeditated, as in the case of a duel, the death of either antagonist has under English law always been held to be murder and not excusable homicide. The excuse of self-defence covers the case in which a person in defence of others whom it is his duty to protect—children, wife, master, etc.—kills an assailant (see s. 7 of the Offences against the Person Act 1861 *supra*).

Manslaughter.—In English law the term "manslaughter" is applied to those forms of homicide which though neither justifiable nor excusable are attended by alleviating circumstances which bring them short of wilful murder. The offence is not defined by statute, but only by judicial rulings, and may be described as unlawful and felonious killing without malice express or implied. Its punishment is as a maximum penal servitude for life, and as a minimum a fine or recognizances to be of good behaviour. The quantum of punishment between the limits above stated is in the discretion of the court, and not, as under Continental codes, with fixed minima; and the offence includes acts and omissions of very varying gravity, from acts which only by the charitable appreciation of a jury fall short of wilful murder, to acts or omissions which can only technically be described as criminal.

There are two main forms of "manslaughter":—

1. "Voluntary" homicide under grave and sudden provocation or on a sudden quarrel in the heat of passion, without the slayer taking undue advantage or acting in an unusual manner. The substance of the alleviation of guilt lies in the absence of time for cool reflection or the formation of a premeditated design to kill. Under English law the provocation must be by acts and not by words or gestures, and must be serious and not trivial, and the killing must be immediately after provocation and while the slayer has lost his self-control in consequence of the provocation. The

provocation need not be by assault or violence, and perhaps the best-recognized example is the slaying by a husband of a man found committing adultery with the slayer's wife.

2. "Involuntary" homicide as a result of rashness or negligence in respect of matters involving danger to human life, e.g., in driving trains or vehicles, or in dealing with dangerous weapons, or in performing surgical operations, or in taking care of the helpless.

The whole question of criminal responsibility for negligence was considered by the court of criminal appeal in 1925 in *Rex v. Bateman* (28 Cox C.C. 33) and it was there laid down that it was not a question of epithets, but that "in order to establish criminal liability the facts must be such that, in the opinion of the jury, the negligence of the accused went beyond a mere matter of compensation between subjects and showed such a disregard for the life and the safety of others as to amount to a crime against the State and conduct deserving punishment." In the criminal courts the amount and degree of negligence is the determining question, and there must be *mens rea*.

From the point of view of civil as distinct from criminal responsibility homicide does not by the common law give any cause of action against the person causing the death of another in favour of the wife or blood relations of the deceased. In early law this was otherwise; and the wer of the deceased came historically before the right of chief or State. But under English law the rights of relations, except by way of appeal for felony, were swept aside in favour of the Crown, on the principle that every homicide is presumed felonious (murder) unless the contrary is proved, and that in all cases of homicide not justifiable by law a forfeiture was incurred. Trial by battle or appeal for felony was abolished in 1819 by 59 Geo. III., C. 46 in consequence of the case of *Ashford v. Thornton* (1 B. and Ald. 405) where the right was successfully maintained. The rights of the relatives were also defeated by application of the maxim "*actio personalis moritur cum persona*" ("a personal action dies with the person") to all proceedings for injury to the person or to reputation.

In England the law was altered at the instance of Lord Campbell in 1846 (9 and 10 V. c. 93) so as to give a right of a claim by the husband, wife, parent or child of a person killed by a wrongful (or even criminal) act, neglect or default by another which would have given the deceased if he had survived a cause of action against the wrongdoer. The compensation payable is what the surviving relative has lost by the death, and under the Workmen's Compensation Acts (in all cases to which they apply) the employer is liable even without negligence to compensate the dependants of an employee killed by an accident arising out of and in the course of the employment; and in such cases even if the death was due to serious and wilful misconduct by the employee, compensation is payable.

In the Indian penal code the definitions of murder are so drawn as to limit the offences to cases where it was actually intended to cause death or bodily injury by the acts or omissions of the slayer, and the definition of culpable homicide short of murder is so drawn as to exclude the forms of unintentional manslaughter due to neglect of duty.

In European codes distinctions corresponding to those of the English law are drawn between premeditated and other forms of criminal homicide; but more elaborate distinctions are drawn between the degrees of deliberation or criminality manifested in the slaying, and the minimum or maximum penalty is varied accordingly.

The most notable difference between England and the United States in regard to the law on this subject is the recognition by State legislation of degrees in murder. English law treats all unlawful killing not reducible to manslaughter as of the same degree of guilt in law. American statutes seek to discriminate for purposes of punishment between the graver and the less culpable forms of murder. (See CRIMINAL LAW; MURDER; MANSLAUGHTER; FELO DE SE.)

HOMILETICS, in theology the application of the general principles of rhetoric to the specific department of public preaching (Gr. *ὁμιλητικός*, from *ὁμιλεῖν*, to assemble together). It may be further defined as the science that treats of the analysis, classi-

fication, preparation, composition and delivery of sermons. (See HOMILY, PREACHING.)

BIBLIOGRAPHY.—The older literature is cited in W. G. Blaikie, *For the Work of the Ministry* (1873); and D. P. Kidder, *Treatise on Homiletics* (1864). See also A. E. Garvie, *The Christian Preacher* (Edinburgh, 1920); the published lectures delivered at Yale university on the Lyman Beecher foundation; Hastings' *E.R.E. s.v.* "Preaching."

HOMILY, a simple religious address confining itself principally to the practical exposition of some ethical topic or some passage of Scripture. The Greek word *ὁμιλία*, from which homily is derived, means communion, intercourse and especially interchange of thought and feeling by means of words (conversation); it was early employed in classical Greek to denote the instruction which a philosopher gave to his pupils in familiar talk (Xenophon, *Mem.* I. ii. 6, 15). This usage of the word was long preserved (Aelian, *Varia Hist.* iii. 19); and the *ὁμιλίας* of Acts xx. 11 may suggest a didactic character in the apostle Paul's discourse in the upper chamber of Troas, when "he talked a long while, even till break of day." The custom of delivering expositions or comments more or less extemporaneous on the lessons of the day had become a regular part of the service of the Jewish synagogue; and this custom passed over soon and readily into the Christian Church, as may be gathered from the first *Apology* (lxvii.) of Justin Martyr, where we read that, in connection with the practice of reading portions from the collected writings of the prophets and from the memoirs of the apostles, it had by that time become usual for the president (*ὁ προεστώς*) to deliver a discourse in which "he verbally instructs and exhorts us to the imitation of these excellent things." This discourse was later regarded as a part of the regular duty of the bishop, but he could devolve it, if he thought fit, on a presbyter or deacon, or even on a layman. An early and well-known instance of such delegation is that mentioned by Eusebius (*Hist. Eccl.* vi. 19) in the case of Origen (A.D. 216). In course of time the exposition of the lesson for the day came more frequently to assume a more elaborate character; but when it did so the fact was as far as possible denoted by a change of name, the word *ὁμιλία* being reserved for the expository or exegetical lecture as distinguished from the pulpit oration or sermon. While the church of the 3rd and 4th centuries could point to a brilliant succession of great preachers, whose discourses were wont to be taken down in shorthand and circulated among the Christian public as edifying reading, it does not appear that the supply of ordinary homiletical talent kept pace with the rapidity of church extension throughout the Roman empire. In the smaller and remoter communities it not uncommonly happened that the minister was totally unqualified to undertake the work of preaching; and though, as is curiously shown by the case of Rome (Sozomen, *Hist. Eccl.* vii. 19), the regular exposition of the appointed lessons was by no means regarded as part of the necessary business of a church, it was generally felt to be advisable that some provision should be made for the public instruction of congregations. Even in Jerome's time (*De Vir.* III. c. 115), accordingly, it had become usual to read, in the regular meetings of the churches which were not so fortunate as to possess a competent preacher, the written discourses of celebrated fathers; and at a considerably later period we have on record the canon of at least one provincial council (that of Vaux, probably the third, held in A.D. 529), positively enjoining that if the presbyter through any infirmity is unable himself to preach, "homilies of the holy fathers" (*homiliae sanctorum patrum*) are to be read by the deacons. Thus the finally fixed meaning of the word homily as an ecclesiastical term came to be a written discourse (generally possessing the sanction of some great name) read in church by or for the officiating clergyman when from any cause he was unable to deliver a sermon of his own. As the standard of clerical education sank during the dark ages, the habit of using the sermons of others became almost universal. Among the authors whose works were found specially serviceable in this way may be mentioned the Venerable Bede, who is credited with no fewer than 140 homilies in the Basel and Cologne editions of his works, and who certainly was the author of many *Homiliae de Tempore* which were much in vogue during the 8th and following centuries. Prior to Charlemagne it is probable that several other

collections of homilies had obtained considerable popularity, but in the time of that emperor these had suffered so many mutilations and corruptions that an authoritative revision was felt to be imperatively necessary. The result was the well-known *Homiliarium*, prepared by Paul Warnefrid, otherwise known as Paulus Diaconus (q.v.). It consists of 176 homilies arranged in order for all the Sundays and festivals of the ecclesiastical year; and probably was completed before the year 780. Though written in Latin, its discourses were doubtless intended to be delivered in the vulgar tongue; the clergy, however, were often too indolent or too ignorant for this, although by more than one provincial council they were enjoined to exert themselves so that they might be able to do so. Hence an important form of literary activity came to be the translation of the homilies approved by the church into the vernacular. Thus we find Alfred the Great translating the homilies of Bede; and in a similar manner arose Aelfric's Anglo-Saxon *Homilies* and the German *Homiliarium* of Otfried of Weissenburg. Such *Homiliaria* as were in use in England down to the end of the 15th century were at the time of the Reformation eagerly sought for and destroyed, so that they are now extremely rare, and the few copies which have been preserved are generally in a mutilated or imperfect form.

The books of *Homilies* referred to in the xxxvth Article of the Church of England originated at a convocation in 1542, at which it was agreed to make certain homilies "for stay of such errors as were then by ignorant preachers sparkled among the people." After some delay a volume was published in 1547 called *Certain Sermons, or Homilies, appoynted by the Kynges Maestie to be declared and redde, by all Parsones, Vicars, or Curates, euery Soday in their Churches, where thei haue cures*. A second book of *Homilies* was issued in 1563, called *The Seconde Tome of Homelyes, of such matters as were promysed and Instituted in the former part of Homelyes, set out by the auctorithye of the Quenes Maestie: And to be read in euey paryshe Churche agreeablye*. Of the 12 homilies in the first book, Nos. 1 and 3-5 are by Cranmer, No. 6 by Bonner, No. 2 by Nicholas Harpsfield, No. 11 by Thomas Becon. The authorship of the rest is uncertain: 8 and 9 may be by Ridley and 12 by Latimer. Of the original 20 in the second book, Nos. 1-3, 7-9, 15, 16, 19 are probably by Jewel; No. 4 by Grindal; Nos. 5, 6 by Pilkington; others are derived from other sources; e.g., 10 from Erasmus' *Paraclesis*, etc.; 14 from Taverner's *Epistles*, etc. No. 21 was added by convocation in 1571. The two books were combined in *Certain Sermons or Homilies appointed to be read in Churches* (London, 1623). See J. Griffiths, *The two books of Homilies* (Oxford, 1859); J. T. Tomlinson, *Prayer Book, Articles and Homilies* (London, 1897).

HOMINISM, a term applied by W. Windelband to that form of Pragmatism which in England is usually called Humanism. The name is associated with the dictum of Protagoras the Sophist, *Homo mensura*, man is the measure of all things. See PRAGMATISM.

HOMOEOPATHY. A system of therapeutics based upon the law *similia similibus curentur*, which was introduced in 1796 by S. C. F. Hahnemann, a native of Meissen in Germany. (Formerly the accepted form was *similia similibus curantur* ["like is cured by like"] but research has proved that Hahnemann himself used the less positive subjunctive *curentur*, signifying "like should be cured by like.") Some points of Hahnemann's system were borrowed from previous writers—as he himself, though imperfectly, admits. Not to mention others, he was anticipated by Hippocrates, and especially by Paracelsus (1495-1541). The identical words *similia similibus curantur* occur in the Geneva edition (1658) of the works of Paracelsus, as a marginal heading of one of the paragraphs. The essential tenets of homoeopathy are that the cure of disease is effected by drugs that are capable of producing in a healthy individual symptoms similar to those of the disease to be treated, and that to ascertain the curative virtues of any drug it must be "proved" upon healthy persons—that is, taken by individuals of both sexes in a state of health in gradually increasing doses. The manifestations of drug action thus produced are carefully recorded, and this record of "drug-diseases," after being verified by repetition on many "provers," constitutes the

distinguishing feature of the homoeopathic materia medica, which, while it embraces the sources, preparation and uses of drugs, as known to the orthodox pharmacopoeia, contains, in addition, the various "provings" obtained in the manner above described.

Another peculiar feature of homoeopathy is its theory of dose. This was one of the later creations of Hahnemann's mind. Most homoeopaths believe more or less in the action of minute doses of medicine, but it must not be considered as an integral part of the system. The dose is the corollary, not the principle. The question of dose has divided the members of the homoeopathic school into bitter factions, and is therefore a matter for careful consideration. Many employ low potencies; i.e., mother tinctures, first, second, sixth dilutions, etc., while others use hundred-thousandths and millionths.

Some homoeopaths of the present day still believe with Hahnemann that, even after the material medicinal particles of a drug have been subdivided to the fullest extent, the continuation of the dynamization or trituration or succession develops a spiritual curative agency, and that the higher the potency, the more subtle and more powerful is the curative action. Hahnemann says (*Organon*, 3rd American edition, p. 101), "It is only by means of the spiritual influence of a morbid agent that our spiritual vital power can be diseased, and in like manner only by the spiritual operation of medicine can health be restored." This is absolutely denied by others. Thus there exist two schools among the adherents of homoeopathy. On the one hand there are the Hahnemannians, the "purists" or "high potency" men, who still profess to regard the *Organon* as their Bible, who believe in all the teachings of Hahnemann, who adhere in their prescriptions to the single dose, the single medicine, and the highest possible potency, and regard the doctrine of the spiritual dynamization acquired by trituration and succession as indubitable. On the other side there are the "rational" or "low potency" men, who believe in the universality of the law of cure, but think that it cannot always be applied, on account of an imperfect materia medica and a lack of knowledge on the part of the physician. They believe that in many cases of severe and acute pain palliatives are required, and that they are free to use all the adjuvants at present known to science for the relief of suffering humanity—massage, balneology, electricity, hygiene, etc. The American Institute of Homoeopathy, the national body of the United States, has adopted the following resolution and ordered it to be published conspicuously in each number of the *Transactions* of the society: "A homoeopathic physician is one who adds to his knowledge of medicine a special knowledge of homoeopathic therapeutics. All that pertains to the great field of medical learning is his by tradition, by inheritance, by right."

It is claimed that the effect produced upon both the laity and the general profession of medicine by the introduction of homoeopathy was salutary in many ways. It diminished the quantity of medicine that was formerly considered necessary, and thus revealed the fact that the *vis medicatrix naturae* is often sufficient, with occasional and gentle assistance, to cure many diseases, especially those fevers that run a definite and regular course. Corroboration of the law *similia similibus curentur* is seen, according to homoeopaths, in the adoption of the serum therapy, which consists in the treatment of the most malignant diseases (diphtheria, lock-jaw, typhoid fever, tuberculosis, bubonic plague) by introducing into the system a modified form (similar) of those poisons that produce them in the healthy individual. Hahnemann undoubtedly deserves the credit of being the first to break decidedly with the old school of medical practice, in which, forgetful of the teachings of Hippocrates, nature was either overlooked or rudely opposed by wrong and ungentle methods. We can scarcely now estimate the force of character and of courage which was implied in his abandoning the common lines of medicine. More than this, he and his followers showed results in the treatment of disease which compared very favourably with the results of contemporary orthodox practice.

Homoeopathy has given prominence to the therapeutical side of medicine, and has done much to stimulate the study of the physiological action of drugs. It has done service in directing more

special attention to various powerful drugs, such as aconite, nuxvomica, belladonna, and to the advantage of giving them in simpler forms than were common before the days of Hahnemann. But in the medical profession homoeopathy nevertheless remains under the stigma of being a dissenting sect. It is in the United States that homoeopathy chiefly flourishes. In other countries it has a few practitioners and a few homoeopathic hospitals have been founded. Associations (some of which conduct examinations and grant diplomas) are in existence in England, the United States, Canada, Germany, France and Italy to further the principles of the school and in each of the countries mentioned one or more journals devoted to homoeopathy is in existence.

HOMOLOGY. Owen (1804-92) introduced the terms homology and analogy into biological literature to imply two different types of similarity of structure in organisms. Homologous structures were such as were capable of being shown by study of a series of forms to be structurally equivalent, though not necessarily functionally similar, to a part or organ of the "archetype." Analogous structures were those which showed physiological similarity only. With the coming of the evolution theory the archetype of Cuvierian biology became identified with a common ancestor, so that the current definition of homology in biology is that of Dendy (1912): "homologous organs are such as have the same essential structure which they owe to inheritance from a common ancestor." In 1870 Lankester introduced the term homoplasy to indicate structural resemblance associated with similar physiological activity but derived independently in the evolutionary process, and added the term homogeny to signify homology in the sense in which that term is now employed. In the light of modern experimental work on evolution it is doubtful whether the distinction, stated thus, is of so fundamental a character as it then appeared. The important researches of Sturtevant (1924) show that similar bodily modifications have arisen as sports again and again in different species of the fruit-fly *Drosophila*; and that these *mutant* characters can be referred to changes in the corresponding location on equivalent chromosomes (see CYTOLOGY). There is good reason to believe parallel mutation (appearance of sports) has occurred constantly in the evolutionary process; and if this is so, it is impossible on purely morphological grounds to say when a new structure has arisen independently or has been inherited from a common ancestor. Owen's archetype may be replaced in the future not by the Darwinian concept of a common ancestor, but by a common locus of instability in the chromosome, or a similar physico-chemical pattern in the hereditary materials. (See ZOOLOGY; EVOLUTION.)

(L. T. H.)

HOMONYM, a term for those words which differ in sense but are alike in sound or spelling or both (Gr. *ὁμόνυμος*, having the same name). Words spelt but not sounded alike, e.g., "bow," are *homographs*; and words alike only in sound, e.g., "meat," "meet," *homophones*. Skeat (*Etymol. Dict.*) gives a list of English homonyms.

HOMOPHONY, a musical term signifying literally "like voices," that is, voices or instruments in unison, but which in practice has come to signify music with one outstanding part, to which the other parts are subordinate, as opposed to polyphonic music, composed of a number of parts of more or less equal importance.

HOMS or **HIMS**, a city of Syria, situated in the great Orontes plain, on a canal about 1 m. from the river; pop. estimated at 50,000 (35,000 Muslims). The neighbourhood is exceptionally fertile, and the climate good. The gardens and orchards of Homs have always been famed for their yield. Silk is the chief industry.

History.—Through Homs passed the road along which was borne the traffic of Egypt, Palestine, and Damascus bound for

the northern lands, and its plain was the battleground of warring empires. At Kadesh (now identified with *Tell Nebi Mend*, near Homs) Rameses II. fought the great indecisive battle against the Hittites. Known as Emesa in classical times it was devoted to the worship of the Sun god. Heliogabalus was born here and became a priest in its temple. On his elevation to the imperial throne (A.D. 218) he showed favour to the city, and rebuilt its temple. It was there that Aurelian quelled the rebellion led by Zenobia (A.D. 272); and Caracalla made it into a Roman colony. In 635 Homs concluded a treaty with the Arabs, and peace and security were bought for a sum of money. The arrangement did not endure, and in 638 it fell to Abu 'Ubaida. It rebelled in the reign of Merwan II., who lashed it with shot from 80 catapults for five months, reduced it and dismantled its walls (745). The subsequent centuries saw its subordination to Aleppo, Damascus and Hama. It passed under Egyptian rule (1831-40), and was moved to a revolt which was with difficulty suppressed.

The mausoleum of the famous Muslim general, Khālid ibn el-Welid, is in one of its mosques. (E. Ro.)

HONAN, one of the most densely peopled and historically one of the most famous provinces of China. Its name signifies "south of the River," i.e., of the Hwang-ho, whose basin was the scene of Chinese civilization in its formative period, but in fact a part of the province lies north of the river. Honan comprises the south-western portion of the great plain of north China which is here broken by eastward extensions of the Tsin-ling mountain axis. In the north of the province are the fertile terraces bordering the Yellow river and the important valley of the Lo. This is separated by the chains of the Fu-niu-shan from the rich agricultural land in the valleys of the Upper Hwai and its numerous affluents. The southern boundary of the province follows in part the crest of the Hwai-yang shan which divides the Hwai from the Yang-tze basin, but in the south-west it includes the upper valley of the Han river which affords direct communication with the Wu-Han cities. The western and south-western portions of Honan have a general elevation of about 3,000 feet.

If not the birthplace, Honan was certainly the chief centre of the spread and dispersion of early Chinese culture. The open lands above the marshy levels of the Yellow, Hwai and Upper Han rivers were not only valuable settlement sites but controlled the lines of movement either along the Hwai-Hwang-ho watershed to Shantung or by the Hwai-Yang-tze divide to the new culture centres in the Yang-tze valley. It was also the terminus of the corridor route from the west between the Shansi plateau and the easterly spurs of the Tsin-ling and its two chief centres in the north, Loyang (Honan-fu) and Kai-feng, were frequently selected as imperial capitals. The area of the province is about 81,000 sq.m. supporting a population of 32,000,000, which is mainly rural in character, for more than 90% of the population lives in towns and villages of less than 10,000 inhabitants.

The densest grouping is in eastern Honan on the higher agricultural land bordering the Peking-Hankow railway. These eastern plains, especially the districts lying between Changte and Juning yield excellent crops of wheat, maize, millets, cotton, sesame, beans and hemp. But the double danger of drought and flood (from both the Yellow and Hwai rivers) constantly menaces this countryside. A secondary focus of population occurs in the Upper Hwai basin with Nan-yang as its centre. The main industrial development has been the exploitation of the anthracite coal measures of Honan-fu and the bituminous coals of the Lushan-Juchow district. At present the output is moderate in amount and serves only a local demand. Iron, tin and argentiferous lead are also found. Other industrial enterprises include the cotton industry of north-east Honan based on local supplies and the silk industry of Nan-yang which utilizes silk from worms fed on the small oaks of the neighbouring Fu-niu-shan. The value of the central position of Honan is as yet neutralized by the lack of transport facilities. The rivers are subject to great seasonal variation of level, while the railway routes, apart from short mineral lines, are restricted to the Peking-Hankow railway and the east-west Lung-Hai line. Honan stands to gain greatly by the development of motor transportation. Kai-feng, the capital city,

has an estimated population of nearly 300,000 and Cheng-chow, at the junction of the Lung-Hai line with the trunk railway is an industrial town of growing importance.

HONAVAR, a seaport of British India, North Kanara district of Bombay. Pop. (1921) 7,038. It is mentioned as a place of trade as early as the 16th century. In 1670, the English factors here had a bull-dog which killed a sacred bull, in revenge for which they were murdered, to the number of eighteen. In 1784 it was defended for three months by Captain Torriano and a detachment of sepoy against Tippoo Sultan.

HONDA or **SAN BARTOLOME DE HONDA**, a town of the department of Tolima, Colombia, on the west bank of the Magdalena river, 580 m. above its mouth. Pop. (1918) 7,999. It is about 650 ft. above sea-level and overlooks the rapids of the Magdalena, shut in closely by spurs of the Eastern and Central Cordilleras. The climate is hot and damp and the temperature frequently rises to 102° F in the shade. Honda dates back to the beginning of the 17th century, and has been one of the important centres of traffic in South America for 300 years. There is a suspension bridge across the Magdalena at the head of the rapids. A railway 18 m. long connects with the landing place of La Dorada, or Las Yeguas, where the steamers of the lower Magdalena discharge and receive their cargoes and with Beltrán 34 m. above, where navigation of the upper river begins. Up to 1908 the greater part of the traffic for Bogotá crossed the river at this point, and was carried on mule-back over the old *camino real*, which was at best only a rough bridle-path; now the trans-shipment is made to smaller steamboats on the upper river for carriage to Girardot, 93 m. distant, from which place a railway runs to the Bogotá plateau. Honda was nearly destroyed by an earthquake in 1808.

HONDECOETER, MELCHIOR D' (1636–1695), Dutch painter, born at Utrecht, was the pupil of his father Gysbert and of his uncle J. B. Weenix. He lived at The Hague (1659–63) and at Amsterdam where he married in 1663 and lived till his death on April 3, 1695. One of his earliest works is a "Tub with Fish," dated 1655, in the gallery of Brunswick. He acquired celebrity as a painter of birds, which he represented not exclusively, like Fyt, as the gamekeeper's perquisite after a day's shooting, or stock of a poulterer's shop, but as living beings with passions, joys, fears and quarrels. Without the brilliant tone and high finish of Fyt, his birds are full of action. Very few of his pictures are dated, though more are signed. Amongst the former we should note the "Jackdaw deprived of his Borrowed Plumes" (1671), at The Hague, "Game and Poultry," and "A Spaniel hunting a Partridge" (1672), in the gallery of Brussels; or "A Park with Poultry" (1686) at the Hermitage of Leningrad. William III. employed Hondecoeter to paint a picture, now at The Hague, of his menagerie at Loo. But he is better in the homelier works with which he adorned the royal chateaux of Bensberg and Oranienstein. His masterpieces are at The Hague and at Amsterdam. But there are fine examples in private collections in England, and in the public galleries of Berlin, Carlsruhe, Cassel, Cologne, Copenhagen, Dresden, Florence, Glasgow, Hanover, Leningrad, London, Montpellier, Munich, New York, Paris, Rotterdam, Stuttgart and Vienna.

HONDURAS, a republic occupying the central portion of Central America, with a coastline of 400 m. on the Caribbean sea and a frontage of some 40 m. on the Gulf of Fonseca, on the Pacific Ocean. It is bounded on the north by the Caribbean sea, on the east by Nicaragua, on the south by Nicaragua, the Pacific ocean and Salvador, and on the west by Guatemala. (See CENTRAL AMERICA MAP.) The name is Spanish (it may be translated "wave-like") and is explained with equal insistence either as referring to the depths off shore, or to deep, wave-like valleys and hills which scar the entire country, excepting for the relatively narrow coastal plains on either shore. The country faces on the sea to the north and on inlets on the north-west, where the boundary is the Gulf of Honduras which forms the only Caribbean frontage of the neighbouring country, Guatemala, as well as the southern boundary of Belize or British Honduras. Around many inlets and lagoons the coastline follows a generally easterly direction until it reaches

Cape Gracias a Dios (Cape "Thanks-to-God"), named, it has been suggested, because there the coast turns sharply south and the Spanish mariners who were seeking a westward passage gratefully found themselves again skirting a north and south shore line that might possibly open into the passage to the long-sought Oriental islands. Cape Gracias a Dios marks the boundary of Honduras and Nicaragua, which continues inland along the river variously known

FIESTA DAY IN ONE OF THE SMALL INLAND VILLAGES OF HONDURAS

as the Wanks, Segovia or Coco. The frontier, which is still in dispute and runs through a sparsely inhabited territory which furnishes a base for revolutionary movements between the two countries, crosses the continental divide and at present follows the river Negro to the Bay of Fonseca. There, for a short distance, Honduras fronts on this great arm of the Pacific, holding sovereignty over the islands of Tigre (where its Pacific port, Amapala, is situated), Sacate Grande and Gueguensi. The boundary line with Salvador starts at the mouth of the river Goascoran and follows an irregular line through the mountains, first in a northerly and then in a westerly direction, to a point directly west of Ocotepeque: there the boundaries of Honduras, Salvador and Guatemala meet. The boundary line between Honduras and Guatemala has been in dispute for nearly four centuries, and has been a serious question since the independence and break-up of the captain-generalcy of Guatemala into the five countries of Central America. Along the western frontier the line is fairly well accepted, but as it approaches the Caribbean the divergence of claims covers a relatively great area, whose growing economic importance, owing to the increasing banana industry, became an important issue in 1928. Following the mediation of the secretary of State of the United States, the whole subject was in that year submitted to the decision of a Central American tribunal under the 1923 treaties.

Physical Features.—The general aspect of the country is mountainous; its southern half is traversed by a continuation of the main Nicaraguan Cordillera. The chain does not, in this republic, approach within 50 or 60 m. of the Pacific; nor does it throughout maintain its general character of an unbroken range, but sometimes turns back on itself, forming interior basins or valleys, within which are collected the headwaters of the streams that traverse the country in the direction of the Atlantic. Nevertheless, viewed from the Pacific, it presents the appearance of a great natural wall, with many volcanic peaks towering above it and with a lower range of mountains intervening between it and the sea. It would almost seem that at one time the Pacific broke at the foot of the great mountain barrier, and that the subordinate coast range was subsequently thrust up by volcanic forces. At one point the main range is interrupted by a great transverse valley or plain known as the plain of Comayagua, which has an extreme length of about 40 m., with a width of from 5 to 15 miles. From this plain the valley of the river Humuya extends north to the Atlantic, and that of the Goascoran south to the Pacific. These three depressions collectively constitute a great transverse valley reaching from sea to sea, which was pointed out soon after the conquest as an appropriate course for inter-oceanic communication. The mountains of the northern half of Honduras are not volcanic in character and are inferior in altitude to those of

the south, which sometimes exceed 10,000 feet. The relief of all the highlands of the Atlantic watershed is extremely varied; its culminating points are probably in the mountain mass about the sources of the Choluteca, Sulaco and Roman, and in the Sierra de Pija, near the coast. Farther eastward the different ranges are less clearly marked and the surface of the country resembles a plateau intersected by numerous watercourses.

The rivers of the Atlantic slope of Honduras are numerous and some of them large and navigable. The largest is the Ulua, with its tributary the Humuya. It rises in the plain of Comayagua and flows north to the Atlantic; it drains a wide expanse of territory, comprehending nearly one-third of the entire State, and probably discharges a greater amount of water into the sea than any other river of Central America, the Segovia excepted. It may be navigated by light draught steamers for the greater part of its course. The Rio Roman or Aguan is a large stream falling into the Atlantic near Trujillo, with a total length of about 120 miles. Its largest tributary is the Rio Mangualil, celebrated for its gold washings, and may be ascended by light draught boats for 80 miles. Rio Tinto, Negro, or Poyer or Poyas, is a considerable stream, navigable by small vessels for about 60 miles. Some English settlements were made on its banks during the 18th century. The Patuca rises near the frontier of Nicaragua, and enters the Atlantic east of the Brus or Brewer lagoon. The Segovia or Wanks is one of the longest rivers in Central America, rising within 50 m. of the Bay of Fonseca, and flowing into the Caribbean sea at Cape Gracias a Dios. Three considerable rivers flow into the Pacific—the Goascoran, Nacaome and Choluteca, the last named having a length of about 150 miles. The Goascoran, which almost interlocks with the Humuya, in the plain of Comayagua, has a length of about 80 miles. The lake of Yojoa or Taulébe is the only large inland lake in Honduras, and is about 25 m. by 6 to 8 m.; its surface is 2,050 ft. above the sea. It has two outlets on the south, the rivers Jaitique and Sacapa, which unite about 15 m. from the lake; and it is drained on the north by the Rio Blanco, a narrow, deep stream falling into the Ulua.

Honduras resembles the neighbouring countries in the general character of its geological formations, fauna and flora. Here, as in other Central American States, there are but two seasons, the wet, from May to November, and the dry, from November to May. On the moist lowlands of the Atlantic coast the climate is oppressive, but delightful on the highlands of the interior. At Tegucigalpa, on the uplands, a year's observations showed the maximum temperature to be 90° F in May, and the minimum to be 50° F in December (*see* CENTRAL AMERICA for Fauna, Flora, Climate).

The People.—The population of Honduras, according to official reports of 1928, is 700,811, of whom 348,465 are males. The census of 1916 showed a total of 605,997, of whom 299,952 were males. The area of Honduras is about 46,250 sq. m.; the density of population 15 to the sq. mile. The census figures of Honduras show a steady growth in population of 1 to 1½% per year; but an exact enumeration is virtually impossible, owing to the scattering of population and the large proportion of Indians. While the Indians—many thousands of them still living in a primitive state—constitute the majority of the population of Honduras, the cities are populated with mixed-bloods and the ruling groups are largely of almost pure Spanish descent. The Hondurans have been leaders of most of the various efforts to form a Central Union (*see* CENTRAL AMERICA), and the keen political acumen of the leaders has often sought expression in the most idealistic movements and in a broad analysis of the situations surrounding the relations of the Central American countries to each other, to the United States and to the outside world. There are about 20,000 negroes in Honduras, the larger proportion being British subjects imported under contract for work in the banana plantations. The descendants of the negro slaves brought to Honduras during the colonial days still survive, some mixed with the Indians and others retaining their race purity while evincing sound Honduran citizenship and patriotism. The negro blood, as in the other Central American countries, is closely confined to the Caribbean littoral. The Indian tribes of Honduras are fairly well defined in characteristics and

race, being generally peaceable small farmers, but about 100,000 are officially estimated to live in the mountains in an almost wild state. The Carib Indians of tradition are believed to be the progenitors of certain groups on the Caribbean coast, who are the mainstay of the mahogany and pine lumbering interests of the river regions.

There is some immigration into Honduras from Salvador, the thickly settled farming sections of that country sending forth an excellent type of farmer-immigrant into the sparsely populated regions of the Honduran interior. The driving overland of herds of cattle for the markets of Salvador and Guatemala has opened routes along which this immigration moves, and while it is as yet not a great item and ebbs and flows with the needs of the crops, it indicates a tendency toward readjustment of the populations in Central America. There is virtually no immigration from Europe, although some small groups of European farmers have arrived from time to time. The importation of negroes from the British West Indies is, as noted, on a contract basis which provides for their return to their homes after certain periods.

The chief city of Honduras is the capital, Tegucigalpa (*q.v.*), in the highlands of the interior, with a population of 38,950. Other important urban centres are Comayagua (6,412); Juticalpa (8,000); Santa Rosa de Copan (13,000); San Pedro Sula (8,000); Puerto Cortes (4,000); Tela (3,500); Trujillo (2,000); Pespire (7,000); Yuscaran (5,000); Ceiba (10,000); Puerto Castilla (4,000); Amapala (3,000); Nacaome (8,000); Santa Rosa (10,000); La Esperanza (11,000). In general, the population of Honduras flocks less to large towns than is common elsewhere in Spanish America, tiny farms being found at close intervals along the highways, and the rural life being more generally scattered over the country than the sparse population figures would seem to promise.

Political Organization.—The present Honduran constitution was promulgated on Sept. 10, 1924, previous instruments or modifications having been dated Dec. 11, 1825, Jan. 1839, Feb. 1848, Sept. 1865, Dec. 1873, Nov. 1880, Oct. 1894, Sept. 1904 (later replaced by the older instrument of 1894). The first article of the present constitution declares Honduras to be "a state separated from the Republic of Central America. Consequently it recognizes as a primal necessity return to union with other sec-

The majority of the Honduran population is composed of Indians. Although of friendly disposition and, here and there, converts to Roman Catholicism, for the greatest part they remain an aboriginal people

tions of the dissolved republic." The Constitution gives citizenship, on mere declaration of desire, to citizens of the other Central American republics. Every Honduran male citizen of 21 years, or of 18 years if he is married or able to read and write, is entitled to vote.

The legislative power in Honduras is vested in a single chamber, the Congress of deputies, whose members are elected for four years, half being renewed every two years; there is one deputy for each 10,000 inhabitants. No relative of the president "within the fourth degree of consanguinity or second of affinity" may serve

in the Congress, nor may he be appointed to any high administrative office. Congress meets on Jan. 1 of each year and sits for 60 days. The executive power is vested in the president, a vice-president being elected at the same time, both for four years, by popular and direct vote. They take office on Feb. 1, 1925, 1929, etc. In case of a failure to obtain an absolute majority the election goes to Congress, which must choose between the three highest candidates for both offices. The president's cabinet consists of from three to six secretaries of State, in charge of the usual government departments, each cabinet officer sometimes having two or more departments under his charge. The president and vice-president may not succeed themselves nor may any close relative succeed them.

The judiciary consists of a supreme court of five magistrates elected for four years by popular vote; the judges may be re-elected. Inferior courts are established under special laws. Justices of the peace are elected by popular municipal vote. Honduras is divided into 17 departments and one territory, each having a governor appointed by the president. The municipal governments are elected by direct vote. Police power is locally administered, the centralized form of the republic permitting the use of Federal troops if necessary.

Religion and Education.—Education is under the direction of a cabinet officer, the minister of public instruction, who has a staff of inspectors and officials. Local schools are under the municipalities but are supervised by the department governors, as the schools receive help from the Federal government. According to the latest available statistics (1925) there were 987 primary schools, with 28,050 pupils out of a school population of 78,857. The secondary schools, entered after the pupils pass through five grades, include the National Institute and School of Commerce at Tegucigalpa, and seven other schools, with a total enrolment of something over 500. There are special industrial and agricultural schools, the national agricultural school near Comayagua being one of the best in Central America. There are three normal schools, one of them at Tegucigalpa, for both men and women, and there are branches for the education of teachers in some of the secondary schools. The Central university at Tegucigalpa and special schools give technical education in law, medicine, etc.

The constitution grants freedom of worship, and there is no State-supported church. Roman Catholicism is the chief religion, however. The Indians in some of the interior villages

A HERD OF NATIVE CATTLE FEEDING ON PARA OR JARAGUA PASTURES. The rich pasture lands of Honduras have been utilized extensively, with the result that cattle-raising and dairy-farming are prosperous industries now. The clump of trees in the background is tarros, native bamboo.

continue tribal rites; but even there the Roman Catholic churches are established and the support of the natives is general.

Finances.—The Honduran peso is on a silver basis, its value approximating 2s., or 50 cents United States currency, the old silver peso being the basis of exchange. While the coins of a dozen countries circulate freely, the United States dollar is the most common unit of exchange; one bank, whose chief offices are on the Caribbean coast where the banana companies are active, guarantees to redeem its own paper money at "two-for-one" with American dollars, while the official currency of the Banco Nacional

fluctuates with the price of silver. The revenues of Honduras are derived from the customs, and from the liquor, powder and tobacco monopolies. The revenues for the fiscal year ending July 31, 1926 were £944,568 and the expenditures estimated at £1,135,417. The deficit is made up from time to time by internal bonds, and by advances from the large fruit and mining companies against their estimated import and export taxes. The internal debt as of April 30, 1926, was 7,553,425 pesos, which included the following items: war claims, to Aug. 1, 1926, 4,959,541 pesos; annual interest at 3%, 375,389 pesos; due to banks, 2,000,000 pesos; due to private companies, 1,140,000 pesos; obligations incurred in connection with the National railway, 3,138,000 pesos.

The entire public debt of Honduras as of Dec. 31, 1926, totalled £2,456,000. There is a United States loan of \$500,000, and the old British loan, once carried, with 60 years interest, at £29,114,775, is fully accounted for in the total at £452,000, according to the agreement entered into on Oct. 29, 1925. This drastic reduction of the old debt was reached after many negotiations and periods of despair of ever being able to reach a settlement. The debt, the principal of which was contracted in 1867, 1869 and 1870, chiefly for the building of the National railway, was £5,398,570, the balance being unpaid interest. The Honduran loan was floated at varying prices in London, the sales averaging around 20% of the face value, but the money that reached Honduras and went into the railway was only a fraction of the receipts, and the entire transaction was the cause of a parliamentary investigation whose hearings were published. While the scandal was finally placed at the doors of the Honduran agents in London and certain British brokers, the debt has been held against Honduras for 60 years, although various offers on both sides have been made. The final settlement arranged in 1925 recognizes the debt and accepts the terms of the Corporation of Foreign Bondholders. The debt is being paid through a 3% customs surcharge paid to the fiscal agent of the corporation which furnishes stamps to be affixed to customs documents. The agreement provides for payments of £20,000 annually and for interest of 8.86% on the unpaid balance after 1925. The total will be £1,200,000. The Banco de Honduras is the chief bank; it is native owned and operated, and is the official bank of issue. It has branches throughout the country and collects and expends Government funds on order from the treasury. The only private bank of importance is the Banco Atlantida at Ceiba owned by one of the leading banana shipping companies; it issues paper currency and has branches in the chief business centres.

Defence.—The army, under the Washington treaties of Feb. 7, 1923, is limited to 2,500 officers and men, but under the Constitution all able bodied men are liable to 19 years' military service (2 years' active) at the age of 21; this provision, long existent, has been practically inoperative. Honduras developed military aviation earlier than most other Latin American countries, and the military aviation school outside Tegucigalpa has a number of planes, repair shops and hangars.

Economics and Trade.—Honduras is a producer of tropical hardwoods, pitch-pine and dyewoods, of bananas and coffee, and of cattle in large numbers. Its mineral resources are considerable, but there are only two important mining companies, extracting gold and silver. Silver only reaches an important figure in exports, the total for the fiscal year ending July 31, 1927 being \$1,362,718 (the conversion to American dollars is here followed, as the official data of the Pan American Union in Washington are in that currency). The chief export item is, however, bananas, which totalled 17,090,182 bunches valued at \$13,580,937, in 1926-27. Sugar, a growing industry, showed exports of 49,827,666 lb., valued at \$1,363,179, together with \$59,993 worth of molasses. Coffee exports were valued at \$493,828, hides at \$82,548 and cattle (6,766 head) at \$108,542. The United States took \$13,485,731 of the \$17,546,290 of exports in 1926-27, Great Britain \$2,135,488, Canada \$1,006,894, Germany \$431,936, the Netherlands \$64,949 and France \$43,072. The total of exports shows a steady growth from \$7,897,001 (1923-24) to \$11,983,053

(1924-25), and to \$13,456,005 (1925-26) and to \$17,546,290 (1926-27). Imports in 1926-27 totalled \$10,630,416, of which the United States sent \$8,445,384. Great Britain \$748,037, Germany \$456,297, France \$192,974 and Italy \$113,180. Imports were \$11,137,917 in 1923-24, \$12,752,763 in 1924-25 and \$9,899,950 in 1925-26. The largest single item of import was cotton cloth, \$1,701,701; the second was oils, \$564,133; the third flour, \$362,580. Iron and steel manufactures, unclassified, totalled \$646,007.

Communications.—The National railway originally built from Puerto Cortes to Potrerillos has 60 m. of track. The other railways total 450 m., including the following private lines: Trujillo railway, 74 m.; Vacarro Bros. line from Ceiba, 127 m.; Cuyamel Fruit Co. line in Cuyamel district, 27 m.; United Fruit Co. in Tela district, 125 m.; Tropical Lumber Co., 7 m.; Ulua branch, 32 miles. There is now a through highway between the Atlantic and the Pacific, including a boat trip across Lake Yojoa. The original highway in this system was the solidly and expensively built road up from San Lorenzo (the mainland terminus on the Pacific, 24 m. by water from the island port of Amapala in the Gulf of Fonseca), up to Tegucigalpa, a distance of 84 miles. This has been built for some years and is one of the most picturesque arterial highways of Latin America. The newer portion of the transcontinental highway leads from Tegucigalpa to Comayagua, 70 m., while from Comayagua to Lake Yojoa the road was built by the Honduras Petroleum company as a portion of its obligation for its oil concession. The lake is crossed by motor launch and the road continues from Limon, on the lake, to Potrerillos, the terminus of the railway. Other roads are gradually linking up interior towns, and while the dream of railway development still stirs the country from time to time, modern motor transport and good roads are now regarded as the surest and most permanent type of communications.

There is aeroplane service along the Caribbean coast, and a line has been operated from time to time between Tegucigalpa and the Caribbean ports. There are landing fields at various points throughout the country. The steamship lines on the Pacific side serve Amapala, the only Pacific port, which, although land-locked and calm, has no deep water pier and offers no direct facilities for transport to the interior, as the highway to Tegucigalpa and the rest of the country is 24 m. distant and can be reached only by combined lighter-schooners, loaded again at Amapala after freight has been lightered from the steamers, or vice versa. On the Atlantic side, service is given by a number of banana fruit lines, which make quick trips to New Orleans, New York and Boston. Fruit ships now sail to British ports direct from Honduras, and in general the banana traffic has given the north coast of Honduras exceptionally good steamship service—far better than a country of similar total trade would enjoy if its produce were less perishable. The telegraph and wireless systems of Honduras are well developed. The Tropical Radio, originally established by the United Fruit company for the convenience of its ships and agents, has transmitting and receiving towers at Tegucigalpa and various ports. The telegraph is Government-operated and communicates with virtually every town in the republic and through the connections with other Governments' lines provides very cheap and relatively quick communication throughout Central America.

HISTORY

Honduras, at the point now known as Cape Honduras, was the first landing place of Columbus on the soil of Central America, on his last voyage. Here the discoverer took possession of the continent in the name of the king of Spain, in 1502. The first settlement in Honduras was made by Cristobal de Olid under orders from Hernando Cortes, in Mexico, but the reports of the discovery of gold and silver mines tempted Olid to seek to set up a private principality, and Cortes made his memorable march from Mexico over the mountains and through the jungles and innumerable rivers of southern Mexico and Guatemala to re-assume control. He founded Puerto Cortes in 1525, re-established order and the loyalty of the succeeding governors, and returned

to Mexico in 1526. Honduras was incorporated into the captaincy general of Guatemala in 1539, and was then regarded as one of the promising sources of mineral wealth in the New World (see CENTRAL AMERICA). Honduras has been a continual sufferer from revolutions and war, one explanation being that, lying as it does between Guatemala, Salvador and Nicaragua, all fairly well balanced against one another, Honduras has been in a position

YELLOW-PINE FOREST IN INTERIOR
The highlands of inner Honduras are covered with large tracts of pine and other conifers, which would yield rich export profits if properly managed

to throw the balance to any of the contending nations, and has thus been subject to intrigue from all three sides. Each ruler of a neighbouring country, if he had designs on another, sought to put one of his puppets into power as president of Honduras, either by intrigue or by revolution, a practice hardly conducive to peace. Between 1867 and 1870, Honduras assumed its heavy burden of debt in the hope of obtaining the Inter-oceanic railway, but dishonesty at home and in London dissipated the moneys received from the loans, and left Honduras bankrupt and in trouble, both domestic and with her neighbours. Intervention by the neighbouring States placed Marco Aurelio Soto, a nominee of Guatemala, in the presidency in 1873, and he was re-elected in 1877 and 1880, following the promulgation of a new constitution.

There was a succession of rulers and revolutions, from 1883 to 1903 in which year Manuel Bonilla was elected president and promised to consolidate and pacify the country. His enemies appealed to José Santos Zelaya, the dictator of Nicaragua and, in the course of the war which followed, American marines intervened to end hostilities and Miguel R. Dávila, a creature of Zelaya, became president of Honduras. In 1910 Dávila was eliminated by a revolution led by Manuel Bonilla, and following the peace conference and the subsequent death of Bonilla in 1913, Dr. Francisco Bertrand became president. A liberal revolution led by General Rafael López Gutiérrez ousted Bertrand in 1919, and Gutiérrez became president. Revolution threatened in 1922 and 1923, and in April 1924 the United States sent a personal representative of President Coolidge to mediate between the factions. Marines and bluejackets were landed twice and promptly withdrawn, and after various conferences and postponements of the 1924 election, difficulties were smoothed out and Dr. Miguel Paz Baraona was elected president, with Presentación Quesada as vice-president. They took office, under the new constitution which had been a part of the results of the discussions and conferences, on Feb. 1, 1925. The only issue of importance which arose in President Paz Baraona's term was that of the boundary with Guatemala, precipitated in 1927 by the development of banana lands and the increased economic importance of the disputed territory. The United States offered its good offices and conferences were held under the chairmanship of the American minister to Costa Rica, and when no results were obtained, the United States secretary of State assumed the rôle of mediator and brought about a submission of the question to a Central American tribunal set up under the Treaties of 1923.

BIBLIOGRAPHY.—Dana G. Munro, *The Five Republics of Central America* (1915); Wallace Thompson, *Rainbow Countries of Central America* (1926); L. E. Elliott, *Central America* (1924); and W. S. Robertson, *History of the Latin American Nations* (1925). An early work of great interest and charm is E. G. Squier, *Honduras; Descriptive, Historical and Statistical* (1870). Official documents including messages of the president and statistical and demographical materials, have been published with considerable regularity by the Honduran Government. The Pan American Union, Washington, issues a booklet on the country and annual summaries of trade. Publications of the Department of Commerce of the United States, of the Council of the Corporation of Foreign Bondholders and of the Department of Overseas Trade in London contain valuable information. (W. THO.)

HONDURAS, BRITISH: *see* BRITISH HONDURAS.

HONE, NATHANIEL (1718–1784), Irish painter, was born in Dublin, but spent the greater part of his life in London, where he died on Aug. 14, 1784. He was a foundation member of the Royal Academy, and exhibited portraits there regularly. Among his best works are the portrait of himself in the National Portrait Gallery, and another of himself in the Royal Academy collection. He was an excellent engraver in mezzotint, and a good miniaturist and enamel-worker.

HONE, WILLIAM (1780–1842), English writer and bookseller, was born at Bath, and established himself as a bookseller in London. From Feb. 1 to Oct. 25, 1817, he published the *Reformer's Register*, writing in it as the serious critic of the State abuses, which he soon after attacked in the famous political squibs and parodies, illustrated by George Cruikshank. In April 1817 three *ex-officio* informations were filed against him by the attorney-general, Sir William Garrow. Three separate trials took place in the Guildhall before special juries on Dec. 18, 19 and 20, 1817. The first, for publishing Wilkes's *Catechism of a Ministerial Member* (1817), was before Mr. Justice Abbot (afterwards Lord Tenterden); the second, for parodying the litany and libelling the prince regent, and the third, for publishing the *Sinecurist's Creed* (1817), a parody on the Athanasian creed, were before Lord Ellenborough. Hone was acquitted on each count, and received a popular ovation. Among Hone's most successful political satires were *The Political House that Jack Built* (1819), *The Queen's Matrimonial Ladder* (1820), in favour of Queen Caroline, *The Man in the Moon* (1820), *The Political Showman* (1821), all illustrated by Cruikshank. In 1826 Hone published the *Every-day Book*, in 1827–28 the *Table-Book*, and in 1829 the *Year-book*; all three were collections of curious information on manners, antiquities and various other subjects. These entertaining books are the works by which Hone is best remembered. In preparing them he had the approval of Southey and the assistance of Charles Lamb, but they were not profitable, and Hone was lodged in King's Bench prison for debt. Friends rescued him and set him up in a coffee-house in Gracechurch street; but this, too, ended in failure. Hone became devout in later years, and used to preach in Weigh House chapel, Eastcheap. He died at Tottenham on Nov. 6, 1842.

HONE, a variety of finely siliceous stone employed for whetting or sharpening edge tools, and for abrading steel and other hard surfaces. Hones are generally prepared in the form of flat slabs or small pencils or rods, but some are made with the outline of the special instrument they are designed to sharpen. Their abrading action is due to the quartz or silica which is always present in predominating proportion, some kinds consisting of almost pure quartz, while in others the siliceous element is very intimately mixed with aluminous or calcareous matter, forming a uniform compact stone, the extremely fine siliceous particles of which impart a remarkably keen edge to the instruments for the sharpening of which they are applied. In some cases the presence of minute garnets or magnetite assists in the cutting action. Hones are used either dry, with water or with oil, and generally the object to be sharpened is drawn with hand pressure backward and forward over the surface of the hone; but sometimes the stone is moved over the cutting edge.

The coarsest type of stone which can be included among hones is the bat or scythe stone, a porous fine-grained sandstone used for sharpening scythes and cutters of mowing machines, and for other like purposes. Next come the ragstones, which consist of quartzose mica-schist, and give a finer edge than any sandstone. Under the head of oilstones or hones proper the most famous and best-known qualities are the German razor hone, the Turkey oilstone, and the Arkansas stone.

The hones yield on analysis 98% of silica, with small proportions of alumina, potash and soda, and mere traces of iron, lime, magnesia and fluorine. They are white in colour, extremely hard and keen in grit, and not easily worn down or broken. Geologically the materials are called novaculites and are supposed to be metamorphosed sandstone silt, chert or limestone resulting from the permeation through the mass of heated siliceous waters. The

finer kind is employed for fine cutting instruments, and also for polishing steel pivots of watch-wheels and similar minute work, the second and coarser quality being used for common tools. Both varieties are largely exported from the United States in the form of blocks, slips, pencils, rods and wheels.

HONEGGER, ARTHUR (1892–), Swiss composer, was born at Havre in 1892. He studied for two years at Zurich before entering the Paris conservatoire in 1912, where he was under Gédalge and Widor. As one of the group known as "les Six" he must be classed with the newest French school and he undoubtedly owes much to the influence of Debussy and Florent Schmitt. But there is a sturdy element in his music which recalls his true nationality and in the mass effects of his recent oratorios he has broken away more and more from French traditions. While some of his harmonic audacities are startling, the impetus of his rhythm is so strong that they fall into place in the general scheme. His development may still have surprises in store; his personal idiom, on the other hand, seems to be well established. The clashing of scale passages and rhythmic figures in contrary motion is a device which he uses constantly with great effect. His respect for sonata form is shown particularly in his chamber music. The success of his biblical drama *King David* has made him known to a wide public whose ear would normally be shocked by atonality and modern counterpoint. The choruses are the outstanding feature of this work, which was first written for the stage at Mézières (canton Vaud) in 1921 and completely revised as an oratorio for concert purposes in 1926.

After *King David*, Honegger's best known work is *Pacific 231* (1924), a brilliant example of modern programme music which at once hit the popular taste. The two works represent the extremes of Honegger's style. In his opera *Judith* (1924) the choruses are again the backbone of the work. The form is more concise and the rhythm sharper and more syncopated than in *King David*. Both here, and in his latest opera *Antigone*, the solo parts tend to be dramatic rather than lyrical. The composer has explained that his aim is to replace recitative by a melodic leading of the singing voice, which is to grow out of the text itself, to avoid dwelling on high notes (in the interests of distinct enunciation) and to be definitely non-instrumental. The oratorio *Judith* adapted from the opera and produced at Leipzig in 1928, is an interesting experiment to bring oratorio into line with modern feeling. It is short, lasting little over an hour, and is divided into thirteen numbers, so arranged as to offer sharp contrasts.

HONESTY (*Lunaria biennis*), hardy biennial of the family Cruciferae, suitable for garden cultivation. It is an attractive everlasting plant 2 ft. to 4 ft. high, with a silvery dissepiment. The similar but less ornamental perennial honesty (*L. rediviva*) is also cultivated.

HONEY, a sweet viscid liquid, elaborated by honey-bees from nectar obtained by them chiefly from the nectaries of flowers, and after transportation to the hive in the honey-stomach, ripened into honey and finally deposited into the cells of their combs prepared for this storage. The U.S. Department of Agriculture has defined honey for purposes of preventing adulteration in the following terms: "Honey is the nectar and saccharine exudations of plants, gathered, modified, and stored in the combs by honey-bees (*Apis mellifica*); is laevo-rotatory, contains not more than 25% of water, not more than 0.25% of ash, and not more than 8% of sucrose." This official definition, largely expressed as limitations in the quantities of materials normally found in honeys, does not attempt to itemize all the materials found in honeys but only those which are of greatest importance in detecting sophistication of this product. By this definition, only honey produced by the common honey-bee is properly designated honey, even that of the other species of *Apis* being excluded. This is due to the fact that the honey of *A. dorsata*, *zonata*, *indica* and others does not enter U.S. markets. Honey gathered by other species of insects is equally excluded by the definition for the same reason. The same limitations apply to honey in practically all European countries. Further official definitions are given of comb-honey, extracted honey (removed from the comb by centrifugal force) and

strained honey (removed by squeezing or the application of heat by the older methods of bee-keeping). Some species of wasps, the honey-ants of Texas and Mexico, and some other ants not only collect nectar as food, but store it for later use by various means. These cases are of biological interest but the honeys thus produced are not used as human food except in certain cases where Mexican Indians are said to collect the stores of the honey-ants.

It was formerly a popular saying in some temperate regions (as England) that where there is the best honey there also is the best wool, a pastoral region often affording a greater profusion of nectar-secreting flowers than lands under tillage. Dry weather with cool nights and hot days is that usually most favourable to the secretion of nectar. In most European countries, nectar is obtained largely from plants growing wild in their native habitat, but in America, where the honey-bee is not native, the larger part of the marketed honey crop is derived from cultivated and to a considerable degree from imported plants. Nectar is often protected in the flowers from rain and other adverse factors by special morphological structures of great complexity. The odour of flowers was formerly associated with the presence of nectar, but now this is not held to be true, since many flowers possess strong odours without ever containing nectar, while others overflow with nectar without giving forth an odour perceptible to man.

The exudation of a nectar-like or saccharine fluid is a function exclusively of flowers but may be found as a secretion or excretion on all parts of various plants which occur above ground. A sweet material, manna, is produced by leaves and stems of a species of ash, and nectar-secreting glands are found on leaves, petioles, stipules, bracts and even on the outer surfaces of corollas and calyces of various plant species. The origin of nectar-secretion manifested specially by flowers among the several parts of plants has been carefully considered by Darwin, who regards the saccharine matter in nectar as a waste product of chemical changes in the sap, which, when it happens to be excreted within the envelopes of flowers, is utilized for the important object of cross-fertilization, and subsequently is much increased in quantity and stored in various ways (see *Cross and Self Fertilization of Plants*, p. 402 *et seq.*, 1876). It has been noted with respect to the nectar of various species of plants that it is most abundant when the anthers are about to dehisce and absent in the unexpanded flower. Bonnier showed that in most flowering plants there occurs an accumulation of soluble food in the form of sugars at the bases of flowers to act as a quick food supply immediately after fertilization occurs, and in some species there is regularly a secretion of this sugar supply in the form of nectar, while the majority of flowering plants form no such secretion regularly but may do so under unusual environmental conditions. The secretions or excretions of nectar from parts of plants other than the interior of flowers are commonly called plant honey-dews.

Another important source of sweet liquid for honey-bees is the excretions of many species of sucking insects, these being called insect honey-dews to distinguish them from normal plant secretions. Various orders of Hemiptera form this material which is eagerly gathered by bees, but only when no supplies of nectar are available. These insects vary in their locations on plants and often confine themselves to certain plant species. The insects extract the sap from leaves or stems, utilize what is needed for their own livelihood and excrete the residue, which often contains considerable quantities of sugars. Insect honey-dews contain the same sugars that occur in nectars and approximately in the same proportions, but the final product made from these materials by bees contains considerably larger quantities of dextrin, more ash and usually has a dark colour and none too attractive flavour. Plant secretions from parts of plants other than flowers also may contain more dextrin and ash and may have stronger flavours.

Pettigrew is of opinion that few bees go more than 2 m. from home in search of honey. The number of blossoms visited in order to meet the requirements of a single hive of bees must be very great; for it has been found by A. S. Wilson that 125 heads of common red clover, which is a plant comparatively abundant in nectar, yield but one gramme (15.432 grains) of sugar; and as each head contains about 60 florets, 7,500,000 distinct flower-tubes

must on this estimate be exhausted for each kilogramme (2.204 lb.) of sugar collected. Among the richer sources of nectar of north temperate regions are reckoned the apple, asparagus, asters, barberry, basswood, and the European lime or linden, beans, bone-set, borage, broom, buckwheat, catnip, or catmint, cherry, cleome, clover, cotton, crocus, currant, dandelion, eucalyptus, figwort, furze, golden-rod, gooseberry, hawthorn, heather, horehound, hyacinth, lucerne (alfalfa in America), maple, mignonette, mint, motherwort, mustard, onion, pear, poplar, quince, rape, raspberry, sage, sycamore, teasel, thyme, tulip-tree, turnip and willows, and the "honey-dew" of the leaves of the whitethorn, oak, linden, beech and some other trees.

Content of Honey.—Honey contains a large number of materials which have been detected by chemical means as well as others which appear only from physiological experimentation. An average analysis, as made by Browne of the U.S. Department of Agriculture from American honeys, is as follows: water, 17.70%; laevulose, 40.50%; dextrose, 34.02%; cane-sugar (sucrose), 1.90%; dextrans and gums, 1.51%; ash (a large number of inorganic compounds, doubtless varying greatly with honey from different plant and geographical sources), 0.15%. These percentages still leave a considerable amount of material not accounted for in the usual chemical analysis. Several materials are found in honey which either vary considerably or are difficult to determine quantitatively, as follows: pollen grains suspended in honey, derived probably by accidental contamination during the gathering or ripening process, a minute source of protein material in the honey; small particles of bees-wax, probably not all derived from the process of extracting honey by modern methods; some albuminoids, possibly in part from pollen grains but also possibly normal to honey itself; free acid, usually calculated by chemists as formic but said to consist largely of malic (the calculation as formic being a result of an unfounded theory of former times that bees use formic acid from the poison glands as a preservative, whereas the poison glands do not produce formic acid); various colouring materials of plant origin, such as chlorophyll derivatives, carotin, xanthophyll, etc. Other substances which have been found in honeys but which cannot be determined quantitatively are: various enzymes, such as invertase produced in considerable quantities by honey-bees and used in the transformation of sucrose in nectar into dextrose and laevulose, diastase (amylase), catalase, inulase and other enzymes in certain honeys; aromatic bodies of doubtful character and origin which give the characteristic aromas to honeys from various plant species. In certain honeys or honey-dew honeys, higher alcohols, mannite, dulcitol, have been detected, and in rare cases the trisaccharide melezitose has been found. The recent work in nutrition has caused a search to be made for vitamins in honeys of various sources. Vitamins A, B and C have been found, but far more work is needed in this field.

Honey is a supersaturated solution of these materials in a non-crystallizable sugar under ordinary conditions, whereas dextrose forms crystals most readily. The proportions of these two sugars vary enormously in honeys of different plant origin, those of the California sages and tupelo of the south-eastern United States being high in laevulose, as a result of which these honeys rarely, if ever, form crystals. On the other hand, honeys from lucerne (alfalfa) are high in dextrose and form crystals quickly after removal from the hive and combs. The fineness of the crystals formed in honey depends on the rapidity of granulation or crystallization, since dextrose crystals are not definite and fixed in form. A disturbance of the balance of the supersaturated honey solution, as by the artificial removal of some ash, immediately upsets the balance and precipitation immediately follows. Dextrose forms a crystal with one molecule of water of crystallization, with the result that when honey granulates, the water content of the solution of uncrystallized sugars is increased. As a result of this, fermentation of honey is more apt to occur in granulated honey than in liquid honey. Honey also has certain interesting physical properties, so far unexplained. For example, if a solution of honey and water in equal parts is made and subjected to extremely low temperatures, the solution does not freeze solid as a similar sugar solution would do, but forms a mushy mass. This is the explana-

tion of the use of honey and water as an anti-freeze solution for automobile radiators.

Honey in Ancient Times.—The term "virgin-honey" is an ancient designation applied to the honey from combs that have never contained brood, or to that which flows spontaneously from honey-comb with or without the application of heat. The honey obtained from old hives was formerly considered inferior in quality, because of contaminations, but this does not hold true in modern bee-keeping practice. The far-famed honey of Narbonne is white, granular and highly aromatic; and still finer honey is that procured from the Corbières mountains, 6 to 9 m. to the south-west. The honey of Gâtinais is usually white, and is less odorous and granulates less readily than that of Narbonne. Honey from white clover has a slight amber, and that from heather a dark, golden-yellow hue. What is made from honey-dew is often dark in colour, and disagreeable to the palate, and some such honeys do not crystallize. "We have seen aphide honey from sycamores," says F. Cheshire (*Pract. Bee-keeping*, p. 74), "as deep in tone as walnut liquor, and where much of it is stored the value of the whole crop is practically nil." The honey of the stingless bees (*Meliponia* and *Trigona*) of Brazil varies greatly in quality according to the species of flowers from which it is collected, some kinds being black and sour, and others excellent. The fine aroma of Maltese honey is due to its collection from orange blossoms, Narbonne honey being harvested chiefly from Labiate plants, as rosemary.

Adulterants of honey are cane-sugar, artificially prepared invert sugars, various syrups and the different varieties of manufactured glucose. Honey sophisticated with glucose containing copperas as an impurity is turned an inky colour by liquids containing tannin, as tea. These adulterations are readily detected by modern chemical methods.

Honey is mildly laxative in effect. Some few kinds are purported to be poisonous, as the reddish honey stored by the Brazilian wasp *Nectarina* (*Polistes*, Latr.) *Lecheguana*, Shuck., the effects of which have been vividly described by Aug. de Saint-Hilaire, the spring honey of the wild bees of East Nepal, said to be rendered noxious by collection from rhododendron flowers (Hooker, *Himalayan Journals*, i. 190, ed. 1855), and the honey of Trebizond, which from its source, the blossoms of *Azalea pontica* and *Rhododendron ponticum* (perhaps to be identified with Pliny's *Aegolethron*), acquires the qualities of an irritant and intoxicant narcotic, as described by Xenophon (*Anab.* iv. 8). Pliny (*Nat. Hist.* xxi. 45) describes as noxious a livid-coloured honey found in Persia and Gaetulia. Honey obtained from *Kalmia latifolia*, L., the calico bush, mountain laurel or spoonwood of the northern United States, and allied species, is sometimes reputed deleterious; and G. Bidie (*Madras Quart. Journ. Med. Sci.*, Oct. 1861, p. 399) mentions urtication, headache, extreme prostration and nausea, and intense thirst among the symptoms produced by a small quantity only of a honey from Coorg jungle. A South African species of *Euphorbia*, as was experienced by the missionary Moffat (*Miss. Lab.* p. 32, 1849), yields a poisonous honey. The nectar of certain flowers is asserted to cause even in bees a fatal kind of vertigo. The evidence for any honey having poisonous properties is exceedingly doubtful and in all probability the symptoms described by these old writers were due either to overeating or to sensitivity to osmotic pressure set up by honey in an empty stomach. Later observations do not substantiate these old theories. As a demulcent and flavouring agent, honey is employed in the *oxymel*, *oxymel scillae*, *mel boracis* and *confectio piperis* of the *British Pharmacopoeia*.

To the ancients honey was of very great importance as an article of diet, being almost their only available source of sugar. It was valued by them also for its medicinal virtues. According to Hindu medical writers, honey when new is laxative, and when more than a year old astringent (U. C. Dutt, *Mat. Med. of the Hindus*, p. 277, 1877). Ceromel, formed by mixing at a gentle heat one part by weight of yellow wax with four of clarified honey and straining, is used in India and other tropical countries as a mild stimulant for ulcers in the place of animal fats, which there rapidly become rancid and unfit for medicinal purposes. Pills

prepared with honey as an excipient are said to remain undurated, however long they may be kept (*Med. Times*, 1857, i. 269). Mead, of yore a favourite beverage in England, is made by fermentation of the liquor obtained by boiling in water combs from which the honey has been drained. In the preparation of sack-mead, an ounce of hops is added to each gallon of the liquor, and after the fermentation a small quantity of brandy. Metheglin, or hydromel, is manufactured by fermenting with yeast a solution of honey flavoured with boiled hops (*see* Cooley, *Cyclop.*). A kind of mead is largely consumed in Abyssinia, where it is carried on journeys in large horns (Stern, *Wanderings*, p. 317, 1862). In Russia a drink termed *lipetz* is made from the delicious honey of the linden. The *mulsum* of the ancient Romans consisted of honey, wine and water boiled together. The *clarre*, or *piment*, of Chaucer's time was wine mixed with honey and spices, and strained till clear; a similar drink was *bracket*, made with wort of ale instead of wine. Honey is occasionally employed for giving strength and flavour to ale. In ancient Egypt it was valued as an embalming material; and in the East, for the preservation of fruit, and the making of cakes, sweetmeats, and other articles of food, it is largely consumed. Grafts, seeds and bird's eggs, for transmission to great distances, are sometimes packed in honey. In India a mixture of honey and milk, or of equal parts of curds, honey and clarified butter, is a respectful offering to a guest, or to a bridegroom on his arrival at the door of the bride's father, and one of the purificatory ceremonies of the Hindus is the placing of a little honey in the mouth of a new-born male infant. Cream or fresh butter together with honey, and with or without bread, is a favourite dish with the Arabs.

Among the observances at the Fandroana or New Year's festival, in Madagascar, is the eating of mingled rice and honey by the queen and her guests; in the same country honey is placed in the sacred water of sprinkling used at the blessing of the children previous to circumcision. Honey was frequently employed in the ancient religious ceremonies of the heathen, but was forbidden as a sacrifice in the Jewish ritual (Lev. ii. 11). With milk or water it was presented by the Greeks as a libation to the dead (*Odys.* xi. 27; Eurip. *Orest.* 115). A honeycake was the monthly food of the fabled serpent-guardian of the Acropolis (Herod. viii. 41). By the aborigines of Peru honey was offered to the sun.

Honey Production.—In Hungary, the amounts of honey and of wax are in favourable years respectively about 190,000 and 12,000 cwt., and in unfavourable years, about 12,000 and 3,000 hundredweights. In Poland the system of bee-keeping introduced by Dolinowski has been found to afford an average of 40 lb. of honey and wax and two new swarms per hive, the common peasant's hive yielding, with two swarms, only 3 lb. of honey and wax. Recently other methods of bee-keeping have been introduced. When, in August, in the loftier valleys of Bormic, Italy, flowering ceases, the bees in their wooden hives are, by means of spring-carts, transported at night to lower regions, where they obtain from the buckwheat crops the darker honey which serves them for winter consumption. Similar migratory bee-keeping is practised in many parts of Europe and America.

In Palestine, "the land flowing with milk and honey" (Ex. iii. 17; Numb. xiii. 27), wild bees are numerous, especially in the wilderness of Judaea, and the selling of their produce, obtained from crevices in rocks, hollows in trees and elsewhere, is with many of the inhabitants a means of subsistence. Commenting on I Sam. xiv. 26, J. Roberts (*Oriental Illust.*) remarks that in the East "the forests literally flow with honey; large combs may be seen hanging on the trees, as you pass along, full of honey." In Galilee, and at Bethlehem and other places in Palestine, a more modern bee-keeping is now extensively carried on. The ancient hives, sometimes still used, are sun-burnt tubes of mud, about 4 ft. in length and 8 in. in diameter, and, with the exception of a small central aperture for the passage of the bees, closed at each end with mud. These are laid together in long rows, or piled pyramidally, and are protected from the sun by a covering of mud and of boughs. The honey is taken from the bees when the ends have been removed, by means of an iron hook. On the precipitous slopes of the Teesta valley, in India, the procuring of

honey from the pendulous bees' nests, which are sometimes large enough to be conspicuous features at a mile's distance, is the only means by which the idle poor raise their annual rent.

The vast increase in the use of cane and beet-sugars, together with the extensive sale of artificially manufactured syrups made from cane, starch and other materials, has to a considerable degree reduced the importance of honey as an article of human diet. In most countries at present, the amount of cane and beet-sugar consumed exceeds the honey used by 50 times, whereas in ancient times honey was the most important source of sweetness. There is, of course, much evidence that the present excessive use of artificially manufactured sugars and syrups is detrimental. All such sugars and syrups are wholly deficient in vitamins and have had extracted from them many other important food constituents in the manufacturing processes; just as occurs in the highly developed manufacture of other modern food-stuffs. The recent protest against artificially manufactured foods is resulting in an increase in the advice that honey be used as a natural food product, in place of such large quantities of manufactured sweets. Various new and important uses are also being found for honey, in which other syrups cannot be employed satisfactorily.

It is also now known that honey has the important virtue of being a mild disinfectant, in fact, if bacteria of various species are placed in honey, they die within a few hours by the dehydration set up by the high laevulose content of the honey. Furthermore, modern processes of removing honey from the comb have been developed so that any danger of contamination is reduced to the utmost. Comb-honey is of course sealed by the cleanly bees themselves in the cells, where contamination is impossible. These facts, together with the various materials now known to occur in honey and not in other sweets, are rapidly increasing the importance of honey as an article of human food. (See also BEE-KEEPING.)

HONEYCOMB, a cloth so called because of the particular pattern made by the arrangement of the crossing of the warp and weft threads; these form cells somewhat similar to those of the real honeycomb. They differ from the latter in that they are rectangular instead of hexagonal. The bottom of the cell is formed by those threads and picks which weave "plain," while the ascending sides of the figure are formed by the gradually increasing length of float of the warp and weft yarns.

The figure shows two of the commonest designs which are used for these cloths, design A being what is often termed the "perfect honeycomb." In the figure it will be seen that the highest number of successive white squares, representing a weft thread floating or passing over warp threads, is seven, whereas the corresponding highest number of successive black squares, a warp thread passing over weft threads or picks, is five. Two of each of these maximum floats form the top or highest edges of the cell, and the number of successive like squares decreases as the bottom of the cell is reached when the floats are one of black and one of white (see middle of design, etc.). The weave produces a reversible cloth, and it is extensively used for the embellishment of quilts and other fancy goods. It is also largely used in the manufacture of cotton, linen and union towels. B is, for certain purposes, a more suitable weave, than A, but both are very largely used in the towel industry. (T. W.)

HONEY DEW, a secretion consisting of exudations of sugar from the leaves of various trees under certain atmospheric conditions. It is usually the result of a superfluity of sap, but may also be produced by the puncture of certain insects (*Aphides*, *q.v.*); the latter condition constitutes a form of plant disease. See PLANTS: Pathology.

HONEY-EATER, or HONEY-SUCKER, the name given to birds of the family *Meliphagidae*, characteristic of the Australian region, and possessing a long protrusible tongue by means of which

they obtain honey, and also the insects attracted thereto. They are small birds, mostly of restricted range, though *Glycyphila rufifrons*, the white-throated honey-eater, is found over the greater part of Australia and Tasmania. One of the most curious forms is *Prothemadera*, the parson-bird of New Zealand, so-called from its dark plumage and the two tufts of white feathers beneath the chin. The bell-bird of the same island, *Anthornis melanura*, the Australian wattle-birds (*Anthochaera*) and the pugnacious friar-birds (*Tropidorhynchus*) are related to this group. These latter are the objects of mimicry by two orioles (*Mimeta*) in the islands of Bouru and Ceram (Wallace, *Malay Archipelago*).

HONEY-GUIDE, a bird so called from its habit of pointing out to man and to the ratel (*Mellivora capensis*) nests of bees, the produce of which it then hopes to share. Stories to this effect are found in the narratives of many African travellers. But Layard says (*B. South Africa*, p. 242) that the birds not infrequently lead to a leopard or a snake, and will even follow a dog with vociferations. Nevertheless its noisy cry and antics unquestionably have, in many cases, the effect signified by its English name. Further observations on the meaning of this habit are needed. The honey-guides are small birds, of plain plumage with a sparrow-like bill. Two species are Asiatic, while the remainder are confined to Africa. The largest genus is *Indicator*.

HONEY LOCUST, the popular name of a North American tree (*Gleditsia triacanthos*), of the family Leguminosae, native to fertile soils from western Pennsylvania through Ohio and Ontario to Michigan and Minnesota and southward to Alabama and Texas, and also naturalized from cultivation eastward of this range. It reaches from 75 to 140 ft. in height with a trunk 2 or 3, or sometimes 5 or 6 ft. in diameter, and slender spreading branches which form a broad, flattish crown. The branchlets bear numerous simple or three-forked (whence the species-name *triacanthos*) sharp stiff spines, 3 to 4 in. long, at first red in colour, then chestnut brown; they are borne above the leaf-axils and represent undeveloped branchlets; sometimes they are borne also on the trunk and main branches. The long-stalked leaves are 7 to 8 in. long with eight to fourteen pairs of narrowly oblong leaflets. The flowers, which are of two kinds, are borne in racemes in the leaf-axils; the staminate flowers in larger numbers. The brown pods are often 12 to 18 in. long, have thin, tough walls, and contain a quantity of sweetish, succulent pulp between the numerous seeds; they contract spirally when drying. The tree was first cultivated in Europe towards the end of the 17th century by Bishop Compton in his garden at Fulham, near London, and is now extensively planted as an ornamental tree. The much smaller swamp honey locust or water locust (*G. aquatica*), with shining brown pods, 1 in. to 2 in. long and containing only 1 or 2 seeds, inhabits deep swamps in the Mississippi valley from Illinois southward, ranging also eastward to South Carolina and Florida. The name of the genus commemorates Johann Gottlieb Gleditsch (1714-1786), a friend of Linnaeus, and the author of one of the earliest works on scientific forestry.

HONEYSUCKLE, botanical name *Lonicera*, a genus of climbing, erect or prostrate shrubs, of the family Caprifoliaceae, so named after the 16th-century German botanist Adam Lonicer. The common British species is *L. Periclymenum*, the woodbine; *L. Caprifolium* and *L. Xylosteum* are found in a few counties in the south and east of England. Some of the garden varieties of the woodbine are very beautiful, and are held in high esteem for their delicious fragrance, even the wild plant, with its pale flowers, compensating for its sickly looks "with never-cloying odours." The North American sub-evergreen *L. sempervirens*, with its fine heads of blossoms, commonly called the trumpet honeysuckle, the most handsome of all the cultivated honeysuckles, is a distinct and beautiful species producing both scarlet and yellow flowered varieties, and the Japanese *L. flexuosa* var. *aureoreticulata* is esteemed for its charmingly variegated leaves netted with golden yellow. The fly honeysuckle, *L. Xylosteum*, a hardy shrub of dwarfish, erect habit and *L. tatarica*, of similar habit, both European, are amongst the oldest English garden shrubs, and bear axillary flowers of various colours, occurring two on a peduncle. There are numerous other species, many of them introduced to

DESIGNS USED IN THE MANUFACTURE OF HONEYCOMB TOWELLING. The pattern at left is known as the "perfect 8-thread honeycomb"; that at right is a modification of the "perfect honeycomb"

our gardens, and well worth cultivating in shrubberies or as climbers on walls and bowers, either for their beauty or the fragrance of their blossoms.

The wood of the fly honeysuckle is extremely hard and is employed to make teeth for rakes; and, like that of *L. tatarica*, it is a favourite material for walking-sticks.

There are about 175 species, widely distributed in the northern hemisphere, upwards of 30 of which, together with numerous varieties, are more or less cultivated. Some 25 species, inclusive of several naturalized from the Old World, are found in the United States and Canada. Honeysuckles (*Lonicera*) flourish in any ordinary garden soil. Pruning should be done about March, cutting out some of the old wood, and shortening back some of the younger growths of the preceding year.

In the western counties of England the name honeysuckle is applied to the meadow clover, *Trifolium pratense*. Another plant of the same family (*Leguminosae*), *Hedysarum coronarium*, a very handsome hardy biennial, is called the French honeysuckle. The name is moreover applied with various affixes to several other totally different plants. Thus white honeysuckle and false honeysuckle are names for the North American *Azalea viscosa*; Australian or heath honeysuckle is the Australian *Banksia serrata*; Jamaica honeysuckle, *Passiflora laurifolia*; dwarf honeysuckle, the widely spread *Cornus suecica*; Virgin Mary's honeysuckle, the European *Pulmonaria officinalis*; while West Indian honeysuckle is *Tecoma capensis*, and is also a name applied to *Desmodium*.

HONFLEUR, seaport of France, in the department of Calvados, 57 m. N.E. of Caen by rail, on the Seine estuary, opposite Havre, with which it communicates by steamboat. Pop. (1926) 8,158. Honfleur dates from the 11th century and is 500 years older than Havre, which supplanted it in the 18th century. During the Hundred Years' War it was frequently taken and re-taken, the last English occupation ending in 1440. In 1562 the Protestants took it after a siege of the suburb of St. Léonard; and though Henry IV. captured it in 1590 he had again to invest it in 1594 after the rest of Normandy had submitted to his arms. Early in the 17th century Honfleur was a centre for exploration, its colonists founded Quebec, and Honfleur traders established factories in Java and Sumatra and a fishing establishment in Newfoundland.

The most noteworthy building is the timber church of St. Catherine. The church tower stands on the other side of a street. St. Léonard's dates from the 17th century, with the exception of its ogival portal and rose-window of the 16th, and its 18th century octagonal tower. The ruins of a 16th-century castle, called Lieutenant, and houses of the same period are also of interest. Above the town is the chapel of Notre-Dame-de-Grâce; a shrine resorted to by pilgrim sailors, founded in 1034 by Robert the Magnificent of Normandy and rebuilt in 1606. The town has a tribunal and a chamber of commerce. The port consists of the tidal harbour and four floating basins. A reservoir affords the means of sluicing the channel and supplying the basins. The harbour was begun by Duquesne in 1668. Honfleur has regular steamship service for passengers to Havre, Southampton and London and bus service with Trouville. Honfleur exports mainly to England and trades in poultry, butter, eggs, cheese, chocolate, baskets, shell work, vegetables, fruit, seeds and purple ore. Timber from Scandinavia, English coal and artificial manures are imported. There are important saw-mills, as well as shipbuilding yards, manufactories of chemical manures, oil, shoes and iron foundries.

HONGKONG, an important British island possession off the south coast of China in 22° 9'–22° 17' N.; 114° 5'–114° 18' E.

FLOWERING BRANCH AND BERRIES OF THE BRITISH HONEYSUCKLE OR WOODBINE (*L. PERICLYMENUM*)

The present British colony of Greater Hongkong is a compact group of islands and peninsulas, comprising the island of Hongkong itself, the Kowloon peninsula and the so-called New Territories, which together command the entrance to the Canton river. The island of Hongkong lies 75 miles S.E. of Canton and has a dominant position in the group. It is very irregular in shape, about 11 miles in length, and has an area of about 32 square miles. It is separated from the mainland by a channel about a mile broad between Victoria, the island capital, and Kowloon point, but narrowing at Ly-ee-mun Pass to about half a mile.

Hongkong island, a detached fragment of the South China massif, is chiefly composed of primary rocks, of which granite occupies about half the total area and forms the basis of the structure. The main topographical features of the whole group of islands are largely due to two sets of fracture-lines trending N.E.–S.W. and N.W.–S.E. As a result, the coasts are extremely broken and provide a number of splendid natural harbours. The chief physical feature of the island is an E.–W. range of steep conical hills which rise some 1,500 ft. above the basal plateau, very little of which is suitable for cultivation. Victoria Peak (1,774') in the north-west and immediately south-west of the capital, is the highest point. From the sea, and especially from the fine harbour which fronts the capital, the general aspect of the city rising in hill-side terraces, is very attractive.

Hongkong lies just within the tropics and had formerly the reputation of being unhealthy. This has been largely remedied by sanitation but some districts of the colony are healthier than others, owing to differences of altitude or aspect. The Peak in Hongkong island is usually 8° F cooler than Victoria below and so affords a valuable sanatorium for the white population. The prevailing winds throughout the year are easterly. The mean July temperature is 82° F, but that of February only 57.7° F, the relatively cool winters being due to north-east winds. The monsoonal rainfall increases to a June maximum of 16.3" with a secondary maximum in August. The mean annual rainfall is 90 inches. Typhoons account for most of the climatic eccentricities and at times cause great damage to property and shipping.

Prior to the British occupation Hongkong was a desolate island, occupied by a small fishing population, and was a notorious haunt of pirates. It was during the "Opium War" of 1839–42 that its harbour, which since 1821 had sheltered opium vessels, was utilized as a naval base for British ships. Barren and unhealthy as

A CROWDED STREET IN THE CHINESE QUARTER OF HONGKONG

the island was and lacking natural resources, the great commercial and strategic significance of this deep, sheltered harbour, ten square miles in area, possessing east and west entrances and lying right on the path of the chief trade route to China, was quickly realized. Its cession to Great Britain in 1841, confirmed by the Treaty of Nanking (1842), was one of the chief results of the war and, despite the fact that owing to the lack of other resources its development was for a long time purely commercial, it has grown in less than a century to be one of the world's greatest ports.

The history of Hongkong since 1842 has been inseparably con-

nected with the development of its trade and this, fostered by a free-port policy, has grown with the progressive opening up of China's foreign relations. Hongkong's development falls into well defined stages. During the first years of British control opium was the foundation of its trade, but in 1849 the island became the chief centre for the coolie transport-traffic to the gold fields of California and Australia. From 1850-60 Hongkong acquired the

VIEW OF THE PEAK (1,825 FT.), THE HIGHEST GROUND NEAR HONGKONG
The Peak is the summer resort of the official classes and wealthier merchants. On the left is the Commodore's residence

nucleus of a settled Chinese population which has proved essential to its commerce. A short period of reaction set in with the loss of the raw-cotton trade built up during the American Civil War, but in 1869, the opening of the Suez canal enlarged its sphere and brought it into closer touch with Europe. While the tonnage of ships calling at Hongkong doubled between 1860 and 1870, it quadrupled between 1870 and 1880, following the opening of the canal.

It had been apparent from the beginning that Hongkong was menaced owing to its proximity to the mainland. A special source of danger was the Kowloon peninsula which dominated the harbour and threatened Victoria. Following the 2nd Opium War, Britain obtained (1860) the cession of Kowloon peninsula and Stonecutter's island; but Hongkong was not completely defensible so long as the whole harbour was not contained within British territory. Hence during the struggle for concessions, at the end of the century, Great Britain obtained (1898) a 99 years' lease of the mainland as far north as the Shumchün river and of the islands around Hongkong within the limits of $114^{\circ} 5'$ and $114^{\circ} 18' E.$ and $22^{\circ} 17' N.$ This involved the control of a relatively wide stretch of sea, and so provided additional security.

Although both territorial extensions were acquired on strategic grounds, they have since proved useful in other directions for Kowloon is now an outlet for the overflow population of Hongkong and a field for its industrial development while the New Territories are a potential source of raw materials for its trade and industry. Thus the three units are supplementary, and together make up the complex but compact unit of Greater Hongkong.

Hongkong for Chinese customs purposes is regarded as a foreign port but its essential trade function is to serve as a point of transshipment for goods passing between China and the outer world, and at the same time act as an entrepôt for the coastal trade between north and south China. Although it has commercial relations with all parts of the world, the Far East trade in 1922 accounted for no less than 95% of its exports and 66% of its imports. The nature of this trade is well illustrated by the chief commodities—rice, sugar, cotton yarn, tin and coal. In recent years Hongkong has been the principal centre of rice distribution in the world. The main source of supply is French Indo-China, which in 1922 stood second in the total import and export trade of Hongkong and is mainly an exporter of foodstuffs and raw materials in return for Chinese and foreign goods. The rice-exports of the port, whose value in 1924 amounted to £9,681,958 are chiefly to China, for Hongkong, lying between the chief supplier and consumer, handles 85% of China's total rice-import. Rice is exported to a smaller extent to the United States, Cuba and the Philippines while Japan is supplied only when her crops fail. Hongkong is also, after

Java, the chief sugar-distributing centre of the Far East. The bulk of the imports, largely determined by the colony's refining industry, comes from the Dutch East Indies (74%); and most of the remainder from the Philippines. The total exports in 1924 were valued at £7,911,373. China takes about 70% of the refined and 75% of the raw sugar exports. Cotton-yarn is usually third in both the import and export trade of Hongkong. It is imported from India (57%), Japan, North China, the United States and Great Britain, to the value of about £4,000,000. Of the total exports South China takes about 50% and French Indo-China 40%. Japan is increasing its hold on the cotton piece goods trade, formerly almost monopolized by Britain. After Singapore, Hongkong is the chief tin market of the Far East. This commodity comes chiefly from Yunnan, via Haiphong, and is sent to Hongkong to obtain the best market and the best facilities for exportation, its chief destination being America, and to a lesser degree, Japan. The total value of tin-exports in 1924 was £1,774,049. The importation of coal, great as it is, is only sufficient to meet the needs of the coastal and local traffic. Japan supplies about 65% of the total imports, of which only 25% is re-exported mainly to neighbouring ports. The importation and exportation of raw opium was prohibited by Ordinance No. 30 of Dec. 21, 1923, and there is now no legitimate movement of opium in the colony.

Although Hongkong's commercial relations embrace the whole field of China, its real trade-sphere in that country radiates from a centre in the Canton delta into Indo-China and East Yunnan, and as far north as a line passing west from between Amoy and Foochow along the main watershed into Kweichow. With Canton, the chief collecting and distributing centre for all the foreign trade of the interior of South China, Hongkong's relations are especially close. Since ocean vessels cannot get beyond Whampoa, commodities for Canton are transhipped at Hongkong and sent up the river in small vessels. Thus Hongkong is in a sense the deep-water port of this ancient outlet of south China. In 1922 out of Hongkong's exports to China, amounting to about 60% of her total exports, Canton took 53%, to the value of £17,000,000. Hongkong in that year supplied 94% of Canton's imports and took 99.5% of its exports, the silk-trade accounting for 68% of the latter. So too, more than 90% of the total trade of the southern ports of Kwangtung is with Hongkong, which is also the chief source of foreign goods for Swatow and Amoy. Imports from Hongkong reach as far as Hankow, but the export trade of the Yang-tze basin is in the hands of Shanghai. Hongkong can, however, compete more successfully in north China where the demand for its refined sugar is the chief factor in the trade, and it is probable that the completion of the Canton-Hankow railway will increase its contacts with the Yang-tze lands.

Next to the Far East, the United States looms largest in Hongkong's trade relations, receiving about 3.5% of its exports and supplying 16% of its imports. Hongkong's chief export to the States during the period 1913-18 was rice but tin is now the chief commodity. In return the United States is the main source of its imports of flour and kerosene, the value of which in 1924 was £2,309,925 and £1,594,806 respectively. Britain's share in the trade with Hongkong is relatively small; the latter can, in no sense, be regarded as a centre of British Imperial trade, for its sphere is essentially the Far East and the Pacific.

Hongkong is tending to become the centre of Japan's growing trade with south China, and it is the point of transshipment in the trade between Japan and Indo-China. The latter exports rice and tin (originally from Yunnan) via Hongkong to Japan, and in return receives cotton yarn and manufactured goods. There is also a steady trade with the Straits Settlements, because exports are mainly Chinese foodstuffs and manufactured goods for the Chinese colonies in Malaya.

The Total Trade of Hongkong (excluding Treasure)

Year	Imports	Exports	Total
	£	£	£
1923 . . .	61,954,498	61,372,331	123,326,829
1924 . . .	72,155,478	63,674,794	135,830,272

Depending as it does on the changing demand and supply of the Far Eastern market, Hongkong's trade is liable to great fluctuations. In the boom period after the World War the import trade more than doubled between 1918 and 1920, but this was followed by a marked decrease, due partly to the continued fall of exchange on the *tael*, partly to the troubled internal conditions of China and the political and trade friction between Hongkong and Canton. Trade in 1925 and 1926 was hurt by the Cantonese boycott.

The total shipping entering and clearing at ports in the colony during 1924 amounted to 764,492 vessels of 56,731,077 tons. Of

MARKET IN HONGKONG

Many of the articles on view in the crowded markets are made by native craftsmen, who may be seen working in their shops. The crafts of jewellery, furniture-making and weaving are carried on extensively

these, 56,765 vessels of 37,770,499 tons were engaged in foreign trade. The growth of Hongkong's shipping after the war was remarkable, the tonnage in 1923 exceeding that of 1918 by no less than 24,000,000 tons.

Hongkong has become the chief centre of the Far East passenger service and is a port of call for the largest liners in the service. River steamers, launches and junks trade with Macao, Canton and the smaller delta ports of Kwangtung and as far up the Sikiang river as Wuchow where they connect with a fleet of Chinese motor-boats. In colonial waters the traffic is very heavy, varying with the amount of ocean shipping. Steam launches in the local trade in 1923 amounted to 17,400,000 tons, while junks in both local and foreign trade totalled 3,900,000 tons. These river and harbour fleets are vitally important to Hongkong since its chief markets lie in the adjacent delta-lands of the Si-kiang and the hinterland of Canton. Although commerce remains the life-blood of the colony, Greater Hongkong has in recent years developed considerable industrial and agricultural activities. The industries depend on trade for most of the necessary raw materials and so cover a wide range—tin- and sugar-refining, rice polishing, furniture-making, ship-building and engineering, the manufacture of cement, paper, rope, glass, soap, ginger, canned and knitted goods. The chief industries are controlled by Europeans but the factory system under purely Chinese management is proving successful. Local production of raw materials, wherever possible, will greatly assist further industrial development in the colony. The island itself has no valuable mineral resources except building-stone, but the New Territories contain deposits of copper, tin, iron, wolfram, silver-lead and limestone. These may prove workable after initial expert investigation and the revision of the present Mining Ordinances of the colony.

The chief economic value of the New Territories, however, lies in their agriculture in spite of the limitations imposed by the high relief. Rice supplies the needs of the whole peasant population and occupies 90% of the total cultivated area. Sugar is at present the only important commercial crop. There are, however, great possibilities for fruit-growing, especially if the hill-sides are terraced. The pineapple crop is already considerable, and is the basis of a growing native canning-industry. Road-making is help-

ing to improve the facilities for marketing the garden-produce of the New Territories. The great extent of hill-pasture also affords opportunities for stock-raising. While Hongkong itself is of small agricultural value, afforestation has converted the "desolate rock" of 1842 into a fairly well-wooded island; the main objects of the forestry policy have been soil-preservation, water-conservation, revenue and beauty. The chief tree is the pine but several others, including the camphor and eucalyptus, have been successfully acclimatised. Oil-producing trees are receiving especial attention.

In addition to the Chinese roads, the best of which are paved, Hongkong island contains a network of good macadamised roads which are essentially defensive and are of small economic value. They take the form of a circular route following the coast with cross-connections using the hill-gaps. The construction of a railway from Kowloon to Canton was one of the conditions accompanying the lease of the New Territories. The through route was opened in 1911 and connects with Hongkong by ferry from Kowloon. There are no other good external communications. Not least among the many important economic aspects of Hongkong is its pre-eminence as a banking centre. The circulation on Dec. 31, 1924 of notes of the three banks having authorized issues amounted to \$62,511,402 and the total amount of coin in circulation was \$17,864,370.96. The revenue of the colony for 1924 was \$24,209,640 and the expenditure \$26,726,428. During the period 1915-24 the assessment of the whole colony rose from about 14½ to over 22 million dollars.

The population of Greater Hongkong was in 1924 made up as follows: Foreign Civil Community, 16,000; City of Victoria, 420,000; Villages of Hongkong Island, 29,800; New Territories, 85,000; Population Afloat, 68,750; Total Chinese Population 783,550; Total Civil Population 799,550. The boat-population which centres in Victoria harbour, and the agricultural population of the New Territories are both indigenous and form distinct and stable elements in what is, as a whole, a fluctuating and changing native population. Thus in 1924, no less than 129,859 emigrants left the colony, more than half of whom were bound for the Straits Settlements, but these were balanced by 130,194 new arrivals. Immigrants from the Canton delta account for 76% of the total population of Hongkong and Kowloon. The industrial element is appreciably growing, especially in Kowloon. The colony is faced with the social problems involved in the new industrialism of the Far East and has to its credit the first factory regulations governing the conduct of industry and the employment of woman and child labour, following the report of a special enquiry in 1921-2. A good deal of pioneer educational work has also been done. In 1924 the total number of children and schools in the colony was 47,933, of whom nearly 15,000 were at English schools. The educational system is crowned by the University of Hongkong, which in the face of serious financial difficulties, offers advanced instruction in most forms of Western science and learning, and, as the only British university in the Far East, makes a wide appeal.

Acquired in the first instance as a defensive base for the China trade, Hongkong has become by the stress of events a vital factor in the strategic geography of the Pacific. As a naturally strong naval base and the focus of British interests in the Far East, its status in any regional agreement concerning the peace of the Pacific is of world-wide significance. One of the most important results of the Washington Conference of 1921-2 was an agreement by the United States, Great Britain and Japan respecting the non-fortification of naval bases in the Pacific, as part of which Great Britain undertook not to develop a first-class naval base at Hongkong. It has been claimed in consequence that its strategic security in case of a naval war will in part depend on the efficiency of Singapore.

(P. M. R.)

HONGKONG AND SHANGHAI BANKING CORPORATION, one of the largest and most influential financial institutions in the Far East, with branches in many of the principal cities in China, Japan, Siam, India, Burma and the Straits Settlements, as well as in London, Lyons, Hamburg, New York and San Francisco. The Bank was founded in Hongkong in 1864, and opened its doors to business simultaneously in Hongkong and Shanghai on April 3, 1865. A year later it was incor-

VICTORIA AND THE SURROUNDING COUNTRY

1. Government Plaza, showing Government House, situated in the second stratum of the city of Victoria. Victoria is built on three levels: the lowest given over to shipping, business and native dwellings; the second largely to government buildings and parks; while the third, on Victoria Peak, is the residential section and summer colony
2. View of Victoria Peak, 1774 feet above the harbour of Hongkong, showing residences built on its slopes. The peak district is especially popular during the hot season, between May and October, when the temperature is many degrees cooler there than in the lower levels of the city
3. View of Victoria, rising in terraces from the waterfront, showing in the background the ridge of steep hills, which at some points is nearly 1800 ft. high
4. Dock hands in Victoria, transporting goods on a street near the waterfront. Hongkong is a shipping centre for goods passing between China and other parts of the world, and the entrepôt for the coastal trade between North and South China
5. "The Bund" or waterfront esplanade of Victoria City
6. Des Voeux Road, running parallel with "The Bund"; one of the principal shopping and business streets of Victoria

porated by a Special Ordinance of the Legislative Council of Hongkong, with a capital of silver \$5,000,000 divided into 40,000 shares of \$125 each.

After 1870 extension was rapid, due to a great extent to the work of the late Sir Thomas Jackson, the chief manager from 1876 to 1902, and the history of the Bank for the past half-century has been one of signal and continuous progress. The capital has been increased on four separate occasions, in 1883, 1890, 1907 and 1921, to its present figure of \$20,000,000.

Apart from its ordinary routine banking operations the Hongkong Bank has from its earliest days enjoyed the confidence of the leading statesmen and financiers of China, and has been responsible for the issue of the principal Government and railway loans. At first without competition, later in association with other British banking houses, and since 1913 as head of the British group in the international Consortium of Banks, the Hongkong and Shanghai Bank has been closely associated with the whole of China's foreign financial transactions. The court of directors and general management remains as from the first in Hongkong. (A. Mon.)

HONITON, a market town and municipal borough in Devonshire, England, situated on the left bank of the Otter, 16½ m. E.N.E. of Exeter by the S.R. Pop. (1921) 3,093. Honiton (*Hone-tona*, *Huneton*) is situated on the British Icknield Street, and was probably the site of an early settlement, but it does not appear in history before the Domesday Survey, when it was a considerable manor, held by Drew (Drogo) under the count of Mortain, who had succeeded Elmer the Saxon, with a subject population of 33, a flock of 80 sheep, a mill and 2 salt-workers. The borough was founded before 1217 by William de Vernon, earl of Devon, whose ancestor Richard de Redvers had received the manor from Henry I. In the 14th century it passed to the Courtenays, and in 1698 Sir William Courtenay was confirmed in the right of holding court leet, view of frankpledge and the nomination of a portreeve, these privileges having been surrendered to James II. The borough was represented by two members in parliament in 1300 and 1311, and then not again till 1640, from which date it returned two members until disfranchised by the act of 1868, the returning officer being the portreeve, who was also the chief magistrate of the borough until its incorporation by charter of 1846. In 1221 Falkes de Breauté, then custodian of the borough, rendered a palfre for holding a three days' fair at the feast of All Saints, transferred in 1247 to the feast of St. Margaret, and still held under that grant. A great market for corn and other produce is still held on Saturday by prescription. The wool manufacture flourished at Honiton in the reign of Henry VII., and it is said to have been the first town at which serges were made, but the industry entirely declined during the 19th century. The lace manufacture was introduced by Flemish refugees, and was flourishing in the reign of Charles I.

The town consists of one wide street, down which a stream of water runs, extending for about 1 m., and crossed at right angles by a lesser street. The restored church of St. Michael, formerly a parish church about ½ m. from the town, was built by Courtenay, bishop of Exeter, about 1482. It retains a carved screen, and the black marble tomb of Queen Elizabeth's physician, Marwood. Allhallows Grammar School, founded in 1614, was enlarged in 1893; St. Margaret's hospital, founded as a lazaret-house in the 14th century, is converted into almshouses. Honiton is famous for its lace industry, established by refugees from Flanders under Queen Elizabeth. The delicate fabric made by hand on the pillow was long in demand; its sale was, however, greatly diminished by the competition of cheaper machine-made goods, and a school of lace-making was opened to promote its recovery. The town possesses breweries, flour-mills, saw-mills and an iron foundry; its trade in butter is considerable.

HONNEF, a town and health resort (in the Prussian Rhine province) situated on the right bank of the Rhine, at the foot of the Siebengebirge, 8 m. above Bonn by the Cologne-Linz railway. Pop. (1925) 8,123. It does a considerable trade in wine. The town is surrounded by vineyards and orchards, and has a mineral spring.

HONOLULU, capital and principal port of Hawaii (*q.v.*), and seat of the city and county of Honolulu, is situated in 21° 19' N., 157° 52' W., on the south coast of Oahu island 2,091 m. S.W. of San Francisco. Pop. (1890) 22,907; (1900) 39,920; (1910) 52,183; (1920) 83,327; (1927) 106,600. The city extends 10 m. along the shore and 4 m. inland across a plain a mile wide and up ridges and valleys to a mountain range 2,000–3,100 ft. high. Near the middle are the modern harbour, business section, civic centre, and, a mile back, the crater Punchbowl (500 ft.); at the east end stands, like a lion couchant, the crater Diamond Head (760 ft.); at the west end are the lower Salt lake craters. With foreground of opalescent waters, middleground of colourful exotic vegetation, background of deeply-cut verdant mountains and a sky of azure, it is reputed one of the most beautiful of cities. Tempered by cool trade breezes, the temperature on the plain is 56°–88° with a mean of 74.6°, while annual rainfall averages 28.6 in., the temperature decreasing and rainfall increasing with altitude. At the cross-roads of trans-Pacific trade routes, arrivals of ocean steamers average three a day. The city is headquarters for a fleet of inter-island steamers. Rural Oahu is reached by railway and concrete and macadam roads. Honolulu is well served by electric railway, light and power, gas, automatic-telephone, water and sewer systems, inter-island and shore-to-ship wireless and trans-Pacific cable and wireless. The civic centre, a spacious park, contains or is bordered by the Federal building, the Territorial capitol (formerly palace), judiciary, office, library, archives and armoury buildings and several fine quasi-public and private buildings. The new Royal Hawaiian hotel at Waikiki beach is notable among other fine buildings. There are many drives, parks and playgrounds, the largest being Kapiolani park, between Waikiki and Diamond Head. Much has been done for beautification, including elimination of bill boards from the island. There is a profusion of introduced plants: monkey-pods, Indian and Chinese banyans, silk, cotton and umbrella trees, Norfolk island pines and Australian ironwoods, numerous palms, variegated coleus and croton shrubs, bougainvillea, bignonia, cup-of-gold and night-blooming-cereus vines, flame trees, shower trees, and the jacaranda, coral and African tulip trees, and over 2,000 varieties of hibiscus; the whole city indeed is a botanical garden. The principal manufactures are pineapple canneries and iron works. There is a chamber of commerce and a stock and bond exchange. Periodicals are published in seven languages. There are numerous civic, scientific, historical, literary, art, dramatic, music, professional, industrial, religious and social welfare organizations. The United Welfare Fund (community chest) contributes \$450,000 annually towards the million-dollar expense of 25 welfare organizations. The principal clubs are the Pacific (oldest west of the Missouri), University, Commercial, Oahu Country, Mid-Pacific Country, Honolulu Hawaii Polo and Racing and Pearl Harbour Yacht. There is an excellent art museum. The Bernice Pauahi Bishop museum, besides having the most extensive Polynesian collections, maintains a large staff of scientists and is now making a scientific survey of the Pacific. Honolulu is a centre for Pan-Pacific conferences, notably those of the Institute of Pacific Relations and the Pacific Science Association, and others under the auspices of the Pan-Pacific Union. Pearl Harbour, with the largest U.S. naval station, is 7 m. west. Schofield Barracks, largest U.S. military post, is 20–25 m. west on a plateau 800–1,000 ft. high. Ft. Shafter, 3 m. west of the civic centre, is military headquarters of the Hawaiian department. Forts Ruger, De Russy, Armstrong and Kamehameha are respectively at Diamond Head, Waikiki and the entrances to Honolulu and Pearl harbours. (W. F. Fr.)

HONORIUS, the name of four popes and one antipope.

1. **HONORIUS I.**, pope from 625 to 638, was of a noble Roman family. He continued the work of Gregory the Great, especially in England; Bede (*Hist. Eccl.* ii. 17) gives a letter of his to King Edwin of Northumbria, in which he admonishes him diligently to study Gregory's writings; and it was at Edwin's request that Honorius conferred the pallium on the bishops of Canterbury and York (*ib.* ii. 18). He also admonished the Irish for not following the custom of the Catholic Church in the celebration of Easter

(ib. ii. 19), and commissioned Birinus to preach Christianity in Wessex (ib. iii. 7). The emperor Heraclius aided him in his difficulties with the schism of the "three chapters" in Istria and Venetia, a schism that was ended by the deposition in 628 of the schismatic patriarch Fortunatus of Aquileia-Grado and the elevation of a Roman sub-deacon to the patriarchate. The support given to him by Constantinople may have influenced Honorius, who joined the patriarchs of Constantinople and Alexandria in supporting the doctrine of "one will" in Christ, and expounded this view forcibly, if somewhat obscurely, in two letters to the patriarch Sergius (Epist. 4 and 5 in Migne, *Patrologia. Ser. Lat.* lxxx. 470, 474). For this he was (October 638) anathematized by name along with the Monothelite heretics by the council of Constantinople (First Trullan) in 681; a condemnation after confirmed by more than one pope, particularly by Leo II. See Hefele, *Die Irrlehre des Honorius u. die vaticanische Lehre der Unfehlbarkeit* (1871), who, however, modified his view in his *Concilien-geschichte* (1877). Honorius I. was succeeded by Severinus.

See the articles by R. Zöpfel and G. Krüger in Herzog-Hauck, *Realencyklopädie* (ed. 1900), and by T. Grisar in Wetzler and Welte's *Kirchenlexikon* (Freiburg, 1889). See also U. Chevalier, *Répertoire des sources hist.*, etc., Bio-bibliographie, s. "Honorius I." (Paris, 1905).

2. HONORIUS II. (d. 1072), antipope, was the name taken by Peter Cadalus, who was born at Verona and became bishop of Parma in 1046. After the death of Nicholas II. in 1061 he was chosen pope by some German and Lombard bishops at Basel in opposition to Alexander II., who had been elected by the Hildebrandine party. The antipope marched on Rome in 1063, and entered the city, but soon took refuge in the castle of St. Angelo. After a war lasting about a year Cadalus fled from Rome. He died in 1072, without having abandoned his claim to the papal chair.

See art. on Honorius II. in Hauck's *Realencyklopädie*, Bd. viii. (1900).

3. HONORIUS II. (Lamberto Scannabecchi), pope from Dec. 15, 1124, to Feb. 13, 1130, a native of Fagnano near Imola, of considerable learning and great religious zeal, successively archdeacon at Bologna, cardinal-priest of Sta. Prassede under Urban II., cardinal-bishop of Ostia and Velletri under Paschal II., shared the exile of Gelasius II. in France, and helped Calixtus II. to conclude the Concordat of Worms (1122), which settled the investiture contest. He was consecrated on Dec. 21, 1124. By means of a close alliance with the Frangipani, he maintained peace at Rome. He recognized the Saxon Lothair III. as king of the Romans and later as emperor, and excommunicated his rival, Conrad of Hohenstaufen. He sanctioned the Praemonstratensian order and that of the Knights Templars. He excommunicated Count William of Normandy for marriage in prohibited degree; brought to an end, through the influence of Bernard of Clairvaux, the struggle with Louis VI. of France; and arranged with Henry I. for the reception of papal legates in England. He laid claim as feudal overlord to the Norman possessions in southern Italy (July 1127), and excommunicated the claimant, Duke Roger of Sicily, but was unable to prevent the foundation of the Neapolitan monarchy, for Duke Roger defeated the papal army and forced recognition in August 1128.

The chief sources for the life of Honorius II. are his "Epistolae et Privilegia," in J. P. Migne, *Patrol. Lat.* vol. 166, and the *Vitae* of Cardinals Pandulf and Boso in J. M. Watterich, *Pontif. Roman. vitae*, vol. 2 (Leipzig, 1862); also "Codice diplomatico e bollario di Onorio II." in Fr. Liverani *opere*, vol. 4 (Macerata, 1859), and Jaffé-Wattenbach, *Regesta pontif. Roman.* (1885-1888).

See J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893); F. Gregorovius, *Rome in the Middle Ages*, vol. 4, trans. by Mrs. G. W. Hamilton (London, 1896); H. H. Milman, *Latin Christianity*, vol. 4 (London, 1899); Fr. Liverani, "Lamberto da Fiagnano" in *Opere*, vol. 3 (Macerata, 1859); A. Wagner, *Die unteritalischen Normannen und das Papsttum 1086-1150* (Breslau, 1885); E. Bernheim, *Zur Geschichte des Wormser Concordats* (Göttingen, 1878); Volkmar, "Das Verhältnis Lothars III. zur Investiturfrage," in *Forschungen zur deutschen Geschichte*, vol. 26.

4. HONORIUS III. (Cencio Savelli), pope from June 18, 1216, to March 18, 1227, a highly-educated and pious Roman, successively canon of Sta. Maria Maggiore, cardinal-deacon of Sta. Lucia in Silice, vice-chancellor, chamberlain and cardinal-priest of Sti. Giovanni e Paolo, was the successor of Innocent III. He made peace with the emperor Frederick II. (q.v.) Honorius was

eager to carry out the decrees of the Lateran Council of 1215 against the Albigenses and to further the crusade proclaimed by his predecessor. He crowned Peter of Courtenay emperor of Byzantium in April 1217; espoused the cause of the young Henry III. of England against the barons; accepted the Isle of Man as a perpetual fief; arbitrated differences between Philip II. of France and James of Aragon; and made special ecclesiastical regulations for the Scandinavian countries. He sanctioned the Dominican order (1216), making St. Dominic papal major-domo in 1218; approved the Franciscan order (1223); and authorized many of the tertiary orders. He was succeeded by Gregory IX.

Honorius III. left many writings which have been collected and published by Abbé Horoy in the *Medii aevi bibliotheca patristica*, vols. i.-ii. (Paris, 1879-1883). Among them are five books of decretals, compiled about 1226; a continuation of the *Liber Pontificalis*; a life of Gregory VII.; a coronation form; and a large number of sermons. His most important work is the *Liber censuum Romanae ecclesiae*, written in 1192 and containing a record of the income of the Roman Church and of its relations with secular authorities. The last named is admirably edited by P. Fabre in *Bibliothèque des écoles françaises d'Athènes et de Rome* (Paris, 1892). The letters of Honorius are in F. Liverani, *Spicilegium Liberianum* (1863). There are good *Regesta* in Latin and Italian, edited by P. Pressutti (Rome, 1888, etc.).

HONORIUS, FLAVIUS (384-423), son of Theodosius I., ascended the throne as "emperor of the West" in 395. During the early part of his reign the West was attacked on all sides by barbarian hordes. Italy was saved by the exertions of Honorius' guardian and father-in-law, the Vandal Stilicho (q.v.), but Gaul was overrun by barbarians (winter 406-407) and in 409 the central Government was forced to abandon Britain. After the murder of Stilicho (408), Italy was again invaded by Alaric, the Visigoths, and in 410 Rome was taken and sacked. Alaric died in the same year, and in 412 Honorius concluded peace with his brother-in-law and successor, Ataulphus (Adolphus), who married the emperor's sister Placidia and removed with his troops to southern Gaul.

A succession of usurpers arose (411-416) in Gaul and Spain, but were overthrown by Honorius' general, Constantius, who was rewarded with a share in the Government (d. 421). It was only as a supporter of the orthodox church and persecutor of the heathen that Honorius displayed any energy. In 399 the exercise of the pagan cult was prohibited, and the revenues of the temples, which were to be appropriated for the use of the public or pulled down, were confiscated to defray the expenses of the army. Honorius was equally severe on heretics, such as the Donatists and Manichaeans. He is also to be credited with the abolition of the gladiatorial shows in 404 (although there is said to be evidence of their existence later), a reduction of the taxes, improvements in criminal law, and the reorganization of the *defensores civitatum*, municipal officers whose duty it was to defend the rights of the people and set forth their grievances. Honorius at first established his court at Milan, but on the report of the invasion of Italy, fled to Ravenna, where he resided till his death on Aug. 27, 423.

See Gibbon, *Decline and Fall*, chs. 28-33; J. B. Bury, *Later Roman Empire*, i. chs. 1-5, 11. chs. 4, 6; E. A. Freeman, "Tyrants of Britain, Gaul and Spain" in *Eng. Hist. Rev.* (Jan. 1886); T. Hodgkin, *Italy and her Invaders* (Oxford, 1892), i. chs. 13, 15-18; E. V. Wiersheim, *Geschichte der Völkerwanderung*, ii. 2. See, *Geschichte des Untergangs der Antiken Welt*. v. vi. For the loss of Britain see Collingwood in *Journ. Roy. Soc.* 12. p. 74 seq.

HONOUR, a term which may be defined as respect, esteem or deference paid to, or received by, a person in consideration of his character, worth or position; also the state or condition of the person exciting the feeling or expression of such esteem; particularly a high personal character coupled with conduct in accordance with a nice sense of what is right and true and due to the position so held. Further, the word is commonly used of the dignities, distinctions or titles, granted as a mark of such esteem or as a reward for services or merit, and quite generally of the credit or renown conferred by a person or thing on the country, town or particular society to which he or it belongs. The standard of conduct may be laid down not only by a sense of what is due to lofty personal character but also by the usages of society, hence it is that debts which cannot be legally enforced, such as gambling debts, are

called "debts of honour." Similarly in the middle ages and later, courts, known as "courts of honour," sat to decide questions such as precedence, disputes as to coat armour, etc. (see CHIVALRY); such courts, chiefly military, are found in countries where duelling has not fallen into desuetude (see DUEL).

In English the word was spelled with or without the *u* indifferently until the 17th century, but during the 18th century it became fashionable to spell the word "honour"; Johnson's and Webster's Dictionaries stereotyped the English and American spellings respectively.

HONOURABLE, a style or title of honour common to the United Kingdom, the British colonies and the United States of America. See FORMS OF ADDRESS.

In the British colonies the title "honourable" is given to members of the executive and legislative bodies, to judges, etc., during their term of service. It is sometimes retained by royal licence after a certain number of years' service.

In the United States of America the title is very widespread, being commonly given to any one who holds or has held any office of importance in state or nation, more particularly to members of Congress or of the state legislatures, judges, justices, and certain other judicial and executive officials. (See also PRECEDENCE.)

HONOURABLE ARTILLERY COMPANY. On Aug. 25, 1537, Henry VIII. granted a Charter of Incorporation to the Guild of Fraternity of Saint George, a Guild of Archers and Handgunmen. The wording of the charter, however, implies that a guild existed before the grant was made and that it was now receiving royal support. As a military formation it is probably the oldest regiment in the world. All kinds of archery being classified as "artillery," this Guild of archers soon became known as the "Artillery Company." (It has, however, had numerous designations.) Under the Charter the government of the Guild was placed in the hands of four Masters or Rulers and they were charged (*inter alia*) with the establishment of a Perpetual Fraternity of Saint George for the general encouragement of the "Science of Artillery for Longe Bowes Crosbowes and Handgonnes, etc." Under Edward III., the chief resort of London archers for practice was in the open spaces at Finsbury and Moorfields, later known as the "Artillery Ground" or "Artillery Garden" and in this neighbourhood the H.A.C. has always had its headquarters, except for the first few years of its existence. During the early years following its incorporation the Company was the training centre for the City of London when necessity demanded an augmentation of the forces, a notable occasion being the year of the Great Armada. On this occasion not only did it train the citizens of London in the science of "small-artillery" but many of its members went to several parts of the kingdom with the rank of officers to train the various Trained Bands.

The system of training inaugurated in London by the Company stimulated the incorporations of other towns to follow their example, notably in the early part of the 17th century. None of these provincial companies have survived but an off-shoot of the old Company still flourishes in the U.S.A. as "The Ancient and Honourable Artillery Company of Boston, Massachusetts," the oldest military body in the New World, whose original title was "The Military Company of Massachusetts." The original members of this American Company were members of the London Company who had migrated in the 16th century. They trained the citizens in the art of war and when the militia came into existence, its officers were drawn from the Company.

The Roll of the Regiment contains the name of one of England's greatest poets, viz., John Milton who was entered on June 2, 1635. His military career was short but no doubt he gained an intimate knowledge of the pike or musket. Charles I. took an interest in the Company and sanctioned the enrolment of the Prince of Wales, then only eleven years old, and his brother, James, Duke of York, as members of the Company. The Elector of Palatine, a grandson of James I., became a member also on the same day—June 1, 1641.

At the outbreak of the Civil War the Company represented the only efficient trained bands in the country and Parliament re-

garded them as a reliable reserve. Of their number the name of Skippon is known to history. Captain Philip Skippon was Captain of the Company in 1639 and became "commander of the forces" with the rank of "Sergeant-Major General" in 1642. He joined the Parliamentary forces and became Chief of the Staff to the Earl of Essex.

In 1660 the Duke of York was elected "commander-in-chief" of the Company, he being the first and last holder of that title. His successor, William III., styled himself "Captain-General" and this title still survives, King George V. being "Captain-General and Colonel" of the Company. In the middle of the 17th century the Company was in great favour at Court and many of the nobility and gentry of the royal household enrolled themselves as members, e.g., Prince Rupert, the Duke of Albemarle, the Earl of Sandwich, Lord Craven, the Dukes of Monmouth, Ormonde, Manchester, Anglesey and Buckingham. Other distinguished members of the Company about this time were, Marlborough, Christopher Wren the architect, Vauban the great French Engineer, William, second Earl of Denbigh, an ancestor of the present Colonel Commandant, and Kirke—the notorious Colonel of "Kirke's Lambs." The Company kept abreast of the times as regards developments in the military art and in 1714 added some grenadiers to the establishment. In 1860 a troop of horse artillery was added but this was disbanded in 1869.

The Company was well represented in the British Expeditionary Force during the South African War 1899–1902 for which it was granted the battle honour "South Africa 1900–02." In 1908 it became a unit of the Territorial Army. During the World War it was greatly expanded and three of its infantry battalions and 7 batteries of artillery fought either in France, Italy, Iraq, Palestine or Aden, battle honours for which are now borne upon its King's Colour. This is the only regiment which has the unique distinction of having battle honours on its King's Colour only.

See G. A. Raikes, *History of the Honourable Artillery Company*; G. Goold Walker, *The Honourable Artillery Company 1547–1926*.

HONTHEIM, JOHANN NIKOLAUS VON (1701–1790), German historian and theologian, was born of noble family on Jan. 27, 1701, at Trier. He was educated at Trier, Louvain and Leyden, and after travelling extensively in Europe, spent three years in Rome, where he was ordained priest in 1728. Returning to Trier as canon, he became a professor at the university in 1732, but six years later went to Coblenz as official to the archbishop-elect. In 1747, broken down by overwork, he retired to St. Simeon's at Trier, and in May 1748 was appointed auxiliary bishop and vicar-general. He was consecrated at Mainz, in Feb. 1749, under the title of bishop of Myriophori *in partibus*. The archbishop of Trier was practically a great secular prince, and upon Hontheim fell the whole spiritual administration of the diocese; this work, in addition to that of pro-chancellor of the university, he carried on single-handed until 1778. Hontheim died on Sept. 2, 1790, at his château at Montquentin near Orval.

As a historian his reputation rests on his *Historia Trevirensis diplomatica et pragmatica* (3 vols., 1750), and his *Prodromus historiae trevirensis* (2 vols., 1757). The *Historiae scriptorum et monumentarum Trevirensis amplissima collectio*, remains in ms. at the city library of Trier. It is, however, as "Febronius" that Hontheim is best remembered. The character of his book on "the state of the church and the lawful power of the Roman pontiff" is described elsewhere (see FEBRONIANISM). The author of the book was known at Rome almost as soon as it was published; but it was not till some years afterwards (1778) that he was called on to retract. The removal of the censure followed (1781) when Hontheim published at Frankfurt his *Justini Febronii acti commentarius in suam retractationem*, etc.

See O. Mejer, *Febronius, Weihbischof Johann Nikolaus von Hontheim und sein Widerruf* (Tübingen, 1880), and article in *Allgemeine deutsche Biographie* (1881).

HONTHORST, GERARD VAN (1590–1656), Dutch painter, born at Utrecht on Nov. 4, 1590, was brought up in the school of Bloemart. He then went to Italy, where he copied the naturalism and eccentricities of Michelangelo da Caravaggio.

Home again in 1622, he entered the Guild of St. Luke, becoming dean in 1625-26-28 and 1629. The queen of Bohemia, sister of Charles I. and electress palatine, being an exile in Holland, asked him to teach her children drawing; and Honthorst, thus approved, was invited by Charles I. to England. There he painted several portraits, and a vast allegory, now at Hampton Court, of the king and queen of Bohemia as Diana and Apollo in the clouds receiving the duke of Buckingham as Mercury and guardian of the king of Bohemia's children. In his home at Utrecht Honthorst finished, in 1631, a large picture of the king and queen of Bohemia "and all their children." For Lord Dorchester about the same period he completed some illustrations of the *Odyssey*; for the king of Denmark he composed incidents of Danish history, of which one example remains in the gallery of Copenhagen. In 1637 he settled at The Hague, and became court painter (1641).

His most attractive pieces are those in which he cultivates the style of Caravaggio, those, namely, which represent taverns, with players, singers and eaters. He shows great skill in reproducing scenes illuminated by candlelight (*e.g.*, Christ before Pilate in the National Gallery, London), and he liked to transmute every subject into a night scene. He died on April 27, 1656.

HOOCH, PIETER DE (hōch) (1629-after 1683), Dutch painter, born in Rotterdam, and a pupil of N. Berchem at Haarlem. From 1653 he was in the service of Justus de Grange, and lived at Delft, The Hague and Leyden. In 1654 he married a girl of Delft, Jannetje van der Burch. From 1654 to 1657 he was a member of the painter's guild of Delft, but after that date we have no traces of his doings until about 1667, when his presence is recorded in Amsterdam. His dated pictures prove that he was still alive in 1683. His work shows affinity with the painting of Vermeer, who was a pupil of Carel Fabritius and who was living at Delft at the same period as De Hooch. De Hooch only once painted a canvas of large size, and that unfortunately perished in a fire at Rotterdam in 1864. But his small pieces display perfect finish combined with great power of discrimination. Though he sometimes paints open-air scenes, these are not his favourite subjects. He is most at home in interiors illuminated by different lights, with the radiance of the day, in different intensities, seen through doors and windows. He thus brings together the most delicate varieties of tone. Sometimes he chooses the drawing-room where dames and cavaliers dance, or dine, or sing; sometimes—mostly indeed—he prefers cottages or courtyards, where the housewives tend their children or superintend the labours of the cook. Satin and gold are as familiar to him as camlet and fur; and there is no article of furniture in a Dutch house of the middle class that he does not paint with pleasure.

It is possible to bring together over 320 examples of De Hooch. There are three at Leningrad, three in Buckingham Palace, six in the National Gallery, London, two in the Wallace Collection, six in the Amsterdam museum, some in the Louvre and at Munich and Darmstadt and New York; many others are in private galleries.

See Hoistede de Groot's *Catalogue raisonné* (1907).

HOOD, HORACE LAMBERT ALEXANDER (1870-1916), British naval officer, was born in London on Oct. 2, 1870, the third son of the 4th viscount Hood and a lineal descendant of the 1st viscount, Adml. Sir Samuel Hood (*q.v.*). He entered the navy in 1883, saw service on the Nile (1897-98), and in the Somaliland expedition (1903-4). After serving a year as naval attaché at Washington, he commanded the naval college at Osborne from Oct. 1910 to Jan. 1913. He commanded a squadron of battle cruisers in the battle of Jutland (May 31, 1916), and went down on his flagship "Invincible."

See J. S. Corbett (Official) *History of the Great War. Naval operations* (vol. iii., 1923).

HOOD, JOHN BELL (1831-1879), American soldier, lieutenant-general of the Confederate army, was born at Owingsville, Ky., in 1831, and graduated at West Point Military Academy in 1853. As a cavalry officer he saw service against Indians, and later he was cavalry instructor at West Point. He resigned from the U.S. service in 1861, and became a colonel in the Confederate army. He was soon promoted brigadier-general, and with the famous

"Texas brigade" of the Army of Northern Virginia he served throughout the campaign of 1862. At Gettysburg he commanded one of the divisions of Longstreet's corps, receiving a wound which disabled his arm. With Longstreet he was transferred in the autumn of 1863 to the Army of Tennessee. At the battle of Chickamauga (Sept. 19-20) Hood was severely wounded again and his leg was amputated. He remained with the Army of Tennessee as a corps commander, and when the general dissatisfaction with the Fabian policy of Gen. J. E. Johnston brought about the removal of that officer, Hood was put in his place. He had won a great reputation as a fighting general, and it was with the distinct understanding that battles were to be fought that he was placed at the head of the Army of Tennessee. But in spite of skill and courage he was uniformly unsuccessful in the battles around Atlanta. In the end he had to abandon the place, but he forthwith sought to attack Sherman in another direction, and finally invaded Tennessee. His march was pushed with the greatest energy, but he failed to draw the main body of the enemy after him, and, while Sherman with a picked force made his "March to the Sea," Thomas collected an army to oppose Hood. A severe battle was fought at Franklin on Nov. 30, 1864, and finally Hood was defeated and his army almost annihilated in the battle of Nashville on Dec. 15-16, 1864. He was then relieved at his own request (Jan. 23, 1865). After the war he engaged in business in New Orleans, where he died of yellow fever on Aug. 30, 1879. His experiences in the Civil War are narrated in his *Advance and Retreat* (New Orleans, 1880).

See Ida Richardson Hood, "In Memory of General J. B. Hood," in *Southern Hist. Soc. Papers*, vol. xxxii., p. 151-156 (1904).

HOOD, SAMUEL HOOD, VISCOUNT (1724-1816), British admiral, was the son of Samuel Hood, vicar of Butleigh, Somerset, and prebendary of Wells. He was born on Dec. 12, 1724, and entered the navy on May 6, 1741. He served part of his time as midshipman with Rodney in the "Ludlow Castle," and became lieutenant in 1746. In 1754 he was made commander of the "Jamaica" sloop, and served in her on the North American station, where in 1756, he was posted to the "Lively." He returned to England later in the year in the "Grafton" to which he had been appointed by Commodore Charles Holmes. In 1757, while in temporary command of the "Antelope" (50 guns), he drove a French ship ashore in Audierne Bay, and took two privateers. In recognition of his services he was given command of the frigate "Bideford." In 1759, when captain of the "Vestal" (32), he captured the French "Bellona" (32) after a sharp action off Cape Finisterre. During the war his services were wholly in the Channel, and he was engaged under Rodney in 1759 in destroying the transports collected by the French for the proposed invasion of England. In 1760 he was sent by his own request to the Mediterranean. In 1778, after further service in North America, he became commissioner of the dockyard at Portsmouth and governor of the Naval Academy; and in 1780 was promoted rear-admiral and was sent to the West Indies as second in command under Rodney.

Hood joined Rodney in Jan. 1781, and remained in the West Indies or on the coast of North America till the close of the War of American Independence. The unfortunate turn taken by the campaign of 1781 was largely due to Rodney's neglect of his advice. If he had been allowed to choose his own position there can be no doubt that he could have prevented de Grasse from reaching Fort Royal with the reinforcements from France in April (*see* RODNEY, LORD). When the fleet went on to the coast of North America during the hurricane months of 1781 he was sent to serve with Admiral Graves in the unsuccessful effort to relieve the army at Yorktown. When he returned to the West Indies he was for a time in independent command owing to Rodney's absence in England and the British islands of St. Kitts and Nevis were attacked by the French admiral, the Comte de Grasse, with a much superior force to Hood's squadron. Hood's attempt to save it from capture, Jan. 1782, with 22 ships to 29, failed, but the bold movements by which he first turned the French out of their anchorage at the Basse Terre of St. Kitts, and then beat off the attacks of the enemy, were the most brilliant things done by

any British admiral during the war. He was made an Irish peer for his share in the defeat of de Grasse on April 9 and 12 near Dominica.

On the outbreak of the revolutionary war Hood was sent to the Mediterranean as commander-in-chief. His period of command (May 1793–Oct. 1794), was very active. In Aug. he occupied Toulon on the invitation of the French royalists, and in co-operation with the Spaniards. In Dec. of the same year the allies, who did not work harmoniously together, were driven out, mainly by the generalship of Napoleon, and Hood now occupied Corsica, which he had been invited to take in the name of the king of England by Paoli. Meanwhile the French at Toulon had recovered sufficiently to send a fleet to sea. In June Hood sailed in the hope of bringing it to action. The plan which he laid to attack it in the Golfe Jouan in June may possibly have served to some extent as an inspiration, if not as a model, to Nelson for the battle of the Nile, but the wind was unfavourable, and the attack could not be carried out. In Oct. Hood, who was now full admiral, was recalled to England. He held no further command at sea, but in 1796 he was named governor of Greenwich Hospital, a post which he held till his death on Jan. 27, 1816. A peerage of Great Britain was conferred on his wife as Baroness Hood of Catherington in 1795, and he was himself created Viscount Hood of Whitley in 1796. The titles descended to his only son, Henry (1753–1836), the ancestor of the present Viscount Hood. There are several portraits of Lord Hood by Abbot in the Guildhall and in the National Portrait Gallery. He was also painted by Reynolds and Gainsborough.

BIBLIOGRAPHY.—There is no good life of Lord Hood, but a biographical notice of him by M'Arthur, his secretary during the Mediterranean command, is in the *Naval Chronicle*, vol. ii. Charnock's *Biogr. Nav.* vi., Ralfe, *Nav. Biog.* i., may also be consulted. His correspondence during his command in America has been published by the Navy Record Society.

HOOD, SIR SAMUEL (1762–1814), British vice-admiral, cousin of Lord Hood and of Lord Bridport, entered the Navy in 1776. His first engagement was the battle off Ushant in 1778, and he was present in the West Indies, under the command of his cousin Sir Samuel Hood, at all the actions which culminated in Rodney's victory of April 12, 1782. After the peace, he spent some time in France, and on his return was given the command of a sloop, from which he proceeded in succession to various frigates. Early in 1793 the "Juno" went to the Mediterranean, and Hood distinguished himself by an audacious feat of seamanship in extricating his vessel from the harbour of Toulon, which he had entered in ignorance of Lord Hood's withdrawal. Soon afterwards he was put in command of a frigate squadron for the protection of Levantine commerce, and in 1797 was given the "Zealous" (74 guns), being present at Nelson's unsuccessful attack on Santa Cruz. He conducted the negotiations which relieved the squadron from the consequences of its failure. At the battle of the Nile the "Zealous" put her first opponent out of action in twelve minutes, and Hood immediately engaged other ships, the "Guerrier" being left powerless. When Nelson left Egypt Hood commanded the blockading force off Alexandria and Rosetta. Later he rejoined Nelson on the coast of the two Sicilies.

In the "Venerable" Hood was present at the action of Algeciras, and the battle in the Straits of Gibraltar (1801) when his ship suffered heavily. A year later Captain Hood was employed in Trinidad as a commissioner, and, upon the death of the flag officer commanding the Leeward station, succeeded him as Commodore. Island after island fell to him, and soon, outside Martinique, the French had scarcely a foothold in the West Indies. In command next of the squadron blockading Rochefort, Hood had a sharp action on Sept. 25, 1805, with a small French squadron which was trying to escape. On this occasion he lost an arm. Promoted rear-admiral, Hood brought the operations against Madeira to a successful conclusion (1807) and a year later took part, in the "Centaur," in the war between Russia and Sweden. Present in the roads of Corunna at the re-embarkation of the army of Sir John Moore, Hood thence returned to the Mediterranean, where for two years he commanded a division of the British fleet. In 1811 he became vice-admiral. He died at Madras, Dec. 24, 1814.

See *Naval Chronicle*, xvii. 1 (the material was furnished by Hood himself; it does not go beyond 1806).

HOOD, ALEXANDER (1758–1798), brother of Admiral Sir Samuel Hood, entered the Navy in 1767, and accompanied Captain Cook in his second voyage round the world. Under Howe and Rodney he distinguished himself in the West Indies, and at the victory of April 12, 1782, was in command of one of Rodney's frigates. Under Sir Samuel Hood he then proceeded to the Mona passage, where he captured the French corvette "Cérés." It was not until 1797 that he went afloat again. His first experience was bitter; his ship, the "Mars," was unenviably prominent in the mutiny at Spithead. On April 21, 1798, occurred the famous duel of the "Mars" with the "Hercule," fought in the dusk near the Bec du Raz, in which, though successful, Hood lost his life.

See *Naval Chronicle*, vi. 175; Ralfe, *Naval Biographies*, iv. 48; James, *Naval History*, and Chevalier, *Hist. de la marine française sous la première république*.

HOOD, THOMAS (1799–1845), British humorist and poet, the son of Thomas Hood, bookseller, was born in London on May 23, 1799. On the death of her husband in 1811 Mrs. Hood removed to Islington, where Thomas Hood had a schoolmaster who appreciated his talents. The boy earned a few guineas—his first literary fee—by revising for the press a new edition of *Paul and Virginia*. After a short period in a counting-house, where the confinement threatened his health, he was transferred to the care of his father's relations at Dundee. On his return to London in 1818 he learned engraving, in which he acquired a skill that enabled him to illustrate his own works.

In 1821 he became sub-editor of the *London Magazine*, and thus came into contact with Charles Lamb, Cary, de Quincey, Allan Cunningham, Proctor, Talfourd, Hartley Coleridge, the peasant-poet Clare and other contributors to the magazine. He had married in 1825, and *Odes and Addresses*—his first work—was written in conjunction with his brother-in-law J. H. Reynolds, the friend of Keats. *The Plea of the Midsummer Fairies* (1827), a book of verse written under the strong influence of Keats, and a dramatic romance, *Lamia*, published later, belong to this time. But reputation came to him not from his serious verse, but from the series of the *Comic Annual*, dating from 1830, which Hood undertook and continued, almost unassisted, for several years. He treated current events in a fine spirit of caricature, entirely free from grossness and vulgarity, without a trait of personal malice, and with an undercurrent of true sympathy and honest purpose that gives these papers, like the sketches of Hogarth, a permanent value. Hood was an inveterate punster, and annoyed his more serious readers by his excesses in this direction. He defended himself in the couplet:

However critics may take offence,
A double meaning has double sense.

In another annual called the *Gem* appeared the poem on the story of "Eugene Aram," which first showed his full poetical power. Hood started a magazine in his own name, and conducted this work from a sick-bed. To this period belong those poems, too few in number, but immortal in the English language, such as the "Song of the Shirt" (which appeared anonymously in the Christmas number of *Punch*, 1843), the "Bridge of Sighs" and the "Song of the Labourer," which pictured in moving verse the appalling condition of the industrial worker of his day.

Hood was associated with the *Athenaeum*, started in 1828 by J. Silk Buckingham, and he was a regular contributor for the rest of his life. Prolonged illness brought on straitened circumstances; and Sir Robert Peel allotted to him a small pension from the civil list, which was continued to his wife and family after his death on May 3, 1845. When nine years later Lord Houghton unveiled a monument to the poet at Kensal Green, many working-men and women came to do honour to the writer whose best efforts had been dedicated to the cause and the sufferings of the workers of the world.

BIBLIOGRAPHY.—The list of Hood's separately published works is as follows: *Odes and Addresses to Great People* (1825); *Whims and Oddities* (two series, 1826 and 1827); *The Plea of the Midsummer Fairies, Hero and Leander, Lycus the Centaur and other Poems* (1827), his only collection of serious verse; *The Dream of Eugene Aram, the*

Murderer (1831); *Tynney Hall*, a novel (3 vols., 1834); *The Comic Annual* (1830-42); *Hood's Own; or, Laughter from Year to Year* (1838, second series, 1861); *Up the Rhine* (1840); *Hood's Magazine and Comic Miscellany* (1844-48); *National Tales* (2 vols., 1837), a collection of short novelettes; *Whimsicalities* (1844), with illustrations from Leech's designs; and many contributions to contemporary periodicals.

The chief sources of his biography are: *Memorials of Thomas Hood, collected, arranged and edited by his daughter* (1860); his "Literary Reminiscences" in *Hood's Own*; Alexander Elliot, *Hood in Scotland* (1885). See also the memoir of Hood's friend C. W. Dilke, by his grandson Sir Charles Dilke, prefixed to *Papers of a Critic*; and M. H. Spielmann's *History of Punch*. There is an excellent edition of the *Poems of Thomas Hood* (2 vols., 1897), with a biographical introduction of great interest by Alfred Ainger.

HOOD, TOM (1835-1874), English humorist, son of the poet Thomas Hood, was born at Lake House, Wanstead, Essex. After some years of journalism and five years at the War Office he became, in 1865, editor of *Fun*. In 1867 he first issued *Tom Hood's Comic Annual*. He died on Nov. 20, 1874.

See a memoir by his sister, F. F. Broderip, prefixed to his *Poems* (1877).

HOOD, MOUNT, a peak of the Cascade range in Clackamas and Hood River counties, Oregon, about 50 m. E. of Portland. It is an extinct volcanic cone of great symmetrical beauty rising to a height of 11,253 ft. above sea-level, the highest point in the State. The peak was built upon the comparatively level back of the range, which is about 4,000 ft., by successive volcanic eruptions. The summit is a part of the rim of the ancient crater; steam jets and fumaroles still exist about Crater Rock. Its crest, clad in perpetual ice and snow, gives rise to eight glaciers which extend down its sides to an elevation of about 6,000 ft. above the sea. Mt. Hood was first discovered in 1792 by a member of Vancouver's exploring expedition and was named in honour of Rear Admiral Samuel Hood of the British admiralty. The first successful ascent was made on Aug. 4, 1854, from the south side, by a party under Captain Barlow, builder of the pioneer road to Oregon. It is now more frequently climbed than any other snow-peak in America.

See J. H. Williams, *The Guardians of the Columbia*; *Mt. Hood, Mt. Adams and Mt. Helens* (1912).

HOOD, a covering for the head. Some form of hood as a loose covering easily drawn on or off the head has formed a natural part of outdoor costume both for men and women at all times and in all quarters of the globe where climatic conditions called for it. In the middle ages and later both men and women wore it, but with men it tended to be superseded by the hat before it became merely an occasional and additional head-covering in time of bad weather. For illustrations and examples of the hood as worn by men and women in mediaeval and later times see *DRESS*; for the hood or cowl as part of the dress of a religious see *COWL*, and as forming a distinctive mark of degree in academic costume see *ROBES*. The word is applied to many objects resembling a hood in function or shape, such as a folding cover for a carriage to protect the occupants from rain or wind, the belled covering for the head of a hawk trained for falconry, the endmost planks in a ship's bottom at bow or stern, and, in botany and zoology, certain parts of a flower or of the neck of an animal, which in arrangement of structure or of colour, recall this article of dress.

HOOD MOULD, in architecture, a moulding projecting from the face of the wall, immediately above an arch or opening whose curvature or outline it follows. It originated in the Romanesque period (see *BYZANTINE AND ROMANESQUE ARCHITECTURE*) as a protection to the mouldings below and to throw water away from the opening, and was later developed into an important decorative feature. It is almost universal over exterior arches in the Gothic work (see *GOTHIC ARCHITECTURE*) of France, Germany and Spain; in England it was, furthermore, common in interior work, especially in nave arcades. In profile, the hood mould has, usually, a downward sloping upper surface, and a hollow below to act as a drip (*q.v.*); at its lower end, near the spring of the arch, it is either received upon the capital of a column or ends in a projecting, carved, ornamented boss (see *LABEL*).

HOOD OF AVALON, ARTHUR WILLIAM ACLAND HOOD, BARON (1824-1901), English admiral, born on July 14, 1824, younger son of Sir Alexander Hood of St. Andries, Somerset, 2nd baronet, and grandson of Captain Alexander Hood. While still a boy Hood entered the navy (1836) and saw active service on the north coast of Spain, and on the coast of Syria. On Nov. 27, 1854 Hood was promoted to be commander in recognition of his service with the naval brigade before Sebastopol. In 1856 he commissioned the "Acorn" brig for the China station, and took part in the capture of Canton in Dec. 1857, for which, in Feb. 1858, he received a post-captain's commission. From 1862 to 1866 he commanded the "Pylades" on the North American station, and was then appointed to the command of the "Excellent" and the government of the Royal Naval college at Portsmouth. On the expiration of three years Hood was made director of naval ordnance. In June 1874 he commanded the "Monarch" in the Channel Fleet, and in March 1876 was promoted to flag rank. From 1880 to 1882 he commanded the Channel Fleet, becoming vice-admiral on July 23, 1880. In June 1885 he was appointed first sea lord of the Admiralty. The intense conservatism of his character, and his antagonistic attitude towards every change, helped to account for the alarming state of the navy on his resignation in 1889. He died on Nov. 15, 1901, and was buried at Butleigh on the 23rd. In Feb. 1892 he had been raised to the peerage as Lord Hood of Avalon, but on his death the title became extinct.

HOOD RIVER, a city of northern Oregon, U.S.A., on the Columbia river, at the mouth of Hood river; the county seat of Hood River county. It is on the Columbia River highway, and is served by the Mount Hood and the Union Pacific railways. The population in 1928 was about 3,500. The city has a marvelously beautiful location, on the south bank of the river, with Mount Hood 26m. away to the south-west and Mount Adams 40m. north. It is a shipping point for lumber and for the famous apples and other fruit grown in the valley; and has saw-mills, cider factories, vinegar works and other industries. The city was settled about 1882, and was incorporated in 1895.

HOOFT, PIETER CORNELISSEN (1581-1647), Dutch poet and historian, was born at Amsterdam on March 16, 1581. His father was for some time burgomaster of Amsterdam. As early as 1598 the young man was made a member of the chamber of rhetoric *In Liefde bloeiende*, and produced before that body his tragedy of *Achilles and Polyxena*, not printed until 1614. In June 1598 he left Holland and proceeded to Paris, Venice, Florence and Rome, and in 1600 to Naples. During his Italian sojourn he made a deep and fruitful study of the best literature of Italy. He returned through Germany, reaching Amsterdam in May 1601. In 1602 he brought out his second tragedy, *Theseus and Ariadne* (pr. 1614). In 1605 he completed his beautiful pastoral drama *Granida* (pr. 1615). Hooft produced three other plays: *Geeraerd van Velzen* (1612, pr. 1613); *Ware-nar* (1614, pr. 1617), adapted from the *Aulularia* of Plautus; and *Baeto* (1616, pr. 1626). He studied law and history at Leyden from 1606 to 1609, and in June of the latter year received from Prince Maurice of Orange the appointment of steward of Muiden, bailiff of Gooiland and lord of Weesp, a joint office of great emolument. He repaired and adorned the decayed castle of Muiden, where he lived for the rest of his life. There he entertained the poet Vondel, the scholar Barlaeus, Constantin Huygens, Vossius, Laurens Reael and others.

In 1618 he abandoned poetry for history. His prose works are *History of Henry the Great* (Henry IV. of France) (1626); *Miseries of the Princes of the House of Medici* (Amsterdam, 1638); a *Dutch History* (in 20 books, 1642), embracing the period from 1555 to 1585, a magnificent performance, to the perfecting of which he had given 15 years of labour. The seven concluding books were published posthumously in 1654. Hooft died on a visit to The Hague, on May 21, 1647, and was buried in the New Church at Amsterdam.

Hooft is one of the most brilliant figures that adorn Dutch literature at its best period. He was the first writer to introduce a modern and European tone into *belles lettres*, and the first to

refresh the sources of native thought from the springs of antique and Renaissance poetry. His lyrics and his pastoral of *Granida* are strongly marked by the influence of Tasso and Sannazaro; his later tragedies belong more exactly to the familiar tone of his native country. But high as Hooft stands among the Dutch poets, he stands higher—he holds perhaps the highest place—among writers of Dutch prose. His historical style has won the warmest eulogy, and his letters are the most charming ever published in the Dutch language.

Hooft's poetical and dramatic works were collected in 2 vols. (1871, 1875) by P. Leendertz. His letters were edited by B. Huydecoper (Leyden, 1738) and by van Vloten (Leyden, 4 vols., 1855). The best original account of Hooft is given by G. Brandt in his *Leven van P.C. Hooft* (1677), and his funeral address (1647), edited together by J. C. Matthes (Groningen, 1874). There is an account of the Muiden circle in Edmund Gosse's *Northern Studies* (1879). See also P. Prinsen, *P. C. Hooft* (1922).

HOOGHLY or **HUGLI**, a town and district of British India, in the Burdwan division of Bengal. The town, situated on the right bank of the Hooghly river, 24 m. above Calcutta by rail, forms one municipality with Chinsura (*q.v.*). Pop. (1921) 29,938. The principal buildings are the Hooghly college (at Chinsura) and a handsome *imambara*. In the suburb of Bandel are a Portuguese church, built in 1660, and a monastery formerly occupied by Augustinians.

The DISTRICT, area of 1,188 sq.m. and a population of 1,080,142, is flat, with a gradual ascent to the north and north-west. The scenery along the Hooghly (outside the towns) has a quiet beauty of its own, presenting the appearance of a series of orchards and gardens, villages and temples interspersed with factories. Baidyabati, Champdani, Bhadreswar, Serampore and Rishria-Konnagore are all mill-towns on the bank of the river. The principal rivers, besides the Hooghly, are the Damodar and the Rupnarayan. As in other deltaic districts, the highest land lies nearest the rivers, and the lowest levels are found midway between two streams. There are in consequence considerable marshes; there are drainage works for the Dankuni marshes, which extend over 27 sq. miles. Rice and jute are the principal crops; a small area is irrigated from the Eden canal. The manufacture of jute gives employment to over 50,000 persons.

HOOGHLY or **HUGLI**, the most westerly and commercially the most important channel by which the Ganges enters the Bay of Bengal. It takes its distinctive name near the town of Santipur, about 120 m. from the sea. The stream now known as the Hooghly represents three western deltaic distributaries of the Ganges—viz., (1) the Bhagirathi, (2) the Jalangi and (3) part of the Matabhanga. The Bhagirathi and Jalangi unite at Nadia, above the point of their junction with the lower waters of the Matabhanga, which has taken the name of the Churni before the point of junction and thrown out new distributaries of its own. These three western distributaries are known as the Nadia rivers, and are the head waters of the Hooghly. Like other deltaic distributaries, they are subject to sudden changes and to silting up. The keeping open of the Nadia rivers, therefore, forms one of the great tasks of engineering in Bengal. Proceeding south from Santipur, with a twist to the east, the Hooghly river divides Nadia from Hooghly district, until it touches the district of the Twenty-four Parganas. It then proceeds almost due south to Calcutta, next twists to the south-west and finally turns south, entering the Bay of Bengal in 21° 41' N., 88° E.

In the 40 miles of its course above Calcutta, the channels of the Hooghly are under no supervision, and they have silted up and shifted, yet it was upon this upper section that all the famous ports of Bengal lay in olden times. From Calcutta to the sea (about 90 m.) the river is a record of engineering improvement and success. A minute supervision, with steady dredging and constant readjustment of buoys, keeps it a safe waterway for ships of the largest tonnage, and since 1915 65 m. of the lower reaches have been lighted. Much attention has also been paid to the port of Calcutta (*q.v.*).

HOOGSTRATEN, SAMUEL DIRKSZ VAN (1627–1678), Dutch painter, was born at Dordrecht on Aug. 2, 1627, and died there on Oct. 19, 1678. He studied first with his father,

and then, from about 1642 onwards, in the school of Rembrandt. He then travelled as a master and a portrait painter, visiting, among other cities, Vienna (1651) and Rome. He was in London in 1662. He married (1656) at Dordrecht, where he became (1671) provost of the mint. Hoogstraten's works are scarce; but a sufficient number of them has been preserved to show that he strove to imitate different styles at different times. In a portrait dated 1645 in the Lichtenstein collection at Vienna he imitates Rembrandt; and he continues in this vein as late as 1653, when he produced that wonderful figure of a Jew looking out of a casement (Vienna Museum).

HOOK, JAMES CLARKE (1819–1907), English painter, was born in London on Nov. 21, 1819. He worked for a year, in the sculpture galleries of the British Museum, and in 1836 he was admitted a student of the Royal Academy, where he worked for three years. He exhibited for the first time in 1839. The travelling studentship in painting was awarded to him for "Rizpah watching the Dead Sons of Saul" in 1846; and he went for three years to Italy. Hook passed through Paris, worked diligently for some time in the Louvre, traversed Switzerland, and, though he stayed only part of three years in Italy, gained much from studies of Titian, Tintoret, Carpaccio, Mansueti and other Venetians. On his return home with a series of Venetian subject pictures he became A.R.A. He then went to live in Surrey and in 1853 visited Clovelly. He turned from the anecdotic picture to a series of land and sea studies, some admirable examples of which are in the Tate gallery. Hook died at Churt, Surrey, on April 14, 1907. He had been R.A. since 1860.

See A. H. Palmer, "J. C. Hook, R.A.," *Portfolio* (1888); F. G. Stephens, "J. C. Hook, Royal Academician: His Life and Work," *Art Annual* (1888); P. G. Hamerton, *Etching and Etchers* (1877); Allan J. Hook, *Life of J. C. H., R.A., Pt. I. 1819–60* (priv. pr., 1929).

HOOK, THEODORE EDWARD (1788–1841), English author, was born in London, spent a year at Harrow and subsequently matriculated at Oxford, though he never resided at the university. His father, James Hook (1746–1827), the composer of numerous popular songs, took great delight in exhibiting the boy's extraordinary musical and metrical gifts, and the precocious Theodore became "the little pet lion of the green room." At the age of 16, in conjunction with his father, he scored a dramatic success with *The Soldier's Return*, a comic opera, rapidly followed up by a series of over a dozen sparkling ventures, the instant popularity of which was hardly dependent on the inimitable acting of John Liston and Charles Mathews. Hook gave up some ten of the best years of his life to the pleasures of the town, winning a foremost place in the world of fashion by his matchless powers of improvisation and mimicry, and startling the public by the audacity of his practical jokes. His unique gift of improvisation eventually charmed the prince regent into a declaration that "something must be done for Hook," and Hook was appointed accountant-general and treasurer of the Mauritius with a salary of £2,000 a year. For five delightful years he was the life and soul of the island, but in 1817 he was arrested and brought to England on a criminal charge. A sum of about £12,000 had been abstracted by a deputy official, and for this amount Hook was held responsible.

During the tardy scrutiny of the audit board he lived obscurely and maintained himself by writing for magazines and newspapers. In 1820 he launched the newspaper *John Bull*, the champion of high Toryism and the virulent detractor of Queen Caroline. Witty, incisive criticism and pitiless invective secured it a large circulation. He was arrested for the second time on account of his debt to the State, which he made no effort to defray. In a sponging-house, where he was confined for two years, he wrote the nine volumes of stories afterwards collected under the title of *Sayings and Doings* (1826–29). In the remaining 23 years of his life he poured forth no fewer than 38 volumes, besides numberless articles, squibs and sketches. The best of his many racy novels are *Maxwell* (1830), *Love and Pride* (1833), the autobiographic *Gilbert Gurney* (1836), *Jack Brag* (1837), *Gurney Married* (1838), and *Peregrine Bunce* (1842). He died on Aug. 24, 1841.

See the Rev. R. H. D. Barham, *Life and Remains of Hook* (3rd ed.,

1877); and an article by J. G. Lockhart in the *Quarterly Review* (May 1843).

HOOKAH, a pipe with a long flexible tube attached to a large bowl containing water, often scented, and resting upon its own base. (Arabic *huqqah*, a vase or casket.) The smoke of the tobacco is made to pass through the water in the bowl, and is thus cooled before reaching the smoker. The *narghile* of India is in principle the same as that of the hookah; the word is derived from *nargil*, the coconut tree, as the water was at first placed in a coconut. The receptacle is now often made of porcelain, glass or metal. This pipe is common in India, Egypt and the East generally.

HOOKE, ROBERT (1635–1703), English experimental physicist, was born on July 18, 1635, at Freshwater, in the Isle of Wight. After 1655 he was employed and patronized by the Hon. Robert Boyle, who turned his skill to account in the construction of his air-pump. On Nov. 12, 1662 he was appointed curator of experiments to the Royal Society, of which he was elected a fellow in 1663, and filled the office during the remainder of his life. In 1665 he was appointed professor of geometry in Gresham college. He was secretary to the Royal Society between 1677 and 1683, publishing in 1681–82 the papers read before that body under the title of *Philosophical Collections*. Degrees and other marks of public respect were conferred on Hooke. He died on Mar. 3, 1703, in London.

Hooke's scientific achievements would probably have been more striking if they had been less varied. He originated much, but perfected little. His optical investigations led him to adopt in an imperfect form the undulatory theory of light. He was the first to state clearly that the motions of the heavenly bodies must be regarded as a mechanical problem, and he approached in a remarkable manner the discovery of universal gravitation. He invented the wheel barometer, discussed the application of barometrical indications to meteorological forecasting, and originated the idea of using the pendulum as a measure of gravity. He is credited with the invention of the anchor escapement for clocks, and also with the application of spiral springs to the balances of watches, together with the explanation of their action by the principle *Ut tensio sic vis* (1676). Hooke had an irritable temper, his habits were penurious and solitary. He made many virulent attacks on Newton and other men of science claiming that work published by them was due to him.

His principal writings are *Micrographia* (1664); *Lectiones Cutlerianae* (1674–79); and *Posthumous Works*, containing a sketch of his "Philosophical Algebra," published by R. Waller in 1705.

HOOKER, JOSEPH (1814–1879), American general, was born in Hadley (Mass.), on Nov. 13, 1814. He was educated at the military academy at West Point (1833–37), and entered the 1st United States artillery. In the war with Mexico (1846–48) he served as a staff officer, and rose to the rank of lieutenant-colonel. In 1853 he left the service and bought a large farm near Sonoma (Calif.). At the beginning of the Civil War he sacrificed his estate and offered his sword to the Federal Government. He was commissioned brigadier-general of volunteers, and major-general on May 5, 1862. In the engagement of Williamsburg (May 5) he received the sobriquet of "Fighting Joe." He was engaged at the battle of Fair Oaks, and did splendid service during the "Seven Days." In the campaign of Northern Virginia (Aug. 1862), he led his division with fiery energy at Bristoe Station, Manassas and Chantilly.

In the Maryland campaign (Sept.) he was at the head of the 1st corps, Army of the Potomac, forced the defile of South Mountain, and opened the way for the advance of the army. The 1st corps opened the great battle of Antietam, and in a sanguinary fight with the Confederates under Stonewall Jackson, Hooker was severely wounded. He was commissioned brigadier-general in the United States army on Sept. 20, 1862, and in the battle of Fredericksburg (*q.v.*) under Burnside, he commanded the centre grand division (3rd and 5th corps). When Burnside resigned the command Hooker succeeded him, and effected a much-needed reorganization in the army. In this task, as in subordinate commands in battle, Hooker was excelled by few. But his grave defects as a

commander-in-chief were soon to be obvious. By a well planned movement, he placed himself on the enemy's flank, but at the decisive moment he checked the advance of his troops. Lee turned upon him, Jackson surprised and destroyed a whole army corps, and the battle of Chancellorsville (*see* WILDERNESS), in which Hooker was himself disabled, ended in a retreat. The second advance of Lee into Union territory was strenuously resisted by Hooker, who would have inflicted a heavy blow on Lee's scattered forces had he not been prevented by orders from Washington. Even then Hooker followed the Confederates only a day behind them, until, finding himself distrusted, he resigned the command on the eve of the battle (June 28, 1863).

But when after a signal defeat Rosecrans was besieged in Chattanooga, and Grant with all the forces of the West was hurried to the rescue, two corps of the army of the Potomac were sent over by rail, and Hooker, as one of the finest fighting generals of the service, went with them in command. He won the "Battle above the Clouds" on Lookout Mountain which cleared the way for the crowning victory of the Army of the Cumberland on Missionary Ridge (*see* CHATTANOOGA). And in command of the same corps he took part in all the battles and combats of the Atlanta campaign of 1864. When General McPherson was killed before Atlanta, the command of the Army of the Tennessee fell vacant. Hooker, as senior to the other army commanders, Thomas and Schofield, was normally entitled to receive it, but Gen. Sherman feared to commit a whole army to a man of Hooker's peculiar temperament, and the place was given to Howard. Hooker thereupon left the army. He retired from active service, with the full rank of major-general, on Oct. 15, 1868. He died at Garden City, Long Island, on Oct. 31, 1879.

HOOKER, SIR JOSEPH DALTON (1817–1911), English botanist and traveller, son of the botanist Sir W. J. Hooker, was born on June 30, 1817, at Halesworth, Suffolk. He was educated at Glasgow university, and after taking his M.D. in 1839 joined Sir James Ross's Antarctic expedition as assistant-surgeon. On his return in 1843 he published *Flora Antarctica*, *Flora Novae Zelandiae* and *Flora Tasmanica*. His next expedition was to the northern frontiers of India (1847–51), his survey of hitherto unexplored regions being published by the Calcutta Trigonometrical Survey Office, and his botanical observations forming the basis of elaborate works on the rhododendrons of the Sikkim Himalayas and on Indian flora. Hooker also journeyed to Palestine (1860), Morocco (1871) and the United States (1877). In 1855 he was appointed assistant-director of Kew Gardens, and from 1865–85 was full director. He was president of the Royal Society from 1873–78. He was an early friend of Darwin: it was he who, with Lyell, first induced Darwin to make public his views on the origin of species.

Hooker's works, in addition to those already mentioned, include *Outlines of the Distribution of Arctic Plants* (1862), a standard *Student's Flora of the British Isles* (1870) and a monumental work, the *Genera plantarum* (1862–83) based on the collections at Kew. On the publication of the last part of his *Flora of British India* in 1897 he was created G.C.S.I. Among other honours he was awarded the Order of Merit in 1907. He died at Sunningdale on Dec. 10, 1911.

See L. Huxley, *Life and Letters of Sir J. D. Hooker* (2 vols., 1918), containing a full list of his works.

HOOKER, RICHARD (1553–1600), English writer, author of the *Laws of Ecclesiastical Polity*, son of Richard Vowell or Hooker, was born at Heavitree, near Exeter. His uncle, John Hooker *alias* Vowell, chamberlain of Exeter, and a man of some literary repute, induced Bishop Jewel to become Richard's patron and to bestow on him a clerk's place in Corpus Christi college, Oxford. He was admitted in 1568, and became a fellow in 1577. After his marriage, in 1581, he was presented to the living of Drayton Beauchamp in Buckinghamshire, and a few months later (March 1585) to the mastership of the Temple. Here he had his famous controversy with Walter Travers, a Presbyterian and evening lecturer in the same church. At his own request, Hooker was transferred in 1591 to the rectory of Boscombe near Salisbury, where he completed the first four of the proposed

Eight Books of the Laws of Ecclesiastical Polity, published in 1593 or 1594. In 1595 he was promoted to the rectory of Bishopsbourne near Canterbury, where he lived to see the completion of the fifth book in 1597. In the passage from London to Gravesend some time in 1600 he caught a severe cold from which he never recovered; he died on Nov. 2 of the same year. A volume professing to contain books vi. and viii. of the *Polity* was published at London in 1648, but the bulk of book vi., as has been shown by Keble, is a deviation from Hooker's subject, and doubtless the genuine copy, known to have been completed, has been lost. Book vii., which was published in a new edition of the work by Gauden in 1662, and book viii., may be regarded as in substance the composition of Hooker; but they have been unskillfully edited, and probably manipulated for theological purposes.

Hooker's *Polity*, which exhibits his respect for reason and for liberty, his broad sympathies, his dignity of language, and his wide reading, especially in patristic literature, was an answer to the attacks of the Presbyterians on the Episcopalian polity and customs. Its theological interest lies in its recognition of the greatness of Calvin as well as of the weaknesses and dangers of the Puritan movement, in its contention that the Bible was never meant to regulate the externals of church worship and government, in its defence of the Anglican Church against the charge of Romanism and in its interpretation of the sacraments. Its philosophical interest lies in the fact that the fundamental principle on which Hooker bases his reasoning is the unity and all-embracing character of law. Law—as operative in nature, as regulating each man's individual character and actions, as seen in the formations of societies and governments—is a manifestation and development of the divine order according to which God Himself acts. Natural law is eternal and immutable; positive law, which includes all forms of government, varies according to external necessity and expediency. The application of positive laws is to be determined by reason enlightened and strengthened by every variety of knowledge, discipline and experience.

Applying his principles to man individually, the foundation of morality is, according to Hooker, immutable, and rests "on that law which God from the beginning hath set Himself to do all things by"; this law is to be discovered by reason; and the perfection which reason teaches us to strive after is stated, with characteristic regard to the facts of human nature, to be "a triple perfection: first a sensual, consisting in those things which very life itself requireth, either as necessary supplements, or as beauties or ornaments thereof; then an intellectual, consisting in those things which none underneath man is either capable of or acquainted with; lastly, a spiritual or divine, consisting in those things whereunto we tend by supernatural means here, but cannot here attain unto them." Applying his principles to man as a member of a community, he assigns practically the same origin and sanctions to ecclesiastical as to civil government. His theory of government forms the basis of the *Treatise on Civil Government* by Locke, although Locke developed the theory in a way that Hooker would not have sanctioned.

The force and justification of government Hooker derives from public approbation, either given directly by the parties immediately concerned, or indirectly through inheritance from their ancestors. His theory is in various of its aspects and applications liable to objection; but taken as a whole it is the first philosophical statement of the principles which, though disregarded in the succeeding age, have since regulated political progress in England and gradually modified its constitution. One of the corollaries of his principles is his theory of the relation of church and State, according to which, with the qualifications implied in his theory of government, he asserts the royal supremacy in matters of religion, and identifies the church and commonwealth as but different aspects of the same government.

BIBLIOGRAPHY.—A life of Hooker by Dr. Gauden was published in his edition of Hooker's works (1662). To correct the errors in this life Izaak Walton wrote another, which was published in the 2nd edition of Hooker's works in 1666. The standard modern edition of the works is that by Keble, which first appeared in 1836, and has since been several times reprinted (1888 ed., revised by Dean Church and Bishop Paget).

The *Laws of Ecclesiastical Polity* was printed in the Everyman's Library (2 vols., 1907), and bk. i. was edited by R. W. Church (1868-76). See also V. Stanley, *R. Hooker* (1907) and L. S. Thornton, *R. Hooker, a Study of his Theology* (1924).

HOOKER, THOMAS (1586-1647), New England theologian, was born, probably on July 7, 1586, at Marfield, in the parish of Tilton, Leicestershire, England. He took his M.A. in 1611 at Emmanuel college, Cambridge, the intellectual centre of Puritanism, remained there as a fellow for a few years, and then preached in the parish of Esher in Surrey. About 1626 he became lecturer to the church of St. Mary at Chelmsford, Essex, delivering on market days and Sunday afternoons evangelical addresses which were notable for their moral fervour. In 1629 Archbishop Laud took measures to suppress church lectureships, which were an innovation of Puritanism. Hooker was placed under bond and retired to Little Baddow, 4m. from Chelmsford. In 1630 he was cited to appear before the Court of High Commission, but he forfeited his bond and fled to Holland, whence in 1633 he emigrated to the Colony of Massachusetts Bay in America, and became pastor at Newtowne, now Cambridge, Mass., of a company of Puritans who had arrived from England in the previous year and in expectation of his joining them were called "Mr. Hooker's Company." Hooker publicly criticized the limitation of suffrage to church members, and, according to a contemporary historian, William Hubbard (*General History of New England*) "after Mr. Hooker's coming over it was observed that many of the freemen grew to be very jealous of their liberties." He was a leader of the emigrants who in 1636 founded Hartford, Conn. In a sermon before the Connecticut general court of 1638, he declared that "the choice of public magistrates belongs unto the people by God's own allowance" and that "they who have the power to appoint officers and magistrates, it is in their power, also, to set the bounds and limitations of the power and place unto which they call them." Though this theory was in advance of the age and has caused many historians to call him "the father of American democracy," Hooker had no idea of the separation of church and state—"the privilege of election, which belongs to the people," he said, must be exercised "according to the blessed will and law of God." Hooker was pastor of the Hartford church until his death, on July 7, 1647. Hooker through his piety, zeal and wisdom was unquestionably one of the foremost of colonial clergymen.

See G. L. Walker's *Thomas Hooker* (1891), the best biography, which contains a bibliography of Hooker's published works.

HOOKER, SIR WILLIAM JACKSON (1785-1865), English botanist, was born at Norwich on July 6, 1785, and educated at the high school there. The natural history specimens of his first botanical expedition to Iceland in 1809 were lost on the homeward voyage through the burning of the ship, but Hooker was able to publish an account of the island and of its inhabitants and flora (*Tour in Iceland*, 1811). In 1814 he spent nine months in botanizing excursions in France, Switzerland and northern Italy, and in 1815 settled at Halesworth, Suffolk, devoting himself to the formation of his herbarium, which became of worldwide renown among botanists. In 1816 appeared the *British Jungermanniae*, succeeded by a new edition of William Curtis's *Flora Londinensis*, by the *Muscologia Britannica*, prepared in conjunction with Dr. T. Taylor (1818), and by his *Musci exotici* (2 vols., 1818-20), devoted to new foreign mosses and other cryptogams. In 1820 he accepted the regius professorship of botany in Glasgow. The following year he brought out the *Flora Scotica*. In 1841 he was appointed director of the Royal Botanical Gardens at Kew, and under his direction the gardens expanded from 11 to 75 acres. He died on Aug. 12, 1865.

Hooker's most important works besides those mentioned above are: *Exotic Flora* (3 vols., 1822-27); *Account of Sabine's Arctic Plants* (1824); *The Botanical Magazine* (38 vols., 1827-65); *Icones Filicum*, in concert with Dr. R. K. Greville (2 vols., 1829-31); *British Flora*, undertaken with Dr. G. A. W. Arnott, etc. (1830); *British Flora Cryptogamia* (1833); *Characters of Genera from the British Flora* (1830); *Flora Boreali-Americana* (2 vols., 1840); *The Journal of Botany* (4 vols., 1830-42); *Companion to the Botanical Magazine* (2 vols., 1835-36); *Icones plantarum* (10 vols., 1837-51); the *Botany of Beechey's Voyage to the Pacific and Behring's Straits* (with Dr. Arnott, 1841); the *Genera Filicum* (1842); *The London Journal of*

Botany (7 vols., 1842-48); *Species filicum* (5 vols., 1846-64), the standard work on this subject; *A Century of Orchideae* (1846); *Journal of Botany and Kew Garden Miscellany* (9 vols., 1849-57); *Niger Flora* (1849); *Victoria Regia* (1851); *Museums of Economic Botany at Kew* (1855); *Filices exoticae* (1857-59); *The British Ferns* (1861-62); *A Century of Ferns* (1854); *A Second Century of Ferns* (1860-61).

See *Sir William Jackson Hooker*, by his son J. D. Hooker (1903).

HOOKWORM, parasitism caused by the hookworms *Necator americanus*, *Ankylostoma duodenale*, and, more rarely, *Ankylostoma braziliense*, which inhabit a relatively small portion of man's small intestine. A single healthy female hookworm passes daily several hundred eggs which leave man in his excrement. Under favourable conditions, such as its deposit on suitable soil, larvae form therein, develop to an infective stage, and enter the soil. Infection ordinarily occurs through the piercing by infective larvae of the skin, commonly of one who walks barefoot over infected soil. Carried by the circulation from the skin to the lungs, larvae reach the air passages and, like all foreign bodies, are driven up these to the throat, are swallowed, and so finally reach the small intestine. Man's normal mechanisms are thus subverted to the hookworm's use.

The treatment of ankylostome infestation involves, firstly, disinfestation by a vermifuge or anthelmintic, and, secondly, neutralization of the consequences of infection. To increase their concentration in the bowel, and presumably their efficacy, anthelmintics have customarily been preceded by purging and fasting. Accumulating evidence, however, suggests that purging lessens effectiveness. Starvation, beyond the ordinary nightly fast, increases, for some drugs, risk of poisoning the host. Anthelmintics are best given in the early morning. The ideal vermifuge, with a dosage which poisons all hookworms without endangering the host, is non-existent. The dosage employed for any drug should give the greatest efficiency compatible with safety, and may be termed the optimum dose. Attainment of increased safety is attempted by dividing the optimum dose into fractions, usually 3 or 4, given with intervals of one or two hours, by which means treatment can be stopped at any stage should ill effects appear, while efficacy is apparently increased; nevertheless, supervising costs of mass treatment are thereby increased. Subsequent removal of the drug by purgation lessens risk of poisoning.

The many millions of persons infected throughout the tropics necessitates mass treatment, the essentials of which, namely safety, efficacy, cheapness, and palatability, are varyingly combined in the five anthelmintics in present or recent use. These are eucalyptus-chloroform, betanaphthol, thymol, oil of chenopodium, and carbon tetrachloride. By some they have been administered promiscuously to whole communities in which examination of a few individuals has shown a high rate of infection.

Eucalyptus-chloroform has been almost completely abandoned as inefficient. Pure betanaphthol, in optimum dosage of two grammes, is inefficient; in larger doses it has caused deaths in India and Brazil. Thymol and oil of chenopodium, in their respective optimum doses of 4 grammes and 1.2 cubic centimetres or mls (the latter dose equalling 48 drops or 20 minims) have for *N. americanus* equal efficiency and minimal risk; contrary statements emanate from the use of oil of chenopodium in excessive dosage of 3 mls, due apparently to considering a drop of this liquid as equivalent to a minim. For *A. duodenale* chenopodium appears the better drug, and is, in London, the cheaper. Its active principle is ascaridol. Unfortunately the oil contains markedly varying quantities of this substance, and its amount lessens on keeping. Ascaridol, extracted and administered in place of the whole oil, is effective but relatively costly. Carbon tetrachloride, recently introduced, has been taken by many thousands of persons in dosage of three mls, and has proved most efficient. The medicinally pure drug produces in large doses, in dogs, extensive fatty degeneration, followed by necrosis of the liver, and, apparently, of the kidneys; changes aggravated by starvation and fatty food, and lessened by glucose. Extensive similar change has been present in man when death has followed the 3-ml dose. A number of such deaths have been recorded. Clearly this dose required reduction, so that the efficacy of carbon tetrachloride under

optimum dosage has still to be ascertained. It is the cheapest of all advocated treatments. A combination of this drug with ascaridol is being tested.

Hygienically viewed, treatment of whole unsanitated communities lessens the risk of further infections; since destruction of female worms diminishes the seeding of egg-containing material upon the soil, and, on the whole, the number of infective larvae originating therefrom. Nevertheless, an imperfectly treated, and still lightly infected, person, seeding a favourable spot, is a danger to the community.

Individually viewed, disinfestation, by treatment, of the obviously ill and presumably heavily infected, restores health, always provided damaged tissues be still reparable. In the case of apparently healthy, but infected, persons, comparison of their condition of general health, wage-earning capacity, blood state and, in children, development of body and mind, before, and again a sufficient period after, disinfestation shows that they are often markedly improved by disinfestation; so that a light infection definitely handicaps the apparently healthy. Whether the lightest infections do, or may, penalize the individual is questioned. If, as now appears likely, we can detect infection by a single female worm, treatment producing complete disinfestation of such cases, combined with critical observation of conditions before and after effecting this, will doubtless shortly settle this point, so vital to the individual and community.

Iron and arsenic, ineffective before, may be essential for combating anaemia after disinfestation. Treatment of skin lesions at the site of infection varies with the condition present. (See PARASITOLOGY; TROPICAL MEDICINE.)

HOOOLIGAN, the generally accepted modern British term for a young street ruffian or rowdy. It seems to have been first applied to the young street ruffians of the south-east of London about 1890, but though popular in the district, did not attract general attention till later, when authentic information of its origin was lost; however, it appears that the most probable source was a comic song which was popular in the lower class music-hall in the late '80s or early '90s, which described the doings of a rowdy family named Hooligan (*i.e.*, Irish, Houlihan). A comic character with the same name also appears to have been the central figure in a series of adventures running through an obscure English comic paper of about the same date, and also in a similar New York paper, where his confrère in the adventures is a German named Schneider (see *Notes and Queries*, 9th series, vol. ii. pp. 227 and 316 (1898), and 10th series, vol. vii. p. 115 (1901).

HOOLOCK: see PRIMATES, GIBBON.

HOOPER, HORACE EVERETT (1859-1922), publisher of *The Encyclopædia Britannica*, was born in Worcester (Mass.), on Dec. 8, 1859. He was of English descent, his father's family having settled in New England about 1650, while his mother was a descendant of John Leverett, governor of Massachusetts, 1672-79. Having been educated in the public schools of Worcester and of Washington (D.C.), he started in business in early life at Denver (Colo.), but a few years later removed to Chicago, where, with others, he organized the Western Book and Stationery Company, with book stores in a number of the large western cities. In 1895 he moved to New York and joined a company for the sale of *The Century Dictionary*, and his success in this enterprise led to wider fields. In 1897 he went to London and arranged with A. and C. Black, publishers of *The Encyclopædia Britannica*, for a reprint of the 9th Edition of that work, and with *The Times* for its sale through that paper. Later he purchased the copyright. By reducing the price and by providing for payments in small monthly instalments, the sale of the work was revolutionized, 70,000 sets being sold in the next five years.

The success of this enterprise led Hooper to have prepared, in 1902, a large supplement in 11 volumes (under the editorship of Sir Donald Mackenzie Wallace, President Arthur T. Hadley of Yale, and Hugh Chisholm) which, added to the volumes of the 9th Edition, formed the 10th Edition. For this also there was a large sale. His next enterprise was *The Historians' History of the World*, 1904, a work in 25 volumes. Meanwhile, Hooper's relation with *The Times* grew more close. He took an intimate part in the business management, and it was at his suggestion and under his personal direction that *The Times Book Club* was formed. In 1908 when the proprietorship of *The Times* passed into the late Lord Northcliffe's hands, Hooper's connection with that paper came to an end.

In 1903 Hooper entered upon a larger enterprise than any yet attempted, the preparation of an entirely new edition, the 11th, of *The Encyclopædia Britannica* under the editorship of Hugh Chisholm. This was published in the closing months of 1910 and the first of 1911 under an arrangement with the Cambridge University Press. Hitherto all large works of reference had been issued volume by volume over a period of years. By his energy and the liberal expenditure of money, Hooper arranged that the 11th Edition of *The Encyclopædia Britannica* should all be published at the same time, thus greatly enhancing the usefulness of the work. Of this edition 75,000 sets were sold in the next few years, the use of India paper being one factor in its success. In 1915 Hooper published the work in a smaller and cheaper form known as the Handy Volume Issue, the contents being identical with the original issue. In this form nearly 200,000 sets were sold within a few years. The last enterprise in which Hooper was engaged was the publication in 1922 of the Three War Volumes of *The Encyclopædia Britannica*, which supplemented the 11th Edition, and with the 29 volumes of that Edition constituted the 12th Edition.

Hooper's success in publishing and distributing so widely the important works mentioned above lay partly in the originality, boldness, and brilliance of his operations, but chiefly in his faith in the intelligence and ambition of the great masses of the people. He believed in the educational value of good books, and that the people would order such books and use them if the matter were properly placed before them. The ideals he set before himself were the maintenance in *The Encyclopædia Britannica* of the highest standard of scholarship and the placing of the work as an educational aid in the greatest number of homes. Many professional educationists of note have done less than he towards popular enlightenment. For a number of years Hooper lived in England. He was a strong believer in the unity of the English-speaking peoples, and exerted his influence toward the removal of causes of friction between England and America and the establishment of cordial feeling and a mutual understanding. He died at Bedford Hills (N.Y.), on June 13, 1922.

HOOPER, JOHN (d. 1555), bishop of Gloucester and Worcester and martyr, was born in Somerset about the end of the 15th century and graduated B.A. at Oxford in 1519. In 1538 a John Hooper appears among the names of the Black friars at Gloucester, another among the White friars at Bristol who surrendered their houses to the king, and another as canon of Wormesley priory in Herefordshire; but identification of any of these with the future bishop is doubtful, and in the sentence pronounced against him by Gardiner he is described as "*olim monachus de Cliva Ordinis Cisterciensis*," i.e., of the Cistercian house at Cleve, Somerset. Before 1546 he was employed in the household of Sir Thomas Arundell and Hooper speaks of himself at this period as being "a courtier and living too much of a court life in the palace of our king." But he chanced upon some of Zwingli's works and Bullinger's commentaries on St. Paul's epistles; and after some molestation in England and some correspondence with Bullinger he took refuge on the continent, reaching Strasbourg in the midst of the Schmalkaldic war. There he married Anne de Tserclaes, and later proceeded by way of Basle to Zürich, where his Zwinglian convictions were confirmed by constant intercourse with Bullinger, Zwingli's successor.

In May 1549 Hooper returned to England. He at once became

the principal champion of Swiss Protestantism against the Lutherans as well as the Catholics and was appointed chaplain to protector Somerset. After Somerset's fall he became Warwick's chaplain and after a course of Lent lectures before the king was offered the bishopric of Gloucester. This led to a prolonged controversy; Hooper had already denounced the "Aaronic vestments" and the oath by the saints prescribed in the new Ordinal; and he refused to be consecrated according to its rites. Cranmer, Ridley, Bucer and others urged submission; confinement to his house by order of the council proved ineffectual; and he spent some weeks in the Fleet prison before he submitted to consecration with the legal ceremonies (March 8, 1551).

Although he had opposed Northumberland's plot for the exclusion of Mary from the throne, he was sent to the Fleet on Sept. 1, 1553, on a doubtful charge of debt to the queen; the real cause was his staunchness to a religion which was still by law established. Edward VI.'s legislation was, however, repealed in the following month, and in March 1554 Hooper was deprived of his bishopric as a married man. There was still no statute by which he could be condemned to the stake, but Hooper was kept in prison, and in December the heresy acts were revived. On Jan. 29, 1555, Hooper, Rogers, Rowland Taylor and others were condemned by Gardiner and degraded by Bonner. Hooper was sent to Gloucester, where he was burnt on Feb. 9, meeting his fate with steadfast courage and unshaken conviction.

Hooper was the first of the bishops to suffer, because his Zwinglian views placed him further beyond the pale than Cranmer, Ridley and Latimer. He represented the extreme reforming party in England. While he expressed dissatisfaction with some of Calvin's earlier writings, he approved of the *Consensus Tigurinus* negotiated in 1549 between the Zwinglians and Calvinists of Switzerland; and it was this form of religion that he laboured to spread in England against the wishes of Cranmer, Ridley, Bucer, Peter Martyr and other more conservative theologians. He would have reduced episcopacy to narrow limits; and his views had considerable influence on the Puritans of Elizabeth's reign, when many editions of his works were published.

BIBLIOGRAPHY.—Two volumes of Hooper's writings are included in the Parker Society's publications and another edition appeared at Oxford in 1855. See also H. Gough, *General Index to Parker Soc. Publ.* (1855); J. Strype, *Works* (General Index), 2 vols. (1828); J. Foxe, *Acts and Monuments*, ed. G. Townsend, 8 vols. (1843-49); *Acts of the Privy Council* (1890); Cal. HOOPESTON, a city of Vermilion county, Ill., U.S.A., 100m. S. of Chicago. It is served by the Chicago and Eastern Illinois and the Nickel Plate railways. The population in 1920 was 5,451 (95% native white). Grain, hay and live stock are shipped in large quantities. The city has grain elevators, machine shops, corn-canning plants with an annual output of over 800,000 cases, and factories making cans, canning machinery, malleable iron and chemicals. It was settled about 1870 and incorporated in 1874.

HOOPOE (*Upupa epops*), a bird conspicuous by its variegated plumage and large erectile crest. It is a summer visitor to almost all Europe and to Siberia, wintering in Africa and India. It is resident in north-east Africa and China. It is about the size of a thrush, with a long, pointed, arched bill; its head and neck are golden buff; the crest, which it opens and closes continually, is tipped with black and white; the rest of the plumage is a combination of black, white, grey, and buff.

The hoopoe feeds on worms, grubs, and insects. The nest, in a hole in a tree or wall, rapidly becomes a noisome spot, the faeces of both parents and young being left where they are deposited. The hoopoe is esteemed as food in southern Europe.

Other species occur in Asia and Africa. The European species often reaches the British Isles, where it is usually soon shot by some collector. But for this barbarism, it would probably breed.

HOORN, a seaport in the province of North Holland, on a

bay of the Zuider Zee called the Hoornerhop, and a junction station $2\frac{3}{4}$ m. by rail N. by E. of Amsterdam. Pop. (1926) 11,806. Hoorn, latinized as *Horna* or *Hornum*, is mentioned in a document of 1311. In 1356 it received municipal privileges, and in 1426 it was surrounded with walls. Here in 1416 the first great net was made for the herring fishery. In 1569 Spanish forces entered the town; but in 1572 it cast in its lot with the states of the Netherlands. Among the celebrities of Hoorn are William Schouten, who discovered in 1616 the passage round Cape Horn, or Hoorn, as he named it in honour of his birthplace; and Abel Janszoon Tasman, whose fame is associated with Tasmania. Hoorn is distinguished for the beauty of its numerous gabled houses of the 16th and 17th centuries. Many of these are decorated with inscriptions and bas-reliefs, some of which commemorate the battle on the Zuider Zee in 1573. The Gothic bastion tower overlooking the harbour was built in 1532; the East gate not later than 1578. Among the public buildings are the St. John's hospital (1563), now used for military purposes; the old mint; the hospital for aged men and women (beginning of 17th century); the weigh-house (1609); the town hall, in which the states of West Friesland formerly met; and the old court-house, which dates from the beginning of the 17th century, though parts of it are older. There is a considerable trade with other parts of the Netherlands, especially in cheese and cattle. The small industries include gold and silver work, tobacco factories, sawmills and some boat-building yards, a considerable number of vessels being engaged in the Zuider Zee fisheries.

HOOSICK FALLS, a village of Rensselaer county, New York, 30m. N.E. of Albany, on the Hoosick river. It is served by the Boston and Maine railroad. The population in 1925 was 5,050. The falls of the river furnish abundant water-power, and the village has various manufacturing industries. It was founded about 1688 by Dutch settlers, and was incorporated in 1827. At Walloomsac, 3m. N.E., was fought on Aug. 16, 1777, the battle of Bennington. The battlefield is now owned and maintained by the State.

HOOVER, HERBERT CLARK (1874-), thirty-first president of the United States, was born on Aug. 10, 1874, in the farming village of West Branch, Ia. He is the second of three children of Jesse and Huldah Minthorn Hoover, both Quakers with a long American Quaker ancestry. Jesse Hoover, the father, was the village blacksmith. He also sold farm machinery. He died when Herbert was six years old. Huldah, the mother, a woman of unusual mental gifts, was a Quaker preacher well known and admired not only in West Branch but in neighbouring Quaker communities for her speaking talent. She died when Herbert was nine.

After the death of the mother the three orphaned children were divided among the Hoover and Minthorn families, Herbert joining the family of his uncle Allan Hoover, who lived on a farm a few miles from West Branch. Later he was taken to Newberg, Ore., with the family of his mother's brother, Dr. John Minthorn, a physician much interested in education. Here he attended a small Quaker academy. Later his uncle moved to Salem where he opened a real estate office. Herbert went along as office boy, at the same time attending night school. He thus prepared himself for college and in Oct. 1891 he entered the just opened Stanford university in California, where he specialized in geology and engineering. He largely earned his way during the four university years, acting as secretary, in term time, to Dr. Branner, the professor of geology, and working during the summer vacation for the Arkansas State and U.S. Geological Survey.

Graduating in 1895 with Stanford's "pioneer class" he found a first job, not as a geologist or mining engineering expert, but as a day labourer in the Mayflower mine in California. But he soon graduated also from this rough but informing mining school and

began a career as an engineer and technical expert. His work began in Colorado, New Mexico, Arizona and Nevada, and carried him on to western Australia, then (1897) experiencing an exciting development of gold mining. Here he rapidly made a name for himself which led to his being engaged in 1899 as chief engineer of the newly established governmental department of mines in China. He returned to America from Australia in 1899 and was married to Lou Henry of Monterey, Cal., who had just graduated from Stanford and with whom he had become acquainted in Dr. Branner's geological laboratories.

Departing at once for China the young couple began a busy life of geological and mining expeditions and surveys which were effectively arrested in the next year when the Boxer Rebellion broke out. The Hoovers, with other foreigners, were besieged for four harrowing and dangerous weeks in Tientsin. In 1900 they returned to America and Europe, but soon departed again for China, remaining there until 1901. Hoover was now 27 years old and ready to go anywhere in the world that opportunity offered. The opportunities were abundant and his responses to them during the next 12 years took him again to Australia, Russia, Burma, Italy, Central America and elsewhere. He became identified with more than a score of mining companies, for several of which he was managing director. During this period he maintained offices in San Francisco, New York and London. During this period also his two sons, Herbert, Jr., and Allan, were born. In 1909 appeared his book on *Principles of Mining* and in 1912 a translation by himself and his wife from the mediaeval Latin of Agricola's *De Re Metallica*, an exhaustive treatise on mining and smelting published in 1550.

When the World War broke out in 1914 thousands of travelling Americans, endeavouring to return home, found themselves stranded in London because of the impossibility of obtaining cash on checks and letters of credit. Hoover, also in London at this time on a mission for the Panama-Pacific Exposition, mobilized the resources of himself and a group of engineer friends, advanced cash on personal checks, arranged for hotel rooms and steamer accommodations and thus philanthropically assisted more than 150,000 of these stranded fellow countrymen, personally unknown to him, to return to America. Before he completed this useful work a much greater relief task called him. The immediate result of the occupation of Belgium and northern France by the German armies was practically to establish an impassable ring of steel around 7,500,000 Belgians and 2,500,000 French men, women and children. The situation spelled starvation for the isolated people unless the ring could be broken and philanthropy allowed to provide food for them. The Belgian national relief committee called on Hoover who, with the approval of Walter Hines Page, American ambassador in London, organized the Commission for Relief in Belgium, and arranged with the warring nations to permit the passage through the blockade of food and clothing for distribution under the protection and guidance of the commission. He appealed to the charity of the world and arranged with the Governments of France, England and the United States to advance funds for the purchase of food. The commission, of which Hoover was the responsible and controlling head throughout the war, sent into occupied Belgium and France, during those four long and difficult years, about 5,000,000 tons of food and clothing of a market value of about \$1,000,000,000. This huge work was accomplished in the face of great and continuing diplomatic and practical difficulties, and its success brought world fame to Hoover. (See RELIEF.)

With the entrance of the United States into the war in April 1917, President Wilson called Hoover from Europe to be U.S. food administrator under the terms of the Lever Act. He at once developed an elaborate organization for stimulating production, checking hoarding and speculation and conserving food supplies. He had comparatively little authority in his hands, but he called on the people for co-operation and received almost universal backing for his requests. These even called for meatless and wheatless days and other personal food limitations. He extended the Food Administration to every State, city and hamlet and enrolled thousands of volunteer workers and local committee

BY COURTESY OF THE NEW YORK DEPARTMENT OF EDUCATION
OLD STONE SCHOOL-HOUSE BUILT NEAR HOOSICK FALLS IN 1812

members. By the activities of the Food Administration he was able to meet the large food demands of the Allies who were having difficulty in maintaining the *morale* of their people because of food shortage due to reduced production and to loss of cargoes by the U-boat destruction.

In connection with the Food Administration Hoover established the U.S. Grain Corporation, Sugar Equalization Board and Food Purchase Board, all for the purpose of a more centralized handling of food supplies during the emergency. He also served as chairman of the Interallied Food Council. After the Armistice, the terms of which, at his suggestion, provided for the furnishing of food supplies to enemy countries, he became chief executive officer of the joint Allied committee which later developed into the Supreme Economic Council and of which he was the head. This council exercised great authority in European economic affairs during the period of the Armistice.

When the Armistice came in Nov. 1918, and the dark curtain of war was lifted, revealing the terrible scene of disorganized and hungry eastern Europe, it was at once apparent that another great relief operation was necessary. The United States promptly took the first large-scale action by setting up, under Hoover's chairmanship, the American Relief Administration, with a congressional appropriation of \$100,000,000 available for immediate use in getting food supplies to the suffering and panic-stricken countries. Later large loans were made by the American and Allied Governments to these countries. Altogether in eight months nearly 5,000,000 tons of food-stuffs of a value of \$1,000,000,000 were sent into 23 countries. These supplies not only prevented starvation but aided largely in the economic reconstruction of the exhausted nations.

With the signing of the peace the American Relief Administration, as an independent agency acting for the U.S. Government, was liquidated, but as suffering from lack of food still persisted in parts of Europe Hoover and his associates formed a private charitable organization called the European Children's Fund to carry on the relief of millions of destitute and orphaned children in central and eastern Europe suffering from under-nutrition and disease. This organization continued its work until June 1922, and during its life it gave free meals to more than 8,000,000 children. In addition to this warm clothing valued at more than \$3,000,000 was distributed to 2,000,000 children.

In 1920 some of Hoover's friends conducted an unorganized and unsuccessful campaign to secure his nomination as the Republican candidate for president. After Harding's election Hoover entered his cabinet as secretary of Commerce. With characteristic vigour and constructive capacity he began at once a reorganization and new development of the department based on the idea of changing the attitude of the Government toward business from one of interference and control to one of co-operation. He held many conferences of manufacturers, distributors and consumers and suggested many opportunities for bettering business methods by voluntary agreement. He gave special attention to the rapid development of means of collecting and distributing reliable information of business conditions abroad with the aim of revealing opportunities for expanding U.S. foreign trade. Through a division of simplified practice he took successful steps to effect a general reduction in the number of different varieties and sizes in which articles of commerce were manufactured (see STANDARDIZATION). The Patent Office and Bureau of Mines were transferred from the Department of the Interior to his department. He was offered at various times the secretaryship of the Interior and of Agriculture but preferred to continue his development of the Department of Commerce.

In addition to his governmental activities he accepted many other public responsibilities. In 1922 he organized the important American Child Health Association and became its first president. He became trustee of Stanford university, his alma mater, where he founded the famous Hoover War library and the Food Research institute. He accepted the active chairmanship of the National Research Fund established by the National Academy of Sciences for the support of research in pure science. In 1922 he published *American Individualism*, a book devoted to setting out

his interpretation of the basis and character of American democracy.

In the fall of 1921, only a few months after he had become secretary of Commerce, Hoover was called on in his private capacity to undertake another great relief operation. Ten million people in the valley of the Volga in Russia were threatened with starvation as the result of drought and economic disorganization. By appealing to American private and governmental charity he was able to distribute, in the famine-stricken regions, through an effective organization manned largely by associates in his earlier relief operations, nearly 1,000,000 tons of food and medical supplies of a total value of about \$65,000,000.

In 1927, as personal representative of President Coolidge, and with the support of the army and navy and the American Red Cross, he went to the rescue of the sufferers from the great Mississippi flood. Under his vigorous direction effective local and governmental measures of relief were promptly adopted and 700,000 refugees removed from danger of drowning, disease and starvation.

At the Republican national convention in 1924 he was put forward, against his protest, for the vice-presidential nomination and 334½ votes were cast for him. Gen. Charles G. Dawes being nominated with 682½. At the Republican convention in 1928 at Kansas City, Mo., he was nominated for president on the first ballot, with 837 votes out of a total of 1,089. In the ensuing election he received 444 of the 531 electoral votes and the overwhelming popular vote of 21,500,000 as compared with 15,005,000 (both figures are approximate) for Gov. Smith, the Democratic candidate. A notable incident of the election was Hoover's victory in the "Solid South"; he carried for the Republican Party, for the first time since the Reconstruction period, Florida, North Carolina, Texas and Virginia; on the other hand he lost Massachusetts and Rhode Island, which with one exception had gone Republican at every presidential election since 1860. Immediately after his success at the polls (Nov. 19) he sailed from San Pedro, California, on a good will mission to the sister republics of Latin America returning Jan. 6, 1929. (V. K.)

THE HOP, A PLANT EXTENSIVELY CULTIVATED THROUGHOUT THE TEMPERATE REGIONS FOR USE IN THE MANUFACTURE OF BEER. IT HAS MEDICINAL QUALITIES ALSO, AND IN BELGIUM IS EATEN LIKE ASPARAGUS. A, male inflorescence; B, female inflorescence; C, fruits

HOP, *Humulus lupulus*, L., an herbaceous twining plant, belonging to the family Moraceae. It is of common occurrence in hedges and thickets in the southern counties of England, but is believed not to be native in Scotland. On the European continent it is distributed from Greece to Scandinavia, and extends

through the Caucasus and Central Asia to the Altai Mountains. It has been introduced into the northern and western states of North America and also into Brazil, Australia and the Himalayas.

It is a perennial plant, producing annually several long twining roughish striated stems, which twist from left to right, are often 15 to 20 ft. long and climb freely over hedges and bushes. The roughness of stem and leaves is due to lines of strong hooked hairs, which help the plant to cling to its support. The leaves are stalked, opposite, 3-5 lobed, and coarsely serrate, and bear a general resemblance to those of the vine, but are, as well as the whole plant, rough to the touch; the upper leaves are sometimes scarcely divided, or quite entire. The stipules are between the leaf-stalks, each consisting of two lateral ones united, or rarely with the tips free. The male and female flowers are produced on distinct plants. The male inflorescence forms a panicle; the flowers consist of a small greenish five-parted perianth enclosing five stamens, whose anthers open by terminal slits. The female inflorescence is less conspicuous in the young state. The catkin or strobile consists of a number of small acute bracts, with two sessile ovaries at their base, each subtended by a rounded bractlet. Both the bracts and bractlets enlarge greatly during the development of the ovary, and form, when fully grown, the membranous scales of the strobile, they are known as "petals" by hop-growers. The bracts can then only be distinguished from the bractlets by being rather more acute and more strongly veined. The perianth is short, cup-shaped, undivided and closely applied to the ovary, which it ultimately encloses. In the young strobile the two purple hairy styles of each ovary project beyond the bracts. The ovary contains a single ovule which becomes in the fruit an exalbuminous seed, containing a spirally-coiled embryo. The light dusty pollen is carried by the wind from the male to the female flowers.

The ovary and the base of the bracts are covered with a yellowish powder, consisting of minute sessile grains, called lupulin or lupulinic glands. It is to the lupulin in these glands that the medicinal properties of the hop are chiefly due. Besides the common hop there are two other species, the American hop (*H. americanus*) and the Japanese hop (*H. japonicus*), both of which are cultivated. (V. H. B.)

HOP, CULTIVATION OF THE. There are two species commercially grown, *Humulus Lupulus*, a native of Europe and Asia, and *Humulus americanus*, a native of America. The cultivation of the Old World hop probably originated in Asia, whence it gradually extended westward through Europe to England and subsequently to America. The American hop is grown chiefly in the Pacific States. In all countries where the hop is cultivated the crop is localized in fairly well defined areas; this is due, to some extent to climate but also largely to the fact that many of the operations involved are very specialized and require experienced labour, which can be obtained only in districts where the workmen have lived among hops all their lives.

Hops are grown in Austria, Bavaria, Belgium, Czechoslovakia, England, France, Germany, Hungary, Jugoslavia, Poland, Rumania, Russia, Canada, the United States of America, Australia and New Zealand. Germany has the largest area of land under hops but England produces the greatest weight of hops, followed closely by the United States of America; the hops of the latter countries being pollinated develop larger cones and therefore a higher crop per acre.

The plant is somewhat sensitive to climatic conditions, and even the comparatively small differences in these in different hopgrowing districts are sufficient to determine the variety of hop which will thrive most satisfactorily. The mean summer temperature should be about 60° F and the district should not be subject to strong winds during the growing and ripening periods. The rainfall should be abundant during the growing period and light during the ripening period.

The most suitable soil for hop growing is a fairly heavy loam overlying a pervious subsoil, such as gravel or chalk; it must be deep enough to enable the roots to penetrate to a level where moisture is always available; this moisture however must not be stagnant—hops cannot tolerate a badly drained soil.

Hops are propagated vegetatively by means of cuttings (con-

sisting of the basal portions of the previous year's bines) taken in the spring; they are grown in nursery beds for the first year and are then known as "bedded setts." These are exactly like the parent plants and the variety is thus kept true to type.

Planting.—Before planting hops the land is prepared by deep ploughing and loosening the subsoil with a subsoil plough; then, in early spring, the ground is set out with small sticks to indicate the positions of the "hills" or places where the hops are planted. (This term is derived from the old custom of growing hops on small mounds of earth.) These are commonly placed six or six and a half feet apart each way, the width of planting being governed by the vigour of the variety and the fertility of the soil. The setting out is carried out with great care as it is essential that the rows be perfectly straight and the hills exactly the correct distance apart, in order that they may be in the right positions relative to the overhead wire-work which supports the strings up which the bines climb. Having set out the ground and obtained "setts" of a suitable variety, planting is commenced at the first spell of fine weather in January or February. In England one male plant is provided for each 200 female plants, as it has been found that fertilized cones develop more rapidly and grow larger than unfertilized cones; in Germany and other mid-European hop growing districts however the male is rigorously excluded and seedless hops are produced. Holes about nine inches square are dug, a little farmyard manure or shoddy mixed with the soil in the bottom and, usually, two setts with the old bines trimmed off placed in the hole with the crowns close to the stick and just below soil level. The hole is then filled in and the stick pulled over at a slant to indicate that the setts have been planted.

Methods of Training.—During the first year of growth in the hop garden only a small amount of bine is produced and small poles are sufficient to support it; during the second year the plants will grow to their normal height and it is necessary to provide full length supports. The old method was to train the bines up poles about 14 feet in length, two or three being placed at each hill; this method has however been almost completely replaced by various methods of training on string, supported by a system of wires attached to stout poles.

During the dormant period the hops are "dressed." The soil is scraped away with a hoe so that the crown of the plant is exposed. The bases of the previous season's bines are then cut off close to the rootstock and any underground runners that may have been produced are removed. The object of this operation is to restrict the number of shoots, to keep the rootstock below soil level and to prevent the plant from spreading into the alleys. When "dressing" has been completed the coconut fibre string (coir yarn) is put up.

Growth commences in April and by the end of the month or the beginning of May the young bines will be 1 or 2 ft. long. Each hill produces more shoots than will be required to furnish the strings; it has been found that those of medium strength are the most fruitful and two of these are trained up each string; the remainder are pulled off. As growth continues it is necessary to go through the hops from time to time and replace any bines that may have fallen away from the strings.

In the autumn the land is ploughed in such manner that the rows of hills are situated on the ridges and the open furrows run along the middle of the alleys; this throws the excess water from heavy rains away from the hills and allows them to lie in a drier condition during the winter. In the spring the land is again ploughed; this time the furrow slices are thrown in the opposite direction, forming the ridge in the middle of the alley and leaving the rows of hops on narrow unploughed strips of land. When "dressing" has been completed these strips are dug by hand. The succeeding cultivation consists in working the ground with cultivators to produce a good tilth and to keep down weeds, the depth being gradually decreased as the season progresses until the hops are in "burr," when cultivation is either discontinued or carried out very shallow to keep weeds in check. The ground close to the hills is hand hoed periodically.

Hop Pests and Diseases.—The hop is subject to several

fungous diseases and insect pests, and growers keep a careful watch for the first appearance of these enemies. Of fungous diseases perhaps the most serious is the Downy Mildew (*Pseudoperonospora humuli* [Miy. et Tak.] Wils.) which may attack the hop at any stage of its growth. When the young shoot is infected it assumes a characteristic "fir-tree" spiked appearance and blackish spores are produced on the underside of the leaves; the older leaves become spotted with angular brown patches. The greatest financial loss to the grower, however, is caused when the cones are attacked; a crop of hops nearly ready to harvest and in an apparently healthy condition may be turned brown and thus rendered of little commercial value in perhaps three or four days. The remedies suggested to combat this disease are the removal of all "spiked" shoots and spraying with "Bordeaux Mixture" as a protective measure; the spraying has to be repeated in order that all new growth may be covered by the copper compound.

Another serious fungous disease is the Hop Mould (*Sphaerotheca Humuli* [D.C.] Burr.). This fungus produces white powdery patches of spores on the leaves; if the "burr" becomes infected its growth will be arrested and it will remain in the form of a small knob covered with the white fungus. When fully grown cones are attacked they become foxy-red in colour (Red Mould) and dark brown bodies—the winter stage of the fungus—are found on the cone. The remedy for this disease is dusting the plants with finely divided sulphur.

The Mosaic disease, caused by a virus, gives considerable trouble with some varieties; the shoots become brittle and stunted, the margins of the leaves turn backward and their colour becomes mottled with light patches; the affected plants produce very few cones and are killed in a season or two. The plants suffering from this disease must be dug up and burned as soon as it is recognized. A similar disease, called "Nettlehead," occurs principally on the variety "Fuggles."

The most important insect enemy of the hop is the Hop Aphis (*Phorodon humuli*, Schrank.). The eggs of this insect are laid on damson, plum and similar trees in the autumn and hatch out in April; from May to mid-June winged aphides fly to the hop where they produce wingless progeny which increase with great rapidity. In September another generation of winged aphides is produced which migrate to the damson trees. The aphides weaken the hop by extracting its sap as food; they also excrete a sticky substance ("Honeydew") which covers the leaves and blocks their pores. Upon this "Honeydew" a black fungus grows which gives the plant a sooty appearance. If the insects invade the cones the black fungus follows and the value of the crop is considerably reduced. The remedy for this pest is to wash the plants with a soapy solution of nicotine, or other insecticide, using a powerful spray.

Other important animal enemies are wireworms (the larvae of click beetles), which damage the young shoots below ground level, and red spiders (*Tetranychus altheae*, v. Haust.), which attack the leaves, particularly in dry weather.

Harvesting.—English hops are ready to harvest at the end of August or beginning of September. The signs of ripeness are as follows: the "seeds" become firm in texture and purplish in colour, the cones become crisp and rustle when pressed in the hand and develop their characteristic aroma.

The hops are picked into baskets, of five or six bushels capacity, or bins of loose sacking suspended on a light wooden framework. The pickers are organized into companies of six to ten baskets or bins, each company being in charge of a "binman" who is responsible for the work of the company. The price paid for picking varies from 2d. to 3d. a bushel according to the nature of the crop.

The hops are taken from the garden in loosely woven bags ("green bags" or "pokes"), holding ten bushels, to the kilns where they are dried as soon as possible after picking. In Kent the buildings containing the kilns are known as oast houses. The common kiln is built of brick, the wall being either circular or square, 18 or 20 ft. in diameter or side and about 16 ft. in height. From this a tiled roof, sealed inside with lath and plaster, extends in conical or pyramidal shape a further 18 to 24 feet. The roof terminates in an opening about 3 ft. in diameter surmounted by a

wooden cowl pivoted and provided with a vane, so that its opening is always away from the wind. An open batten floor is fixed in the kiln about 14 ft. from ground level and upon this is laid a loosely woven horsehair cloth. In the lower part an open fire of anthracite burns in a brick fireplace. The hops are placed on the horsehair cloth ("hair") to a depth of 8 to 16 in. and are dried by the hot air and products of combustion which pass through them from the fire.

The operation of the kiln requires very skilful management; a mistake in drying may reduce the commercial value of the hops enormously. Great care is necessary in the control of temperature; a thermometer is fitted below the "hair" floor to guide the dryer. At first the temperature is kept comparatively low, rising gradually from about 100° F at the time of loading to about 150° F at the end of four hours and reaching the maximum of 160° F at the end of the sixth hour. The rate at which the temperature is allowed to rise is, however, intimately connected with the strength of the draught. Nine or ten hours are generally required to dry a load.

The hops when dry are removed from the kiln, care being taken not to break the cones (which are then in a brittle condition) as breakage causes the loss of lupulin—the valuable part of the hop. They are allowed to remain exposed to the air for a few hours during which the residual moisture becomes more evenly distributed and some moisture is absorbed from the atmosphere. In America the hops are allowed to remain in this state for some weeks before being baled, but in England they are pressed into "pockets" (large bags made of stout jute sacking about 6 ft. in length and 2 ft. diameter) after four or five hours' exposure. Each pocket contains just over 1½ cwt. of hops and is marked with a serial number, the name of the grower, parish, district and year of growth.

The pockets are sent by the grower to a hop factor who cuts a sample of about 1 lb. from each pocket and by these samples sells the hops to hop merchants who, in turn, sell them to brewers.

For further information on the cultivation of hops, see "Cultivation, Diseases and Insect Pests of the Hop Crop" (Ministry of Agriculture and Fisheries) and the articles on "Hops" and "Diseases of Hops" in vol. iv., *Farm Crops* (The Gresham Publishing Company Ltd.). (A. H. B.)

UNITED STATES

The growing of hops in the United States started in Virginia about 1648. Thereafter the industry shifted to New York and Wisconsin, and then to the Pacific coast, which now produces practically all the hops grown in the United States.

On the Pacific coast, hop farms are always called hop ranches and are located alongside or very close to rivers because of their need of an abundant water supply. At the same time, lands for hop growing must be well drained, as hops are easily drowned. Hops require exceptionally rich and deep soil, the roots often going to a depth of 20 feet. Nearly all hops on the Pacific coast are grown on the high wire trellis system, which runs between 16 and 20 ft. from the ground level.

The spraying of hop vines with insecticides is a guarantee against hop aphis if it is efficiently done throughout the hop growing season, but the expense of such spraying is too large a factor of cost for the hop growers to stand except when hops can be sold at prices well above 20 to 25 cents per pound. Hence when the prospects are such that hops must be sold below that price, less spraying against the aphis is done by the grower and the risk of loss or damage of the hop crop is greater. In some years the loss or damage of the hop crop in Oregon, western Washington and Sonoma county, Calif., by insufficient or inefficient spraying represents over 50% of the value of the crop.

During the past 15 years the consumption of hops within the United States, the export of hops from the United States and the prices of hops, have been subject to violent changes. National Prohibition reduced the consumption of hops from about 35,000,000 lb. in 1914 to about 6,000,000 lb. in 1920. It is (1928) about 18,000,000 lb. per year. The United States exports of hops, which ran as high as 31,000,000 lb. in 1919, fell to about 11,600,000 lb. in 1927.

The controlling factor that determines the brewing value of

the hop is its quantity of brewing soluble resins. In that respect the Pacific coast hops are far richer than any other hops grown in the world. It is not uncommon for Pacific coast hops to run as high as 20% in resin content, nor is it uncommon for the best foreign hops to run as low as 10%. Pacific coast hops average about 30 to 40% richer in brewing resins than English and Continental hops.

By far the largest hop farms in the world are on the Pacific coast. One of its farms has 650 ac. in hops, all grown on the high trellis system. This farm is only one of a number of hop ranches owned and operated by the same company which grew in 1927 a total of 2,500 ac. of hops in various districts of the Pacific coast.

Hop Picking by Machine.—In California a large part of the hop crop is picked by machines invented by E. Clemens Horst. The advantages of machine picking are absolute cleanliness of the hops, complete picking, lower harvest cost, fewer workers and the opportunity to harvest hops both by day and by night, regardless of weather conditions. To pick hops by machine, they must be grown on the high wire trellis system. The vines are carried on wagons from the fields to the picking machine, which is located alongside the hop drying houses.

The theoretical picking capacity of one machine is 30 vines per minute; on the basis of 1,000 hop hills per acre and at 2 hop vines per hill, this would require 50 min. to pick an acre of hops, or 12 ac. of hops in a 10-hour day. The actual working capacity for machine runs from 5 to 6 ac. of hops per 10-hour day, according to the quantity of hops on the vines and the efficiency of the machine crew. A total of 60 persons is necessary to cut and load the hop vines in the field, haul them to the machine, operate the machines and deliver the clean hops to the hop drying floors.

Hop-drying.—The temperature at which hops are dried is one of the controlling factors in fixing the value of the hops for brewing purposes. The lower the maximum temperature used in drying the hops, the better will be their quality, because the higher the temperature, the greater will be the conversion of the resins that are soluble in the brewing process, into those that are insoluble and therefore useless. The higher the maximum temperature used, the smaller will be the aromatic oils of the hops. Some of the most desirable aromatic oils of the hops volatilize and are lost at temperatures of 100° F.

On the Pacific coast practically all the hop drying is done in stove kilns, thus avoiding any contact of the fuel fumes with the hops. The largest hop-growing company of the Pacific coast dries nearly all its hops by the heated air-drying system in which the air is driven through the hops with fan blowers, thus accomplishing the drying in about one-half the usual time and at very much lower temperatures. In 1927 this company developed a successful plan by which hops are dried by air at a natural outdoor temperature. This results in hops of the very highest quality both in aromatic oils and in soluble brewing resins. The method requires about ten times the drying floor space that is necessitated by the heated air-drying system. Large fan blowers are used to blow the natural air through the hops. (E. C. H.)

HOPE, ANTHONY, the pen-name of Sir ANTHONY HOPE HAWKINS (1863–), British novelist, who was born on Feb. 9, 1863, the second son of the Rev. E. C. Hawkins, vicar of St. Bride's, Fleet Street, London. He was educated at Marlborough and Balliol College, Oxford, where he was president of the Union Society. He was called to the bar at the Middle Temple in 1877. He won a great popular success with the publication (May 1894) of *The Prisoner of Zenda*. This was followed a few weeks later by *The Dolly Dialogues* (previously published in separate installments in the *Westminster Gazette*). *The Prisoner of Zenda*, owing something to the *Prince Otto* of R. L. Stevenson, established a fashion for what was christened, after its fictitious locality, "Ruritania romance"; while the *Dolly Dialogues* was the forerunner of a whole school of epigrammatic drawing-room comedy. A dramatic version of *The Prisoner of Zenda*, with Sir George (then Mr.) Alexander as "Rupert Rassendyll," had a long run at the St. James's Theatre. In 1894 also appeared *The God in the*

Car, a novel suggested by the influence on English society of Cecil Rhodes's career; and *Half a Hero*, a complementary study of Australian politics. In a series of novels Anthony Hope advanced from his light comedy and gallant romantic inventions to the graver kind of fiction of which *The God in the Car* had been an earlier essay. Other notable novels were: *Quisante* (1900), a study of English society face to face with a political genius of an alien type; *Tristram of Blent* (1901), a study of family pride; the witty *The Intrusions of Peggy* (1902); *Double Harness* (1904); *A Servant of the Public* (1905); *The Great Miss Driver* (1908) and *Second String* (1909). Mr. Hawkins married (1903) Miss Elizabeth Somerville Sheldon of New York. He was knighted in 1918.

See his *Memories and Notes* (1927).

HOPE, THOMAS ["Anastasiu"] (c. 1770–1831), English collector, born in London about 1770, was the eldest son of John Hope of Amsterdam, and was descended from a Scottish family of London and Amsterdam merchants. About the age of eighteen he travelled widely in Europe, Asia and Africa, making a large collection of works of art. On his return to London about 1796 he bought a house in Duchess Street, Cavendish Square. In 1807 he published sketches of his furniture, accompanied by letterpress, in a folio volume, entitled *Household Furniture and Interior Decoration*, which had considerable influence on interior decoration, notwithstanding Byron's scornful reference to "House-furnisher withal, one Thomas hight." Hope's furniture designs were in that pseudo-classical manner known as "English Empire." In 1819 he published anonymously *Anastasiu, or Memoirs of a Modern Greek, written at the close of the 18th century*. It was at first generally attributed to Lord Byron, who told Lady Blessington that he wept bitterly on reading it because he had not written it and Hope had. Hope died on Feb. 3, 1831.

HOPE, a city of Hempstead county, Arkansas, U.S.A., in the south-western part of the State; on Federal highway 67, and served by the Frisco, the Louisiana and Arkansas and the Missouri Pacific railways. The population was 4,790 in 1920 (29% negroes). It is an important shipping point for cotton, lumber, cattle and hides, and for lumber products from its own mills.

HOPFEN, HANS VON (1835–1904), German novelist and poet, born at Munich on Jan. 3, 1835, became one of the circle of young writers encouraged by Maximilian II. of Bavaria. His early songs and ballads appeared in the *Münchener Dichterbuch*. In 1866 he settled in Berlin, where he died (at Lichterfelde) on Nov. 19, 1904. His novels include: *Peregrina* (1864); *Verdorben zu Paris* (1868, new ed. 1892); *Arge Sitten* (1869); *Der graue Freund* (1874, 2nd ed., 1876); and *Verfehlte Liebe* (1876, 2nd ed., 1879), while of his shorter stories *Tiroler Geschichten* (1884–85) command most favour.

An autobiographical sketch is contained in K. E. Franzos, *Geschichte des Erstlingswerkes* (1904).

HOPI. A division of Shoshonean Indians in northern Arizona, inhabiting seven small towns and forming part of the Pueblo group. They are also known as Moki or Moqui and their district as Tusayan. They were discovered by Tobar of Coronado's expedition in 1540, annexed in 1598 by Oñate, missionized in 1629. After the Pueblo rebellion of 1680 most of the Hopi moved their towns on mesas for defence; only Oraibi perhaps still occupies the same site as in 1540. Soon after the rebellion, groups of Tewa from the Rio Grande established themselves among the Hopi; one of these remained and still preserves its old speech in the town of Hano. A single mission was re-established, at Awatobi, but permanently abandoned on the destruction of this pueblo by the other Hopi.

HOPI INDIANS WEAVING BASKETS
Hopi women work with fibre as other women work with yarn and thread. Here are two women constructing baskets of beautiful colour and intricate design

BY COURTESY OF E. CLEMENS HORST COMPANY

MODERN METHODS OF HARVESTING AND PICKING HOPS

1. High wire trellis system of raising hop vines. Pickers in wagons go between rows of trellises, pulling the vines from the wires above
2. Hop vines being pulled to the ground, after stripping (see fig. 3)
3. The picking machine, which strips pods and leaves from the stems
4. Vines carried by conveyor from ground to floor above for stripping

5. Revolving perforated cylinders through which picked hops and leaves pass after going through picking machine. The stems remain in the cylinders, which are tilted at an angle, while pods fall through holes
6. Interior of hop picking machine, showing revolving drums fitted with V-shaped wire fingers which remove the hops from the vines

Awatobi and Oraibi were the largest towns in this period; Shongopovi, Mishongnovi and Walpi already existed; Sichomovi and Shipaulovi were founded in the 18th century. The population, perhaps 4,000 at discovery, has long been nearly stationary at about 2,000, nearly half of it in Oraibi until in recent years factionalism between the conservative and progressive elements in that town led to a secession and the founding of Hotavila.

Since their discovery, the Hopi have been the westernmost of the Pueblos. Spanish influence therefore rested lightly on them and native culture has been maintained more purely than at Zuñi, Acoma and especially the Rio Grande towns. The Hopi snake dance, perhaps the most famous native ceremony still practised in the United States, owes its interest and repute to the purity of its aboriginal flavour; except in details, it was like other Pueblo rites before these were modified or abandoned. The Hopi are also the last of the Pueblos to grow, spin and weave a native cotton.

See the series of monographs by Fewkes and Mindeleff in *Reports of the Bureau of American Ethnology*, and by Voth and Dorsey in *Publications of Field Museum of Natural History*. (A. L. K.)

HÖPKEN, ANDERS JOHAN, COUNT VON (1712–1789), Swedish statesman, was the son of Daniel Niklas Höpken, one of Arvid Horn's most determined opponents and a founder of the Hat party. When in 1738 the Hats came into power the younger Höpken obtained a seat in the secret committee of the diet, and during the Finnish war of 1741–42 was one of the two commissioners appointed to negotiate with Russia. During the diet of 1746–47 Höpken's influence was of the greatest importance. It was chiefly through his efforts that the estates issued a "national declaration" protesting against the arrogant attitude of the Russian ambassador, who attempted to dominate the crown prince Adolphus Frederick and the Government. This spirited policy restored the waning prestige of the Hat party and firmly established their anti-Muscovite system. In 1746 Höpken was created a senator. In 1751 he succeeded Gustaf Tessin as prime minister, and controlled the foreign policy of Sweden for the next nine years. On the outbreak of the Seven Years' War, he contracted an armed neutrality treaty with Denmark (1756); but in the following year acceded to the league against Frederick II. of Prussia. During the crisis of 1760–62, when the Hats were at last compelled to give an account of their stewardship, Höpken retired from the senate as well as from the premiership. After the revolution of 1772 he re-entered the senate, finally retiring in 1780. The noble style of Höpken's biographies and orations earned for him the title of the Swedish Tacitus. He helped to found the *Vetenskaps Akademi*, and when Gustavus III. in 1786 established the Swedish Academy, he gave Höpken the first place in it.

See L. G. de Geer, *Minne af Grefve A. J. von Höpken* (Stockholm, 1882); Carl Silfverstolpe, *Grefve Höpkens Skrifter* (Stockholm, 1890–93). (R. N. B.)

HOPKINS, ESEK (1718–1802), the first admiral of the U.S. navy, was born at Scituate, R.I., in 1718. He belonged to one of the most prominent Puritan families of New England. At the age of 20 he went to sea and rapidly came to the front as a good sailor and skilful trader. Marrying, three years later, into a prosperous family of Newport, he became commodore of a fleet of 17 merchantmen, the movements of which he directed with skill and energy. In war as well as peace, Hopkins was establishing his reputation as one of the leading colonial seamen, for as captain of a privateer he made brilliant and successful ventures during the Seven Years' War. At the outbreak of the Revolutionary War Hopkins was appointed brigadier-general by Rhode Island, was commissioned, in Dec. 1775, by the Continental Congress, commander-in-chief of the navy, and in Jan. 1776, hoisted his flag as admiral of the eight converted merchantmen which then constituted the navy of the United States. His first cruise resulted in a great acquisition of material of war and an indecisive fight with H.M.S. "Glasgow." At first this created great enthusiasm, but criticism soon made itself heard. Hopkins and two of his captains were tried for breach of orders, and, though ably defended by John Adams, were censured by Congress. The commands, nevertheless, were not interfered with, and a prize

was soon afterwards named after the admiral by their orders. But the difficulties and mutual distrust continually increased, and in 1777 Congress summarily dismissed Hopkins from his command, on the complaint of some of his officers. Before the order arrived, the admiral had detected the conspiracy against him, and had had the ringleaders tried and degraded by court-martial. But the Congress followed up its order by dismissing him from the navy. For the rest of his life he lived in Rhode Island, playing a prominent part in State politics. He died at Providence in 1802.

See Edward Field, *Life of Esek Hopkins* (Providence, 1898); also an article by R. Grieve in the *New England Magazine* of Nov. 1897.

HOPKINS, SIR FREDERICK GOWLAND (1861–), biochemist, was born in 1861 at Eastbourne. He was educated at private schools and his first technical training was received in the laboratory of a consulting chemist. In 1888 he began his medical studies at Guy's hospital, and was at the same time appointed the first holder of the research studentship founded in memory of Sir William Gull. He combined activities in research with clinical work, and after taking his degree at the University of London in 1894 became a member of the staff of the medical school of Guy's. In 1898 he married Jessie Stevens, daughter of Edward Stevens of St. Lawrence, Kent, and in the following year was called by Sir Michael Foster to Cambridge where he joined the illustrious school of physiology which Foster was founding. From 1905 to 1910 he was a tutor at Emmanuel college but after that time Trinity college created the post of praelector in physiological chemistry specially for him.

His first research (*Philos. Trans. Roy. Soc.* 18955, 186B 661) was of an academic character. He showed that the wing pigments of certain butterflies were derivatives of uric acid, and gave a new turn to thought concerning animal pigmentation by demonstrating that excretory substances may function in ornament. At this time much interest was taken in uric acid in medical circles and Hopkins contrived a method for its quantitative estimation which was for a long time the standard technique (*Proc. Roy. Soc.* 1892, 52 93, and *Journ. Pathol. and Bacteriol.* 1893 i. 451). He himself applied it to a wide range of physiological and pathological questions. He early realized that one of the urgent needs of biochemistry, then entering its modern phase under Hoppe-Seyler and Hofmeister, was accurate knowledge of the proteins. While at Guy's he concerned himself with methods for obtaining pure material for study in this domain (*Journ. Physiol.* 1900 25 306) and his first publication from Cambridge (F. G. Hopkins and S. N. Pincus, *Journ. Physiol.* 1899 23 130) described a crystalline egg-albumin which displayed the properties of a pure substance. Shortly afterwards he succeeded (with S. W. Cole) in isolating from proteins the amino-acid tryptophane (F. G. Hopkins and S. W. Cole, *Journ. Physiol.* 1901 27 418). In 1905 he was elected to the Royal Society and in the following year laid the foundation, in collaboration with Fletcher, of our knowledge of the chemistry of muscular contraction by his researches into lactic acid production in muscle (F. G. Hopkins and W. Fletcher, *Journ. Physiol.* 1906 35 247). In the same year he published preliminary reports of experiments involving "pure diets" which proved the existence of essential amino-acids (F. G. Hopkins and C. Willcock, *Journ. Physiol.* 1906 35 88) and of those accessory factors in foods which were afterwards to be known by the name of vitamins (*Analyst*, 1906 31 395). Another important research was that of 1910 (with Savory) on Bence-Jones protein (F. G. Hopkins and G. Savory, *Journ. Physiol.* 1910 42 189) and two years later the full results of the vitamine experiments were published (*Journ. Physiol.* 1912 44 425).

Up to this time the department of physiological chemistry at Cambridge had been but an appanage of the department of physiology and Hopkins had been reader in Biochemistry, but in 1913 biochemistry became an independent department with Hopkins as its first professor. In this year he was a sectional president of the British Association and his address "The Dynamic Side of Biochemistry" (*Ann. Reports Brit. Assoc.*, 1913) achieved an international renown. From 1913 to 1918 he wrote the biochemical section of the annual reports of the Chemical

Society. In 1915 the Royal College of Physicians awarded him its Baly medal and in 1917 he delivered the Croonian lecture to the Royal Society (F. G. Hopkins and W. Fletcher, *Proc. Roy. Soc.* 1917. 89 B 444), receiving its Royal Medal in 1918 and its Copley Medal in 1926. In 1921 a munificent bequest by the trustees of Sir William Dunn established the Cambridge biochemical department on a surer foundation and in the same year Hopkins made his most recent fundamental contribution to the science by isolating from living tissues the sulphur-containing dipeptide glutathione (*Biochem. Journ.* 1921: 15, 286) and by showing its great importance for the oxidations in living cells. He was knighted in 1925 and in 1927 chosen to deliver the opening address at the 12th International Physiological Congress at Stockholm. In 1929 he was joint winner, with Dr. Eijkman, of the Nobel prize for physiology. The further fruits of his work can be seen in the biochemical laboratory at the University of Cambridge with its 40 research workers covering an unprecedentedly wide field of investigation. (J. NE.)

HOPKINS, MARK (1802-1887), American educationist, great-nephew of the theologian Samuel Hopkins, was born in Stockbridge, Mass., on Feb. 4, 1802. He graduated in 1824 at Williams college, where he was a tutor in 1825-27, and where in 1830, after having graduated in the previous year at the Berkshire Medical college at Pittsfield, he became professor of moral philosophy and rhetoric. He was president of Williams college from 1836 until 1872, but retained his professorship till his death on June 17, 1887. He was one of the ablest and most successful of the old type of college president, being particularly noted for his stressing of the development of the individual student.

For Mark Hopkins see monographs by F. Carter (1892) and L. W. Spring (1888), No. 4, vol. i., of the *Mon. of the Indust. Educ. Assoc.*; Anon. ed., *Early Letters of Mark Hopkins* (1930).

HOPKINS, SAMUEL (1721-1803), American theologian, was born in Waterbury (Conn.), on Sept. 17, 1721. He graduated at Yale college in 1741; studied divinity at Northampton (Mass.), with Jonathan Edwards; was licensed to preach in 1742, and in Dec. 1743 was ordained pastor of the church in the North Parish of Sheffield, or Housatonic (now Great Barrington, Mass.). There he laboured until 1769, for part of the time in intimate association with his old teacher, Edwards, whose call to Stockbridge he had been instrumental in procuring. Opposition to his theological views caused his dismissal, and from April 1770 until his death on Dec. 20, 1803, he was the pastor of the First Church in Newport (R.I.), though he preached elsewhere while Newport was occupied by the British. Personally he was remarkable for force and energy of character and for the utter fearlessness with which he followed premises to their conclusions. Though he was originally a slave-holder, to him belongs the honour of having been the first among the Congregational ministers of New England to denounce slavery both by voice and pen.

Among his publications are a valuable *Life and Character of Jonathan Edwards* (1799), and numerous pamphlets and addresses, including *A Dialogue . . . showing it to be the Duty and Interest of the American States to emancipate all their African Slaves* (1776), and *A Discourse upon the Slave Trade* (1793). His distinctive theological tenets are to be found in his important work, *A System of Doctrines Contained in Divine Revelation, Explained and Defended* (1793), which has had an influence hardly inferior to that exercised by the writings of Edwards himself. They may be summed up as follows: God so rules the universe as to produce its highest happiness, considered as a whole. Since God's sovereignty is absolute, sin must be, by divine permission, a means by which this happiness of the whole is secured, though that this is its consequence, renders it no less heinous in the sinner. Virtue consists in preference for the good of the whole to any private advantage; hence the really virtuous man must willingly accept any disposition of himself that God may deem wise—a doctrine often called "willingness to be damned." All have natural power to choose the right, and are therefore responsible for their acts; but all men lack inclination to choose the right unless the existing "bias" of their wills is transformed by the power of God from self-seeking into an effective inclination towards virtue.

BIBLIOGRAPHY.—The best edition of Hopkins's *Works* (1852) contains an excellent biographical sketch by E. A. Park. In 1854 was published separately Hopkins's *Treatise on the Millennium*. See also Stephen West's *Sketches of the Life of the Late Reverend Samuel Hopkins* (Hartford, Conn., 1805); B. Dexter's *Biographical Sketches and Annals of Yale College* (1907); and Williston Walker's *Ten New England Leaders* (1901). (W. W.)

HOPKINSON, FRANCIS (1737-1791), American author and statesman, one of the signers of the Declaration of Independence, was born in Philadelphia (Pa.), Sept. 21, 1737. By his father, Thomas Hopkinson, a lawyer, first president of the American Philosophical Society, and a trustee of the college, he was enrolled as the first student in the College of Philadelphia (now the University of Pennsylvania), from which he received his bachelor's degree in 1757, his master's in 1760, and the degree of LL.D. in 1790. He aided the revolutionary movement and the later struggle for the adoption of the Constitution by a series of prose and poetic satires, which were widely reprinted and most effective. Perhaps the best known are *A Pretty Story* (1774); *A Prophecy*; *The Battle of the Kegs*; and *The New Roof, A Song for Federal Mechanics*. He died on May 9, 1791. His *Miscellaneous Essays and Occasional Writings* was published in 1792. Much of his work has never been reprinted from contemporary magazines.

His son JOSEPH HOPKINSON (1770-1842), also a lawyer, legislator and judge, is best known as author of the patriotic anthem *Hail Columbia*.

See G. E. Hastings, *The Life and Works of Francis Hopkinson* (1926), which contains an excellent bibliography; and O. G. Sonneck's *Francis Hopkinson, the First American Poet-Composer* (1905).

HOPKINSON, JOHN (1849-1898), English engineer and physicist, was born in Manchester on July 27, 1849. After a brilliant career at Cambridge and London universities, he became a pupil in the engineering works in which his father was a partner. In 1872 he undertook the duties of engineering manager in the glass manufactories of Messrs. Chance Brothers and Company at Birmingham. Six years later he removed to London, where he established a most successful practice as a consulting engineer. His work was mainly electrical, and his services were in great demand as an expert witness in patent cases. In 1890 he was appointed director of the Siemens laboratory at King's college, London, with the title of professor of electrical engineering. His death occurred prematurely on Aug. 27, 1898, when he was killed, together with one son and two daughters, by an accident while climbing the Petite Dent de Veisivi, above Evolena. Hopkinson presented a rare combination of practical with theoretical ability. His name is best known in connection with electricity and magnetism. He worked out the general theory of the magnetic circuit in the dynamo (in conjunction with his brother Edward), and the theory of alternating currents, and conducted a series of observations on the phenomena attending magnetization in iron and nickel and the curious alloys of the two which can exist both in a magnetic and non-magnetic state at the same temperature. By the application of the principles he elucidated, he furthered to an immense extent the employment of electricity for the purposes of daily life. He made great improvements in the design and efficiency of the dynamo. Hopkinson took a leading part in the development of the three-wire system and the closed-circuit transformer used in the distribution of electric current and he introduced the series-parallel method of working motors. During his work with Messrs. Chance, Hopkinson turned his attention to problems of lighthouse illumination, and he was able to devise improvements in both the catoptric and dioptric methods for concentrating and directing the beam. He was a strong advocate of the group-flashing system as a means of differentiating lights, and invented an arrangement for carrying it into effect optically. He further undertook researches on electrostatic capacity, the phenomena of the residual charge, and other problems arising out of Clerk Maxwell's electro-magnetic theory.

His original papers were collected and published, with a memoir by his son, in 1901.

HOPKINSVILLE, a city of south-western Kentucky, U.S.A., 100 m. S. of Evansville, Ind.; the county seat of Christian county.

It is on Federal highways 41, 241 and 68 and is served by the Illinois Central, the Louisville and Nashville, and the Tennessee Central railways. The population was 9,696 in 1920 (38% negroes) and was estimated locally at 14,000 in 1928. It is the seat of the Western State hospital for the insane and of Bethel Woman's college (Baptist; founded 1854); has the largest dark-fired tobacco market in the country and a large mule and live stock market; and its manufactures include flour, brick, crushed stone, cigar boxes, furniture, shirts and overalls. Race-horses are bred in the vicinity. When Christian county was created in 1797 Hopkinsville (originally called Elizabethtown) was made the county seat, and was renamed in honour of Samuel Hopkins (c. 1750-1819), a Kentucky pioneer and an officer in the Revolution. The town was incorporated in 1798, was chartered as a city in 1897, and in 1916 adopted a commission form of government.

HOPPE-SEYLER, FELIX (1825-1895), German physiologist, became in 1856 assistant to Virchow in Berlin, in 1864 professor of applied chemistry at Tübingen and in 1872 professor of physiological chemistry at Strasbourg. He pursued important researches on blood and metabolism, and was the first to obtain lecithin in the pure state. His most important studies concern milk, bile, urine and chlorophyll. He wrote a handbook of chemical analysis applied to physiology and pathology (1858) and a treatise on physiological chemistry (1877).

HOPPNER, JOHN (1758-1810), English portrait-painter, was born, it is said, on April 4, 1758, at Whitechapel. His father was of German extraction, and his mother was one of the German attendants at the royal palace. Hoppner received the patronage of George III., whose regard for him gave rise to the report that he was the king's natural son. As a boy he was a chorister at the royal chapel, and in 1775 entered as a student at the Royal Academy. In 1778 he took a silver medal for drawing from the life, and in 1782 the Academy's highest award, the gold medal for historical painting, his subject being King Lear. He first exhibited at the Royal Academy in 1780. His earliest love was for landscape, but necessity obliged him to turn to the more lucrative business of portrait-painting. At once successful, he had, throughout life, the most fashionable and wealthy sitters, and was the greatest rival of the growing attraction of Lawrence. Ideal subjects were very rarely attempted by Hoppner, though a "Sleeping Venus," "Belisarius," "Jupiter and Io," a "Bacchante" and "Cupid and Psyche" are mentioned among his works. The prince of Wales especially patronized him, and many of his finest portraits are in the state apartments at St. James's Palace, the best perhaps being those of the prince, the duke and duchess of York, of Lord Rodney and of Lord Nelson. Among his other sitters were Sir Walter Scott, Wellington, Frere and Sir George Beaumont. A *Series of Portraits of Ladies* was published by him in 1803, and a volume of translations of Eastern tales into English verse in 1805. Hoppner died on Jan. 23, 1810.

He was confessedly an imitator of Reynolds. When first painted, his works were much admired for the brilliancy and harmony of their colouring, but the injury due to destructive mediums and lapse of time which many of them suffered caused a great depreciation in his reputation. The appearance, however, of some of his pictures in good condition has shown that his fame as a brilliant colourist was well founded.

The best account of Hoppner's life and paintings is the exhaustive work by William McKay and W. Roberts (1909).

HOP-SCOTCH, an old English children's game in which a small object, like a flat stone, is kicked by the player while hopping from one division to another of an oblong space marked upon the ground and divided into 10 or 12 numbered divisions. The stone must rest in each successively, without touching a line or going out of the division aimed for. The game consists in driving the stone into each division and back to the starting point.

HOPTON, RALPH HOPTON, BARON (1598-1652), Royalist commander in the English Civil War, was the son of Robert Hopton of Witham, Somerset. He appears to have been educated at Lincoln college, Oxford, and to have served in the army of the elector palatine in the early campaigns of the Thirty Years' War, and in 1624 he was lieutenant-colonel of a regiment

raised in England to serve in Mansfield's army. Charles I., at his coronation, made Hopton a Knight of the Bath. Hopton, as member of parliament successively for Bath, Somerset and Wells, at first opposed the royal policy, but after Strafford's attainder (for which he voted) he gradually became an ardent supporter of Charles, and at the beginning of the Great Rebellion he was made lieutenant-general under the marquess of Hertford in the west. His first achievement was the rallying of Cornwall to the royal cause, his next to carry the war from that county into Devon. In May 1643 he won the brilliant victory of Stratton, in June he overran Devon, and on July 5 he inflicted a severe defeat on Sir William Waller at Lansdown. In the last action he was severely wounded by the explosion of a powder-wagon and he was soon after shut up in Devizes by Waller, where he defended himself until relieved by the victory of Roundway Down on July 13. He was created Baron Hopton of Stratton. But his successes in the west were cut short by the defeat of Cheriton or Alresford in March 1644. After this he served in the western campaign under Charles's own command, and towards the end of the war, after Lord Goring had left England, he succeeded to the command of the royal army, which his predecessor had allowed to waste away in indiscipline. It was no longer possible to stem the tide of the parliament's victory, and Hopton, defeated in his last stand at Torrington (Feb. 16, 1646), surrendered to Fairfax. Subsequently he accompanied the prince of Wales in his attempts to prolong the war in the Scilly and Channel islands. He died in exile, at Bruges in Sept. 1652.

HOQUIAM (hō'-kwī-ām), a city of Grays Harbor county, Washington, U.S.A., on Grays Harbor, at the mouth of the Hoquiam river, 12m. from the ocean, adjoining the city of Aberdeen on the west. It is on the Olympic highway; is served by the Chicago, Milwaukee, St. Paul and Pacific, Northern Pacific and the Union Pacific railways; and has a municipal airport. The population was 2,608 in 1900; 10,058 in 1920; and was estimated locally at 15,500 in 1928.

The Port of Grays Harbor (see ABERDEEN), the greatest lumber-shipping port in the country, and one of the greatest in the world, is at the junction of the two cities, the terminals lying within the bounds of Hoquiam. The commercial and industrial interests of the cities are identical. Back of them, in the Olympic Peninsula, is the greatest remaining stand of evergreen timber in the country. Hoquiam has giant saw-mills; door, veneer and other woodworking plants; a steel foundry; and canneries handling fruit and vegetables, clams and salmon. The pulp and paper industry has begun to develop. In 1927 the output of the factories within the city limits was valued at \$20,000,000. Hoquiam is the gateway to the vast recreational area of the Olympic Peninsula, which contains Lake Quinault, the Olympic National Forest, Mount Olympus National Monument, and numerous sea-side resorts. The Quinault Indian Reservation is on the coast, to the north-west. Hoquiam was settled in 1882 and incorporated in 1889. The name is a modification of an Indian word meaning "hungry for wood."

HOR, MOUNT, the scene of Aaron's death, according to the Bible, and since the time of Josephus, generally identified with Jabal Hārōn, about 4,500 ft., near Petra. A shrine on the summit is said to cover the grave of Aaron, and is an object of pilgrimage to the surrounding tribes, but it is obviously of comparatively modern construction. This identification is challenged by many, and other localities have been suggested, e.g., J. Madāra, Hermon, etc.

See Numbers, xxxiii. 37 and xxxiv. 7, 8.

HORACE (65-8 B.C.), Quintus Horatius Flaccus, second only in fame to Virgil amongst those Roman poets whose work is still extant, was born on Dec. 8, 65 B.C., two years before the birth of Augustus Caesar, and ten years before the first invasion of Britain by Julius, in the Consulship of L. Aurelius Cotta and L. Manlius Torquatus. His works comprise four books of odes (*Carmina*), one of epodes, two of satires (or *sermōnes*), two of epistles, the *Carmen Saeculare*, and the letter to the Pisos called the *De Arte Poetica*. The main authorities for the facts of his life are the references in his own works, and a short essay by Suetonius. His birthplace was Venusia, a town on the borders of Apulia and

Lucania (*Lucanus an Apulus anceps*). He was the son of a freedman (*libertinus*), who received the name Horatius either because he was manumitted by one of the patrician family of Horatii or else because Venusia belonged to the Horatian tribe. To this father Horace owed a debt of gratitude which he has handed down to posterity in one of the pleasantest passages of his satires. The man was either a collector of taxes or of payments at auctions. He was not rich. His plot of land was unproductive. But he would not send his son to the school at Venusia to be educated amongst the children of the self-important local farmers and retired centurions. He took the boy himself to Rome, where he could receive a more liberal education, attended him to the schools, and so watched over his character and morals that, as the poet tells us, he preserved them from any taint of blame. (*Satires*, I., vi.) Under the name of Orbilius Horace has also rendered immortal one of his schoolmasters who grounded him by the free use of the cane in the Greek of Homer and the Latin of Livius Andronicus. From Rome the young student proceeded to Athens, then the university of the world. But he has left us no account of his residence in that city, nor of the academic courses in Greek poetry and philosophy of which he afterwards made such profitable use. He was still at Athens when the murder of Julius Caesar brought Brutus to Greece, and like other young Romans, Horace rallied to the republican cause. He appears to have proceeded with Brutus to Asia Minor, and when the army to resist Octavius and Antony was raised, he was given, despite his youth and inexperience (*imbellis et firmus parum*), the post of a military tribune, which entailed the command of a sixth part of a Roman legion. He fought in the battle of Philippi, 42 B.C., and has left it on record that he threw away his shield (*Od.* II. vii. 10), a playful reference to the defeat of his side which has been much debated by commentators, some of whom seem too apt to demand all the heroic virtues from any author who may form the subject of their notes. Horace speaks of himself as having been rescued, trembling, by Mercury, who wrapped him in a mist; and whilst, on the one hand, we need not press too closely a poet's description of his conduct during a rout, it is fairly obvious that a man of tact and humour would not boast overmuch of his bravery in defence of a cause which he afterwards forsook. Horace might, presumably, after Philippi, have joined the fleet of Sextus Pompeius, or have committed suicide. Happily he did neither, and was saved.

Of the circumstances in which he returned to Rome, after the amnesty granted by the conquerors, nothing is known, except that he found himself in want, "*decisis humilem pennis inopemque paterni et laris et fundi*" (*Ep.* II., ii. 50). His paternal property, that is to say, was confiscated, Venusia being one of the 18 cities awarded, after the Roman custom, to the victorious troops. He was on the wrong side in politics, and without friends, but he managed to secure the minor post of a scribe in the Quaestor's office. He also began to write verse. Poverty, he says, was his inspiration.

Paupertas impulit audax
Ut versus facerem.

Epist. II., ii, 51.

The meaning of these words has been questioned. It has been thought, but this must remain doubtful, that early satirical efforts of Horace, which have not come down to us, may have been directed against the new régime, and that it was not merely the friendship which he now formed with Virgil, Varius and Asinius Pollio which introduced him to Maecenas, but in part the wise policy of that lover of literature and friend of Augustus, who made a practice of disarming criticism by patronage. At least it is certain that in his first interview with Maecenas Horace felt confusion and shame (*Sat.* I, vi., 54). But this may have been the natural attitude of a freedman's son in talking to a lineal descendant of Etruscan kings. Maecenas at any rate, grew to like him, and they formed a friendship which lasted for life. Apart from frequent apostrophes and references in the poet's own work, we have a surer testimony in the dying words of the courtier to his imperial master:

Horati Flacci ut mei memor esto

Augustus also extended to the young writer his favour and

confidence to so marked an extent that when in need of a secretary, he begged Maecenas to spare him his protégé: and when Horace declined, showed no resentment, but continued his efforts to gain the poet's good will. The attitude is characteristic of Augustus, but it marks also the estimation in which Horace came to be held during one of those comparatively rare periods of history in which monarchs and statesmen have possessed a genuine taste for literature. For Horace, if persuaded to the imperial cause, showed himself no effusive flatterer, and has deservedly won admiration for preserving a certain simplicity and independence of outlook in a Rome that was presently to become a forcing ground for sycophancy and corruption. Of his life, when established in the society of the capital, there are no outstanding incidents to be told. Maecenas gave him a small property among the Sabine hills, north-east of Tibur, which is still a place of pious pilgrimage even for many who have little knowledge of Latin verse, and this farm was the poet's delight:

satis beatus unicus Sabinis (*Od.* II., xviii., 14).

There he loved to retire, to meditate, to write, and to be far from indifferent to the flavour of wine. In Rome he was contented with a very modest establishment (*Sat.* I. vi. 114). An amused spectator of the pastimes and follies of the metropolis, he was a genuine lover of the countryside. He remembers fondly the resounding Aufidus, the familiar river of his youth, and in another place associates it with his hope of poetic immortality:

..... usque ego postera
crescam laude recens, dum Capitolium
scandet cum tacita virgine pontifex.
dicar, qua violens obstrepit Aufidus
et qua pauper aquae Daunus agrestium
regnabit populorum.

Od. III., xxx. 7

He tells us how in his childhood the wood-pigeons covered him with leaves when he was asleep on the hillside of Monte Voltore, and how the protection of the Muses enabled him to escape at Philippi the dangers of a falling tree, and shipwreck off Palinurus. He is never tired of alluding to the rustic surroundings that he loves, and of picturing himself in the enjoyment of them, of depreciating with mock modesty his own talents, his religious zeal (*parcus deorum cultor et infrequens*) of writing descriptions of his pleasant but homely feasts. In the city we see him a late riser, reading a little, playing at ball, bathing and dining, strolling round the Circus or the Forum, vastly interested in fortune-tellers, in sorcerers, an observer of life rather than an eager pursuer of luxury and fashion.

He never married. It was not very fashionable, nor, we may say, very necessary, among literary men of the period to do so. He describes himself, at the age of 44, as being short, prematurely grey, fond of basking in the sun, quick-tempered but easily appeased. He was also stout. Augustus (if we are to believe Suetonius) mentioned this, together with his shortness of stature, in a jesting letter written to acknowledge the receipt of one of his books.

That he made many friends, and held them in affectionate esteem, the number of odes which take the form of invitations to his country hospitality abundantly proves. Nor can the depth of his friendship be doubted:

Navis quae tibi creditum
Debes Virgilium, finibus Atticis
Reddas incolumem, precor,
Et serves animae dimidium meae.

Od. I., iii. 5

Virgil is his "other self." But his amatory addresses read often like exercises.

Of the many love affairs to which he alludes in his various writings, it may be safely surmised that some are imaginary, and those which have a foundation of truth were neither more reputable, nor more permanently disturbing to his emotions, than those of his pagan contemporaries. But he gives the impression of having outgrown in later life not only the violence of passion, but also the taste for dissipation, and having brought himself by degrees to find more delight in good company and philosophy than in the looser pleasures which at one time he certainly did not disdain.

Lenior et melior fis accedente senecta. (*Epist.* II., ii., 211)

His Epicurean philosophy seems to have been tempered in part by an occasional leaning towards Stoicism, in part by a genuine admiration for the simple virtues of the Sabine peasantry.

Quod si pudica mulier in partem juvet
Domum atque dulces liberos
(Sabina qualis aut perusta solibus
Pernicis uxor Apuli)
Sacrum vetustis exstruat lignis focum
Lassi sub adventum viri. *Epod.* ii.

He is a hedonist who moralizes on moderation and good sense, an agnostic with a touch of superstition—derived rather perhaps from his rustic origin than from any lingering reverence for the half-Hellenised mythology which he exploits so well.

He died in the month of November, 8 B.C. having almost completed his 57th year, of a sudden and severe illness which left him too weak to sign his will: but, according to a common custom of the time, he bequeathed by word of mouth his property to the emperor. He was buried on the extreme part of the Esquiline Hill, near the tomb of Maecenas, who had died about the middle of the same year.

Satires.—Of the permanent value of his poetry it is not easy to form a just estimate, because of the imitative quality of the task which he set himself and the limitations which it prescribed. He began as a writer of satires, the word *satira* or *satura* having at the time a technical significance in Rome. It was the only branch of Roman literature that was not formed on a Greek model (*satira quidem tota nostra est*, Quintilian, X., i., 93), although in the hands of Lucilius, its inventor, it already used a Greek measure, the hexameter, as well as the more native trochaic metre, for its expression. Lucilius aspired to be in Rome what the great Attic comedians had been in their age, but by writing direct satire instead of comedy. His works, except for a few fragments, have perished. Horace set out to adapt the hexameter, very rude and harsh in Lucilius, to the needs of satirical verse, and to embody therein his reflections on the Rome of his day. He succeeded marvellously in remoulding this heroic measure to fit the common speech demanded by his theme, and the facility with which Juvenal followed him in its use shows how well the work had been done. But the satires of Horace have none of the prophetic rage of Juvenal. They pillory types—the miser, the legacy hunter, the parasite, the nouveau riche, but exhibit no philosophy of anger against the conditions of the age. Between the publication of the first and second books the poet had received from Maecenas the Sabine farm, and acquired also, it may be gathered, a circle of kindly and critical readers, for he complains that there are some who consider him too bitter, others who say that his work is without force and too easy to produce. (*Sat.* II., i., 1.) From the sixth satire of this second book we learn that his intimacy with Maecenas has now lasted for seven years, a further indication, perhaps, that he may have written previous works which do not survive, as the output, even if we add the Epodes, published a year before the second book, seems small in comparison with the length of time. On the other hand the date of composition of some of the Odes may be considerably earlier than their publication.

Odes.—The Epodes are in lyrical form. If they are the iambs to which Horace refers in the lines

Parios ego primus iambos
Ostendi Latio, numeros animosque secutus
Archilochi. *Epod.* I., xix. 25

it is difficult to justify his claim, since other Roman poets, notably Catullus, had preceded him. Nor can it be said that either the personal lampoons or the other subjects treated in these poems rival Catullus in elegance or power. His talent did not ripen so early. The completion of the Epodes as a book is to be dated not long after the battle of Actium. It is to the Odes to which we must turn for Horace's true title to lyric fame both in his own eyes and amongst critics of succeeding generations. Both form and impulse are here borrowed from the Attic founts. Anacreon and Simonides, Sappho and Alcaeus are the models, and sometimes, especially at the beginning of an ode, they are followed not merely in outline, but in detail. In this respect, however, they

differ in no way from the general body of Latin literature. No kind of verse, as is pointed out above, except satire was indigenous. The merit of Horace is to be decided by the extent to which, after the amazingly difficult task of taming his metres to the native tongue, he succeeded in showing feeling as well as rhetoric, beauty as well as grace.

His ingenuity, his subtle choice of epithets, his neat presentation of moral platitudes, have won the admiration of succeeding ages, established him as a text book in schools, and compelled the flattery of imitators and translators alike. The taste, the fancy, and the quality of playful irony which he brought to his work are not to be denied. But how far was he a great poet? Evidently he had not in his temperament the ardour of Catullus. He could never have reached the high solemnity of Lucretius or the strange mystical intensity of Virgil, if he had essayed the epic or the metaphysical muse. But he has not been altogether well served by his popularity. In the 18th century, when it was more important to write wittily than to write passionately, in the 19th century, when to have written as a gentleman for gentlemen, or for the sons of gentlemen, seemed a nobler thing than to be sublime, he acquired a prestige as a guide, philosopher and friend which must in any case have diverted attention from his more genuine claims. Furthermore, in the books of the Odes he mingles light themes with serious, or introduces into the same poem matters both grave and gay.

But where his subject allows, or, again, in moments of earnestness interrupting his frivolity, he well justifies a more serious consideration. To Ovid's mention of his rhythmical skill ("*numerous Horatius*"), and the tribute of Petronius, who praises him for his *curiosa felicitas*, justice compels us to add the *insurgit aliquando* of Quintilian. This quality of rising in a phrase above the playful or conventional nature of his theme appears particularly when he is stirred by a memory of the country in which he was born, of the country in which he lives, by a thought of the swift passing of years, the death of a friend, the greatness of the past history of Rome. He pretends to be a trifler, and, contrasting his aims with those of Pindar, writes:—

Ego, apis Matinae
More modoque
Grata carpentis thyma per laborem
Plurimum, circa nemus uvidique
Tiburis ripas, operosa parvus
Carmina fingo.

But in more than one place he shows a not unmerited confidence that he will survive as something more. In his Odes, even occasionally in his other writings, he may be called the poet *malgré lui*; and no repetition in grammar books can make us insensible to the true emotion of passages like

Animaeque magnae prodigum Paulum
or "dulce et decorum est pro patria mori," or the beautiful in memoriam containing the lines

Ergo Quintilium perpetuus Sopor
Urget

In the same way, if we need not look for the traces of real passion in his list of Lalages, Glyceras and Chloes, his affection for the

Fons Bandusiae splendorum vitro
and the music of running streams that almost recurs like a *motif* in the Odes, must remain.

Fies nobilium tu quoque fontium me dicente cavis impositam dicem
saxis, unde loquaces lymphae desiliunt tuae.

If the use of the Greek or Roman pantheon seems often an ornament for his verse, we are moved by all the sad beauty of paganism when he says:

Nos ubi decidimus
Quo pius Aeneas, quo dives Tullus et Ancus
Pulvis et umbra sumus.

The odes are of complicated structure. The metres used consist in the main of (1) combinations of Asclepiad verse, (2) of the Alcaic, (3) of the Sapphic stanzas. But there are several other experimental adaptations of minor importance used on single occasions. Four kinds of Asclepiad line are employed:—

(a) the lesser Asclepiad,

— — — — —
 "Maecenas atavis edite regibus";

(b) the greater Asclepiad,

— — — — —
 "Tu ne quaesieris scire nefas quem mihi quem tibi"

(c) the Glyconic,

— — — — —
 "Nil mortalibus ardui est";

(d) the Pherecratic,

— — — — —
 "Grato Pyrrha sub antro":

and these are used in several different combinations as the metrical arrangement of various odes. The Alcaic stanza used by Horace, as in

Justum et tenacem propositi virum
 Non civium ardor prava jubentium
 Non voltus instantis tyranni
 Mente quatit solida neque Auster.

differs slightly from the Greek original and the Sapphic stanza, e.g.,

Sume, Maecenas, cyathos amici
 Sospitis centum et vigiles lucernas
 Perfer in lucem: procul omnisesto
 Clamor et ira.

appears to have been wilfully altered or misunderstood, the Greek Sapphic, as we know it, being based on a central dactyl. Thus Sappho's

"φαίveraí μοι κήπος ἴσος θεῶν"

becomes in Catullus

Ille mi par esse deo videtur.

But Horace, by the almost invariable use of a different caesura, as in "*auream quisquis mediocritatem*," obtains an entirely different rhythm, less dignified, but more rapid than the Greek.

It is noteworthy that he chose it for the *Carmen Saeculare*, where, however, he occasionally returns to a Sapphic line a little nearer to the Greek use. This ode was written to be sung publicly by a chorus of youths and maidens in the great secular games exhibited by Augustus in 17 B.C. As a stately command performance it reminds us of Tennyson. The selection of Horace to write it makes it clear that he was now the established poet laureate of Rome, and we may perhaps infer from his adoption of the Sapphic stanza on this important occasion that it had proved the most admired and popular of those metrical adaptations which he had so long laboured to achieve.

Epistles.—The *Epistles* form in spirit a quiet end to Horace's literary career. They were written, like the *Satires*, in hexameter verse. They may not have been published later than the first three books of the *Odes* (about 20 B.C.) but it is fairly certain that many of the odes were written, and presumably circulated, before they were collected and placed together, whilst the fourth book of the *Odes*, probably as late as 13 B.C., contains poems written, on state occasions, like the *Carmen Saeculare*, at the emperor's request, and shows throughout, in spite of the sustained perfection of the style, some failure of inspiration. The *Epistles*, however, of their kind, are perfect compositions. They have grace, good sense and wit. They are at the same time more urbane and more polished than the *Satires*. They exhibit, as before, the light of an Epicurean with leanings to more serious convictions, the philosopher of the golden mean. But he is mellowed and calm. He discovers the prevailing fault of his age, as other satirists have discovered of later ages, to be the desire to grow rich rather than happy or wise, to sacrifice the ends of life to a reckless pursuit of the means of living.

The last few *Epistles*—that is to say, the two *Epistles* in the second book and the letter to the Pisos—have a literary theme. One is addressed to the emperor. It takes him to task, with great humility and delicacy, for his admiration of the old comedy. Horace is evidently the dictator of public taste. He had smoothed and made elegant the roughnesses of Lucilius, and is surprised and a little hurt that his imperial master should care for the crude plays of Plautus and Afranius. The bad taste in general of the Roman public is assailed. They prefer pomp and noise to beauty,

the spectacular to the sublime. The *De Arte Poetica*, left unfinished, seems to be written with the idea of dissuading one or other of the sons of Piso from becoming a poet. Let him understand the difficulties of the task, and if he must write, let him learn the primary laws of good composition. Above all things, let him remember the superiority of Greek originals.

vos exemplaria Graeca
 nocturna versate manu versate diurna.

Polished as the *Epistles* are, and interesting as a picture of contemporary life, they display Horace rather as a critic than as a poet. For the latter title he must rely almost entirely upon the *Odes*. But in considering the humour of his more pedestrian work, it is worth remembering, and this applies to *Satires* and *Epistles* alike, that his verbal wit is probably greater than at this distance of time we can appreciate. Not only may some of the happiest allusions to topical matters escape us, but in the very handling of the hexameter so as to fit it for the prosaic uses of everyday speech, there may be metrical felicities which we are not competent to gauge.

There are, in fact, two, if not three Horaces. There is the sedulous adapter. There is the ironical yet kindly man of the world, with a copious if not ambitious flow of criticism upon the manners of his time. The irony and culture are conspicuous throughout. But, half hidden, and almost as though his own humour kept the impulse in rein, there is the poet. Phrases, stanzas, sometimes a whole poem, stand out, and beyond precisosity we find inspiration. Lyric poetry in Rome died with his death, and there must certainly have been a spark of something rarer in him than mere metrical ingenuity or neatness of fancy to account for this absence of successors. To create his English equivalent, we should have to endow an Andrew Marvell with the wit and polish of a Pope.

None of the extant manuscripts of Horace are very ancient. The earliest date from the ninth century, though in the edition of Cruquius (Antwerp, 1598) there is reference to one, at least, of greater antiquity, destroyed in the sack of the Benedictine abbey of St. Peter at Blankenberg in 1566. For the best account of the mss. and editions of Horace, Dr. E. C. Wickham's edition of the *Odes* and *Epodes* should be consulted, as also for the textual notes. Dean Milman's edition of Horace's *Works* contains an excellent Life, and there are translations of the *Odes*, *Satires* and *Epistles* by Professor Conington. Readers are also referred to the *Horatii Opera* of T. E. Page. (E. V. K.)

HORAE, in Greek and Latin mythology the Seasons. In the *Iliad* (v. 749) they are the custodians of the gates of Olympus. In the *Odyssey*, they are represented as bringing round the seasons in regular order. The brief notice in Hesiod (*Theog.*, 901), where they are called the children of Zeus and Themis, who superintend the operations of agriculture, indicates by the names assigned to them (Eunomia, Dikē, Eirenē; i.e., Good Order, Justice, Peace) the extension of their functions from nature to the events of human life, and at the same time invests them with moral attributes.

At Athens they were apparently two in number: Thallo and Carpo, the goddesses of the flowers of spring and of the fruits of summer. In honour of the Horae a yearly festival (Horaea) was celebrated. In later mythology, under Alexandrian influence, the Horae became the four seasons, daughters of Helios and Selene, each represented with the conventional attributes. Subsequently, when the day was divided into 12 equal parts, each of them took the name of Hora.

BIBLIOGRAPHY.—See the articles in Daremberg and Saglio's *Dictionnaire des antiquités* and in Roscher's *Lexikon der Mythologie*; also L. R. Farnell, *Cults of the Greek States*, v., p. 426. (See also GRACES.)

HORAPOLLON, of Phaenobythis in the nome of Panopolis in Egypt, Greek grammarian, flourished in the 4th century A.D. According to Suidas, he wrote commentaries on Sophocles, Alcaeus and Homer, and a work (*Τερμενικά*) on consecrated places. Photius (cod. 279) calls him a dramatist as well, and credits him with a history of Alexandria. Under the name of Horapollon two books on *Hieroglyphics* are extant, which profess to be a translation from an Egyptian original into Greek by a certain Philip-pus. The translation is evidently late and has been ascribed to the 15th century. All that can be said is that there is evidence of

the hieroglyphic tradition being still alive in the days of the author.

See editions by C. Leemans (1835) and A. T. Cory (1840) with English translation and notes; see also G. Rathgeber in Ersch and Gruber's *Allgemeine Encyclopädie*; H. Schäfer, *Zeitschrift für ägyptische Sprache* (1905), p. 72.

HORATHI and CURIATHI, in Roman legend, two sets of three brothers born at one birth on the same day—the former Roman, the latter Alban—the mothers being twin sisters. During the war between Rome and Alba Longa it was agreed that the issue should depend on a combat between the two families. Two of the Horatii were soon slain; the third brother feigned flight, and when the Curiatii, who were all wounded, pursued him separately he slew them one by one. When he entered Rome in triumph, his sister recognized a cloak which he was wearing as a trophy as one she had herself made for her lover, one of the Curiatii. She thereupon invoked a curse upon her brother, who slew her on the spot. Horatius was condemned to be scourged to death, but on his appealing to the people his life was spared (Livy i. 25, 26; Dion. Halic. iii. 13–22). The origin of the story is obscure and disputed. It obviously contains a traditional origin for the right of appeal to the people. The root of the legend is probably in the *sororium tigillum*, the purificatory yoke under which Horatius had to pass.

HORATIUS COCLES, a legendary hero of ancient Rome. With two companions he defended the Sublician bridge against Lars Porsena and the whole army of the Etruscans, while the Romans cut down the bridge behind. Then Horatius threw himself into the Tiber and swam in safety to the shore. A statue was erected in his honour in the temple of Vulcan, and he received as much land as he could plough round in a single day. According to another version, Horatius alone defended the bridge, and was drowned in the Tiber.

E. Pais finds the origin of the story in the worship of Vulcan, and identifies Cocles (the "one-eyed") with one of the Cyclopes. He concludes that the supposed statue of Cocles was really that of Vulcan. He suggests that the legend arose from some religious ceremony, possibly that of throwing the stuffed figures called Argei into the Tiber from the Pons Sublicius on the ides of May. The Horatian family were connected with the worship of Vulcan.

See Livy ii. 10; Dion. Halic. v. 23–25; Polybius vi. 55; Plutarch, *Poplicola*, 16. For a critical examination of the legend, see Schwegler, *Römische Geschichte*, bk. xxi. 18; W. Ihne, *History of Rome*, i.; E. Pais, *Storia di Roma*, i. ch. 4 (1898), and *Ancient Legends of Roman History* (Eng. trans., 1906).

HÖRDE, a manufacturing town in the Prussian province of Westphalia, is 2 m. S.E. from Dortmund on the railway to Soest. Pop. (1925) 34,575. It has an old castle dating from about 1300. There are smelting-works, foundries, puddling-works, rolling-mills and manufactures of iron and plated wares. In the neighbourhood there are iron and coal mines.

HOREA, NICOLAS URSU, Rumanian patriot (1735?–85), was born in Zlatna, Transylvania, of well-to-do peasant stock and early appeared as champion of his nation (then serfs) against the dominant Magyars. He won renown as a notable agitator (*famosus seductor*) and paid three visits in this capacity to Vienna, where he had personal interviews with the emperor Joseph II. (whom he had met on the latter's visit to Transylvania in 1773) and secured his intervention in certain cases of oppression. In 1783 the peasants of Transylvania were in turmoil about the proposed transfer of part of their territory from noble rule to the Military Frontier system. Horea again visited Vienna; saw Joseph on April 1, 1784, and declared that unless the serfs were liberated they would rise and wipe out their oppressors. Joseph is said to have answered: "Thut Ihr das" (Do so), and to have given him a paper of secret instructions. Horea now set about organizing an army out of the peasants who were being conscribed and armed for the frontier regiments. This alarmed the authorities, who suspended the recruiting; whereupon, in Nov. 1784, hostilities broke out. This was probably not Horea's intention (he was thought to be organizing a general rising for May 1785); but he took command of his forces, some 10,000 men. At first the peasants genuinely believed themselves to be

fighting for the Emperor; but when their successes, and the complaints of the nobles, forced the Government to move regular troops against them Horea proclaimed himself "Emperor" and "King of Dacia." He was at last defeated and captured (Dec. 27, 1784). On capture he burned his mysterious paper. Convicted of high treason, Horea was broken on the wheel (Feb. 28, 1785). This mysterious episode was hushed up as far as possible, although the Rumanian peasantry of Transylvania continued to regard Horea as a martyr and liberator; but see Densusianu, *Revoluțiunea lui Horea* (Bucharest, 1884). (C. A. M.)

HOREB, the ancient seat of Yahweh, the tribal god of the Kenites, adopted by His covenant by Israel. This is the name preferred by the Elohist writer (E) whose work is interwoven into the Old Testament narrative, and he is followed by the Deuteronomist school (D). The Yahwistic writer (J), on the other hand, prefers to call the mountain Sinai (*q.v.*), and so do the priestly writers (P). This latter form became the more usual.

HOREHOUND. Common or white horehound, *Marrubium vulgare*, of the family Labiatae, is a perennial herb with a short stout rootstock, and thick stems, about 1 ft. in height, which, as well as their numerous branches, are coated with a white or hoary felt—whence the popular name of the plant. The leaves have long petioles, and are roundish or rhombic-ovate, with a bluntly toothed margin, much wrinkled, white and woolly below and pale green and downy above; the flowers are sessile, in dense whorls or clusters, small and dull-white, with a 10-toothed calyx and the upper lobe of the corolla long and bifid. The plant occurs in Europe, North Africa and West Asia to North-West India, and has been extensively naturalized in North America from Maine to British Columbia and southward to North Carolina, Texas and Mexico, being a common weed almost everywhere in California. In Britain, where it is found generally on sandy or dry chalky ground, it is far from common. White horehound contains a volatile oil, resin, a crystallizable bitter principle termed *marrubium* and other substances, and has a not unpleasant aromatic odour, and a persistent bitter taste. Formerly it was officinal in British pharmacopoeias; and the infusion, syrup or confection of horehound has long been in popular repute for the treatment of a host of dissimilar affections. Black horehound, *Ballota nigra*, is a hairy perennial herb, belonging to the same family, of foetid odour, is 2 to 3 ft. in height, and has stalked, roundish-ovate, toothed leaves and numerous flowers, in dense axillary clusters, with a green or purplish calyx, and a pale red-purple corolla. It occurs in Europe, North Africa and West Asia, and in Britain south of the Forth and Clyde, and has been naturalized into North America from Massachusetts to Pennsylvania.

HORGEN, town in the Swiss canton of Zürich, on the left shore of the Lake of Zürich, and by rail 10½ m. S.S.E. of the town of Zürich. Pop. (1920) 8,471. It possesses industrial establishments of various kinds, and is a centre of the Zürich silk manufacture. In 1406 it came into the possession of Zürich, with which it communicates by lake steamer, as well as by rail.

HORIZON, the apparent circle around which the sky and earth seem to meet. At sea this circle is well defined, the line being called the sea horizon, which divides the visible surface of the ocean from the sky. In astronomy the horizon is that great circle of the sphere the plane of which is at right angles to the direction of the plumb line. Sometimes a distinction is made between the rational and the apparent horizon, the former being the horizon as determined by a plane through the centre of the earth, parallel to that through the station of an observer. But on the celestial sphere the great circles of these two planes are coincident, so that this distinction disappears. The *dip* of the horizon at sea is the angular depression of the apparent sea horizon, or circle bounding the visible ocean, below the apparent celestial horizon as above defined. It is due to the rotundity of the earth and the height of the observer's eye above the water. The dip of the horizon and its distance when the height of the observer's eye above sea-level is h feet, are approximately given by the formulae: $\text{Dip} = 0.97\sqrt{h}$; $\text{Distance} = 1.17\sqrt{h}$ sea-miles. The difference between the co-efficients 0.97 and 1.17 arises from the refraction of the ray.

HORMAYR, JOSEPH, BARON VON (1782–1848), German statesman and historian, was born at Innsbruck on Jan. 20, 1782. He entered the foreign office at Vienna (1801), rose in 1803 to be court secretary and, being a near friend of the Archduke John, director of the secret archives of the state and court. During the Tirolese insurrection of 1809 against Bavarian supremacy, Hormayr was the mainstay of the Austrian party, and assumed the administration; but, returning home without the prestige of success, he fell into disfavour both with the emperor Francis I. and with Prince Metternich, and when, in 1813, he tried to stir up a new insurrection in Tirol, he was arrested and imprisoned at Munkács. In 1816 some amends were made to him by his appointment as imperial historiographer; but in 1828 he accepted an invitation of King Louis I. to Munich, where he became ministerial councillor in the department of foreign affairs. He was Bavarian minister-resident at Hanover (1832–37), and at Bremen (1837–46); superintendent of the national archives at Munich (1846–48). He died on Oct. 5, 1848.

Hormayr's history of the Tirolese rebellion (1817) is far from impartial; for he always liked to put himself into the first place, and the merits of Andreas Hofer and of other leaders are not sufficiently acknowledged. In his later writings he appears as a keen opponent of the policy of the court of Vienna.

See F. v. Krones, *Aus Österreichs stillen und bewegten Jahren 1810–1815; Biographie und Briefe an Erzh. Johann* (Innsbruck, 1892); Hirt, *Tiroler Aufstand* (1909).

HORMISDAS (d. 523), pope from 514 to 523, was a native of Campania. He obtained the reunion of the Eastern and Western Churches, which had been separated since the excommunication of Acacius in 484. After two unsuccessful attempts under the emperor Anastasius I., Hormisdas was able to come to an understanding in 518 with his successor Justin. Legates were despatched to Constantinople; the memorial of the schismatic patriarchs was condemned; and union was resumed with the Holy See. Hormisdas secured Dionysius Exiguus to translate the Apostolic Canons and also renewed the Gelesian decretum. His memorials and briefs are printed in Migne's *Patrol. Lat.* vol. 63, in *Corpus script. eccl. Vindobon.*, vol. xxxv., and in A. Thiel, *Epistolae Rom. Pont. i.*

HORMIZD or **HORMIZDAS**, the name of five kings of the Sassanid dynasty (see PERSIA: *Ancient History*). The name is another form of Ahuramazda or Ormuzd (Ormazd), which under the Sassanids became a common personal name; strictly it is an abbreviation of Hormuzd-dad, "given by Ormuzd."

1. **HORMIZD I.** (reigned 272–273) son of Shapur I., under whom he was governor of Khorasan, appears in his wars against Rome. In the Persian tradition of the history of Ardashir I., preserved in a Pahlavi text (Nöldeke, *Geschichte des Artachsir I. Pāpakān*), he is the son of a daughter of Mithrak, a Persian dynast, whose family Ardashir had extirpated because the magians had predicted that from his blood would come the restorer of the empire of Iran. Only this daughter is preserved by a peasant; Shapur marries her, and her son Hormizd is afterwards acknowledged by Ardashir. In this legend, partially preserved also in Tabari, the great conquests of Shapur are transferred to Hormizd.

2. **HORMIZD II.**, son of Narseh, reigned from 302 to 309. Of his reign nothing is known. After his death his son Adarnases was killed by the grandees; another son, Hormizd, was kept a prisoner, and the throne reserved for the infant of a concubine of Hormizd II. Hormizd escaped from prison and found refuge at the court of Constantine the Great. In 363 he served in the army of Julian against Persia; his son, with the same name, became consul in 366.

3. **HORMIZD III.**, son of Yazdegerd I., succeeded his father in 457. He had continually to fight with his brothers and with the Ephthalites in Bactria, and was killed by Peroz in 459.

4. **HORMIZD IV.**, son of Chosroes I., reigned 578–590. Some characteristic stories are told of him by Tabari (Nöldeke, *Geschichte d. Perser und Araber unter den Sasaniden*). Hormizd protected the common people and introduced a severe discipline in his army and court. When the priests demanded a persecution of the Christians, he declined on the ground that the throne and the government could only be safe if it gained the goodwill of

both concurring religions. Consequently he raised a strong opposition in the ruling classes. From his father he had inherited a war against the Byzantine empire and against the Turks in the east, and negotiations of peace had just begun with the emperor Tiberius, but Hormizd haughtily declined to cede anything of the conquests of his father. Therefore the accounts given of him by the Byzantine authors, Theophylact, Simocatta (iii. 16 ff.), Menander Protector and John of Ephesus (vi. 22), are far from favourable. In 588 his general, Bahram Chobin, defeated the Turks, but in the next year was beaten by the Romans; and when the king superseded him he rebelled with his army. This was the signal for a general insurrection. The magnates deposed Hormizd and proclaimed his son Chosroes II. king. In the war which now followed between Bahram Chobin and Chosroes II. Hormizd was killed by some partisans of his son (590).

5. **HORMIZD V.** was one of the many pretenders, who rose after the murder of Chosroes II. (628). He maintained himself about two years (631, 632) in the district of Nisibis. (Ed. M.)

HORMONES. Certain glands deliver their secretions on to a free surface by means of a definite orifice or duct. Two clear examples of this type are the mammary glands and the sweat glands. Others, however, have no duct, and the substances elaborated by the activity of the gland cells are discharged not on to a free surface but into the blood stream. Such glands are known as the ductless glands or glands of internal secretion. The thyroid gland, the parathyroids, the suprarenal glands and the pituitary gland are the most important examples of this type of endocrine organ.

In certain cases the two functions of producing an external and an internal secretion may be combined in the same gland. Thus the pancreas, in addition to delivering its external secretion the pancreatic juice into the duodenum via the pancreatic duct, also forms an internal secretion of great importance for the regulation of the sugar metabolism of the organism.

The substances produced by the activity of the cells of the ductless glands and discharged into the blood stream are characterized by the property of serving as chemical messengers, produced in one organ and carried in the blood to another where their effect is manifested. They enable a chemical correlation of the activities of the organism to be brought about through the blood, *pari passu* with that which is the function of the nervous system. To substances of this nature Bayliss and Starling gave the name "Hormones," derived from the Greek ὁρμῶν, "I arouse to activity."

It seems clear that this chemical correlation is the more primitive of the two methods by which co-ordination between different parts of the body is achieved. Starling has pointed out that in the lowest animals before the appearance of a central nervous system, it is by chemical means that co-adaptation of function is ensured. As examples he gives the movement of phagocytic cells toward an irritant, the chase for food and the approach of the gametes or sexual cells. In order that this relatively slow process may be applicable to a more complex organism, the development of a blood circulation is necessary, but before this occurs the need for quick responses has necessitated the setting aside of special reactive cells—the rudiments of a central nervous system. That the two methods of correlation, chemical and nervous, are intimately connected will be clear from the detailed account of the various hormones.

The type of evidence which is relied upon in assigning endocrine function to a particular organ may now be considered. In the main the evidence is obtained by two methods, the one being the observation of changes resulting from the partial or complete removal of the organ under consideration, either experimentally or by disease; the other by observation of the effects produced by administration of various extracts of the gland. Information of the first kind dates from the introduction of castration probably as a religious rite; that of the second type from the work of Schäfer and Oliver in 1894.

Although a positive result under either or both of these heads does not constitute a rigid demonstration that a gland produces an internal secretion or hormone, much of the evidence on which

several familiar organs are classed with the ductless glands is of this nature. As Hogben points out, to infer endocrine activity solely from the effects of removal of an organ "is hardly less unwarranted than to deduce from the manifest consequences of decapitation that the head secretes a hormone that maintains the rhythmical contraction of the heart."

Owing to the difficulty in demonstrating the presence in the blood of a hormone which may be of unknown chemical constitution and in minute amount, it is in certain cases necessary to rely on evidence of the type mentioned. The effects of removal of certain glands, or of injection of their extracts, are, however, so specific that, together with other indirect evidence, it is difficult to avoid the conclusion that their normal function is actually to elaborate, and discharge into the blood stream, a hormone which produces the specific effects observed.

Secretin.—The work of Bayliss and Starling in 1902 and 1903 on the regulation of the pancreatic secretion provides one of the best examples of the elucidation of the mode of action of a hormone. It had long been known, particularly from the work of Pawlow and his pupils, that the entry of the acid contents of the stomach into the upper part of the small intestine normally initiated the flow of pancreatic juice; and that the introduction of acid into the duodenum also induced pancreatic secretion. Bayliss and Starling showed that the results were still to be obtained when acid was introduced into a loop of gut completely separated from all nervous connections. The secretion of pancreatic juice could not therefore be due to nervous impulses; injection of acid into the circulation itself did not activate the pancreas.

There remained therefore the possibility that by the action of the acid on the cells lining the upper part of the gut a substance capable of exciting the pancreas to active secretion was liberated into the blood stream. This was tested experimentally and verified by Bayliss and Starling. The mucous membrane scraped from a strip of the upper end of the small intestine was ground with sand extracted with 0.4% hydrochloric acid and filtered. The filtered extract injected into the circulation of a dog gave rise to a flow of pancreatic juice about one minute after the injection. To the active substance in the extract the name secretin was given, its precursor in the mucous membrane being called prosecretin.

Along with the secretin there was also in the extract a substance—termed a "depressor" substance—which brought about a fall in blood pressure following the injection. Bayliss and Starling demonstrated quite clearly that the pancreatic activity could be brought about equally satisfactorily with an extract which showed no depressor activity as a result of treatment with alcohol. The flow of pancreatic juice was not therefore a secondary effect due to the disturbance of the blood pressure.

Further, they demonstrated that secretin was a specific substance elaborated by the cells of the mucous membrane of the intestine; it was not to be found in extracts made from other tissues of the body.

In 1903 they demonstrated that the extracts from the mucous membrane of the small intestine of many animals caused pancreatic secretion when injected into a dog, and that the control of pancreatic secretion by the hormone secretin was a mechanism which exists in many vertebrates. The complete demonstration that secretin is present in the blood of an animal after the introduction of acid into the duodenum was given simultaneously in 1903 by Fleig and Enriquez and Hallion.

The chemical structure of secretin is still unknown. Bayliss and Starling showed that the molecule of secretin was probably not large since it diffuses slightly through parchment paper, and found that it was easily destroyed by pancreatic juice and many metallic salts.

In 1926 J. Mellanby described a method for isolating secretin by absorbing the active substance by means of bile salts and suggests that secretin is a polypeptide; it is, however, not certain that secretin has yet been obtained free from impurity.

It must not be forgotten that pancreatic secretion can be brought about by nervous stimulation, and the question of the relative importance of the hormonal and nervous control of the pancreas remains to be decided. The different properties of the

juice obtained by these two methods of stimulation suggests that in the intact animal both mechanisms are involved (see DIGESTION).

Adrenalin.—Oliver and Schäfer in 1895 showed that an extract of the suprarenal glands contained a substance which when injected caused a large rise in the arterial blood pressure. They showed also that this "pressor" substance was present only in the medulla, and was absent from the cortex of the gland.

The active substance adrenalin was isolated in 1901 by Takamine and later by various workers shown to have the constitution $(OH)_2C_6H_3CHOH\cdot CH_2NH\cdot CH_3$; by the synthesis of this compound and the demonstration of its identity with the natural hormone the formula was finally established.

Natural adrenalin is optically active, rotating the plane of polarized light to the left. When a small amount of adrenalin is injected into the blood stream it produces constriction of almost all the small arterioles of the body with resulting rise of blood pressure. Its action, however, is not confined to the blood vessels but extends to all structures in the body which normally receive a nerve supply from the sympathetic nervous system. Thus it increases the force of the heart, inhibits the movements of the digestive tract and (in many animals) of the bladder; it may also produce sweating, erection of hair, contraction of the pregnant uterus and dilatation of the pupil. Adrenalin is an intensely active substance; 0.0025 milligram per kilogram of body weight, when injected into the circulation, produces a definite rise in blood pressure. At a dilution of 1:250,000,000 its effect on the vessels of the rabbit's ear could be detected. The exact point of action of adrenalin appears to be not on the true sympathetic nerve ending but on some receptive substance which lies between the actual nerve ending and the muscular fibre.

Owing to its constrictor effect on the blood vessels, adrenalin has proved of great value in checking haemorrhage when applied locally. It is probably more valuable in preventing than in checking haemorrhage, and is largely used in intranasal surgery. Its effect is, however, very temporary. The remarkable relationship between the hormone of the suprarenal medulla and the sympathetic nervous system has excited great interest; and it is worthy of note that Balfour showed in 1878 that developmentally the suprarenal medulla has the same origin as the sympathetic system. There is little doubt that adrenalin is discharged into the blood stream from the suprarenal medulla; indeed, its presence in the blood leaving the suprarenal gland has been clearly shown.

Cannon (1915) has collected a considerable amount of evidence that in states of violent emotion such as rage, fear or pain the output of adrenalin is considerably increased and by its action on the blood vessels and other tissues the reaction of the animal to these emotional conditions (in defence or in attack) are made more effective. Other workers, notably Stewart and Rogoff, have called into question the relation of such stimuli to the secretion of adrenalin. Whatever may be the final decision, it is clear that adrenalin is a hormone which is used only for special purposes, and there is no evidence that the suprarenal medulla plays a prominent or indispensable part in regulating the activities of the normal mammalian organism.

The cortex of the suprarenal gland, on the other hand, is indispensable to the life of the organism. In 1855 Addison described in man a fatal disease which is characterized by prostration, muscular wasting, vomiting and brown pigmentation of the skin, and showed that it was associated with disease or atrophy of the suprarenal glands. There is also evidence that overgrowth of the cortex in children is associated with sexual precocity and premature adolescence. Subsequent investigation has thrown little light on the functions of the cortex; it is not yet clear what are the relative parts played by loss of cortex or loss of medullary substance in the causation of the symptoms of Addison's disease, nor indeed is there any definite evidence that the cortex actually elaborates and discharges a hormone into the blood stream.

Thyroxin.—The importance of the thyroid gland to the organism was first realized from the observation that the gland was atrophied in the disease called myxoedema. The symptoms of this disease are obesity, thickening and dryness of the skin, loss of

hair, slowness of speech and mental processes; the respiratory exchange is diminished and all the metabolic changes in the organism are sluggish.

Deficiency or absence of the gland at birth results in a condition known as cretinism in which mental and physical growth is tremendously retarded. The cretin of 18 years of age may have the mental intelligence of a normal child of two or three. Extracts of the gland, or the whole gland itself, given by the mouth, lead to complete recovery in myxoedema and marked improvement in cases of cretinism. Further evidence of the connection between the thyroid gland and growth is provided by the remarkable effects of thyroid extract on the metamorphosis of tadpoles. Feeding tadpoles with thyroid gland causes a greatly accelerated metamorphosis, so that, compared with an untreated control, a minute frog results much before the usual time.

Operative removal of the thyroid gland in man or animals is frequently complicated owing to the presence in the thyroid substance of the parathyroid glands. If the latter are left undisturbed, typical myxoedema results from removal of the thyroid gland, and the myxoedema so produced is completely cured by feeding the gland or extracts of it.

The thyroid is hypertrophied in the disease known as exophthalmic goitre or Graves disease, and the symptoms are the reverse of those noted in myxoedema. The patient loses weight, the pulse rate is increased, the excretion of nitrogen and carbon dioxide is higher than normal, and the resting consumption of oxygen may be increased by 50%. There is also great nervous excitability and in severe cases protrusion of the eyeballs.

Chemically the interesting fact about the thyroid gland is that it has a high content of iodine. Kendall in America in 1914 succeeded in isolating a crystalline compound containing iodine to which he gave the name thyroxin. Thyroxin possesses all the characteristic activities of the gland itself and is to be regarded as the hormone of the thyroid gland. Kendall suggested a chemical formula for thyroxin (which contains 65% of iodine), but the recent work of Harington in 1926 and Harington and Barger in 1927 in England has culminated in the elucidation of its structure and a brilliant synthesis of the natural product.

Thyroxin is an extremely active substance and a dose of one milligram produces definite effects on the oxygen consumption of a normal individual at rest. Daily doses of 2-3 milligrams may increase this resting oxygen usage by 30% above normal, but no effect is produced until about five days after a dose has been given. The human thyroid gland is believed to produce about one milligram of thyroxin per day. Thyroxin can of course completely replace thyroid gland substance or thyroid extracts in the cure of myxoedema or in the treatment of cretinism.

Direct evidence of the presence of thyroxin in the blood stream is not yet available, nor is it at present known at what particular point or tissue thyroxin exerts its action.

It is evident, however, that the hormone exerts an important control over the metabolism of the adult body and over the processes of mental and physical development; in its absence normal growth does not occur.

The Parathyroid Hormone.—The evidence for the existence of a parathyroid hormone is much less conclusive than in the case of the thyroid. Such evidence as is available is derived solely from experiments on mammals and from clinical observations. Extirpation of all four parathyroid glands is followed in a few days by acute symptoms which are chiefly of nervous origin. The excitability of the central nervous system is markedly increased so that reflexes are more readily and more powerfully elicited than normal. At intervals muscular twitchings and spasms occur, probably as a result of the increased excitability of the motor nerve cells of the spinal cord.

The condition is known as tetany, and is frequently fatal, particularly in the case of carnivorous animals. Two hypotheses concerning this condition of tetany have been advanced. Noel Paton and his collaborators reached the conclusion that the tetany is due to accumulation of guanidine derivatives in the blood after removal of the parathyroids, and showed that the introduction of guanidine into the circulation of a normal animal produced symp-

toms similar to those observed after parathyroid removal. These views have not met with universal acceptance and MacCallum has drawn attention to the beneficial results of calcium administration in cases of parathyroid tetany, and to the fact that the tetanic symptoms are also characteristic of deficiency in the calcium content of blood. Various workers confirmed these suggestions and showed that after removal of the parathyroid glands there is a fall in blood calcium content, and that the fatal effects of the ensuing tetany in a carnivorous animal such as the dog can be prevented by the administration of sufficient quantities of calcium lactate. A new light has been thrown on the question following the success of Collip in 1925 in obtaining an extract from parathyroid glands which has a strong effect on the calcium content of the blood in normal dogs and in dogs which have had the parathyroid glands removed.

Injection of the extract raises the blood calcium in both cases; the rise is greater in the case of the animals from which the parathyroids have been removed. Continued injections not only raise the calcium content to a more normal level, but completely prevent the appearance of the tetany which is normally the sequel of loss of the parathyroids.

Further information is required before it can be assumed that the extract prepared by Collip contains the parathyroid hormone. It has yet to be shown that the power of raising the blood calcium is a specific property of the extract, or that under normal conditions the parathyroid glands liberate the active substance into the circulation.

The Pituitary Hormone.—The pituitary gland, like the suprarenal gland, consists of two main portions which are fundamentally distinct. One part is derived embryologically from the roof of the primitive mouth cavity and the other from an outgrowth of nervous tissue. This nervous outgrowth forms the pars nervosa of the adult pituitary gland. The other portion develops into the pars anterior, the main glandular portion of the pituitary, and the pars intermedia, a thin layer which invests the pars nervosa. The pars nervosa with its investment of pars intermedia are together known as the posterior lobe of the pituitary from which is made the familiar pituitary extract of therapeutics, while the pars anterior forms the anterior lobe.

Although it is the anterior lobe which microscopically is the glandular portion of the pituitary, yet it is from the posterior lobe that is obtained the extract which exercises so powerful an effect on a variety of bodily functions.

Though no definite active principle has yet been obtained from the anterior lobe, there is little doubt that it does exercise the function of producing an internal secretion. The evidence is clear that overgrowth of the anterior lobe of the gland produces in man the disease known as acromegaly. This disease is characterized by enlargement of the bones of the face, hands and feet. Where overgrowth of the anterior lobe of the pituitary occurs in early life, there is produced a condition known as gigantism, in which there is general elongation of the long bones of the body. Administration of anterior lobe substance to developing amphibian larvae has been shown by various workers to cause accelerated metamorphosis and growth, while A. M. Evans has recently by similar means succeeded in producing experimental gigantism in rats. Some workers, as a result of extirpation of the anterior lobe, claim that it is essential for the life of the animal. The results are confusing, but it would appear that removal of the anterior lobe in a young animal greatly retards growth, and stops sexual development.

A strikingly active extract can, on the other hand, be obtained from the posterior lobe. Oliver and Schäfer showed, as in the case of the suprarenal gland, that an extract having a powerful pressor action could be obtained from the pituitary gland. Later it became clear that this active principle was confined to the posterior lobe, and that with a second or subsequent injection the blood pressure actually fell. In other words, the pressor effect was replaced by a depressor effect. The depressor substance can be removed from the gland by alcoholic extraction, leaving a pure pressor principle behind. The evidence is satisfactory that this depressor substance is not a specific principle of the pituitary but

one which can be obtained from almost any organ of the body.

Effects of the Extract.—The pressor action of the extract is due essentially to a direct action on the plain muscle fibres of the arteries, causing them to contract. The action, unlike that of adrenalin, appears to have no relation to innervation. Indeed, in mammalia the action on the plain muscle of practically all organs is to stimulate it to contraction. In birds, on the contrary, the effect is to cause a fall in blood pressure. This is definitely not due to the non-specific depressor substance already mentioned, but is apparently due to the substance which in mammals gives the purely pressor reaction.

A second action is an effect on the secretion of urine. In anaesthetised animals the effect is an inhibition of the secretion of urine which lasts until the rise of blood pressure has passed its maximum, and is then followed by an increased flow of urine. It is to be regarded as a corollary of the general pressor effect; the primary inhibition being due to constriction of the blood vessels of the kidney along with those of the body in general, and the later increase to the disappearance of the constriction of the kidney vessels sooner than in other organs, so that a larger volume of blood passes through the kidney.

A third action of the pituitary extract, which is the basis of its commonest therapeutic application, was observed by H. H. Dale in England. This is its intense stimulating action on the plain muscle of the uterus. By the use of this test some idea of the astounding activity of this oxytocic principle can be obtained. Abel of Baltimore has obtained a preparation from the posterior lobe which is capable of causing powerful uterine contractions in a dilution of 1 in 100,000,000,000. As the product is probably still not pure the actual activity of the pure principle will be even more impressive.

Schäfer and his co-workers observed yet another action of the extract—the galactagogue action, a rapid outpouring of milk from the lactating mammary gland when the pituitary extract is administered intravenously. There is no evidence of an increased formation of milk and it is probably a squeezing out of milk already formed in the gland. It is doubtful whether this action is of any serious importance or is even a specific effect of pituitary extract.

The same remarks apply to the action of the extract in causing expansion of the pigment cells of the skin of the frog. The action is exceedingly delicate, but it is difficult to assign any functional importance to it in the mammal. More important is the effect of posterior lobe extract in checking the flow of urine following on the ingestion of water, and in reducing the abnormal flow of dilute urine in cases of the disease diabetes insipidus. This antidiuretic effect must be clearly distinguished from the effect on the kidney mentioned previously as probably a corollary of the pressor effect.

The final effect which must be mentioned is the control which the extract appears to exercise over the metabolism of carbohydrates. This is of such a nature as to act antagonistically to the rise of blood sugar caused by adrenalin, and to the fall in blood sugar produced by the pancreatic hormone insulin.

The question arises whether the effects described are due to various activities of a single principle or whether there are several distinct principles present in the posterior lobe extract. The evidence obtained from the distribution of these activities in extracts of different parts of the gland, and on the results of chemical fractionation of the extracts, makes it necessary to assume that there are at least three different principles. One combines the pressor and diuretic action, the second the oxytocic and galactagogue, and the third is the principle causing expansion of the pigment cells in the frog's skin. Whether the antidiuretic effect and the action on sugar metabolism are due to still other principles is not yet ascertained.

Evidence that the various principles found in extracts of the posterior lobe of the pituitary gland function as true hormones is as yet slight.

The pressor substance does apparently play a part in the normal maintenance of the tone of the blood vessels, since removal of the posterior lobe in the frog causes loss of tone and oedema. The observations of W. E. Dixon and F. H. A. Marshall also suggest that the oxytocic principle acts as a true hormone. They observed

that injection of an ovarian extract made towards the end of pregnancy brought about the appearance of an oxytocic principle in the cerebrospinal fluid. They suggest that the hormone reaches the circulation via the cerebrospinal fluid and is concerned in a mechanism for bringing into play the contractile mechanism of the uterus at the termination of pregnancy. The striking effect of the posterior lobe extract in checking the excessive secretion of urine in diabetes insipidus, and the fact that the latter is frequently associated with lesions of the pituitary gland, also suggest a hormonal control over some part of the kidney function.

Hormones of the Reproductive Organs.—The profound effects on the organism of removal of the testes have of course been known for centuries. In man castration in youth prevents the development of those changes—deepening of the voice, and growth of hair on the face and pubes—which normally occur at puberty. The body remains infantile and the accessory genital organs do not develop. In the adult, castration leads to atrophy of the accessory organs, and frequently to obesity.

The same general effects are found in animals. Castration prevents the appearance of such secondary sexual characters as the comb of the cock and the antlers of the stag. It has been shown conclusively by many workers that transplantation of the testes under the skin of a castrated animal results in a normal development of these secondary sexual characteristics. Indeed so marked is the effect that if testes are transplanted into animals congenitally female, the secondary male characters may develop. Examination of these transplanted testes reveals the fact that the spermatogenic tissue of the testes degenerates, but that, the tissue being between the spermatic tubules, the interstitial tissue persists.

That the testis when removed from its normal position and transplanted in an abnormal position, where it no longer possesses its usual nerve connections, still retains its influence on the secondary male characters and on the accessory sexual glands, is evidence of the clearest type that it secretes a hormone or hormones into the blood which act on other distant organs in the body. Injections of testicular extracts into castrated animals, although not so convincing, also support this conclusion. The interstitial cells are presumably the source of the internal secretion.

The idea of a connection between the testicular influence and rejuvenation has recently been revived by Steinach and others, particularly with reference to this interstitial tissue or "puberty" gland. The grafting into man of testicles from apes (the so-called "monkey glands") has been practised by Voronoff and others with resulting rejuvenation. Steinach also claims that rejuvenation can be brought about by section or ligature of the vas deferens which results in atrophy of the seminiferous tubules without interference to the interstitial tissue. Steinach indeed suggests that under these conditions the interstitial tissue increases in amount and attributes the resulting rejuvenation to this hypertrophy of the puberty gland. Although it is not easy to discriminate between improvement due to such causes as changed nutrition and environment, and suggestion, and that due to the operations described, it must be admitted that both vasectomy and transplantation of the testis lead frequently to a general improvement in condition which may be regarded as rejuvenation.

Removal of the ovaries in the human, before puberty, prevents the occurrence of menstruation, and their removal after puberty brings about the cessation of menstruation and the atrophy of the uterus. In animals, removal of the ovaries results in similar changes. The uterus degenerates and the cyclical changes (known as the oestrous cycle), which result in the animal coming on heat, also stop. If, instead of being completely removed, the ovaries are transplanted to an abnormal position, menstruation (or the oestrous cycle) continues and the uterus remains normal. Much recent work suggests that the onset of heat in mammals is closely connected with the activity of the cells lining the follicle in which the ripening ovum is found. It has been shown by Allen and Doisy that "heat" can be induced in rats, after removal of the ovaries, by injecting an oil they obtained from the liquid contents of the ovarian follicles. Other workers have confirmed and extended their results.

The ovarian hormone (for such it must be regarded) is an oil soluble in alcohol, ether and chloroform. Its chemical nature is not yet known. The possible connection between the ovary and the uterus through the intermediation of the pituitary gland has already been mentioned. After the discharge of the ovum from the ovarian follicle, the cavity of the latter is filled with a mass of cells known as the corpus luteum. In pregnancy this corpus luteum persists for a considerable period. There is general agreement that this organ is responsible for changes which occur in the uterus and mammary glands during pregnancy. Although the actual hormone has not been isolated, there is a considerable amount of evidence that the corpus luteum exercises this control by means of an internal secretion.

Inter-relations of Hormones.—Various theories on the inter-relations between different hormones and ductless glands have been advanced. There are indeed certain features which suggest a balance or interplay of activities. Carbohydrate metabolism is influenced by insulin, the pancreatic hormone, by the thyroid in overactivity, in acromegaly, and by the injection of adrenalin. Growth is affected by the internal secretion of the testis and by the cortex of the suprarenal gland, and arrested by the absence of the thyroid secretion. The anterior lobe of the pituitary gland has also a great influence on growth processes. The pituitary gland frequently enlarges as the result of thyroid removal, and thyroid enlargement may occur in acromegaly. The connection between the enlargement of the thyroid gland and the ovary is also well marked. Much speculation could be indulged in, but a clearer appreciation of the mode of action of the separate hormones is necessary before an adequate conception can be obtained of their normal inter-relations.

HORMUZ, an island in approximately 27° 4' N., 56° 28' E., in the Strait of Ormuz, 1½ m. from the coast of Persia, and 11 m. E.S.E. of Bandar Abbas. It has a perimeter of about 16 m. with a greatest length of 4½ m. and is composed of jagged hills of variegated hues of reddish purple and white of an average of 300 ft. in height, with one peak rising to 600 ft. The principal geological formations are rock-salt, red ochre and a greenish clay; a white encrustation of salt covers large areas. The barrenness of Hormuz is relieved only by a few *Kumar* trees and some small patches of barley or melons. Gazelle are the only wild fauna. The only permanently inhabited place on the island is the village of Hormuz, close southward of the site of the older city and comprising some 300 mat huts. It has a population which may rise to 1,000 males when the salt and oxide mines are being worked, but which falls to less than half in the summer when numbers migrate to the mainland, especially to Minab, for the date harvest or to escape the excessive heat. Persians predominate, but there are also Baluchis and Arabs. The water supply is from rain collected in pools or cisterns and is brackish and often very scanty even for so small a population.

Hormuz island is under the jurisdiction of the governor of the Gulf ports—but until recent years the revenues were farmed from the Persian Government for a fixed sum. The resources of the island are red oxide for export, and salt for local use; copper and iron ore are also present but are not worked. Red oxide (Hormuz red) has been an important article of export from Hormuz for centuries, and, since 1922, has been mined and exported under a concession granted to a Persian merchant. Shipments of this commodity, during the period 1921–27, averaged annually: 2,666 tons to the United Kingdom, 583 tons to the United States, 448 tons to India, and 5,000 tons were sent to Germany during 1926–7. For the better handling of the mineral a truck line has been constructed for some hundreds of yards along the shore.

Of the old and famous city which stood upon the promontory on the northern shore, scarcely anything of definite shape stands at the present day, except the old Portuguese fort, and much even

of that has been undermined and washed away by the action of the sea; but traces of buildings of massive foundations, constructed of stone quarried in the island, and a great number of ruined water cisterns remain.

The name Hormuz referred originally to a town on the mainland situated probably on Khor Minab, near the present day Minab in 27° 9' N., 57° 5' E. The earliest mention of this name occurs, it seems, in the voyage of Nearchus (325 B.C.) when that admiral anchored Alexander's fleet on the shore of Harmozia at the mouth of the Anamis (R. Minab) in Kirman, "in a country pleasant and agreeable and abounding in everything except olives." The foundation of the city which eventually arose here is ascribed to Ardashir Papakan, founder of the Sassanian dynasty, but it was only after the Arab conquest that it attained great prominence. It was situated one parasang (about 4 miles) from the sea on a river which ships ascended to the town. Idrisi, Istakhri and Muqaddasi describe the place as the chief market of Kirman. Indigo is mentioned as the most important product, and Yaqut states that this Hormuz had attracted all the trade of India. After about the year A.D. 1100 Hormuz was under a dynasty of Arab rulers, and subsequent to 1262 it came under the rule of the Ilkhani of Persia. Marco Polo twice visited the place, in 1272 and 1293, and describes the business of the port, particularly noting the export of horses. It cannot be certainly ascertained what brought about the transference of the mart from the mainland to the island. Abul Fida says the town was destroyed by the "Tartars," but the Mongol invasion hardly touched the coast of Kirman.

Be that as it may, the new settlement was established by Quth ud Din, on the island then known as Jerun or Zerun, and in spite of the unfavourable natural conditions, there arose a thriving centre of the world's commerce, from the 14th to the 16th centuries. The new Hormuz gradually superseded Qais (*q.v.*) as the most important emporium trade of the Persian gulf. Friar Odoric gives the earliest notice of the city which he describes as strongly fortified and abounding in costly wares. It was visited in the lapse of time by a number of other travellers from all of whom we infer that it was a fine city rising out of the sea and serving as a mart for all the products of India, which were distributed hence over all Persia. The princes of Hormuz at one time or another appear to have held sway over other islands of the Gulf and even over the shores of Oman. Nikitin, the Russian (*c.* 1470) conveys a similar impression of its importance and calls it "a vast emporium of all the World."

The appearance of the Portuguese in the Indian seas decided the fate of Hormuz. In 1507 the city was attacked by a Portuguese fleet under Albuquerque and partially subdued but it was not until 1514 that, having captured Goa and Malacca, Albuquerque returned and completed his conquest, and built a castle. For about a century, Hormuz remained practically in the dominion of Portugal, though the hereditary ruler, paying from his revenues a yearly tribute to Portugal (in lieu of which the latter eventually took the whole of the customs revenues) continued to be the instrument of government.

The rise of the English trade and factories, in the Indian seas, in the early part of the 17th century, led to constant broils and friction with the Portuguese; while the success of the East India Company in establishing trade relations with Persia only served to embitter the situation. Moreover Shah Abbas I. resented the Portuguese occupation of such a position as Hormuz within his dominions and was strongly desirous of obtaining the aid of English ships in attacking it. During 1620–1 the fleets of Portugal and of the East India Company more than once came into action in Indian waters, and in the latter year, the council of the company at Surat resolved on what was practically maritime war with the Portuguese flag, agreeing, though reluctantly, to lend the aid of their ships to the land forces of Persia, in an attack on the Portuguese. The combined forces first assaulted and destroyed the Portuguese fort on Qishm island and then turned their attention to Hormuz itself. The siege was opened on Feb. 18, 1622, and continued until May 1, when the Portuguese, after a gallant defence, surrendered. Hormuz never recovered from the blow.

The Persians transferred their establishments and material to Gombrun on the mainland, where Shah Abbas founded a port under the name of Bandar Abbas (*q.v.*), and in a few years Hormuz city was little more than a ruin.

HORN, ARVID BERNHARD, COUNT (1664–1742), Swedish statesman, was born at Vuorentaka in Finland on April 6, 1664, of a noble but indigent family. He served for several years in the Netherlands, in Hungary under Prince Eugene, and in Flanders under Waldeck (1690–1695). He was one of the generals of Charles XII. in the earlier part of the great Northern War. In 1704 he was entrusted with his first diplomatic mission, the deposition of Augustus II. of Poland and the election of Stanislaus I. Shortly after the accomplishment of this mission he was besieged by Augustus in Warsaw and compelled to surrender. In 1705 he was made a senator, in 1706 a count and in 1707 governor of Charles XII.'s nephew, the young duke Charles Frederick of Holstein-Gottorp. In 1710 he succeeded Nils Gyldenstolpe as prime minister. Both in 1710 and 1713 Horn was in favour of summoning the estates, but when in 1714 the diet adopted an anti-monarchical attitude, he gravely warned and ultimately dissolved it. After the death of Charles XII. (1718) it was Horn who persuaded the princess Ulrica Leonora to relinquish her hereditary claims and submit to be elected queen of Sweden. He protested against the queen's autocratic behaviour, and resigned both the premiership and his senatorship. He was elected *landtmarskalk* at the diet of 1720, and contributed, on the resignation of Ulrica Leonora, to the election of Frederick of Hesse as king of Sweden, whose first act was to restore to him the office of prime minister. For the next eighteen years he controlled both the foreign and the domestic affairs of Sweden, and it was owing to his care that Sweden so rapidly recovered from the condition in which the wars of Charles XII. had plunged her. Horn increased the influence of the diet and its secret committees in the solution of purely diplomatic questions, thus weakening the central government. In 1734, however, the opposition in the diet denounced his neutrality on the occasion of the war of the Polish Succession, when Stanislaus I., again appeared upon the scene as a candidate for the Polish throne; but Horn was still strong enough to prevent a rupture with Russia. Henceforth he was bitterly but unjustly accused of want of patriotism, and in 1738 was compelled at last to retire before the impetuous onslaught of the triumphant young Hat party. The rest of his life was spent at his estate at Ekebyholm, where he died on April 17, 1742. Horn in many respects resembled his contemporary Walpole. The situation of Sweden, made his policy necessarily opportunist, but it was an opportunism based on excellent common sense.

See V. E. Svedelius, *Arvid Bernhard Horn* (Stockholm, 1879); R. N. Bain, *Gustavus III.*, vol. i. (London, 1894), and *Charles XII.* (1895); C. F. Horn, *A. B. Horn: hans lefnad* (Stockholm, 1852).

HORN, PHILIP DE MONTMORENCY, COUNT OF (1518–1568), a man of illustrious descent and great possessions in the Netherlands, became in succession under Charles V. and Philip II. stadtholder of Gelderland, admiral of Flanders and knight of the Golden Fleece. In 1559 he commanded the fleet which conveyed Philip II. from the Netherlands to Spain, and he remained at the Spanish court till 1563. On his return he placed himself with the prince of Orange and Count Egmont at the head of the party which opposed the policy of Cardinal Granvella. When Granvella retired the three great nobles continued to resist the introduction of the Spanish Inquisition and of Spanish despotic rule into the Netherlands. But though Philip appeared for a time to give way, he had made up his mind to visit the opponents of his policy with ruthless punishment. The

regent, Margaret, duchess of Parma, was replaced by the duke of Alva, who entered the Netherlands at the head of a veteran army and at once began to crush all opposition with a merciless hand. Orange fled from the country, but Egmont and Horn, despite his warning, decided to remain and face the storm. They were both seized, tried and condemned as traitors, and were executed on June 5, 1568, in the great square before the town hall at Brussels. (See also EGMONT, LAMORAL, COUNT OF.)

See biographical notices in A. J. van der Aa, *Biographisch Woordenboek der Nederlanden* (Haarlem, 1851–79); J. Kok, *Vaderlandsch Woordenboek* (Amsterdam, 1785–99); also bibliography to chaps. vi. vii. and xix. in *Cambridge Modern History*, vol. iii., pp. 798–809 (1904).

HORN, English hero of romance. *King Horn* is a heroic poem or gest of 1,546 lines dating from the 13th century. Murry (or Allof), king of Sudenne (Surrey and Sussex?), is slain by Saracen pirates who turn his son Horn adrift with 12 other children. The boat drifts to Westernesse (Cornwall?), where the children are received by King Aylmer (Aethelmaer). Presently Horn is denounced by one of his companions as the lover of the king's daughter, Rymenhild (Rimel), and is banished, taking with him a ring, the gift of his bride and a talisman against danger. In Ireland he serves for seven years, and slays in battle the Saracens who had killed his father. Learning that Rymenhild is to be married against her will to King Mody, he returns to Westernesse disguised as a palmer, and makes himself known to the bride by dropping the ring into the cup she offers him, with the words "Drink to Horn of Horn." He then reconquers his father's kingdom and marries Rymenhild. The story of Horn resembles the legend of Havelok the Dane, and Richard of Ely followed the Horn tradition in the 12th century *De gestis Herewardi Saxonis*.

King Horn was re-edited for the Early English Text Soc. by G. H. McKnight in 1901.

HORN, a class of wind instruments primarily derived from natural animal horns, and having the common characteristics of a conical bore and the absence of lateral holes.

Modern horns may be divided into three classes: (1) the short horns with wide bore, such as the bugles (*q.v.*), and the post-horn. (2) The saxhorns (*q.v.*), a family of hybrid instruments designed by Adolphe Sax, and resulting from the adaptation of valves and of a cup-shaped mouthpiece to instruments of the calibre of the bugle. (3) The French horn, one of the most valuable and difficult wind instruments of the orchestra, having a very slender conical tube wound round in coils upon itself.

The French horn consists of four principal parts—the body, the crooks, the mouthpiece, and the slides.

(a) The *body* is the main tube, having a bore of the form known as *trunco-conical* measuring approximately 7ft. 4in. in length. The body is coiled spirally, and has at one end a wide-mouthed bell from 11 to 12in. in diameter, with a parabolic curve, and at the other a conical ferrule into which fit the crooks.

(b) The *crooks* are interchangeable spiral tubes of varying lengths, by attaching which to the mouthpiece the total length of the tube can be varied at will, and the pitch and key of the instrument thereby altered. The principle of the crook was known early in the 17th century, and it had been applied to the trumpet, trombone, and Jägertrummel before being adapted to the horn. From the crook, in turn, was developed the system of valves, which is but an instantaneous application of the same general principle to the individual notes of the harmonic series, each of which is thereby lowered a semitone, a tone, or a tone and a half as long as the valve remains in operation. The body of the horn without crooks is of the length to produce 8ft. C, and forms the standard, being known as the alto horn in C, which is the highest key in which the horn is pitched.

(c) The *mouthpiece* of the horn differs substantially from that of the trumpet. There is, strictly speaking, no cup, the inside of the mouthpiece being, like the bore of the instrument itself, in the form of a truncated cone or funnel.

(d) The *tuning slides* consist of a pair of sliding U-shaped tubes fitting tightly into each other, by means of which the instrument can be brought strictly into tune, and which also

act as compensators with the crooks.

Pitch.—The pitch of the horn, as of other wind instruments, depends almost exclusively on the length of the air-column set in vibration, but varies in accordance with the amount of blowing force employed.

As regards the fundamental tone, to set in vibration a column of air some 16 or 17 ft. long, is a feat of extreme difficulty; hence it is quite exceptional to find a horn-player who can sound the fundamental on the low C or B \flat *basso* horns.

The practical aggregate compass of the natural horns from B \flat *basso* at the service of composers therefore ranges (actual sounds)

Scale.—By means of hand-stopping, *i.e.*, the practice of thrusting the hand into the bell in order to lower the sound by a tone or a semitone, or by the employment of valves, this compass may be rendered chromatic almost throughout the range.

The valve system consists of valves or pistons attached to additional lengths of tubing, the effect of which is almost invariably to lower the pitch.

Horns are made with either two or three valves by means of which the pitch can be lowered at will a semitone, a tone or a tone and a half. The three devices—crooks, valves, and slides—are, it will be seen, all based upon the same principle, that of providing additional length of tubing in order to deepen the pitch of the whole instrument at will, and to transpose it into a different key. But valves and slides, being instantaneous in operation, give to the instrument a chromatic compass, whereas crooks merely enable the performer to play in many keys upon one instrument instead of requiring a different instrument for each key.

Timbre.—The *timbre* of the natural horn is mellow, rich and sonorous, and distinguished at the same time by a certain human quality which differentiates it from that of all the other members of the brass wind. But it may be noted that the timbre of the piston notes is more resonant and less pleasing than that of the open notes, probably owing to the fact that the strictly conical bore of the natural horn has in this case been replaced by a mixed cylindrical and conical one, as in the trumpet and trombone.

History.—The origin of the horn must be sought in prehistoric times, when, by breaking off the tip of a short animal horn, one or at best two notes, powerful, rough, unsteady, only barely approximating to definite musical sounds, were obtained. This was undoubtedly the archetype of the modern families of brass wind instruments, and from it evolved the trumpet, the bugle, and the tuba no less than the horn.

Before civilization had dawned in classic Greece, the Egyptian, Assyrian and Semitic races were using wind instruments of wood and metal which had left the primitive ram or bugle horn far behind.

Among the Romans there were four instruments known by the name of *cornu*: (1) the short animal horn used by shepherds; (2) the longer, semicircular horn, used for signals; (3) the still longer *cornu*, bent and carried like the buccina, which had the wide bore of the modern tuba; and (4) a small instrument like the mediaeval hunting-horn, or post-horn, with a single spiral turn. A terra-cotta model of one of the last named, slightly broken, but with the spiral intact, was excavated at Ventoux, in France, and is preserved in the department of Greek and Roman antiquities at the British Museum.

All these wind instruments, to which may be added the lituus or cavalry trumpet, and the long straight tuba, seem to have been used during the classic Greek and Roman periods merely to sound fanfares, and therefore, in spite of the high degree of perfection to which they attained as instruments, they scarcely possess any claim to be considered within the domain of music.

After the fall of the Roman empire, when instrumental music had fallen into disrepute, and had been placed under a ban by the Church, the art of playing upon such highly-developed instruments gradually died out in Western Europe. With the disappearance of the civilization and culture of the Romans the skilled crafts also gradually vanished, and the art of making metal pipes of delicate calibre and of bending them was completely lost, and had to be re-acquired step by step during the middle ages from

the more enlightened East.

During the middle ages the bugle-horn or bull's horn was extensively used as a signal instrument on land and sea (*see* BUGLE), by the night-watchmen in cities, in the watch tower of the feudal castle, and by foresters and huntsmen. The hunting-horn is generally represented as small and crescent-shaped in the hunting scenes which abound in illuminated mss. and early printed books, and when played it was held with the wide end curving upwards in front of the huntsman's head.

Music.—The earliest orchestral music for the horn goes back beyond the middle of the 17th century. Already, in 1639, Cavalli, in his opera *Le Nozze de Tito e Pelei* (act. i. sc. 1) introduced a short scena, "Chiamata alla Caccia" in C major for four horns on a basso continuo.

Cesti's operas of the same period likewise contain many passages evidently intended for the horn, although the instruments are not specified in the score, which was nothing unusual at the time. Later Lulli, in the incidental music for a ballet, *La Princesse d'Elide*, which formed part of Molière's divertissement, "Les plaisirs de l'île enchantée," written for a great festival at Versailles, on May 7, 1665, introduced a piece entitled "Les violons et les cors de chasse," written in much the same style as Cavalli's scena, by which, indeed, it is believed to have been inspired. The introduction of the natural horn into the orchestra of the French opera did not occur, however, until much later, viz., in 1735, in André Campra's *Achille et Deidamie*, and then only in a fanfare. In the meantime the horn had already won a place in most of the rising opera houses and ducal orchestras of Germany, and had been introduced by Handel into the orchestra in London in his *Water-music*, composed in honour of George I.

Horns were also employed by Bach, while it scarcely needs saying how largely they have been used since by modern composers from the time of Beethoven (who had an especial fondness for the instrument) onwards.

HORN. The weapons which project from the heads of various species of animals, constituting what are known as horns, embrace substances which are, in their anatomical structure and chemical composition, quite distinct from each other; and although in commerce also they are known indiscriminately as horn, their uses are altogether dissimilar. These differences in structure and properties were thus indicated by Sir R. Owen:—"The weapons to which the term horn is properly or technically applied consist of very different substances, and belong to two organic systems, as distinct from each other as both are from the teeth. Thus the horns of deer consist of bone, and are processes of the frontal bone; those of the giraffe are independent bones or 'epiphyses' covered by hairy skin; those of oxen, sheep, and antelopes are 'apophyses' of the frontal bone, covered by the corium and by a sheath of true horny material; those of the prong-horned antelope consist at their basis of bony processes covered by hairy skin, and are covered by horny sheaths in the rest of their extent. They thus combine the character of those of the giraffe and ordinary antelope, together with the expanded and branched form of the antlers of deer. Only the horns of the rhinoceros are composed wholly of horny matter, and this is disposed in longitudinal fibres so that the horns seem rather to consist of coarse bristles compactly matted together in the form of a more or less elongated sub-compressed cone." True horny matter is really a modified form of epidermic tissue, and consists of the albuminoid "keratin." It forms, not only the horns of the ox tribe, but also the hoofs, claws, or nails of animals generally, the carapace of the tortoises and the armadilloes, the scales of the pangolin, porcupine quills, and birds' feathers, etc.

Horn is employed in the manufacture of combs, buttons, the handles of walking-sticks, umbrellas, and knives, drinking-cups, spoons of various kinds, snuff-boxes, etc. In former times it was applied to several uses for which it is no longer required, although such applications have left their traces in the language. Thus the musical instruments and fog signals known as horns indicate their descent from earlier and simpler forms of apparatus made from horn. In the same way powder-horns were spoken of long after they ceased to be made of that substance; to a small extent lan-

terns still continue to be "glazed" with thin transparent plates of horn.

HORNADAY, WILLIAM TEMPLE (1854–). American zoological park administrator was born at Plainfield, Ind., on Dec. 1, 1854. He was educated at the Iowa State college. Having made a special study of zoology, he travelled extensively to collect specimens, visiting (1874–79) Florida, Cuba, the West Indies, South America, India, Ceylon, the Malay Peninsula and Borneo. From 1882 to 1890 he was chief taxidermist at the U.S. National Museum, Washington, D.C. In 1896 he became director of the N.Y. Zoological Park at The Bronx, New York city, from which position he retired in 1926. He was active in promoting game preserves and instigating legislation for the protection of wild life, having been instrumental in founding the Permanent Wild Life Protection Fund (\$105,000). For years he carried on a "war against the gamehogs of the Atlantic coast," in an attempt to preserve from extinction the vanishing species of mammals and birds which supply the legitimate game for North America. It was largely due to his action that the bison was saved from extinction on the American continent.

Hornaday wrote a number of fascinating works on animal life, among which may be mentioned *Two Years in the Jungle* (1885); *American Natural History* (1904); *Camp-fires in the Canadian Rockies* (1906); *Our Vanishing Wild Life* (1913); *Minds and Manners of Wild Animals* (1922); *A Wild Animal Round Up* (1925); *Wild Animal Interviews* (1928).

HORNBEAM (*Carpinus betulus*), a member of a small genus of trees of the family Betulaceae. The common hornbeam, or yoke-elm, *Carpinus betulus*, is indigenous in the temperate parts of western Asia and of Asia Minor, and in Europe, where it ranges as high as 55° and 56° N. lat. It is common in woods and hedges in parts of Wales and of the south of England. The trunk is usually flattened, and twisted as though composed of several stems united; the bark is smooth and light grey; and the leaves are in two rows, 2 to 3 in. long, elliptic-ovate, doubly toothed, pointed, numerous ribbed, hairy below and opaque, and not glossy as in the beech, have short stalks and when young are plaited. The stipules of the leaves act as protecting scale-leaves to the winter-bud and fall when the bud opens in spring. The flowers appear with the leaves in April and May. The male catkins are about 1½ in. long, and have pale-yellow anthers, bearing tufts of hairs at the apex; the female attain a length in the fruiting stage of 2 to 4 in., with bracts 1 to 1½ in. long. The green and angular fruit or "nut" ripens in Oct.; it is about ¼ in. in length, is in shape like a small chestnut, and is enclosed in leafy, 3-lobed bracts. The hornbeam thrives well on stiff, clayey, moist soils, into which its roots penetrate deeply; on chalk or gravel it does not flourish. Raised from seed it may become a tree 40 to as much as 70 ft. in height, greatly resembling the beech, except in its rounder and closer head. It is, however, rarely grown as a timber-tree, its chief employment being for hedges. The wood of the hornbeam is white and close-grained, and polishes ill, is of considerable tenacity and little flexibility, and is extremely tough and hard to work—whence, according to Gerard, the name of the tree. As a fuel it is excellent; and its charcoal was much esteemed for making gunpowder. In France the leaves serve as fodder. The tree is a favourite with hares and rabbits, and the seedlings are apt to be destroyed by mice.

The American hornbeam, blue or water beech, is *Carpinus americana*; the common hop-hornbeam, a native of the south of Europe, is a member of a closely allied genus, *Ostrya vulgaris*; the allied American species, *O. virginica*, is also known as ironwood from its very hard, tight, close-grained wood.

HORNBILL, the name given to a group of birds, from the horn-like excrescence (*epithema*) on the bill of most species; they form the family *Bucerotidae*, allied to the hoopoes and kingfishers. It is divided into the *Bucerotinae* or true hornbills and the *Bucorvinae* or ground hornbills, which contain but one genus, *Bucorvus*, confined to Africa.

In the helmet hornbill (*Buceros vigil*), the epithema is solid, but in all the other species is honeycombed with air spaces. Hornbills are found in Africa, south-eastern Asia and the Malay Archipelago. They live in flocks and feed mainly upon fruits

and seeds, though the larger forms will devour snakes and the smaller eat insects. They breed in holes in trees, laying large white eggs. When the hen begins to sit, the cock plasters up the entrance with mud, leaving only a small hole through which the hen receives the food he brings. This he casts up enfolded in the lining of the gizzard (C. W. Beebe, *The Bird*, 1907, p. 140). An account of a nestling hornbill is found in Wallace's *Malay Archipelago*.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY
THE GREAT PIED HORNBILL (*DICHO-CEROS BICORNIS*)

HORNBLLENDE is a member of the amphibole (*q.v.*) group of minerals. The name is now restricted to the sesquioxide-bearing members of the monoclinic amphiboles, hornblende occupying the same position in the amphibole group that augite occupies in the pyroxene group. The hornblendes have a complex and variable composition, their constitution being at present unsatisfactorily elucidated. In addition to the dominant molecules, $\text{Ca}(\text{Mg}, \text{Fe})_2(\text{SiO}_3)_2$, they contain variable amounts of Al_2O_3 , Fe_2O_3 and Na_2O , the last probably as $\text{NaAl}(\text{SiO}_3)_2$, but the manner in which the excess sesquioxides enter into their constitution is undecided. The crystals are usually prismatic with well-developed cleavages (110–110) at 56°. The colour is grey, green, brown or black according to the composition. Coloured varieties are usually strongly pleochroic. Some hornblendes contain significant percentages of titanium—as in basaltic hornblende, while others rich in soda are known as alkali-amphiboles (*see AMPHIBOLE*).

The optical extinction angles in the plane of symmetry are usually smaller than those of the corresponding pyroxenes. Hornblende is an essential constituent of many igneous and metamorphic rocks, being specially prominent in diorites, amphibolites and hornblende-schists. Exceptionally well-crystallized examples are known from the basalts of Bilin and Šchima (Czechoslovakia).

HORN-BOOK, a name originally applied to a sheet containing the letters of the alphabet, which formed a primer for the use of children. It was mounted on wood and protected with transparent horn. The wooden frame had a handle, and it was usually hung at the child's girdle. The sheet, which in ancient times was of vellum and latterly of paper, contained first a large cross—the criss-cross—from which the horn-book was called the Christ Cross row, or criss-cross-row. The alphabet in large and small letters followed. The vowels then formed a line, and their combinations with the consonants were given in a tabular form. The usual exorcism—"in the name of the Father and of the Sonne and of the Holy Ghost, Amen"—followed, then the Lord's Prayer, the whole concluding with the Roman numerals.

HORNBY, SIR PHIPPS (1785–1867), British admiral, was born on April 27, 1785, the son of Geoffrey Hornby, rector of Winwick (Lancs). He entered the navy in May 1797, and served with Captain Bligh until 1804, when he was promoted lieutenant of the "Excellent." He took part in various naval engagements in the Napoleonic wars, distinguishing himself in particular in the frigate action off Lissa (1811) under Admiral Sir William Hoste (*q.v.*). From 1816 to 1832 he lived in retirement, and was then appointed superintendent of the Royal Naval Hospital at Plymouth. He again went to sea in 1847, when he was made commander-in-chief in the Pacific. In 1851–2 he was a lord of the Admiralty, and became vice-admiral in 1854 and admiral in 1858. He died on March 19, 1867.

HORNCastle, a market-town in Lincolnshire, England, at the foot of the Wolds, at the confluence of the Bain and Waring streams; the terminus of a branch line of the L.N.E.R., 130 m. N. from London. Pop. of urban district (1921) 3,459. The manor of Horncastle (Hornecastle) belonged to Queen Edith in Saxon

times and was royal demesne in 1086 and the head of a large soke. Under Stephen it belonged to Alice de Cundi, a partisan of the empress Maud, and passing to the crown on her death it was granted by Henry III. to Gerbald de Escald, from whom it descended to Ralph de Rhodes, who sold it to the bishop of Carlisle in 1230. The see of Carlisle retained it till the reign of Edward VI. when it was granted to Edward, Lord Clinton, but was recovered in the following reign. In 1230 Henry III. directed the men of Horncastle to render a reasonable aid to the bishop, who obtained the right to try felons, hold a court leet and have free warren. An inquisition of 1275 shows that the bishop had, besides the return of writs, the assize of bread and ale and waifs and strays in the soke. Horncastle was a centre of the Lincolnshire rebellion of 1536. Royalist troops occupied the town in 1643, and were pursued through its streets after the battle fought at Winceby. Horncastle was never a municipal or parliamentary borough, but during the middle ages it was frequently the residence of the bishops of Carlisle. Its prosperity has always depended largely on its fairs, the great horse fair described by George Borrow in *Romany Rye* being granted to the bishop in 1230 for the octave of St. Lawrence, together with the fair on the feast of St. Barnabas. The three other fairs are apparently of later date. The church of St. Mary is mainly Decorated and Perpendicular, with some Early English remains and an embattled western tower. Queen Elizabeth's grammar school was founded in 1562. The prosperity of the town is chiefly dependent on agriculture and its well-known horse fairs. Brewing and malting, and leather dressing are carried on, and there is some trade in coal, iron and wood.

HORN-DANCE, a mediaeval dance, still celebrated during the September "wakes" at Abbots Bromley, a village on the borders of Needwood forest, Staffordshire. Men, each wearing a deer's skull with antlers, dance through the streets, pursued by a comrade who bestrides a mimic horse, and whips the dancers to keep them on the move. The horn-dance usually takes place on the Monday after Wakes Sunday.

See C. J. Sharp, *The Sword Dances of Northern England together with the Horn Dance of Abbots Bromley* (1911).

HORNE, HENRY SINCLAIR HORNE, 1ST BARON CR. 1919 (1861-1929). British general, was born on Feb. 1, 1861. He joined the Royal Artillery in 1880 and served on the staff throughout the South African War (1899-1902). In 1912 he became inspector of artillery, and in Aug. 1914 went to France in command of the artillery of the I. Army Corps. At the end of 1915 he was given charge of the XV. Army Corps in Egypt and he took this to France in April 1916, commanding it during the opening phases of the battle of the Somme. His method of employing his guns during these operations attracted much attention and was signally successful, as was recognized by his being chosen in Sept. to succeed Sir C. Monro as leader of the I. Army. His troops took a prominent part in the battle of Arras, 1917, and when the enemy, in March and April 1918, made his great effort they repulsed all attacks that were made upon their front. Then, when the Allies' counter-offensive developed in the late summer, their part in the final victories was conspicuous. For his services he was raised to the peerage as Baron Horne of Stirkoke, and received a grant of £30,000. He held the Eastern command from 1919 to 1923, and retired in 1926. He received many honours, including the G.C.B. (1919). Lord Horne died on Aug. 14, 1929.

HORNE, RICHARD HENRY or HENGIST (1803-1884), English poet and critic, was born in London. He was entered at Sandhurst, but receiving no commission he joined the Mexican navy, and served in the war against Spain. In 1837 he published two tragedies, *Cosmo de Medici* and *The Death of Marlowe*, and in 1841 a *History of Napoleon*. The book, however, by which he lives is his epic of *Orion* (1843). It was published originally at a farthing, and passed through many editions. In a volume of critical essays, *A New Spirit of the Age* (1884), he was assisted by Elizabeth Barrett (Mrs. Browning), with whom from 1839 to her marriage in 1846, he conducted a voluminous correspondence. The years 1852-69 were spent in Australia, where he was a commissioner of lands. He received a civil list

pension in 1874.

HORNE, SIR ROBERT STEVENSON, G.B.E., 1920 (1871-), British statesman, was born at Slamannan Manse, Stirlingshire, on Feb. 28, 1871. Educated at George Watson's college, Edinburgh, and the University of Glasgow, he became, in 1895, lecturer in philosophy at University college, Bangor. Called to the Scottish bar in 1896, in 1910 he became a K.C., and stood unsuccessfully as a Unionist for Stirlingshire in both the general elections of that year. In the course of the World War he was appointed assistant inspector-general of transportation. In 1917 he was made director of the Admiralty department of Materials and Priority. In 1918 he became director of the Admiralty labour department, being also made third civil lord of the Admiralty. Later in the same year he was elected Unionist member for the Hillhead division of Glasgow. In 1919 he became minister of labour, and as such presided over the National Industrial Conference of February and April 1919. In 1920 he became president of the Board of Trade. In 1921 he was appointed chancellor of the exchequer in succession to Austen Chamberlain, in Lloyd George's Coalition ministry, but he did not accept office under Bonar Law or Baldwin. Instead he associated himself with the management of two or three large commercial undertakings, including one of the leading English banks and became an important figure in business circles. He was elected lord rector of Aberdeen university in 1921.

HORNE, THOMAS HARTWELL (1780-1862), English theologian and bibliographer, was born in London on Oct. 20, 1780, and educated at Christ's Hospital, with S. T. Coleridge as an elder contemporary. On leaving school he became clerk to a barrister, but showed a keen taste for authorship. As early as 1800 he published *A Brief View of the Necessity and Truth of the Christian Revelation*, which was followed by many works on very varied subjects. He was appointed (1824) senior assistant librarian in the department of printed books in the British Museum. After the project of making a classified catalogue had been abandoned, he took part in the preparation of the alphabetical one, and his connection with the museum continued until within a few months of his death on Jan. 27, 1862.

HORNED OWL, a name applied to an owl (*q.v.*) with tufts of feathers on the head simulating horns, and especially to the European eagle owl (*Bubo bubo*), and the American great horned owl (*B. virginianus*). Of the latter, several subspecies are recognized: the western horned owl (*B. v. pallescens*), the paler Arctic horned owl (*B. v. arcticus*), the dusky horned owl (*B. v. saturatus*) and the smaller Pacific horned owl (*B. v. pacificus*).

HORNED TOAD, the common name of North American lizards of the genus *Phrynosoma*. There are 17 species, of which 10 occur in the arid regions of the western United States and the remainder in similar situations in Mexico. They are short-legged, flat-bodied, harmless creatures of grotesque appearance. The hinder border of the head is armed with long, sharp, hornlike spines; the sides of the body and tail are often similarly protected. Upon these more or less erectile spines they depend chiefly for defence. The horned toads inhabit arid plains, deserts and dry forests, and feed chiefly upon insects. The eggs are retained within the body of the female until ready to hatch. The common horned toad (*P. cornutum*), one of the largest species, is about 6 in. long, with a body width of 2½ inches. It is abundant in high arid plains from western Nebraska and eastern Colorado southward to Texas. Other similar species, some of which are less than 4 in. long, are found from Wyoming to Washington and southward to Mexico.

HORNELL, a city of Steuben county, New York, 90m. S.E. of Buffalo, on the Canisteo river; served by the Erie and the Pittsburgh, Shawmut and Northern railways. The population was 15,025 in 1920 (92% native white) and was estimated locally at 16,500 in 1928. It is the trade centre for a wide agricultural area; has large railroad shops and woodworking industries; and manufactures silk gloves, silk cloth, shoes, furniture and electrical specialties. The aggregate factory output in 1928 was valued at \$15,000,000. A settlement was founded here in 1790, known as Upper Canisteo until 1820, when it was renamed Hornellsville in

honour of Judge George Hornell (d. 1813). It was incorporated as a village in 1852 and as a city in 1888, and in 1906 the name was shortened to its present form.

HORNEMANN, FREDERICK (1772-1801), German traveller in Africa, was born at Hildesheim. He was a young man when, early in 1796, he offered his services to the African Association of London as an explorer in Africa. In Sept. 1797 he arrived in Egypt, and, on Sept. 5, 1798, he joined a caravan returning to the Maghrib from Mecca, attaching himself to a party of Fezzan merchants who accompanied the pilgrims. Hornemann assumed the character of a young mameluke trading to Fezzan; he was accompanied as servant and interpreter by Joseph Freudenburg, a German convert to Islam, who had thrice made the pilgrimage to Mecca. Travelling by way of the oases of Siwa and Aujila, a "black rocky desert" was traversed to Temissa in Fezzan. Murzuk was reached on Nov. 17, 1798. Here Hornemann lived till June 1799, going thence to the city of Tripoli, whence in August of the same year he despatched his journals to London. He then returned to Murzuk. When he left Tripoli it was his intention to go direct to the Hausa country, which region he was the first European definitely to locate. A report reached Murzuk in 1819 that the traveller had gone to "Noofy" (Nupe), and had died there. Hornemann was the first European in modern times to traverse the north-eastern Sahara.

Hornemann's journal was printed at Weimar in 1801; an English translation, *Travels from Cairo to Mourzouk*, etc., with maps and dissertations by Major James Rennell, appeared in London in 1802.

HORNER, FRANCIS (1778-1817), British economist, born at Edinburgh on Aug. 12, 1778, was called to the Scottish bar in 1800. Horner removed to London in 1802, and occupied the interval that elapsed before his admission to the English bar in 1807 with researches in law, philosophy and political economy. In February 1806 he became one of the commissioners for adjusting the claims against the nawab of Arcot, and in November entered parliament as member for St. Ives. Next year he sat for Wendover, and in 1812 for St. Mawes, in the patronage of the marquis of Buckingham. He died at Pisa, on Feb. 8, 1817. As chairman of the parliamentary committee for investigating the depreciation of bank-notes, for which he moved in 1810, he extended and confirmed his fame as a political economist by his share in the famous *Bullion Report*. It was chiefly through his efforts that the paper-issue of the English banks was checked, and gold and silver reinstated in their true position as circulating media. Horner was one of the promoters of the *Edinburgh Review* in 1802. His articles in the early numbers of that publication, chiefly on political economy, form his only literary legacy.

See *Memoirs and Correspondence of Francis Horner, M.P.*, published by his brother in 1843.

HÖRNES, MORITZ (1815-1868), Austrian palaeontologist, born on July 14, 1815, at Vienna, where he was educated. He became assistant in the Vienna mineralogical museum. He studied the Tertiary mollusca of the Vienna Basin and on the Triassic mollusca of Alpine regions. He died in Vienna on Nov. 4, 1868. His son, **RUDOLF HÖRNES** (1850-1912), professor of geology and palaeontology in the university of Graz, carried on researches among the Tertiary mollusca. His *Elemente der Paläontologie* (1884) was translated into French. Another son, **MORITZ HÖRNES** (1852-1917), keeper of the Natural History museum in Vienna, carried out archaeological investigations in Bosnia and Herzegovina. Among his numerous works is *Natur- und Urgeschichte des Menschen* (2 vols., 1909).

HORNET, a name given to several species of large wasps (q.v.), especially the European *Vespa crabro* and North American *V. maculata*. (See SOCIAL INSECTS.)

HORNFELS, in petrology, the group designation for a series of rocks that have been partially or wholly recrystallized by the heat of intrusive igneous masses. Most hornfelses are fine textured and massive, recrystallization having effaced the structures and textures of the original rocks and replaced original minerals by new assemblages. They are the characteristic rocks forming the inner zone of the thermal aureole of alteration surrounding bosses or laccoliths of plutonic rocks. The commonest

types of hornfelses are derived from shales, impure limestones and basic igneous rocks. Shales give rise to brown or black hornfelses rich in biotite mica, andalusite and cordierite; while impure limestones give the "calc-silicate hornfelses" rich in pyroxene, garnet, idocrase or wollastonite. The hornfelses derived from basic igneous rocks are dark green types rich in felspar and pyroxene or monoclinic amphibole. These are the basalt or dolerite hornfelses. (See also METAMORPHISM.) (C. E. T.)

HORNIMAN, ANNIE ELIZABETH FREDERICKA (1860-), British theatrical manager, was born at Forest Hill, London, on Oct. 3, 1860. Educated privately, she studied art for a period at the Slade school under Professor Legros. At an early age she became interested in the theatre, and to the furtherance of this cause most of her subsequent life was devoted. Her first theatrical enterprise at the Avenue theatre, London, in 1894, was a failure. In 1904 she became associated with the Abbey theatre, Dublin, and subsidised the Irish National Theatre Society, which presented a series of plays by Irish dramatists dealing with various phases of Irish life. She will be chiefly remembered, however, for her institution in 1907 of the Repertory Theatre movement in Manchester. She acquired the Gaiety theatre, Manchester, in 1908 and converted it into a repertory house in which some of the best known plays of modern times were originally produced. In 1921 she relinquished her control as owner and conductor of this enterprise, after 14 years of unbroken success.

See P. P. Howe, *The Repertory Theatre: a Record and a Criticism* (1910).

HORNING, LETTERS OF, a term in Scots law. Formerly all decrees of court for payment of money might be put in execution by letters issuing from the King's signet. These signet letters were called letters of horning or letters of four forms. Under them the debtor was charged four times successively to make payment, but in the fourth charge he was called on either to pay or to enter himself in a specified prison. Failing implement of the fourth charge he was denounced rebel at the horn. The method of declaring a person a rebel was by giving three blasts on a horn and publicly proclaiming the fact; hence the expression "put to the horn." This system of execution was simplified by an act of 1837 (Personal Diligence Act), and execution is now usually by diligence. (See EXECUTION.)

HORNPIPE, originally the name of an instrument now obsolete and now the name of an English national dance. The sailors' hornpipe, although the most common, is by no means the only form of the dance, for there is a pretty tune known as the "college hornpipe," and other specimens of a similar kind.

HORNSEY, a municipal borough in Middlesex, England, 6 m. N. of St. Paul's Cathedral, on the L.N.E.R. Pop. (1921) 87,659. The manor, called in the 13th century *Haringee* (a name which survives as Harringay), belonged from an early date to the see of London, the bishops having a seat here. In 1387 the duke of Gloucester, uncle of Richard II., assembled in Hornsey Park the forces by the display of which he compelled the king to dismiss his minister de la Pole, earl of Suffolk; and in 1483 the park was the scene of the ceremonious reception of Edward V., under the charge of Richard, duke of Gloucester, by Edmund Shaw, lord mayor of London. The parish church of St. Mary, Hornsey, has a Perpendicular tower (c. 1500). Finsbury Park, of 120 ac., is within the borough. Hornsey was incorporated in 1903.

HOROSCOPE: see ASTROLOGY.

HOROWITZ, ISALAH (c. 1555-c. 1630), Jewish rabbi and mystic, was born at Prague, and died at Safed. He held various rabbinates, notably at Frankfort-on-the-Main (c. 1606) and at Prague (1614). From 1621 onwards he lived in Palestine. In 1625 he was imprisoned by the pasha but, on being ransomed, settled in Safed, at that time the home of Jewish Kabbala. Horowitz's largest work, *Shelah* (abbreviated from the initials of the full title *Shene luhoth ha-berit*, "Two Tables of the Covenant") is a compilation of ritual, ethics and mysticism. It has been often reprinted, especially in abbreviated form. His prayer book is also marked by cabalistic doctrines.

For an account of the Jewish mystics at Safed see S. Schechter,

Studies in Judaism, series II. (1908).

HORREUM, the Latin word for a magazine for the storage of grain. The storehouses of Rome were extensive, there being no fewer than 290 public *horrea* at the time of Constantine. They were used for the storage of food, being part of the great Roman system of providing food for the population, and were supplied constantly with corn and other provisions from Africa, Spain and elsewhere.

HORROCKS, JEREMIAH (1619–1641), English astronomer, was born in 1619 at Toxteth Park, near Liverpool. He was a student at Emmanuel college, Cambridge, from 1832–35; then he became a tutor at Toxteth and studied astronomy in his spare time. He calculated that, contrary to the prediction in Kepler's Rudolphine Tables, a transit of Venus would occur on Nov. 24 (O.S.) 1639. This was a Sunday, and Horrocks, acting at that time as curate of Hoole, rushed from his clerical duties just in time to see the transit take place. This was the first transit of Venus to be observed. Horrocks was a brilliant young man, and before his death on Jan. 3, 1641, when in his 22nd year, he had considerably advanced the lunar theory; reduced the solar parallax to 14"; suggested perturbations of the moon's orbit as due to the disturbing action of the sun; made observations of the tides; and investigated the irregularities of motion of Jupiter and Saturn.

Only a remnant of the papers left by Horrocks was preserved by the care of William Crabtree. After his death (which occurred soon after that of his friend) these were purchased by Dr. Worthington, of Cambridge; and from his hands the treatise *Venus in sole visa* passed into those of Hevelius, and was published by him in 1662 with his own observations on a transit of Mercury. The remaining fragments were, under the direction of the Royal Society, edited by Dr. Wallis as *Astronomia Kepleriana defensa et promota*, and published with numerous extracts from the letters of Horrocks to Crabtree, and a sketch of the author's life, in a volume entitled *Jeremiae Horroccii opera posthuma* (London, 1672). A memoir of his life by the Rev. Arundell Blount Whetton, prefixed to a translation of the *Venus in sole visa*, appeared at London in 1859.

Crabtree" in the *Palatine Note-Book* (with bibliography, 1883, also in *Notes and Queries*, Dec. 2, 1882). See also *Notes and Queries*, 3rd series, vol. v. (1864), 5th series, vols. II. and IV. (1874).

HORROCKS, JOHN (1768–1804), British cotton manufacturer, was born at Edgeworth, near Bolton. His father was the owner of a small quarry, and John Horrocks spent his early days in dressing and polishing millstones. The Lancashire cotton industry was then in its infancy. Horrocks obtained a few spinning-frames which he erected in a corner of his father's offices. For a time he combined cotton-spinning on a very small scale with stone-working, but finally devoted himself entirely to cotton-spinning, working the frames with his own hands, and travelling through the Lancashire manufacturing districts to sell the yarn. In 1791 he removed to Preston, where he began to manufacture cotton shirtings and long-cloths in addition to spinning the cotton yarn. By taking full advantage of the machinery invented for manufacturing textiles, and by rigidly maintaining the quality of his goods, Horrocks rapidly developed his business. Within a year of his arrival in Preston he erected his first large mill, securing shortly afterwards from the East India Company a monopoly of the manufacture of cottons and muslins for the Indian market. In 1801 the firm became Horrockses, Miller and Company.

HORS D'OEUVRE. Hors d'oeuvre in cookery is the name given to small appetising morsels of food generally served cold, such as caviare, creamed meat or fish masked with aspic, etc. These dishes are served at the beginning of a meal and may be either handed round or placed ready in front of the diner.

Many different kinds of food are used for making hors d'oeuvre dishes, e.g., meat, fish, vegetable or fruit. While some are "made-

up" dishes, other foods are served in a raw state, e.g., oysters. As far as possible, where "made-up" hors d'oeuvre are given, these should be prepared as complete portions so that they need no carving or cutting. Diminutive rolls, thin strips of pastry, toast or special small savoury biscuits are frequently used as *canapés* (foundations) for hors d'oeuvre mixtures. Sieved yolk of a hard-boiled egg, truffles, diced vegetables, aspic jelly, mustard and cress, parsley, etc., are among the many decorations used for these dishes.

Where vegetable salads are used as hors d'oeuvre a mayonnaise sauce mixed with aspic jelly is often employed as a coating. Stuffed hard-boiled eggs, jellied moulds of vegetables, fish, meat, etc., are other forms of hors d'oeuvre, also dainty sandwiches with a well-flavoured savoury paste.

Smoked and cured fish are popular forms of hors d'oeuvre, e.g., smoked salmon, anchovies. Strips of smoked salmon are occasionally spread with a savoury mixture and rolled. Anchovies may be boned and coiled round olives, etc. Prawns may be served *au naturel* by sticking them into a whole lemon. Crab and lobster meat form the basis of many creams, while bivalves, such as oysters or mussels, may be served with vinegar or lemon, a relish sauce, etc., and handed with brown bread and butter.

Hors d'oeuvre *varié* is a mixed dish of different kinds of foods, e.g., sardines, anchovies, olives, some form of galantine, slices of tomato, beetroot, etc.

HORSE, the name given to the well known domestic mammal, *Equus caballus*, and its wild representative, *Equus przewalskii*; the term is also used to include various fossil species and sometimes, more widely, for the whole family *Equidae* (q.v.).

ORIGIN AND HISTORY

Despite a great deal of antiquarian research and much ingenious speculation there remain a good many unsolved riddles connected with the origin and early history of the horse. The most complete series of fossils has been found in America. It appears, however, that the real birthplace of the tribe was in Asia, and that North America was populated by successive waves, which crossed over by the land-bridges existing in Tertiary times. (See *EQUIDAE*.) Horses survived in North America throughout the Pleistocene period, but at the end of that epoch the whole tribe died out, and the continent was not repopulated until the time of the Spanish occupation. Probably the same is true as regards South America. We can only guess at the cause of the extermination of the American horse. Food or climatic conditions can hardly have been concerned, for the other large herbivorous animals of the prairie survived and multiplied—the bison for example. Perhaps the likeliest explanation is that some insect-borne disease, like the tsetse fly disease of Africa, broke out and spread before the race had time to acquire immunity.

The other members of the *Equidae* (asses and zebras) are described in separate articles. There is no question of their specific distinctness from the horse. Hybrids of all kinds are easily bred, but there is no authentic case of fertility either in mules or in zebra-horse or zebra-ass hybrids.

The Wild Horse.—The only truly wild horse now in existence is that known as Prejvalsky's horse (*Equus przewalskii*), named after the Russian explorer, to whom was presented, in 1879, the first specimen known to science. This horse, or rather pony, is found in the Kobdo district of western Mongolia. It lives in small herds of five to 15 head, each under the leadership of an old stallion. In 1902 Karl Hagenbeck of Hamburg led an expedition to the Gobi and succeeded, with the help of some 2,000 Kirghis whom he mobilized, in capturing 32 foals. From these a good many specimens have since been bred, and *Equus przewalskii* has become a familiar object in zoological gardens. An average specimen is about 12 hands (4ft.) high. The head is very large and rather ungainly, with a small eye and generally a rather wicked expression. The mane is short and erect and the forelock wanting; the tail, too, is rather mule-like, with short hair on the upper part of the dock; the feet are rather narrow, as in the asses and zebras, but the ears are quite short, and there are, as in most horses, callosities or "chestnuts" on all four legs. The colour is

TYPES OF HARNESS, SADDLE AND DRAUGHT HORSES

1. Arab stallion, "Shahzada," winner of the third annual Arab horse endurance test; S. G. Hough, owner. An important saddle horse, the Arab is the finest of the Eastern breeds. It is a small horse, commonly about 14½ hands, with remarkable strength and endurance
2. Coach and driving horse, grand ch. "Bobby B." E. A. Darling, owner
3. Belgian mare, a draught breed. The modern Belgian, regarded as a direct descendant of the old Flemish heavy horse, is a massive animal weighing from 2,000 to 2,500 pounds with a height of about 17 hands. The body is short, the shoulders rather short and drooping, but the back is strong and the muscles well developed
4. "Hintlesham Agility," champion Suffolk stallion. Horace Packard & Sons, owners. The Suffolk is a draught breed built rather long and low with a massive body on comparatively slender legs. He displays indomitable pluck in draught and will continue to pull at a dead weight after most horses would jib
5. Harness horse
6. Coach horse. Horses bred for this purpose were brought to a high pitch of perfection during the pre-railway era

dun, darker on the back and legs, but becoming whitish on the under parts of the body. There is also a conspicuous light coloured ring round the muzzle and a black "eel-mark" on the back. The species interbreeds quite freely with domesticated ponies and the hybrids are fertile. Although *Equus przewalskii* is undoubtedly a horse, it is rather a primitive type, being less sharply differentiated from the wild asses than are the domesticated forms. No competent authority has ventured on any precise theory about the relationship of the wild species and our modern domesticated breeds. That Prejvalsky's horse represents the common ancestor of all the latter is highly improbable.

Wild horses were very common in Europe during the Old Stone age, and were hunted and killed for food by Palaeolithic man. Stacked in front of the cave of Solutr , near Lyons, there were found the bones of several tens of thousands of horses, all slain presumably by the inhabitants of the cave, who could scarcely have numbered more than half-a-dozen families. That the horses were wild seems likely from the fact that they were all killed young, mostly indeed as foals; and that they were used for food is clear from the circumstances that the remains are completely dismembered and the long bones split open for their marrow.

Domestication.—The wild horse is a denizen of the dry open steppes; it is therefore understandable that the improvement of the climate and the consequent increase of forest which marked the New Stone age in Europe should have led to a decline in the horse population. In any case bones of horses are rarely found in Neolithic deposits, which contain plentiful remains of oxen, sheep, goats, pigs and dogs. That all the latter species were domesticated at this time is beyond doubt; and the remains of the wild ox and wild boar are easily distinguishable from those of their domesticated relatives. The evidence as regards the horses is not very conclusive, but most probably these were wild. Bronze age deposits, on the other hand, contain plentiful remains of the horse as well as occasional bits and other accoutrements. In Babylonia the horse first appeared about 2000 B.C. It was introduced into Egypt by the Hyksos or shepherd kings who came from the north and east of Syria and conquered Lower Egypt in the 17th century B.C. In both these cases, it is to be noted, the horse was preceded by many centuries by the ox and the ass. From these facts and a few other scraps of evidence one may picture the first domestication of the horse as occurring in central Asia. Probably it was accomplished by a people of nomadic herdsmen, to whom the convenience of riding would be obvious. Sooner or later the mounted nomad came to realize the measure of his advantage over the man who travelled and fought afoot, and was encouraged to wander further afield, conquering as he went. In any case the horse (either as a charger or yoked to a chariot) became in very early times an important factor in war. The use of horses for the workaday purposes of transport and tillage is comparatively a modern development; in Britain, for example, oxen were the common plough animals until the end of the 18th century. Horse flesh seems to have been eaten by certain peoples throughout historic times and is still consumed in considerable quantities in several countries of Europe. Mares' milk, especially in the fermented form of *koumiss*, is used as a beverage by the Kalmucks.

On the subject of the origin and classification of modern breeds of horses there is no general agreement. Probably the whole of the oriental light-legged group, including the Arab, Barb and Turk, and indeed all the native races of Africa and Asia, are to be regarded as the descendants of one original Asiatic ancestor. This type was introduced into Europe by two routes—the one from Asia direct and the other via Africa and Spain—in early historical times, and played an important part in the formation of the light-legged breeds of western Europe. (See HORSE-RACING.)

It seems necessary to suppose that at least one other sub-species of horse was separately domesticated, a European forest type with large bones and broad feet, heavily built and probably hairy legged. This gave rise in particular to the early Flemish heavy horse, which in turn played an important part in the evolution of other heavy breeds like the Clydesdale and Shire. Prof. Cossar Ewart makes a third original group of the Celtic ponies, and postulates a separate wild ancestor for these.

BREEDS

From the point of view of the practical horseman the most satisfactory classifications are those based on utility considerations, the chief groups being heavy draught, harness and saddle. The two last are further divided, according to size, into horses and ponies, the line of distinction being drawn at about 14½ hands.

The most important of the heavy draught breeds are the Belgian, Shire, Clydesdale, Suffolk and Percheron.

Belgian.—The Belgian is regarded as the direct descendant of the old Flemish heavy horse, which was held in high repute during the middle ages as a charger. The modern horse is a massive animal, sharing with the Shire the distinction of reaching the greatest weights. Stallions in full flesh quite commonly weigh from 2,000 to 2,500lb. and occasionally more. The height is generally about 17 hands in the male, and 16.1 or 16.2 in the mare. The body is short, the shoulder often rather steep, and the quarter short and drooping, but the back is strong and the muscles everywhere strongly developed. The legs carry little long hair or feather, and the bone is somewhat round; the head shows little refinement and the temperament is rather sluggish. The Belgian is a useful agricultural horse and a capital animal for heavy dray work. The colours are various—bay, chestnut and roan being common.

Shire.—The Shire is descended from the old English Great horse or Black horse, which was valued in olden times principally for its ability to carry the enormous weight of the armoured knight. Various kings of England, from John to Henry VIII., were at considerable pains to foster the breed, and in particular to maintain its size. The Great horse was descended in part from the pre-Roman horses of the country and, in part, from larger and finer stock introduced mainly from Flanders. The modern Shire is the chief agricultural horse of England, occupying most of the country except the eastern counties and the extreme north, which are given over to the Suffolk and the Clydesdale respectively. The Shire is a large and heavy horse, stallions being generally over 17 and occasionally reaching 18 hands. The back is short and strong, the quarters heavy and powerful, and the whole body both deep and wide. The bone is large and the legs are covered with abundant long hair. Despite his weight the Shire is an active horse, trotting freely and easily when required. The traditional black colour is now less common than bay and brown.

Clydesdale.—The Clydesdale dates from the early part of the 18th century, and originated in Lanarkshire from crosses between the old local breed and horses introduced from England. Some of the latter were of pure Flemish stock, while others were of the early Shire type. The Clydesdale is of similar height to the Shire, but the general build is less massive, the legs being proportionately longer and the body neither so deep nor so wide. The head shows rather more refinement, the neck is more crested and the shoulder has often more slope, but the back is commonly longer and less strong. The bone, too, is smaller, and the "feather" or long hair is less abundant, being confined to the back of the leg. Broadly, it may be said that the Shire is stronger and has more endurance in heavy work than the Clydesdale, but the latter is somewhat faster, more agile, and more mettlesome. Clydesdales are of all the ordinary colours, bay and brown predominating.

Suffolk.—The Suffolk is less widely distributed than the Clydesdale and Shire, but is the common farm horse of Norfolk and Suffolk and of parts of the adjoining counties. Its origin is obscure, but it seems to be related to the other heavy breeds. The colour is uniformly chestnut and the limbs are free from long hair. The build is rather long and low, with a massive body on slender-looking rather than slender legs. The height is nearly a hand less than that of the Clydesdale, but the weight is often quite as great. The Suffolk is a hardy and long-lived horse, contented with plain fare and easily kept fat. He is also remarkable for indomitable pluck in draught, and will continue to pull at a dead weight long after most horses would jib.

Percheron.—The Percheron is so named from the old French district of La Perche, to which it is native. This district forms parts of the modern departments of Orne, Eure et Loir and

Sarthe. The breed contains a good deal of the same Flemish blood as the other heavy draught breeds, but modified by crossing with the Arab. Before the railway era the Percheron was bred largely for the stage coach, and although it has since those days been greatly increased in weight it is still hard limbed and active and able to keep up a steady trot for a considerable distance. The head is leaner and more refined than that of any other heavy draught breed, the ribs are very round and the feet shapely and sound though comparatively small. The height is about 16.2 hands in the male, or comparable to that of the Suffolk. The colour is most commonly some shade of grey, but black and bay occur. In the United States and Argentina the Percheron is the most popular of the draught breeds.

Harness Breeds.—Harness horses may be divided into two main types. On the one hand are breeds like the Hackney, the Yorkshire Coach, the Hanoverian and the Oldenburg, of considerable weight and strength and generally with high and stylish action; on the other hand, there is the light roadster type, represented by the American Standard Bred, in the breeding of which the main emphasis has always been placed on speed. The Hackney originated in the eastern counties of England during the period about 1800; an old local trotting breed, which formed the basis, being improved by the infusion of Thoroughbred blood. The Hackney was brought to a high pitch of perfection, as a strong and fast coacher, during the pre-railway era. Thereafter increasing attention was paid to symmetry and to stylish action and the breed supplied most of the fashionable high stepping carriage horses of Victorian days, but with the advent of the motor-car it lost a good deal of its commercial importance. The Hackney is a horse of 15 or 16 hands in height, with sloping shoulders, somewhat rounded quarters and hard, clean legs. The chief gait is the trot, in which considerable speed is combined with high knee and hock action. The Yorkshire Coach and Cleveland Bay are related breeds, somewhat taller and stronger than the Hackney, and with less extravagant action. The former is lighter in build and shows more Thoroughbred influence than the latter. The Cleveland Bay is indeed stout enough to be used for ordinary farm work; crossed with a Thoroughbred of suitable type it often produces an excellent weight-carrying hunter. The American Standard Bred, like many other breeds of light horses, owes a good deal to the English Thoroughbred; it has, however, been bred all along to trot or pace rather than to gallop. In the trot the legs are moved in diagonal pairs, *i.e.*, the right fore and left hind feet leave and meet the ground simultaneously. In the pace the two legs on the same side move together, as in a trotting camel. Most Standard Bred horses show a natural preference for one of these gaits, but can be easily trained to the other. Trotting and pacing matches run in "sulkies" and on hard cinder tracks have long been the popular form of racing in the United States. The speed attained is, of course, less than that reached by a galloping Thoroughbred, but is nevertheless very fast. The trotting record for the mile is just under 2 min., and the pacing record is nearly 5 sec. less.

Saddle Horses.—The most highly improved of the world's saddle horses are probably the English Hunter, the Arab and the American Gaited Saddle horse. The Hunter is a type rather than a breed. Many horses that are ridden to hounds are "clean bred," that is to say Thoroughbred. Others are the progeny of light cart or Cleveland Bay or half-bred or hunter mares by Thoroughbred sires, while others are of Hunter blood on both sides. Where, as is usual, a Thoroughbred sire is used for hunter breeding it is important that he be of large bone, short legged and with plenty of substance. The long-legged and "weedy" type of horse that is often successful as a flat racer is useless as a sire of commercial saddle horses, at least of those of the more valuable weight-carrying type. A good hunter must be able to show a fair turn of speed, must have strength and endurance enough to carry his rider for a long day across country, and should be comfortable to ride and easy to control in any of the four recognized gaits, the walk, trot, canter and gallop. The importance of hunter breeding is greater than that of hunting, for the bulk of cavalry and other riding horses are of the hunter type and are supplied from the same sources.

The Arab.—The Arab, though by no means the most ancient of the Eastern breeds, is the most highly improved, and is that which has exercised the widest influence on the horse-flesh of the world. The Arab is a small animal, commonly about 14½ and rarely exceeding 15 hands in height. The head is full of character and intelligence, with broad forehead and prominent eyes and nostrils. The shoulders are well sloped and the back short and strong, but the wither tends to be somewhat broad and low. The quarter is long and very level, the limbs hard and clean, the pasterns sloping and the feet small but strong. The common colours are white, grey, bay and chestnut, black being somewhat rare. The Arab has remarkable strength for his size and his endurance is rightly proverbial, but his speed has often been exaggerated; in the last respect he will not bear comparison with the thoroughbred or the American trotter. (J. A. S. W.)

The American Saddle Horse.—The American saddle horse is a distinct and recognized breed of the horse industry, dating from the organization of the American Saddle Horse Breeders' association at Louisville, Ky., in 1891. Antedating by many years, however, this organization of breeders, the five-gaited saddle horse was a necessary feature of farm life in the Blue Grass section of Kentucky and in many of the Central and Southern States. The early settlers who went over the mountains from Virginia into Kentucky, took with them at first horses without a developed gait, and of no particular breed. The Canadians had produced, by crossing on their mares of French descent stallions secured in New England and New York, a horse with a pace, or ambling gait, comfortable under saddle, and developed many years later into great speed in harness. A number of these Canadian mares and stallions were taken to Kentucky, and notably two, Copperbottom and Tom Hal, earned a large part in the saddle horse history of America. By the union of this Canadian blood with that of the native stock, and that of the thoroughbred and part thoroughbred which the Kentuckians were taking from Virginia, was produced the riding horse known universally in America, previous to 1891, as the Kentucky saddle horse. The five gaits which characterized the breed, and distinguished these horses from others were the flat-footed walk, the running walk (now often displaced by what is known as a "stepping," or slow pace), the trot, the canter and the rack.

Although the gaits of these earlier saddlers have been but little improved, their conformation has been radically changed. This has come about by the use of certain lines of thoroughbred blood, which modified and refined the physical appearance of these gaited horses. This thoroughbred part of the foundation is based on a "four mile" race-horse named Denmark, a son of Imported Hedgeford, an English bred horse taken to the United States in the early part of the 19th century. In later years another line of mixed trotting and thoroughbred blood, coming through Harrison Chief, has earned distinction in producing famous winners at the fashionable shows. That the saddle horse in America owes a large part of his ancestry to the racing thoroughbred is evidenced by an analysis of the pedigrees in the nine volumes of the *American Saddle Horse Register*, indicating that of the 27,000 pedigrees therein more than 90% contain thoroughbred blood.

At their best the American saddle horses are seen at the great exhibitions at Louisville, New Madison Sq. Garden (New York), Chicago, Kansas City, Los Angeles and other cities. Their average height is about 15 hands 2 in. and weight, 1,050 pounds. The neck is long, and gracefully arched. He differs, too, from the racing thoroughbred in being higher at the withers than over the hips, thereby relieving the rider of a feeling of pitching forward or "riding down-hill." The tail is curved and carried high above a line from the shoulders back. Among other famous saddle horses of the world are the Barb and the Turk and those of the Cossacks and Kalmucks. (C. M. T.)

Ponies.—The native ponies of Britain are mostly bred in mountain and moorland areas; they are, except in the case of one or two breeds, dwindling in numbers. The replacement of ponies by electric systems of haulage in mines is the chief cause of the lessened demand for these animals. The chief breeds are the Shetland, the Highland pony, the Dales and Fell breeds of the North

PHOTOGRAPHS: (1, 3) SPORT AND GENERAL PRESS AGENCY, LTD.; (2, 4, 5) H. A. STROHMEYER; (6) JAMES'S PRESS AGENCY

VARIOUS MEMBERS OF HORSE FAMILY

1. Shire Gelding, of a heavy draught breed, descended from the old English Great Horse, or Black horse. It is a large and heavy horse, the stallions being generally over 17 hands. The modern Shire is the chief agricultural horse of England
2. A Clydesdale stallion, grand ch. "Mainring," a draught breed, similar to the Shire, although in general less massively built. The head shows more refinement, the neck is more arched and the shoulders often have more slope
3. "Carburateur," a Percheron stallion. The breed is so named from the old French district of La Perche of which it is a native. In the United States and Argentina it is the most popular of the draught breeds
4. "King Larigo," grand champion Shetland stallion. Smallest of the ponies, the upper limit of size of this breed is $10\frac{1}{2}$ hands. Shetland ponies are often used as first mounts for children
5. A mule, a sterile hybrid between the horse and ass, differing from the horse in its smaller size, long ears, and the character of its tail, hair and markings
6. A zebra, African striped member of the horse family. It stands about 4 feet at the shoulder with fairly long ears, a tail with a tuft of hair, and a short erect mane. Ground colour is white and the stripes, absent only on abdomen and inside thighs, are black

of England, the Welsh, the Dartmoor, the Exmoor, and the New Forest. The Shetland is well known as the smallest of these, with an upper limit of size, for Stud Book and show purposes, of 10½ hands. Many mature ponies are under 9 hands in height. Shetlands are sturdy and sure-footed little animals and make excellent first mounts for young children. The Highland pony is of two types. The larger form, found on the mainland, is rather of the cart horse type and is a useful animal for farm work. He is also often used for carrying game during the shooting and stalking seasons. The lighter type is found mainly in the Hebrides and is used by the crofter as a pack horse, carrying a pair of creels. The Fell and Dales ponies are of very sturdy and rather heavy build, whereas the southern breeds are of saddle type, and when crossed with small Thoroughbred or Arab sires produce excellent riding ponies. In Wales there are three types, a small (11 or 12 hand) mountain pony, a rather larger lowland breed with some Hackney blood, and a still larger form showing both Thoroughbred and Hackney influence, and known as the Welsh cob. The Hackney pony is closely related to the Hackney and is, except in the matter of size, of very similar type. The dividing line between the two is drawn at 14 hands. Hackney pony sires were formerly much used for crossing with Welsh and other native mares to produce driving ponies. The Polo pony stands in the same sort of relationship to the Thoroughbred as does the Hunter, some ponies being "clean bred" while others are the progeny of selected small Thoroughbred sires and mares of various sorts, from pure native to those with a high proportion of Arab or Thoroughbred blood. Playing ponies need to be of great strength for their size, and the best type is well described as a weight-carrying hunter in miniature. Quickness and cleverness in turning and a high measure of intelligence are also essential. Ponies are trained to answer to the pressure of the reins on the neck, so that they may be perfectly controlled with one hand.

MANAGEMENT AND FEEDING

Horses are broken to ordinary work at two or three years old, but the rather elaborate training of a lady's hunter or a polo pony is rarely completed before the age of five or six. Length of life varies a good deal, but may be put, on the average, at a little over 20 years. Individual animals have been known to live beyond the age of 40. In the care of horses the four most important points are careful regulation of the diet, provision for an adequate amount of exercise, thorough grooming and regular shoeing by a skilled shoeing-smith. In Britain oats is the standard food-corn, but elsewhere barley, maize, gram and other cereals and pulses are used. The daily ration varies according to the size of the animal and the nature and severity of his work. A heavy dray horse in regular and severe work may require 20 lb. of corn per day, a medium-weight hunter 10 or 12 and a Shetland pony about 6 lb. The ration of hay is, on the average, about the same by weight as that of oats, less for animals on fast work and more for those on slow. Many horses are put to grass during summer, and although the change of diet is beneficial, a grass-fed animal is rarely fit for hard or fast work. An occasional feed of moistened bran and a daily swede or a few carrots are beneficial during winter. Horses must be fed at least three times daily. It is usual to chaff part of the hay and mix this with the corn, the remainder of the fodder being given in long condition. Horses should be allowed to drink freely before each meal. The amount of exercise required varies according to the condition that it is desired to maintain. A heavy draught animal will usually keep healthy on an hour's walk two or three times a week, whereas riding horses, if they are to be kept really fit, should have two hours of walk and trot exercise daily. Thorough and vigorous grooming is most important, especially if the horse is required for fast work; it not only keeps the pores of the skin open, but improves the tone of the muscles. Horses should be re-shod at intervals of four or five weeks, whether the shoes are worn or not, as the hoofs otherwise become overgrown. Even when a horse is unshod the feet require to be trimmed and dressed occasionally. Stables should be kept cool and freely ventilated, clipped horses being rugged up in cold weather.

FOSSIL HORSES

Fossil remains of horses have been found in the Pleistocene formations of all parts of Europe, Asia, Africa, North and South America, and these discoveries show the former wide distribution of the genus. Many of the remains found in the later Pleistocene of Europe and Asia have been referred to the domesticated species (*Equus caballus*), others to the ass and dziggetai (*E. hemionus*); and some South African fossils to the zebra. Most of the Old World fossils and all of those from the New World are referred to a large number of extinct species, only a few of which are sufficiently known and sufficiently distinct for characterization. The oldest and best known extinct species in the Old World is *Equus stenorhis*, found in the upper Pliocene and older Pleistocene of Europe; a species of medium size and proportions near to the lighter breeds of domestic horses, and with a variable tooth-pattern sometimes quite close to that of *Plesippus* of the American Upper Pliocene. It is regarded by Boule (1910) as including races ancestral to the ass, zebra and the domestic horse, and various intermediate forms have been described from the middle and later Pleistocene of Europe and Asia.

Many fossil species of *Equus* have been described from the Pleistocene of North and South America. Two of the North American species known from a series of complete skeletons are *E. scotti* of the lower Pleistocene of Texas and *E. occidentalis* of California. Both are about as large as an average-sized *E. caballus*, but *E. scotti* has more the proportions of a zebra, with relatively large head, deep jaws, short back and relatively small legs and feet. *E. occidentalis* is similar in these general features but differs in minor characters of teeth and skull. The same is true of *E. niobrarenensis* from the lower Pleistocene of Kansas. In general these species from the lower Pleistocene of North America are intermediate between *Plesippus* and the modern *Equus*.

The South American species of *Equus* are also in a rather primitive evolutionary stage according to Boule, but of several fairly distinct types. They occur only in the middle and later Pleistocene, following and finally superseding the aberrant short-legged horses of the *Hippidium* group. Both are invaders from North America, *Hippidium* probably derived directly from *Plathippus*, *Equus* through the intermediate *Plesippus*.

Very little is known of the fossil horses of Africa south of the Sahara, but they seem to be all nearly related to the modern zebras. No fossil *Equidae* are known from Australasia.

For the Tertiary ancestry of the horse, see *EQUIDAE*.

HORSE CHESTNUT. The name of a tree, *Aesculus Hippocastanum* (family Sapindaceae or listed by some authors as Hippocastanaceae) thought to be indigenous in Greece, but now scattered throughout the temperate regions of the world. There are 20 or more named species and varieties of the genus *Aesculus*. One, in particular, is called the common horse-chestnut, but all are popularly known as buckeye or horse-chestnut. Several species are shrubby, as *A. parviflora*, *A. discolor*, *A. georgiana* and *A. splendens*, but the majority are rapid growing, pyramidal trees attaining a height of 60 or more feet. They thrive well in moist sandy loam. The buds, conspicuous for their size, are protected by a coat of viscous substance impervious to water. The buckeyes are deciduous with large compound leaves and white, red or yellow flowers in terminal panicles. They blossom in May or June and the fruit, resembling the sweet chestnut, ripens about the middle of October. There is some disagreement as to uses to which the

fruit can be put, some even maintaining that it is poisonous. *A. glabra*, the American buckeye, in particular, is thought to have poisonous seeds and leaves. Most of the species have bitter flavoured seeds and bark, the bark being used for tanning. *A. californica*, *A. turbinata*, and *A. octandra* are known to bear edible seeds which are used as sweet chestnuts. The wood of the horse-chestnut is not particularly useful, but as ornamentals both the trees and the shrubby kinds are very valuable. (P. W. Z.)

HORSE GUARDS, ROYAL: see GUARDS and HOUSEHOLD TROOPS.

HORSEHAIR: see HAIR.

HORSE LATITUDES, the zones of high atmospheric pressure with calms and variable breezes along the polar edges of the belt of the trade winds (*q.v.*). The *New English Dictionary* gives two somewhat contradictory explanations of the origin of the name: one, that the calm kills horses on a sailing ship, the other, that the name signifies the unruly and boisterous nature of the winds of these latitudes compared with the pleasant trades. Neither explanation is generally accepted.

HORSE-MACKEREL or **SCAD**, a genus of fishes (*Caranx*) found in temperate and especially in tropical seas. Some 90 kinds are known, the majority being wholesome food; some species attain a length of over 3ft. The fish to which the name horse-mackerel is applied in Great Britain is *C. trachurus*. This species is found almost everywhere within the temperate and tropical zones of both hemispheres. The horse-mackerel, together with the American horse-head or ocean old-wife (*Argyrosus vomer*), the pilot-fish (*q.v.*), and the true mackerel (*q.v.*) and its allies belong to the division Scombriformes.

HORSEMANSHIP AND RIDING, the art of managing the horse from his back; controlling his paces and the direction and speed of his movements. In the 16th century Pignatelli at Naples founded his famous academy of horsemanship, and the Italian school was so generally recognized that Henry VIII. and other monarchs had Italian masters of the horse. The Continental *haute école* developed from the teachings of these early masters. The duke of Newcastle's *Méthode nouvelle de dresser les chevaux* (1648) was the standard work of the day, and in 1761 the earl of Pembroke published his *Manual of Cavalry Horsemanship*. The Austrians at the imperial stables at Vienna and later the French at Saumur continued the *haute école* system up to recent years.

FIG. 1.—(A) SIDE VIEW OF RIDER IN CORRECT POSITION. (B) REAR VIEW OF RIDER IN CORRECT POSITION

It, however, never really found favour in England. In a modified degree it is seen to-day at shows and at the Olympic games, as an example of extreme obedience and control of the horse. Though *haute école* produced handiness and dexterity, the horse lost the activity required by the English. The horse's head maintained a fixed profile with a lofty head-carriage, overbent at the poll and balance permanently back, thus becoming cramped in its action and losing its powers of extension and speed. The necessity of handiness, but not at the expense of speed, was recognized by horsemen in Great Britain. Consequently certain "aids" were

adopted from the *haute école* to obtain this desideratum. These "aids" exist in the British Manual of Cavalry Training, vol. i. As opposed to the *haute école* the modern conception of a horse's balance is as follows. "A horse is said to be balanced when his own weight (and that of his rider) is distributed over each leg in such proportion as to allow him to use his powers with the maximum ease and efficiency at all paces." The head and neck form

FIG. 2.—(A) CORRECT LEG POSITION. (B) CORRECT LEG POSITION IN ACTION

the governing factors in weight distribution, and it is by their position that the horse carries his weight forward or backward as his paces are extended or collected. Modern horsemanship includes: (a) learning to ride. (b) Making an animal handy as a hack or charger or for polo. (c) Schooling over fences. (d) Show jumping. (e) Riding to hounds. (f) Racing over fences or on the flat.

Riding for Beginners.—

From Norman times through the Tudor, Stuart and Georgian reigns up to the early part of last century, riding was considered an essential part of a gentleman's education. The introduction of

railways and later of motor cars has resulted in the retention of the riding horse merely for pleasure and sport. In spite of this there has been a large increase during recent years in the number of riders. All riding classes in horse shows are largely filled, including those for children, and in the hunting field the numbers have in no way diminished.

When mounting the rider should take up the reins in his left hand, at the same time holding a lock of the mane or the horse's neck above the withers with the same hand. Standing by the horse's near (left) shoulder facing the tail, he should hold the stirrup with the right hand for the reception of the left foot. Then place the right hand on the back arch of the saddle, spring off the right toe and drop lightly into the saddle.

The rider's seat depends upon balance and grip. It is essential for the beginner to get a good natural seat, comfortable and strong without being stiff. After gaining confidence, first at the walk, then at the trot and canter with the aid of the stirrups, the rider should dispense with the latter for short periods and develop both his balance and grip.

First of all, sit square to the front with the muscles relaxed, then grip with the flat of the thigh and the knee, the lower part of the leg parallel to the girth and the toes turned up. If the stirrups are now adjusted to support the foot in this position they will be at the required length. The body must be supple from the hips, swinging easily backwards and forwards as required or leaning over in the direction that the horse is turning.

Ride as far as possible with a long rein; a strong and well balanced seat independent of the reins is essential for good hands. The upper arm should be normally parallel to the body. The reins when held in both hands should be round the third or little finger. In the case of double reins the bit (curb) reins should be outside round the little finger, unless it is intended to ride more on the bridoon, in which case the position is reversed. The back of the hands should be towards the horse's mouth, and the wrists very slightly rounded. If the reins are held in one hand they are divided on one side by the little finger and on the other side by the forefinger. By turning the wrist towards the body the reins are shortened. A springy tension is obtained between the rider's hand and the bit, by (1) the fingers; (2) the flexion of the wrist; (3) the movement of the forearm from the elbow.

The beginner will find difficulty in retaining his stirrups, but must avoid the habit of lowering the toes. He must learn to press on the stirrup, the heel forced lower down than the toe, which should be at a natural angle as when walking. Pressure should be firmer on the inside of the stirrup next to the horse so that the

soles of the feet are turned slightly outwards. In this position, increased pressure on the stirrup strengthens the grip and the rider will not lose his stirrups.

At the trot rise with the action of the horse, leaning slightly forward; at the canter sit upright, keeping the loins supple, sufficient grip with the knee and thigh, and the leg below the knee vertical: at the gallop, shorten the reins, stand up in the stirrups,

FIG. 3.—USE OF LEGS. A.—GRIPPING WHILE RIDING: LEFT LEG, INCORRECT; RIGHT LEG, CORRECT. B.—AT REST: LEFT LEG, INCORRECT; RIGHT LEG, CORRECT

lean slightly forward and increase the grip with the knees. At all times keep as light a contact with the horse's mouth as is compatible with adequate control.

Handiness.—Handiness is the result of perfect balance in a horse whose movements are readily controlled by the rider. First obtain direct impulsion and free forward movement. To make a horse walk out, close the legs to his flanks and lightly feel the snaffle in his mouth. Occasionally teach him to diverge from the straight line by leaning the rein against his neck on the opposite side to the change of direction. Preferably work on undulating ground. Increased impulsion from leg pressure in conjunction with the voice and possibly the whip will induce the horse to trot. When free forward movement at these paces has been obtained, the horse can gradually be taught to move collectively by a change of balance. The head is raised by means of the snaffle, a pressure of the rider's legs keeping the hind limbs well under the horse to support the weight thus brought back. Later he must be taught to bend from the poll and relax his jaw by a springy feeling of the fingers on the curb bit rein, the head being kept raised by the bridoon. The reins control the horse's forehead and the rider's legs the hindquarters; the combination of both controls the whole mass. The next stage is lateral impulsion, when the horse is taught to move diagonally forward (half passage) to one hand. To move to the half-right, apply a strong pressure of the left leg, pressing the left rein against the horse's neck, the right rein bending and leading him in the required direction, the right leg applied as required to hold the horse up to his bit. He must be kept collected and the head bent in the direction he is moving. Reverse the aids to move diagonally to the left. To obtain lateral movement to either flank, accentuate the above aids. These lessons should be taught first at a walk, then at a collected trot and later at a canter. The next lesson is the canter, which is a collected pace. For example, to canter with the off-fore leading, there are two methods. Firstly, trot collectedly on a large right-handed circle, increase the tension of the reins and the pressure of both legs, the left leg the stronger, at the same time bend the horse's head slightly to the left. He will then canter with the off-fore leading. Later, or if the horse is inclined to disobey this aid, make him half passage to the right at the trot, accentuate the aids to

FIG. 4.—CORRECT CARRIAGE OF HANDS AND HANDLING OF REINS

increase impulsion, when he will break into a canter with the off-fore leading, then move forward on a straight line. Reverse the aids to canter with the near-fore leading. To change the leading leg at the canter check to a trot, half passage in the required direction as above and break into a canter. By degrees reduce the number of paces at the half passage until the horse changes direct at the canter from one leading leg to the other. He must now be taught to canter on a loose rein, occasionally increasing the pace and stretching his neck and fore-legs, again coming back to a collected canter, readily and smoothly adjusting his paces and balance and learning to control his momentum. He can now be taught to rein back one step at a time, being pressed forward at a walk, trot or canter in accordance with the aids applied. He must next be taught to turn on the haunches, the only correct way of turning sharply at fast paces. To turn to the right or right-about, lead the forehead round with the right rein, holding the horse up to the bit with the legs, lean the left rein against his neck, apply a strong pressure of the left leg to check a tendency of the hindquarters to move to the left, and thus keeping them under control, the horse consequently pivots the forehead round the hindquarters. Gradually accentuate the aids to sharpen the turn, reversing them to turn left-handed. The horse must now be taught to pull up on the haunches, by feeling the reins, the rider at the same time closing his legs and leaning his body back. This must be practised first at a walk and trot and later at a canter. When the horse has learnt to extend himself at the gallop and then come back to a collected canter, the halt from the gallop may be taught and finally the turn on the haunches from the gallop. Progress must be slow but progressive, and if the horse is not performing smoothly it is due to his training being hurried. Riding on a loose rein with short periods of

FIG. 5.—RIDER MOUNTING CORRECTLY WITH RIGHT LEG FULLY EXTENDED

collected work will teach him to relax his jaw to the curb bit. But the above syllabus must be executed first on a snaffle, then in a curb bit, again commencing at the first stage. The entire training may extend from six to eighteen months according to the temperament, condition and previous training of the horse. Patience and sympathetic handling are essential.

Schooling over Fences.—First lessons may be confined to jumping free in a lane, using a trained horse as a leader, or the youngster may be led in hand over small obstacles. Training must be progressive over small but solid fences and ditches. Later, when mounted, the rider should approach the fence at a collected canter with the reins in both hands. Three lengths from the fence lower the hands, still maintaining contact with the horse's mouth. Unless the horse is a naturally free jumper, close the legs to retain impulsion and to keep the horse's hocks under him. The rider should be sitting upright ready to lean forward as the horse takes off, his own weight being borne on the knees, thighs and stirrups, the leg below the knee being free to drive on the horse. As the latter raises his forehead, the rider inclines his body forward, his weight being approximately over the horse's centre of gravity. He must be prepared in mid-air

to give the horse more rein which the latter will require on landing. If the rider is leaning back at this period, he will upset the horse's balance and when jumping slowly he is liable to give the horse a chuck in the mouth as he is thrown back himself. This is known as the horse "jumping away" from his rider as opposed to the rider "going with" his horse. Schooling a youngster over simple fences the rider need not attempt to lean back. He can best assist

FIG. 6.—RIDER SHOWN COMING TO A CORRECT STOP

the horse by keeping his weight constant over the latter's centre of gravity (approximately the dees of the stirrup leathers). The lighter the horse's mouth the lighter the contact between hand and mouth. To strengthen the seat and ensure correct balance over fences it is advisable to ride about two inches shorter than is recommended to beginners and on no account must the knee be kept stiff.

Horses refuse from: (1) Pain of the jar on landing. (2) Heavy hands injuring the mouth. (3) Too severe a bit. (4) Fear of falling and lack of confidence. The cause once diagnosed, the remedy is obvious, rest and attention in the case of injury. Regain the horse's confidence, schooling over small fences if necessary in a snaffle. Concentrate on getting the horse to like jumping. Reward him, humour him, keep him quiet and unfurried. Only resort to punishment in extreme cases, after which it is essential to persevere and defeat a recalcitrant horse. If he runs out left-handed turn him sharply to the right and vice versa. If he takes off too close to his fences make use of a ditch or guard rail nine inches high and two to three feet from the fence. Normally he should take off not nearer than the height of the fence and not more than eight feet from it.

Show Jumping.—Practically the same procedure should be adopted, but the rider should exaggerate the leaning forward, thus minimising the risk of touching the fence with the hind legs. The horse must lower his head to give free play to his loins when jumping, the more easily to tuck up his hind legs. It further assists him to judge his take-off and adjust his stride. Never steady a horse too late so that he cannot lower his head. The exaggerated forward seat is permissible as normally there is no question of jumping at speed over a drop on to sticky landing, hence there is no risk of the rider being thrown forward of the horse's centre of gravity and both coming to grief. A good horseman on a well balanced handy horse can lengthen or shorten his mount's stride as required to take off correctly. This necessitates a high standard of training and horsemanship. Show jumpers improve with years and experience. Horses like Broncho and Combined Training, who jumped for England and won the King

George's Cup and the Championship at Olympia, were probably at their best when over twenty years old.

Riding to Hounds.—The seat is the same as for schooling over fences. Good horsemanship is essential for riding a young horse in a hunt. Never jump unnecessary fences, as it is unfair on the farmers and tiring to the horse. Hold your horse together over heavy ground, picking out the best going. Hold a gate open for the huntsman, shut it if you are the last to go through. Stand still when hounds check or are being cast, and if your horse has been galloping turn his head to the wind. Don't ride on the tail of hounds, but to a flank level with the tail hounds and preferably on the downwind side. Watch the leading hounds and the older ones in the body of the pack, who will generally put their more impetuous juniors right when scent is catchy. With regard to all fences, preferably select a sound take-off. Sail on at a low fence with a ditch beyond. With a ditch and possibly a blind one on the take-off, keep the horse collected up to the last few strides. Over trappy blind places it may even be advisable to jump from a walk or trot. Ride slowly over walls, timber and gates; i.e., pull back to a collected canter unless there is a wide ditch beyond. Over a drop, though the rider leans forward as the horse takes off, his body on landing should not exceed the perpendicular to the horse's back. An experienced rider can feel whether the horse's balance is such that he may possibly pitch on landing, in which case he can lean back, or he may find it expedient to lean forward should he anticipate his horse dropping his hind legs in the ditch. If in mid-air the rider is too far forward or too far back, he cannot adjust his position and balance as described above. If he lands with his body too far forward and the horse overjumps and pecks badly, the rider's weight is thrown forward of the horse's centre of gravity and both will come to grief. The horse must have freedom of his head to stretch his fore-legs over a wide place or to save himself if he has blundered on landing. Certainly the rider cannot keep him on his legs by holding him up with the reins. A horse that stumbles can be held together to prevent this, but when he has actually stumbled badly, freedom of his head admits a reasonable chance of recovery. Banks are encountered in many countries. They may have a ditch on one or both sides and may be crowned with a hedge. Invariably they should be ridden at slowly to prevent the horse attempting to fly them, and at the same time giving him time to change his legs at the top. He requires a free head to alternate his change of balance when negotiating banks. A line of pollards indicates the presence of a brook. If the hounds attempt to jump it, it is safe to assume that the horse can clear it. The rider must be determined or he will fail to inspire his horse for the effort. Pull the horse together about twenty lengths from the brook, preparing him to adjust his stride for the take-off, then send him on with increased pace the last few strides, holding him straight at the obstacle. Impetus must be maintained, and this will ensure clearing a good fifteen feet of water. Over dykes and big bottoms it may be necessary to crawl down one side, pop over the bottom and clamber up the far side. Obedience to the rider's leg is necessary for opening gates. Once unlatched, the horse can be trained to push open the gate, the rider giving the final push with the hook of his whip. When pulling back a gate with the latch on the left use the whip in the right hand, and vice versa.

FIG. 7.—DISMOUNTING IN THE USUAL MANNER

Racing over Fences.—Over hurdles the jockey keeps his weight constant over the horse's centre of gravity; viz., he adopts the modern seat of the flat race jockey, the weight being well forward over the pivot of the leading foreleg. This position

gives the maximum assistance to the horse. In steeplechasing over park courses, the same principles are adhered to, but to a lesser degree, as the rider must be prepared to lean back if a horse blunders. The impetus of a bold fencer to some extent counterbalances the leaning back of the rider's body, but to enable the horse to get away from his fence with the utmost speed after landing, the rider must be forward in the recognized position for galloping. Over Liverpool, horses often fall from hitting the fences, but even more frequently from over-jumping. Under these circumstances the so-called forward seat increases the chances of grief. Here the first essential is to keep the horse on his legs and the rider in the saddle. This applies especially to a fence like Becher's brook, where the horse descends over the big drop at such an angle that he may pitch forward on landing. It does not follow that a horse will fall over a drop if the rider is not sitting back. Over timber, for instance, the horse can see a drop on the far side and he can adjust his balance accordingly. But in this case he cannot, added to which there is the momentum derived from the speed of his gallop and the fact that he has stood well back from the fence. Much depends upon the horse and his particular style of jumping and the speed at which the fence is taken. Under the following conditions it is advisable to sit back:— (1) when a horse is inclined to over-jump himself especially when going at great speed. (2) When the landing is heavy. (3) When the drop comes as a surprise and the horse is not prepared to adjust his balance accordingly. Coming at his fences a chaser should extend his paces, stand well back and gain ground at each obstacle.

Racing on the Flat.—This is confined to light-weights. Good jockeyship entails early apprenticeship to get the necessary experience. At first a lad should ride on easy horses, attention being paid to the length of his stirrups and reins. The American jockey, Tod Sloan, was the first exponent of the modern racing seat in Great Britain. The advantages are as follows: (1) Wind resistance is reduced to a minimum. (2) The racehorse must advance his centre of gravity with the free extension of his head and neck to get full extension of his fore-limbs. Therefore the rider's weight must be proportionately advanced. (3) The leading foreleg at the gallop exerts the greatest effort, consequently a tired horse keeps changing his legs; the rider's weight being over the pivot of the leading foreleg reduces this effort. (4) At the same time the rider relieves the horse's loins of as much weight as he can to enable it to bring its hind legs as far forward as possible. By adopting this method he obtains the maximum of propulsion.

The lad first learns to sit still and obey orders. He next learns to keep his place on different types of horses, driving a sluggard, soothing and restraining an impetuous youngster, remaining quiet on a free but temperate horse. During this home training he develops a judgment of pace and learns to appreciate the peculiarities of different horses. If he is to become a successful jockey he must have brains, be keen, determined and in sympathy with horses. The latter quality is essential for good hands which alone can deal with a wayward animal. With these qualities he will develop confidence, and once endowed with this asset he is well on the road to success: smartly off at the start, with his horse instantly balanced in its gallop, seizing the opportunity of coming through his field, getting on the inside at the turns, keeping still when well placed and holding his horse together to make his final effort with a strong finish when required.

(G. Br.)

THE UNITED STATES

Riding, once the medium of transportation of men from place to place, has become in the 20th century in the United States solely a medium of recreation. As such it is increasing rapidly, there being from 300 to 500% more riders in and near cities in 1928 than there were in 1921. The first essential for riding is adequate facilities—that is, good bridle paths in city parks; riding trails near cities; and in suburban districts, where wealthy men have large estates, arrangements whereby riders from one estate may use trails on neighbouring estates. For such purpose swinging gates or panels are installed to permit easy passage of riders. This adds variety to the route—which is important, for when men and women must ride over the same path every day they sometimes grow tired of the sameness of scenery and terrain.

Chicago outranks other cities, except London, in excellency of bridle paths, its paths being broader, better constructed and better maintained than any others. Boston and New York have good paths through the public parks, and Washington's paths are good though somewhat narrow. One of the most beautiful stretches of bridle path anywhere extends through the Wissahickon natural park area in Philadelphia. Automobiles are forbidden in this area, which is an added attraction, for where riders are forced out upon paved highways in close proximity to speeding motor cars there is great danger of accident. St. Louis, San Francisco, Los Angeles and other cities also have built good paths and are steadily improving them. There is likewise amazing development throughout the country in riding trails—which are distinguished from bridle paths through the fact that they are natural trails leading over rights-of-way. Outstanding among these are trails on private estates about Piping Rock, L.I., Greenwich, Conn., Aiken, S.C., Oconomowoc, Wis. and public trails in forest preserves of Westchester county, New York, and Union and Essex counties, New Jersey.

The second essential to riding is good mounts, and in these there is wide variety of choice. Some prefer three-gaited saddle horses, some five-gaited, while those who play polo want mounts of the polo type. Still others, brought up in sections where hunting is popular, select their horses from hunter stock. The important thing is to get a horse that is sure-footed, light-mouthed and that will give the rider a pleasurable and safe ride.

(W. Dr.)

HORSE-NETTLE (*Solanum carolinense*), a North American plant of the nightshade family (Solanaceae), called also sandbrier, native to dry fields and waste places from western New England to Ontario and Nebraska and south to Florida and Texas. It is an erect perennial, 1 to 4 ft. high, armed with sharp yellow prickles, and bearing large more or less deeply-lobed leaves, light blue or white flowers, strongly resembling those of the potato, and orange-yellow berries, about $\frac{1}{4}$ in. in diameter. In sandy or gravelly soils the horse-nettle sometimes becomes a troublesome weed, spreading not only by its seeds, but also by its long underground rootstocks. (See SOLANUM.)

BY COURTESY OF IOWA GEOLOGICAL SOCIETY
THE HORSE-NETTLE (*SOLANUM CAROLINENSE*) OR SANDBRIER

HORSSENS, town of Denmark, at the head of Horsens Fjord, on the east side of Jutland, 32 m. by rail S.W. of Aarhus. Pop. (1925) 28,135. It is the junction of railways to Bryrup and to Tørring inland, and to Juelsminde on the coast. There is also a good harbour. The monastery and church were built in 1270 and there is a museum with a famous collection of stone-age material. There is much pleasure-boating on the fjord. The principal manufactures are textiles, tobacco, soap, engines, electrical apparatus, dairy produce and condensed milk. Organs are also manufactured.

HORSE-POWER. The device, frequently seen in farm-yards, by which the power of a horse is utilized to drive threshing or other machinery, is sometimes described as a "horse-power," but this term usually denotes the unit in which the performance of steam and other engines is expressed, and which is defined as the rate at which work is done when 33,000 lb. are raised one foot in one minute. This value was adopted by James Watt as the result of experiments with strong dray-horses, but, as he was aware, it is in excess of what can be done by an average horse over a full day's work. It is equal to 746 watts. On the metric system it is reckoned as 4,500 kilogram-metres a minute, and the French *cheval-vapeur* is thus equal to 32,549 foot-pounds a minute, or 0.9863 of an English horse-power, or 736 watts. The "nominal horse-power" by which engines are sometimes rated is an arbitrary and obsolescent term of indefinite

significance. An ordinary formula for obtaining it is $\frac{1}{15.6} D^2 \sqrt[3]{S}$

for high-pressure engines, and $\frac{1}{47} D^2 \sqrt[3]{S}$ for condensing engines,

where D is the diameter of the piston in inches and S the length of the stroke in feet, though varying numbers are used for the divisor. The "indicated horse-power" of a reciprocating engine is given by $ASP/33,000$, where A is the area of the piston in square inches, S the length of the stroke in feet, P the mean pressure on the piston in lb. per sq. in., and N the number of effective strokes per minute, namely one for each revolution of the crank-shaft if the engine is single-acting, but twice as many if it is double-acting. The mean pressure P is ascertained from the diagram or "card" given by an indicator (*see STEAM-ENGINE*). In turbine engines this method is inapplicable.

A statement of indicated horse-power supplies a measure of the force acting in the cylinder of an engine, but the power available for doing external work off the crank-shaft is less than this by the amount absorbed in driving the engine itself. The useful residue, known as the "actual" "effective" or "brake" horse-power, can be directly measured by a dynamometer (*q.v.*); it amounts to about 80% of the indicated horse-power for good condensing engines and about 85% for non-condensing engines, or perhaps a little more when the engines are of the largest sizes. When turbines, as often happens in land practice, are directly coupled to electrical generators, their horse-power can be deduced from the electrical output. When they are used for the propulsion of ships recourse is had to "torsion-meters" which measure the amount of twist undergone by the propeller shafts while transmitting power. Two points are selected on the surface of the shaft at different positions along it, and the relative displacement which occurs between them round the shaft when power is being transmitted is determined either by electrical means, as in the Denny-Johnson torsion-meter, or optically, as in the Hopkinson-Thring and Bévis-Gibson instruments. The twist or surface-shear being proportional to the torque, the horse-power can be calculated if the modulus of rigidity of the steel employed is known or if the amount of twist corresponding to a given power has previously been ascertained by direct experiment on the shaft before it has been put in place.

HORSE-RACING AND BREEDING. Horse-racing is mentioned in the *Iliad* (xxiii. 212-650). It was also known to various Oriental peoples at a very early date. Details, however, are few and it is doubtful whether horse-races as the West knows them to-day existed at all among early peoples.

GREAT BRITAIN

It is not possible to say with any conviction or certainty when horse-racing actually began in England. The writers and historians of old were vague and indefinite in the extreme. Probably it began with the origin of the horse itself in Great Britain. For if human nature and the sporting instincts of the people who lived centuries ago had any relation to what they are understood to be to-day, then it is certain that one man matched his horse or pony with another man's for a wager of sorts, perhaps, indeed, for no wager at all but merely to put a dispute to the test. It really matters little. We are entitled to assume that human

nature has changed little if at all through the ages, and that they probably did the same then as we do now, according to their limitations, which we may be sure were determined for them by the very definite limitations of the early English horse. What we are certain of is that racing has been carried on for hundreds of years; and that the horses that came over with the Norman conquest were big animals capable of carrying heavily armoured men and inevitably assisted in imparting to the later English horse that size which has been increasing with its steady evolution.

Kings, prime ministers, peers of the realm, and commoners of varying degree figure as owners in the long history of racing in this country. The reign of Henry VIII. is generally accepted as marking the first definite beginning of anything like organized race-meetings, for it was in that period that racing is believed to have taken place at Chester on what was called the "Rodhee" or "Roody" and must certainly be what is now known as the Roodee on which a three-day meeting each year flourishes to this day. Queen Elizabeth, according to Nichols' *Progress of Queen Elizabeth*, maintained a breeding stud, and in 1585, accompanied by a brilliant retinue, attended the races at Croydon, as also in 1587 and 1588. The first mention of racing at Doncaster is dated 1600. "Wheatley More," which was probably the Doncaster Town Moor of to-day on which the St. Leger is decided every September, was the scene. Probably the earliest description of a race occurs in Clarkson's *History of Richmond* (Yorkshire) (1821). It occurred on May 6, 1622, and is reproduced below:—

A new maid race upon Rychmond Moor of iiii myles, sett forth and measured by Mr. James Raine, Alderman, and Mr. John Metcalfe, and many other gentlemen and good fellowes the vith of May. And further the said James Raine, Alderman, with his brethren hath made up a sume of xii poundes for to buy a free cupp for those knights, gentlemen or good fellowes that have horses or mares to run, leavyng the cupp free to their own disposition, must make upp the value of the said cupp, to reneue the same for the next yeare.

Whereas the names in order as they came this present yeare 1622 was as followeth, John Wagget onely the starter.

Impunius Sir George Bowes	his horse 1
Impunius Mr. Hunphrey Wyvell,	his tryer.
Impunius Mr. Thomas Bowyer	his horse 2
Impunius Mr. Christ. Bollmer,	his tryer.
Impunius Mr. Francis Broughe	his horse 3
Impunius Mr. Matt Rymer,	his tryer.
Impunius Mr. Wansforde	his mare 4
Impunius Mr. Anthony Franckland,	his tryer.
Impunius Mr. Loftus	his horse 5
Impunius Mr. Francis Wickliffe,	his tryer.
Impunius Mr. Gilbert Wharton,	the last and the sixth.
Impunius Mr. Thomas Wharton,	his tryer.

So every party putting xl shillings, hath made upp the stake of xii poundes, for the buying of another cupp for the next year following.

Newmarket.—Although there are the records and a few others which it may not be necessary to enumerate of that early racing it remains a fact that the history of horse-racing in England is really the history of racing at Newmarket since its beginning. At least this can be made to apply until such time as there came a great organized expansion, but the headquarters of the Turf has always been Newmarket, and especially, of course, following the establishment of the Jockey Club in the years 1750 or 1751. James I. may be said to have "discovered" Newmarket and developed it as a sporting centre. Charles I. did much to encourage racing and improve the breed of horses, and there are definite records of the feats of Charles II. on Newmarket Heath. On October 12, 1671, as recorded by Frank Siltzer in "Newmarket," he rode his own horse, Woodcock, in a match against Mr. Elliot (of the Bedchamber) on Flatfoot which the latter won, but two days later the king rode the winner of the plate (being a flagon of 32 price), the other competitors being the Duke of Monmouth, Mr. Elliot, and Mr. Thomas Thin (short for "at the inn" afterwards written Thynne) an ancestor of the Marquess of Bath. In March, 1674, the king, wrote Siltzer, again won the plate, and Sir Robert Carr, writing to his colleagues at Whitehall, says:—"Yesterday his Majesty rode himself three heates and a course, and won the Plate—all fower were hard and ne'er ridden, and I doe assure you the King wonn by good horsemanship."

In 1740 (George II.) we have parliament for the first time taking cognizance of horse racing. In that year an Act was passed which had for its object the putting an end to a number of country meetings by raising the stakes run for. It was insisted that every horse entered for a race must be the *bona fide* property of the person entering it, and that one person might only enter one horse for a race on pain of forfeiture. Parliament also settled the weights which horses had to carry. Thus five-year-olds were set to carry 10st; six-year-olds 11st; and seven-year-olds 12st. It is interesting to note that enactment, since it was the beginning of the more elaborate weight-for-age scale which is of paramount importance at this day and to which reference is made later. Curious is it to note, too, that the penalty inflicted upon the owner of any horse carrying less than those weights was the forfeiture of the horse and the payment of a fine, in addition, of £200. In those days races were over a distance of four miles and it is not surprising that the racing of two-year-olds was unknown.

The Jockey Club.—At the outset of its existence the Jockey Club originating, as has been said, in 1750 or 1751, was concerned only with racing at Newmarket, but it was inevitable that its embrace should in time extend to all racing in England, there and elsewhere. That authority has now lasted for approaching two centuries. It has stood the test of time and public opinion, which has varied enormously in its attitude to racing. Always, however, the honour and integrity of the Jockey Club have been beyond reproach and criticism, and to that fact the enormous development of the Turf and the inherent love of horse racing in the people is primarily due. In 1752 race meetings were held at about 70 different places, ten of which were in Yorkshire, including, of course, York, where in 1709 there had been a race for a gold cup. In 1789 racing took place at 72 places in England, at three in Wales, six in Scotland, and 15 in Ireland. Newmarket then claimed ten fixtures in the year; there are only eight to-day—three each in the spring and autumn and two in the summer. To show how racing has grown through the generations it is worth recalling that 1,166 horses took part in flat races a hundred years ago while to-day the number may be anything between four and five thousand.

English Racehorse Origins.—It may not be inappropriate here to trace the origin of the English racehorse of to-day and note the foundation of the General Stud Book. It is an indisputable fact that thoroughbreds all over the world, in France, North and South America, the countries of Europe, Australia, and the British dominions are all descended from English racehorses; that is to say, they all trace back in direct male line to three Eastern horses which were introduced to this country, viz., the Byerly Turk, the Darley Arabian, and the Godolphin. The last-named was either an Arabian or a Barb, but we know that he was imported about the year 1728. Most interesting is it to know that of the 174 Eastern sires which were mentioned in the first volume of the Stud Book, covering a period of over 200 years, only the three mentioned survived to keep their descent intact to this day. The Darley Arabian was imported by Mr. Darley, brother of Mr. Darley, of Buttercrambe (now called Aldby Park), midway between York and Malton. The Byerly Turk was imported into England by Captain Byerly, whose charger he was through the whole of King William's wars in Ireland, prior to being put to the stud. The Godolphin was discovered in Paris about 1728. It was said he had actually drawn a water-cart. The finder of this foundation horse of the British thoroughbred was Mr. Coke, of Norfolk, who gave him to Mr. R. Williams, by whom he was presented to the Earl of Godolphin. He was a brown bay, standing about 15 hands, and died in 1753.

The better to show the influence of those three Eastern sires it should be understood that there are three outstanding families through the long history of the British racehorse. They are known as the Eclipse, the Matchem, and the Herod lines. By far the most famous is that of Eclipse, whose name is probably familiar to all having even a superficial knowledge of the early thoroughbred horse. Let us glance at the breeding of these horses. Eclipse was sired by Old Marske, who was a grandson of the Darley

Arabian. His dam Spilletta had for her grandsire on her own sire's side the Godolphin. Herod's great-great-grandsire was the Byerly Turk, and the name of the Darley Arabian commences the pedigree of his dam Cypron. The grandsire of Matchem was the Godolphin, his dam having the Byerly Turk at the beginning of her pedigree. Other Eastern sires and mares are concerned with the breeding of Eclipse, Herod, and Matchem, but the three I have mentioned are pre-eminent and they were to remain predominant right through the generations. The vast influence of Eclipse cannot be too carefully noted. The ever-famous horse was foaled in 1764, the breeder being the Duke of Cumberland. He was never beaten. To this day the old saying is as fresh and as true as ever—"Eclipse first and the rest nowhere!" The horse won, or walked over for, 26 races and matches, including eleven King's Plates. In 23 years at the stud he sired 344 winners of races worth £158,047-12-0. Think what a prodigious total it would have been in these days when stakes are many times bigger than they were in the days of Eclipse. His stud fee varied between 20 and 50 guineas. His great descendant, St. Simon, was for nine years at the stud at a fee of 500 guineas, and there are sires at the stud to-day for which the same very high fee is paid.

Two vitally important milestones stand out clear and distinct. One was the publication of the first volume of the General Stud Book in 1781 and the issue of the first Racing Calendar in 1727. At the time of writing Volume XXVI. is the latest. In the first volume 387 mares were included because they were considered to be possessed of pure racing blood. In 1891 that first edition was revised and revised again, and all but seventy-eight mares were eliminated. To-day the Stud Book contains the names of over 6,000. The compiler of the first "Racing Calendar" was one named John Cheny, who lived at Arundel in Sussex, and it is said of him that in order to complete his book he rode all over the country to collect his accounts of race-meetings. The title page, as here reproduced, is taken from C. M. Prior's most interesting history of the "Racing Calendar." This, then, is the reading of the title page of that historical first volume:

"An hystorical list on account of all the horse-matches run, and of all the plates and prizes run for in England (of the value of ten pounds or upwards) in 1727, containing the names of the owners of the horses, etc. that have run, as above and the names and colours of the horses also, with the winner distinguished of every match, plate, prize, or stakes; the conditions of running as to weight, age size, etc., and the plates in which the losing horses have come in with a list also of the principal cock matches of the Kingdom in the year above, and who were the winners and losers of them. London. Printed in the year M.D.C.C.XXXVII."

It has been made clear that the British thoroughbred of to-day had Eastern sires and mares of Eastern origin for his early ancestors. The singular thing is—at least it may appear singular to some people—that long before the present day the English racehorse, due to careful breeding and the marvellous effect of our climate and soil on constitution, bone and general development, would hopelessly out-match the best horse to be found in the East. Indeed, it has been demonstrated here and in India that no weight in reason will bring the two together in such a way as to give the Arabian horse even a remote chance of beating a very moderate thoroughbred. In 1884 the Jockey Club were persuaded by an ardent admirer of the Arab horse to introduce a race for Arabs, which meant reverting to an experiment tried so long ago as 1771. A race entirely for Arabs was brought off at Newmarket and was won by Admiral Tryon's Asil. In the following year this same horse Asil, in receipt of 4st 7 lb. was beaten 20 lengths by Iambic, a very moderate horse owned by the Duke of Portland over a three-mile course at Newmarket. One can understand how the Darley Arabian, the Godolphin and the Byerly Turk were marvels of their day, and no doubt they imparted quality and action to the native breed of the period, but after that our climate and feeding, which are unrivalled for horse-breeding and rearing, careful mating and rigorous compilation of the Stud Book have evolved such a horse to-day as could never have been dreamed of at the beginning of the history of the British thoroughbred. Even in the days of that great dictator of the Turf, Admiral Rous, an Arab horse, according to him; would have had no chance even if it only carried an empty saddle!

Changes of Method and Outlook.—Looking back on Turf history one must be struck with the vast changes in methods, outlook and practices, for things are done now—as, for example, the racing of two-year-olds—that would not have been tolerated many years ago, and many things they did then have been long since abolished and would on no account be revived to-day. Stakes would be raced for in heats over four miles restricted to five-year-olds and upwards and were then opened to four-year-olds. In 1831 they even had time to decide Mr. Osbaldeston's famous Match against Time. That sportsman had made a wager of 1,000 guineas that he would ride 200 miles in ten hours. The ground, forming a circle of four miles, having been marked out on and about the Round Course, he started about seven o'clock in the morning and performed the distance in 8 hours and 42 minutes, without apparent difficulty. He changed his horse every four miles, and rode 29 different horses. A bet of 1,000 to 100 pounds was laid that he did not perform the distance in 9 hours.

Let us look at the British Turf as it is to-day; and doing so it will not be without interest to examine its ramifications, the history of its five "classic" races, the great circle of racecourses which are part of its structure, the conditions under which the sport is conducted and the immensely enhanced value of the modern thoroughbred. We have the Jockey Club still supreme as the governing authority with its reputation as an institution never higher and more respected. It manages its own affairs at Newmarket as it always has done, while all racing elsewhere must submit to rules which have taken generations to perfect and make applicable to the evolution of the horse and the sport itself. Great names have had to do with administration from time to time. Admiral Rous has been mentioned. King Edward VII., the Earls of Derby, the late Duke of Westminster, the Duke of Portland, Sir Fred Johnstone, R. C. Vyner and the late Lord Chaplin have all played big parts and with them racing was essentially a sport rather than the business which in some cases it is tending to become to-day. Mr. Lowther was fearless and even formidable, which is certainly true of Lord Durham, who died in 1928. They and others have at all times aimed at digging out the wrong-doer and ridding the Turf of those undesirables to whom it has ever been as a powerful magnet. When Admiral Rous died in 1877 there was brought into existence a Rous Memorial Fund, essentially a benevolent affair for the relief of the sick and needy connected with the training and riding of racehorses. To this day there are Rous Memorial Stakes run for at Newmarket, Ascot, Goodwood and Doncaster in memory of the Dictator. There are Lowther Stakes, Jersey Stakes, Coventry Stakes, Durham Handicaps and Stakes, indeed many races are named after men who gave the weight of their influence and support to the general welfare of racing. What better example can be quoted than the Derby Stakes? The St. Leger was so named out of compliment to the soldier and sportsman, Colonel St. Leger, who may be said to have founded the race (1776).

The five classic races are confined to three-year-olds, the Oaks and the One Thousand Guineas being restricted to fillies, the Two Thousand Guineas, the Derby, and the St. Leger being open to both colts and fillies. It is unusual for the latter to be entered, and still less usual for them to run, but there are bright conspicuous instances on record of fillies winning the Derby, while they have with some frequency won the St. Leger. It has even happened that a filly has won both the Derby and the Oaks in the same week at Epsom. Signorinetta, bred and owned by an Italian, Chevalier Ginistrelli, who had for some years been settled in this country as an owner-trainer in a modest way, astonished the world in 1908, by winning the Derby at 100 to 1 and then the Oaks two days later. Eleanor in 1801 accomplished the rare feat, and the Yorkshire filly, Blink Bonny, did so in 1857. Fifi-nella won both in 1916 during the World War, when substitute races were decided at Newmarket. In the Two Thousand Guineas and the Derby colts must concede a sex allowance of 5 lb. to fillies. The rule in other respects fixes the sex allowance at 3 lb. The "classics" are excellent examples of races which are confined to horses of a certain age. Apart from them there are weight-for-age events in great numbers, handicaps, selling plates (some of

which can be for horses of all ages on the weight-for-age scale), and races for two-year-olds from the time the season opens towards the end of March to when it finishes in November.

The weight-for-age scale is a fundamental principle in English racing. In a rough sort of way it obtained in the earliest days of racing. The scale was founded by Admiral Rous, and revised by him in 1873, but has been more than once modified in accordance with suggestions from the principal trainers and practical authorities. Horses are called upon to concede weight according to their ages, according to the month in which they race and according to the distance over which they are called upon to run. Thus a two-year-old in March or April over five furlongs would be entitled to receive 2st 4 lb. from a three-year-old, 3st 4 lb. from a four-year-old, and 3st 5 lb. from a five, six or aged horse. The reader will better grasp what is meant from the publication of the present day scale under the Jockey Club rules, which is as follows:

Horse Racing, 13

Age	March and April	May	June	July	Aug.	Sept.	Oct.	Nov.
<i>Five Furlongs—</i>	st. lb	st. lb	st. lb	st. lb	st. lb	st. lb	st. lb	st. lb
Two years . . .	6 0	6 2	6 7	6 10	7 2	7 7	7 9	7 12
Three years . . .	8 4	8 3	8 5	8 7	8 9	8 12	8 12	8 13

A race like that for the Ascot Gold Cup is a good example of a weight-for-age race. Hundreds of others could be quoted, just also as examples might be given of races which have their basis on the weight-for-age scale but which are complicated by penalties for winners of certain sums, a "maiden" allowance for non-winners, and probably stallion allowances to those horses which have been sired by low fee sires as against those sired by the fashionable high fee horses. The tendency, however, is for stallion allowances to be cut out of the valuable races leaving special events to be created for the progeny of low fee horses. It follows that handicaps are close to the backbone of racing, if, indeed, they are not actually part of that backbone; just as handicaps are the mediums in every competitive sport which aims at bringing the good and the mediocre together. It has been pointed out how the racehorse of to-day would "smother" the Eastern horse from whom he has descended; that is to say, no weight in reason would bring them together. It is not so with the true thoroughbred. Racehorses do vary enormously in capacity, owing sometimes to

one and sometimes to a combination of causes; physique breeding, soundness, fitness and temperament are factors of the first importance, but it remains true that the clever adjustment of weights will bring the good, the moderate and the bad horses together. It is, therefore, on the many important handicaps of the year that betting is chiefly concentrated. The Derby at Epsom, it is true, excites an amount of betting that is both enormous in extent and world wide in range; but then the premier "classic" is exceptional in every sense.

Handicap Races.—Handicap races which never fail to produce a vast amount of betting are the Autumn handicaps at Newmarket known as the Cesarewitch and Cambridgeshire; the former is for long distance horses and the latter for what is known as middle distance performers, for while the Cesarewitch is decided over two miles and a quarter the Cambridgeshire is a race of a mile and a furlong. The Royal Hunt Cup at Ascot, the Stewards' Cup at Goodwood, the Jubilee Handicap at Kempton Park, the City and Suburban at Epsom, and the Lincolnshire Handicap at Lincoln are examples of handicap races which attract much speculation. Yet that speculation has changed, too, in its character. In years past much of it was done at what was known as "ante-post rates," that is to say, betting would be opened days and weeks before the race—it is so to-day on the Derby and the Autumn handicaps at Newmarket—and long odds would be offered as a bait by the bookmakers. If such odds were accepted the backer had to take a chance of the horse running. If it did not go to the post the wager would be lost. In recent years, especially since the World War, ante-post betting has been steadily declining, probably owing to lack of enterprise on the part of the modern bookmaker, and perhaps also to the backer awaking to the fact that he can get practically as good odds on the day with the certainty of getting a run for his money. With the coming into operation of the totalisator (*q.v.*) ante-post betting will be still further discouraged. The totalisator is essentially a machine that operates and governs the starting price.

Mention, then, has been made of handicap races, which must closely approximate to half the races decided throughout the year. True, there are very few handicaps figuring in the four days' wonderful programme of an Ascot meeting. The observation, therefore, must be accepted as having general application. Let it be well understood there is, and always will be, a distinct gulf between what is accepted as "handicap form" and "classic form." Because of that gulf classic form is classic. It is the best, and not unworthy of that description which has been applied to it for ages, certainly during the lifetime of the writer. Frequently are we reminded of what just a touch of classic form can bring about in the deciding of a handicap. A horse that has even been thought good enough to run in a classic race, though unplaced, is regarded as having that "touch." If the records be searched examples will be discovered of horses that gained classic honours being successful in one or other of the important handicaps. I think, as I write, of La Fleche, who won the Oaks, the St. Leger, the Cambridgeshire and the One Thousand in the same year (1892), of Sceptre who won the Oaks, the St. Leger, the 2,000 Guineas and the 1,000 Guineas in 1902 and of Pretty Polly who won the Oaks, the St. Leger and the 1,000 Guineas in 1904. Rarely, however, in these days is the winner of a classic race exploited subsequently in a handicap. Such winner assumes too high a commercial value consequent on having gained classic honours for his or her future to be risked in a handicap, which is primarily concerned with betting. There are exceptions, of course, but the common practice is for owners to retire fillies to the stud after their three-year-old careers. Such fillies have gained supreme honours, and there is danger to the stud career awaiting a filly if there should be anything in the nature of over-racing. Certainly this is the policy adopted by the leading owner-breeders of whom the present Lord Derby may be quoted as an excellent example. The wonderful success of his breeding stud may largely be due to the consideration he has at all times shown to those high class fillies which have served him well up to the close of their racing careers. An instance is that of Toboggan, who won the Oaks and the Jockey Club Stakes in 1928. That race in any case was to have been the

last of her career, and it was merely an incident, and not a deciding factor, that she broke down in the race for the Jockey Club Stakes although she won it.

It is even more the custom to guard jealously the subsequent career of a Derby winner. To run the risk of defeat in these times is to accept a heavy responsibility. It has been thrust upon owners by the phenomenal jump in the values of high class bloodstock. It is no exaggeration to say that immediately a horse has passed the post as the winner of the Derby he becomes worth a minimum of £50,000. That is a modest enough figure; it would not be wrong to place it much higher. Felstead, the Derby winner of 1928, though his form preceding the victory had been anything but brilliant, was bid for from America up to £100,000. His owner, Sir Hugo Cunliffe-Owen, being, it need scarcely be said, a very rich man, preferred to keep his horse. Solario did not win the Derby, but he won the St. Leger and the Ascot Gold Cup as a four-year-old. His owner, Sir John Rutherford, refused the Aga Khan's bid of £100,000. When the owner of the 1927 Derby winner, Call Boy, died the horse was subsequently sold privately to his brother for £60,000 and was forthwith sent to the stud rather than be raced as a four-year-old. The Derby had made his reputation to pass on to the stud and entitle him to command a high fee as a first-class sire. Captain Cuttle, who won the Derby of 1922 for Lord Woolavington, was sold to Italy for a sum reported to be £50,000 after a short period at the stud in England. He would not assume stud duties in Italy until reaching nine years of age. It was a wonderful price for a horse of that age.

The post-war Derby winners have been Grand Parade, Spion Kop, Humorist (dead), Captain Cuttle, Papyrus, Sansovino, Manna, Coronach, Call Boy and Felstead. Captain Cuttle, Call Boy and Felstead have been referred to. The others won for owners who maintain studs and the horses, therefore, retired to them, each commanding a fee varying from three to four hundred guineas. While the owners of Derby winners realize the importance of preserving intact the laurels won at Epsom, and while stallion fees remain as high as they do, it will be the policy of such owners to fight shy of allowing their horses to run risks of endangering their reputations by incurring defeat as four-year-olds. No Derby winner since the war has won the Ascot Gold Cup, which until modern times was looked upon as placing the seal on the racing career of a classic winner just as it did in the cases of King Edward's Persimmon, Isinglass, La Fleche, Bayardo, Prince Palatine and others. Grand Parade, Manna and Call Boy were not trained as four-year-olds. Only Spion Kop even ran for the Ascot Gold Cup, and he finished third to two handicap horses in a poor year. The tendency is for Derby winners as four-year-olds to be concentrated on short distance races, such as the Coronation Cup, a mile and a half race at Epsom, and if entered—as they usually are—then run for the Eclipse Stakes (1½ m.) at Sandown Park and probably the Jockey Club Stakes (1½ m.) at Newmarket in the autumn. The inference is that the stamina of the modern thoroughbred and the constitution to withstand a strenuous training for a Cup race of 2½ m. at Ascot are doubted.

VALUE OF THE HORSES

Nothing is more remarkable in the history of the British Turf in the 20th century than the enormous increase in the intrinsic value of the best bred and the highest class horses. This applies to the fashionable stallion, the notable winner, the successful brood mare, the well-bred shapely foal boasting of immaculate parentage and promise for the future. Let us examine the factors that have been at work. There were some five-figure prizes to be won before the century began but they were not associated with the classic races. While such prizes have shown curtailment the values of the classic races have been enhanced. For instance, while in 1899 the Princess of Wales's Stakes and the Jockey Club Stakes, both decided at Newmarket, were each worth £10,000, their respective values to the winners in 1928 were £2,790 and £5,687. And the Eclipse Stakes at Sandown Park has more than held its position in that respect. From being "merely" a ten thousand pounder in 1899, its value to Lord Derby who won the race with Fairway in 1928 was £13,306. When we examine the

increase in the values of the classic races, again taking 1899 as the closing year of the last century, we find that the Duke of Westminster's Flying Fox won what has always been called the "Triple Crown," that is to say the Two Thousand Guineas, the Derby and St. Leger and those races brought in respectively £4,250, £5,450 and £4,050. Lord M. Beresford's Sibola, winner of the One Thousand Guineas in the same year secured £3,800; Musa, the winner of the Oaks for Mr. Douglas Baird, won £4,150. Compare those figures with the winnings of the classic horses of 1928. Flamingo (Two Thousand Guineas) £10,945; his Majesty's Scuttle (One Thousand Guineas) £8,470; Felstead (the Derby) £11,605; Fairway (St. Leger) £12,495.

These figures indicate one of the causes of the amazing advancement in the prices of bloodstock. It may be true enough that the chief competing buyers in this country are only a comparatively few very wealthy men of whom the Aga Khan, Lord Woolavington, Lord Dewar, Lord Glanely, Lord Beaverbrook, the Hon. Esmond Harmsworth, Captain Arnold Wills, Sir Victor Sassoon and Major J. S. Courtauld have been conspicuous since the war. It is, however, also true that the demands from abroad, chiefly America and France, have grown. Especially is this true of America to which country, with its extremely wealthy breeders and owners, have gone some of our best mares, yearlings and foals as well as a number of notable sires. Flying Fox, on the death of his breeder and owner, the Duke of Westminster, was purchased by the French breeder, M. E. Blanc, for the sum of 37,500 guineas. It was given at auction on the same day as a yearling by Persimmon from a mare named Ornament, to be known afterwards as Sceptre, which made 10,000 guineas as a yearling.

When some years ago Tracery was sold to South America by his owner and breeder, the late August Belmont, who had bred and raced the horse in England, he received no less than £53,000. The price of Flying Fox may still be a record for the sale ring, but then no Derby winner has entered the sale ring since. Ard Patrick was sold to Germany for £21,000 in 1903, Rock Sand went to America for £25,000, Minoru went to Russia for a sum said to be under £20,000, and since then the only sale of a Derby winner was the one already related of Captain Cuttle to Italy. All these were private deals. Nothing is more certain than that any Derby winner of modern times, or such high class St. Leger winners as Solario and Fairway, would certainly fetch more than £50,000 if sent into the sale ring.

In 1927 the Aga Khan paid 14,000 guineas for a yearling, afterwards named Aftab, by the Derby winner Papyrus from Sundart, but Aftab could not be raced as a two-year-old. The same buyer is understood to have paid £21,000 in a private transaction for two yearlings bred at the National Stud in Ireland. One of them, a colt by Hurry On from Ecurie, is said to have represented £17,000 of the huge outlay. It also could not be raced. Whereas 172 yearlings were sold at Doncaster in 1910 for a total of 93,395 guineas the record total was reached in 1926 with the marvellous aggregate of 344,990 guineas for 325 yearlings, or about \$5,400 each.

If the prices of yearlings have soared, so also have the prices of mares, which in addition to admirable records on the race-course are well-bred and have been mated with those high class, high-fee stallions referred to. The climax, however, was reached for the sale of English bloodstock at the December sales at Newmarket in 1928 when a great new record was created. Five days of sales realised an aggregate of 474,594 guineas, which is by a long way the highest total recorded ever since the sales began in 1885. The young mare Dian made 14,500 guineas, and her own mother, Diadem, though fourteen years old, made 10,000 guineas. A third brood mare named Bracket, winner of the Cesarewitch in 1920, made 11,000 guineas, and in this case the buyer was Mr. Esmond. She was bought for France; the other two were retained by English buyers. A record price at these sales in 1928 was paid for a foal, a colt by Solario, though one of the first crop of foals by that sire, fetching 5,000 guineas. The youngster's breeder was Sir Abe Bailey, who that year disposed of the whole of his big holding of mares, yearlings, foals and horses in training for an aggregate of 170,000 guineas, or about \$867,000.

Developments in Training and Riding Methods.—During the nineteenth century, and especially in the first half of it, horses were able to race over much longer distances than are favoured to-day. They must have been horses of splendid constitution, soundness, courage, and, indeed, of all those virtues which have been transmitted through generations to the racehorse of to-day. They certainly had far more to endure. Their stabling would be comparatively crude and rough compared with the stabling of to-day. They seem to have been raced for endurance rather than for speed, though, if the times of races can be relied upon then, it is certain they did not lack the capacity to gallop fast as well as stay well. In the very early days they had, of course, to be walked to distant meetings, and when walking was the only means of access they could not venture far beyond the borders of the county in which they were bred. That is an explanation of how there came to be so many meetings clustered in a recognized horse breeding "country" as for example Yorkshire.

The racehorse of to-day is a pampered creature whose individual tastes and whims are studied. Hygiene and sanitation enter into the construction and maintenance of up-to-date stables and studs, and one cannot doubt that while the thoroughbred racehorse in the process of evolution has put on height, he has also become speedier. His temperament may be more highly strung, but in these days of vastly more racing, and greater competition, the call on the nervous reserves of horses is greater. It is not the case that we have more bad tempered horses. Rather is it true that they are more temperamental and susceptible to the big demands made on them.

It is more than probable that the revolution in the methods of jockeyship have been responsible for those calls on the natural nervous resources of the thoroughbred racehorse. In the old days jockeys rode with long stirrup leathers, and while they were willing to make the pace a dawdle at the outset they would sprint home in the closing stages. The most famous British jockeys, before the arrival of the Americans with their new methods, were Fred Archer, Johnny Osborne, Harry Custance and Mornington Cannon. The first mentioned rode 6 winners in one day and 257 winners in one year, and such was the impression made by Archer's skill that he was said to round the famous Tattenham corner in the Derby course with one leg over the rails. The real revolutionary was the American Sloan, who came to England in the closing years of the last century to ride for Lord William Beresford. He began to win a great number of races, some of them on horses that had been regarded as hopeless and on which leading English jockeys of the period had failed time after time. What he did was to pull up the stirrup leathers and throw the weight of his crouching body forward onto the withers. Then the horse, apparently liking the new distribution of weight, was permitted to race from the start and win without being robbed of that reserve necessary for the finish. From that time the great change-over came. English jockeys copied his example, and the first to do so were the first to benefit. Other American jockeys came and so the method became general. D. Maher was a particularly polished exponent of it, and, indeed, he rode three Derby winners and became the leading jockey of his day. Apprentices were taught to ride in this way, and so we have had champion jockeys in Frank Wootton, W. Higgs, S. Donoghue, Weston, Elliott and Gordon Richards who have never known any other way of riding a racehorse. There will never be a reversion to the old method for the handicap would be too enormous and the horse would have no chance; but we may be quite certain that the Sloan methods do take more out of a horse. The fact of being expected to be racing at his top speed as soon as possible after the start and thereafter having to hold his place must take a lot out of horses, especially sprinters.

It is scarcely possible in the space at the disposal of the writer to enumerate those famous horses which either on the racecourse or at the stud have done so much to make Turf history since, say, the days long ago of Eclipse. The names of Pot-8-os, Bird-catcher, St. Albans, Stockwell, Bend Or, Kendal, Ormonde, Cyl-lene, Gallinule, Lord Lyon, Hampton, Ayrshire, Newminster, Hermit, Galopin, St. Simon* (all tracing back to Eclipse), the descendants of Herod (including The Tetrarch), and the progeny

of Matchem occur to the mind. The names of Ormonde and St. Simon are familiar to the present generation because of their prowess on the racecourse, on which they were never beaten, and the rivalry of their ardent supporters. It is, however, beyond question that the name of St. Simon will endure the longer for the reason that he made a great and illustrious name for himself as a sire at the stud. Among many famous breeding mares may be mentioned Lily Agnes, the dam of Ormonde and ancestor of the famous family of racehorses bred and raced by the late Duke of Westminster. Famous sires of recent years include Spearmint, who sired Spion Kop, winner of the Derby of 1920, Flamboyant the sire of Flamingo, and Phalerns the sire of Fairway.

The Totalisator.—The Betting Act passed in 1928 enabled the Jockey Club and the National Hunt Committee to instal the Totalisator (or Pari-mutuel) system of betting on racecourses under their jurisdiction, the whole to be under the supervision of the newly created Betting Board of Control, on which are representatives of the Government, the Jockey Club, the National Hunt Committee, Tattersalls Committee and the Racecourse Owners' Association. The Act was the outcome of years of agitation and clamour, mainly in consequence of the great good accruing to racing on the Continent and most other countries of the world which have controlled betting through the medium of Totalisators or the equivalent French methods of the Pari-mutuel. The agitation was brought to a head when the Jockey Club conducted an inquiry into the causes of declining attendances on racecourses brought about, it was alleged, by the Government imposition, at the instigation of the Chancellor of the Exchequer (Winston Churchill), of a tax on the general turnover of betting. It was alleged that this tax, of 2 percent on every wager on the racecourse and 3½ per cent on every wager at starting price away from the course, was steadily draining the resources of those betting people without whose support racing would not go on. The Jockey Club's inquiry recommended in its findings the introduction of the Totalisator, and with the Government giving certain facilities for the passage of the necessary measure the Betting Act became a reality. The advocates of the Totalisator expressed the keenest enthusiasm, and obviously looked upon it as the only panacea for the decline which was exposed at the time of the Jockey Club inquiry.

Stewardship.—All stewardship in connection with the administration and supervision of racing in England is honorary. Demands have been resisted for the appointment of stipendiary stewards or even advisory stewards without executive control. They have been resisted, but with some weakening which rather points to the principle of advisory stewards being accepted at some future date. Starting was made by the employment of a "gate" towards the end of the century, and in 1928 a decision was reached to adopt a barrier-like gate as used in France and Australia and which is calculated to prevent bursts through on the part of headstrong horses and over-zealous jockeys, resulting in a high percentage of unsatisfactory starts.

STEEPLECHASING AND HURDLE RACING

It was not until 1865 that returns of steeplechasing and hurdle racing came to be officially recorded in the "Racing Calendar," though the first Grand National won by a horse named Lottery was decided in 1839. This sport, which continues from about November to March, while flat racing occupies the rest of the year, is administered by the National Hunt Committee, of which there are about as many members as there are members of the Jockey Club, with six acting as Stewards for the period of their office. Rule 44 of the N. H. Committee is worth quoting as follows:—

"In all steeplechases Courses except at *bona-fide* hunt meetings there shall be:—

(A) In the first two miles at least twelve fences, and in each succeeding mile at least six fences, in all cases exclusive of hurdles.

(B) For each mile at least one ditch six feet wide and two feet deep on the taking off side of a fence, which ditch may be left open or guarded by a bank or rail, not exceeding two feet in height, and which fence must be at least four feet six inches in height, and if of dead brushwood or gorse, two feet in width.

(C) A water jump at least twelve feet wide and two feet deep to be

left open or guarded by a fence not exceeding three feet in height.

In all hurdle races it is stipulated there shall be not less than six flights of hurdles in the first mile and a half, with an additional flight of hurdles for every quarter of a mile, or part of one, beyond that distance, the height of the hurdles being not less than three feet six inches from the bottom bar to the top bar."

Though there are many instances on record of indifferent flat racehorses passing on to National Hunt racing to do well over fences, it is, nevertheless, as true to-day as it always was that the best steeplechase horses have been specially bred for jumping. The word "specially" is used advisedly, because such horses would be allowed to run to grass and no attempt would be made to break them until reaching three or four years of age. Flat racers we know are put into training as yearlings. Ireland has always been the great home of steeplechasers and it always will be. Their best jumpers have been bred from mares owned by the small farmer to whom the ownership of a mare or two has been a business as well as a pleasure. He has been able to mate his mare for a small fee, and when the offspring has arrived he could afford to turn it out in the paddocks, if not to make a 'chaser then to make a fair price as a hunter. This method of rearing and late "breaking" is responsible for the strength and general development of the great steeplechasers of the past among whom such notable Grand National winners as Jerry M., Manifesto, Kirkland, Troytown, Sergeant Murphy, and Shaun Spadah.

Liverpool, where the Grand National Steeplechase takes place towards the end of March every year, is, perhaps, the true home of steeplechasing in England, though the National Hunt Committee's own meeting extends over three days and takes place in March at Cheltenham. Still the Grand National has world-wide fame. The fences at Aintree are recognised as the most formidable anywhere, and no horse that stays the distance of 4 m. 856 yd. and jumps the thirty or so fences, including such notable obstacles as Becher's Brook and Valentine's Brook, is undeserving of his victory even if he be such a humble individual as Tipperary Tim, who in a record field of 42 starters in 1928 proved to be the only horse to escape a fall for which all sufficient reason he came in alone. The value of the race increased until in Tipperary Tim's year (1928) it was worth £11,180 to the winner's owner.

At most racecourses on which flat racing takes place, notable exceptions being Newmarket, Ascot, Goodwood, Doncaster, York and certain others, National Hunt racing takes place in season. The sport does not arouse such wide interest as flat racing, but, in spite of unpleasant English weather conditions, it is enormously popular. It is a fact that both steeplechases and hurdle races are run at a faster pace to-day than twenty or fifty years ago. Again the reason has to do with the change in jockeyship, for the revolution noted in jockeyship on the flat reacted with the jockeys over fences and hurdles. Especially is this true of hurdle racing. The National Hunt jockey of to-day has pulled up his irons by several holes. He does not tarry when the start takes place, but races for the first fence or for the first hurdle as if there were no such obstacle there. The result is that steeplechases and hurdle races are usually truly run throughout, but whether the standard of jockeyship can be the same, and certainly the standard of horsemanship cannot be as high, is doubtful.

Racing in France.—Subsequent to the World War, because of the poor feeding of mares and their young stock and the comparative neglect of the stallions, French racing was in a bad way. It may explain why on three occasions horses sent from England were able to win the Grand Prix de Paris in successive years, Galloper Light (1919) Comrade (1920) Lemonora (1921). That horses from England have not won since 1921 is indicative of the remarkably fine recovery of horse-breeding and racing in France. Not only so but horses have been sent from France to win some of our important races. Thus Sir Gallahad III. and Tapin won the Lincolnshire Handicap; Epinard, one of the best horses foaled in France since the war, won the Stewards' Cup at Goodwood, and was rather unluckily beaten by a neck for the Cambridgeshire; Forseti won the Cesarewitch; Masked Marvel and Insight II. were Cambridgeshire winners for the American, Mr. Macomber, who races and breeds on a big scale in France; Asterus won the Royal Hunt Cup in 1927; and in 1928 Palais Royal II. owned by the

Belgian. M. Wittouck, but bred and raced in France, won the Cambridgeshire after running second to Fairway for the St. Leger.

It is recognised that the French breeders to-day are producing some high-class horses capable of winning races in any part of the world, for if they can win in England they certainly should be able to win anywhere else. That British breeders have recognized this as a fact is shown by their patronage of leading French stallions. Mares have been sent over specially to be mated with them while yearlings have been purchased for England at the annual sales at Deauville. Lord Derby, who races in France in partnership with the American, Mr. Ogden Mills, has met with remarkable success. The horses Kantar and Cri de Guerre were very important winners for the partnership in 1928. The latter won the Grand Prix, and, in all, horses owned by them won about two million francs in stakes in 1928, the same year as Lord Derby headed the list of winning owners in England with the wonderful total of £65,603.

Jockeys' and Entrance Fees.—According to the Rules of Racing, jockeys' fees, unless there is a private registered agreement between the jockey and the owner or trainer, are as follows: For flat racing £5.5.0 for a winner and £3.3.0 for a loser.

For Steeplechasing. Where a race under the National Hunt Club rules is worth £85 or more to the winner the fees are £10.10.0 for a winner and £5.5.0 for a loser. If the race is worth under that amount, the fees are £5.5.0 for a winner and £3.3.0 for a loser.

The entrance fees for some less important races, such as selling plates, are as low as £1 to £2; but in some of the classics a system of forfeits prevails.

For the Grand National of 1929, the closing date was Jan. 1, 1929. If the horse was not withdrawn by Jan. 22, £5 had to be paid. If left in the race after Jan. 22, an additional £25. In 1928 a new ruling was passed enacting an additional £25 to be paid after Mar. 12. The fee for starters or horses not withdrawn after this date being an extra £20 making £100 in all; none of these fees or forfeits are collected until after the races have been run.

(S. Gv.)

THE UNITED STATES AND CANADA

The early history of horse racing in America still awaits adequate and systematic treatment, its records being scattered through a wide range of documents, often of a fugitive and fragmentary description. But the passion for the sport so highly developed in England seems to have been firmly implanted in the Colonies at a very early date. The Puritan regime in New England and the Dutch settlement of New York left racing to become established first in the south, notably Maryland, Virginia and the Carolinas, where the "cavalier spirit" prevailed among the leaders of both social and civic life. As soon as the Dutch dominance was succeeded by the English in New York, the turf began rapidly to develop there also, but in Pennsylvania the Quaker influence was a strong deterrent, resulting in restrictive legislation.

From such scanty records as survive it is evident that the horse known to modern times as "thoroughbred" was being established, as a breed, in the New World contemporaneously with his establishment in the Old, by the constant importation of choice specimens and their use for both racing and breeding purposes. Long before the *General Stud Book* was first published in England, the Jockey club was organized or any of the fixed events termed "classics" were instituted there, the colonial magnates, north and south, were constantly importing both stallions and mares of the best blood and individually famous. These, crossed upon the native stock or interbred among themselves, were the founders of the American thoroughbred of to-day. So far as is known, the first truly thoroughbred horse ever brought over from England was Bull (or Bulle) Rock, a son of the Darley Arabian and a mare by the Byerly Turk, foaled 1718 and imported into Virginia about 1730. He seems to have initiated a period of tremendous expansion, as within the next 30 years Virginia, Maryland and the Carolinas were rapidly populated by a race of fast-multiplying thoroughbreds of the best British blood. The early racing had been at short distances, but the so-called "quarter horses" which supplied it were supplanted by an improved type, racing heats of 3 and

4 m., which, the latter especially, long remained the approved test.

The Revolutionary War naturally had a paralysing effect upon the sport. New York was much of the time in the hands of the British and the region round about it was one of uninterrupted warfare, while Virginia and the Carolinas were fought over incessantly.

After peace came in 1783 it required several decades for recuperation on the part of the impoverished and exhausted combatants of the United States. But re-importation soon became prevalent, and the establishment of new race courses and turf bodies all along the Atlantic coast from New York to Savannah progressed rapidly. Meanwhile, the interest in the sport was spreading beyond the Allegheny mountains, and the pioneers of Kentucky and Tennessee were taking with them some of the best animals that the older States could provide. This interest also extended farther west to Alabama, Louisiana and Mississippi. New Orleans was destined by the middle of the 19th century to be the foremost racing point in America. With the gradual centralization of wealth in and about New York it naturally became a focus for sport and for outdoor recreation, while Virginia and the Carolinas, owing to economic changes, were losing prestige; Virginia's long premier-ship in turf affairs, especially in breeding, passed to Kentucky, whose ascendancy, once gained, was to be permanent. As the frontiers were continually pushed to the west, the racehorse followed or went with the "covered wagon" until at length the discovery of gold in California, in 1849, an impetus for a transcontinental migration, carried him to the Pacific coast itself.

Effect of the Civil War.—For a second time war—the Civil War—intervened to disturb turf affairs, which went into almost total eclipse during this period. With it the last traces of Virginian prominence on the course and at the stud were swept away, while the leadership of New Orleans was shattered for ever. Kentucky suffered severely but temporarily only, while with the cessation of hostilities in 1865 the North took command of the affairs of the thoroughbred, never to relinquish them. The great metropolitan racing plants began to dot the map, and the "absentee landlords" to acquire control of the great stud-farms of the "Blue Grass" region of Kentucky, the most prolific breeding ground of the champions of the 20th century. At the dawn of the 20th century the skies were bright. By 1912 the situation had become so disastrous that many courses were closed, hundreds of animals were being exported any and everywhere and sold for anything they would bring, and other hundreds, their identities destroyed, converted to the most menial uses. Then came the turn of the tide. A steady upward ascent was begun and in 1928 the sport reached a peak of prosperity previously undreamed of. During 1927 the sum of \$13,935,610 was distributed at recognized meetings held in the United States and Canada, and at courses in Cuba and Mexico controlled by sportsmen of the States. The enormous aggregate of 11,832 different races were run and nearly 8,000 different horses started in them.

Modern Tracks.—The great centre of the sport is, however, New York, which supports four major tracks, those of Belmont park, Aqueduct, Jamaica and Empire City park. During midsummer the scene shifts to Saratoga, to the northward, where also the annual yearling sales are held. Maryland, where a renaissance has occurred that has assumed huge proportions, supports four tracks, all contiguous to Baltimore—Pimlico, Laurel, Bowie and Havre de Grace. Chicago also supports four major plants: Lincoln Fields, Arlington park, Washington park and Hawthorne, with a fifth near at hand, Aurora. In Kentucky, at Lexington, is the oldest course in the country. Louisville has Churchill Downs, where the Kentucky Derby has been run annually ever since 1875, and Latonia, just across the Ohio river from Cincinnati, the last-named giving over \$800,000 to be raced for in 1927. St. Louis supports Fairmount park, just across the river (Mississippi) in Illinois, which distributes annually about \$500,000. In Canada important meetings are given at Woodbine park, Toronto; at Windsor and Fort Erie, also in Ontario, and elsewhere.

Practically all American racing is over circular tracks from which the turf has been removed and the surface scientifically graded and expertly conditioned to ensure safety and a high

HORSE RACING IN THE UNITED STATES

BY COURTESY OF (5, 6) THE HORSE REVIEW; PHOTOGRAPHS (1, 3, 4) INTERNATIONAL NEWSREEL, (2) UNDERWOOD AND UNDERWOOD

1. Start of race, Jamaica racetrack, Long Island, N.Y. Starter's stand in background, with "barrier" above, marks position of start of the race. The horses are: right, in front, Tiger Gloss (second at finish); left, Circus Rider and Zero Hour (extreme left, first at finish).
2. First race in 1928 season at Bowie, Maryland, racetrack. View of the start, showing horses close together at the line between Judge's stand (centre) and scoreboard opposite. When starting race the horses are "jockeyed" into position behind the starting line. The starter gives the signal by raising the "barrier" line. Each jockey tries to obtain the position nearest the inside of the track.
3. Jockeys settling for race after start (see fig. 2). Forward bend of jockeys, with weight on stirrups, is the characteristic position in horseracing, allowing maximum freedom of action to the horse, close control by jockey and lessened resistance to the wind.
4. A decisive finish, showing the leading horse over a length ahead. Jockey of Marconi (first) is using the whip while the reins are gathered up in the left hand. Second horse, Quatrain, is being urged on to ensure retaining second place.
5. Trotting race, showing drivers in pneumatic-wheeled sulky, making the turn in first heat of race for the Hambletonian Stake, at Syracuse, N. Y., State Fair, 1927. Guy Dean-Cox leads, Guy McKinney-Ray, winner of the race, is second.
6. Sam Williams-Cox (centre) winning third and final heat of \$5,000 trotting race at Goshen, N. Y., 1927. Clara Bascom-Murphy (left) takes second place.

rate of speed. The track at Belmont park (the Westchester Racing Association, on Long Island) is the largest, being an oval somewhat more than $1\frac{1}{2}$ m. in circumference, with a subsidiary special straightaway, the Widener course, of about seven furlongs, over which the Futurity, the leading annual event for two-year-olds, is decided. Its value in 1928 (gross) was \$128,390, of which \$97,790 went to the winner, High Strung, it being the most valuable prize ever run for in America. It is obvious that computations of money winnings no longer constitute a criterion of class in America, as it is possible for one lucky animal, though of mediocre calibre, to win more in a single effort than an absolute champion could in his entire career in former eras. The list of great money winners has grown by leaps and bounds and by the end of 1927 included no fewer than 52 credited with over \$100,000 each. Much controversy exists as to the real merits of latter-day horses as compared with those of the past. Man o' War, which raced in 1919-20, is by the consensus of opinion one of the supreme thoroughbreds of history; nor can there be any question of the real class of other modern heroes such as Crusader (son of Man o' War), Exterminator, Sarazen, Grey Lag or Reigh Count. But their exploits have by no means dimmed those of such horses of the past as Hindoo and his son Hanover, Luke Blackburn, Salvatore, Henry of Navarre, Sysonby and others; nor, to go even farther back, Longfellow, Ten Broeck, Harry Bassett, Norfolk, Asteroide, Kentucky or Iroquois, since 1881 the only American winner of the Epsom Derby. That no modern mare approaches the turf queens of earlier history—Miss Woodford, Firenze, Imp, Yo Tambien, Beldame or Thora—is admitted. The vogue of the short-distance race, or sprint, is attributable wholly to commercialism in its various forms and, in particular, to the dominant desire for a quick "turn-over" of his money by the owner, the trainer, the speculator and the track manager alike. At best turf gains are problematical, the losses for the most part certain. The expense of production has mounted to altitudes which formerly would have seemed fantastic. Hence the prevalence of two-year-old racing, which has become a positive abuse, and the gigantic stakes offered for that age, which in their turn have inflated yearling values enormously. In the span of 20 years the differences shown are startling. In 1908 in the United States 745 yearlings were sold at auction for a total of \$256,820, the average price per head being \$344. In 1927 a grand total of 703 were sold for \$1,939,425, the average per head being \$2,758.78. The racing of two-year-olds begins on Jan. 1, at the winter meetings at Havana, New Orleans and Tia Juana (the Florida field in 1928 was idle).

Breeding.—Kentucky enjoys a practical monopoly of breeding prestige, and from her Blue Grass pastures come annually a large proportion of the season's best performers. No breeder of the present day operates on the unexampled scale of the late J. B. Haggin, who at one period, at his twin establishments, Elmendorf, in Kentucky, and Rancho del Paso, in California, was using 40 different stallions and over 600 brood mares—the nearest approach to "mass production" that the thoroughbred breed has known. But the number of large establishments is constantly growing and there has been a return to Virginia by several leading breeders. Imported—chiefly English, with a small quota of French and German—stallions and brood mares are constantly being brought into the country for stud purposes, but curiously enough, of the many horses imported since about 1880, none has been able to found what seems like an enduring line, the dominant ones of the day tracing to Australian, imported in 1858; Eclipse (son of Orlando), imported in 1858; and Bonnie Scotland, imported in 1857. Attempts to establish the St. Simon line have been on the whole disappointing; likewise that of Bend Or. The earlier line from Glencoe is now almost extinct, as is that from Diomed. The latter reached its apogee in Lexington (1850-75), still, over a half-century after his death, the most famous thoroughbred ever produced in America. His male line has faded but his blood is everywhere throughout the fabric of the American racehorse, testifying to an influence in its way unprecedented. Leamington, brought over in 1865, with those progenitors just named, ranks as the greatest since the 18th century, but his blood has been incapable of carrying on directly after the passing of his sons, and

is now no longer to be reckoned with. The foreign attitude toward the American thoroughbred for breeding purposes has never been friendly, despite the successes that many American-bred horses have won abroad and the fact that foreign-bred horses brought to America have never, taken as a class, shown any superiority. Yet strains of American blood have, from time to time, cropped up in the classic stake winners of England, France, Germany, Italy and also the Antipodes, including more than one Derby winner.

Jockeyship Methods.—It seems to be conceded that American methods of jockeyship since the 19th century permanently revolutionized race riding, and the entire scope of the sport, throughout the world, has felt their effects. But America for years has suffered from a dearth of good riders, while great ones have become well-nigh unknown. Two reasons are advanced for this somewhat curious situation. One is the prevalence of the sprinting distances, making judgment of pace, generalship and similar qualities ineffective amid the general scrambles that ensue. The other is the fact that the American weight scale is so low that riders of matured skill and experience become virtually outlawed from the saddle just when their skill is growing most assured, because of their excess weight. Many of them have emigrated to Europe and there continued to ride for seasons with conspicuous success, the loss to their own country being proportionate.

Internationally the *entente cordiale* between America and the Old World is, however, closer than ever before, evidences of which were provided by the voyage across the Atlantic, in 1923, of Papyrus and his match race against the American colt Zev, run at Belmont park, of which Zev was the winner; and the three American appearances of the French colt Epinard, in 1924, in which he ran second, successively, to Wise Counsellor at Belmont park, to Ladkin at Aqueduct and to Sarazen at Latonia, the last-named race being perhaps the most brilliant seen on the American turf in the 20th century. (J. L. He.)

HURDLE RACING

The *American Turf Register* records a hurdle race at the Washington, D.C., Jockey Club races in Oct. 1834, "one mile out, leaping six fences, every gentleman riding his own horse for a piece of plate, value one hundred pounds. Mr. Stratton had a bad start; he gradually gained on the others; at the last barrier his horse leaped over one of the leading horses and the fence at one bound." In 1838, at Montreal, Canada, there was great encouragement in racing because of the Governor General's Cup given by the earl of Durham. On the third day, a hurdle race for horses hunted with the Montreal hounds was won by Black Prince. *Nimrod Abroad*, 1842, speaks of hurdle racing in New Brunswick.

The sport in the States has had its ups and downs, but principally the latter, for the reason that, not needing any regular course, the races were run over hurdles placed on the track. These, not being permanent, were flimsy affairs, and when hit by the leaders would give way, bound back, and be difficult to judge by those following. Then again, as the tracks in America are always dirt, the horses in front often made so much dust that those behind were unable to see the jumps and blundered through them. This brought the sport into such great disfavour that hurdle racing was discontinued about 1900 but started again a few years ago.

Many horses raced over both hurdle and steeplechase courses. In 1872, Milesian won the Grand National Steeplechase with Johnny Hylands "riding like a great Captain," and immediately afterward a hurdle race. Resolute, in 1876, won a "chase" at Baltimore, then defeated Deadhead and Bullet in a steeplechase at Jerome Park, and later beat Trouble over hurdles at Saratoga, making 17 brackets that year to his credit. Lochiel, another grand hurdler of that period, held the record at Jerome Park of 2:26 for $1\frac{1}{2}$ m. over seven hurdles. Forget, the property of F. R. and T. Hitchcock, was one of the leading winners of her time (1898-99), coming first to the wire in 17 out of her 35 starts, and still held in 1928 the record for 2 m. at Coney Island.

TROTTING HORSE-RACING

It is in America that the racing of horses in harness has reached its highest development. The standard-bred trotter enjoys the distinction of being the only variety of modern domestic animal which is an American product and occupies a position of recognized supremacy the world over. It is in demand in all quarters of the globe, for breeding and racing purposes, where speed in harness is valued, as much as \$60,000 having been paid for a single stallion (Allen Winter) for export to Europe. Yet the standard-bred is by far the youngest of any sub-species of the equine race, its foundations having been laid little over 100 years ago, while the standard itself, under whose aegis it has reached so high a state of development, was not originated until 1879. It was then sponsored and placed in operation by the late John H. Wallace, the originator and long the compiler and publisher of the *American Trotting Register*, in 1928 in its 23rd volume. The number of stallions registered standard in this work is nearly 70,000, with more than double that number of mares. The index of standard speed is 2:30 for 1 m. for trotters and 2:25 for pacers, and there were in 1928, of official record, over 40,000 standard-record trotters and well on toward 35,000 pacers—the trot and the pace being to-day recognized as but two different forms of one fundamental habit of action.

The American harness race horse was built up from the most heterogeneous elements, including all those which showed aptitude for speed at the trot in harness. But to the imported English thoroughbred stallion Messenger, son of Mambrino, of the Darley Arabian line, belongs the credit of being the one horse whose blood brought order out of chaos and initiated the establishment of a genuine trotting family, destined to become universally dominant. Messenger, foaled 1780, was imported to America in 1788, made his first season that year at Philadelphia and died in 1808 on Long Island, his 20 years of service in America having been spent exclusively in and about Philadelphia and New York, then the two great urban centres of population in the United States. While his progeny highly distinguished themselves on the turf and at the stud, as thoroughbreds, it was as a progenitor of game, fast and enduring trotters that he founded a family and remains for ever famous. Both his sons and daughters handed on the gift of speed in harness, and as the generations multiplied, this speed increased rapidly in rate. His blood began to submerge all other strains in which the trotting faculty was distinctive, the tribes of Just in Morgan and Henry Clay being the foremost.

The line from Messenger proved most potent through his son Mambrino, in turn the sire of Abdallah, he the sire of Hambletonian (Rysdyk's). The latter horse (foaled 1849, died 1876) is the great outstanding figure in the upbuilding of the breed, his influence having been so wide and deep that not even that of Eclipse on the English thoroughbred has equalled it. About 10,000 different harness race horses perform publicly every year in the United States and Canada, of which it would be safe to say that at least 90% trace directly to Hambletonian in the male line, while the vast majority of them have many collateral crosses to him.

Up to 1869, when the National Trotting Association, the first governing body known to the sport, was formed, harness racing was, while a popular pastime in the republic, especially its northern and eastern portions, unorganized, desultory and lacking in social status. Thereafter it progressed rapidly, attracted prominent men in all walks of life and began to divide with the sport of thoroughbred racing the interest of those devoted to turf sports. The contrast between the two forms of racing remains, however, radical and inevitable. Thoroughbred race meetings are comparatively few in number, are held almost exclusively in or near the largest cities and are of lengthy duration. On the other hand, harness race meetings are diffused over the entire country, are of a few days only and many at which stakes and purses of large value are given are held in small towns, this being due to the fact that what may be termed the "amateur spirit" still largely prevails in the conduct of the sport.

Records.—From time immemorial harness racehorses have been handicapped according to their records (*i.e.*, their best official time) at a mile, though of late a new method of classifying them

according to their money-winnings has been steadily gaining favour. The class of a trotter or pacer is largely established by his record and probably always will be. The first authentic instance of fast trotting in America was when Yankee, a gelding of unknown antecedents, trotted a mile in 2:59 at Harlem, N.Y., in 1806. It was not until 1845 that 2:30 was reached by Lady Suffolk with 2:29½. Progress thereafter was steady as the breed became established and training methods improved. Flora Temple scored 2:19½ in 1859. The first 2:15 trotter was Goldsmith Maid (2:14 in 1874), which mare is notable as the largest money-winning animal ever on the turf of any sex, gait or breed, in any country. She was foaled in 1857, first appeared in public at the age of eight and trotted her last race at 20, her total winnings having been \$364,200. She was by Alexander's Abdallah, son of Rysdyk's Hambletonian.

The 2:10 trotting list was begun by Jay-Eye-See, in 1884, when he trotted in just 2:10. The first 2:05 trotter was Nancy Hanks, which scored 2:04 in 1892, the year pneumatic-tired racing vehicles ("sulkies") were introduced, vastly accelerating speed. Two minutes was at last reached in 1903 by Lou Dillon, she trotting in 1:58½ that season. In 1928 the record-holding trotter was Peter Manning, which in 1922 placed the figures at 1:56½. By a somewhat peculiar coincidence, the premier records that year at both the harness racing gaits were identical, the pacing mark being also 1:56½, by Directum I. in 1915. In 1905 Dan Patch paced a mile in 1:55½, but with artificial assistance which was subsequently barred from official performances.

The introduction of the automobile exercised a momentous effect upon the status of the American harness race horse. Previously the breed was taxed to its utmost to supply the demand for not only racing material, but the higher types of roadsters and private driving horses. As this demand no longer exists, the trotter and pacer of to-day approach the thoroughbred in that they are fast being relegated almost exclusively to the race track, for either professional or amateur use. Owing to this turn of evolution, racing methods have likewise been altered. Heat racing, as always, still prevails, but the length of the standard contest has been much curtailed, few races at the better meetings extending beyond the third heat. The emphasis is more upon extreme speed than staying power, and whereas in former years colt racing was indulged in to but a slight extent, the aged performer being supreme, to-day the two and three-year-old occupy the centre of the stage and the most important and richest events are coming more and more to be apportioned to them.

Thus far the most valuable trotting event given in America (or the world) has been the Hambletonian stake (named in honour of the great progenitor) of 1926, won by Guy McKinney, which fell but a trifle short of being worth \$75,000. It is for three-year-olds. No event exceeding \$25,000 has as yet been given for pacers, and in recent years no event for aged trotters has been of larger value. There are numerous futurity events for both two and three-year-olds and the leading money-winner of the season comes almost invariably from the futurity division. Early speed has become extreme. The two-year-old trotting record is now 2:04, held jointly by Mr. McElwyn and Fireglow. Mr. McElwyn and Spencer jointly hold the three-year-old mark of 1:59½. The two-year-old pacing honours are held by Silver Bells at 2:04½, the three-year-old by Highland Scott at 1:59½.

Breeding.—The Blue Grass region of Kentucky is the favoured region for the breeding of trotters, although their production goes on in all parts of the country, and many notable pacers are Canadian-bred. The principal speed nurseries and the premier sires are situated there. Trotting breeding to-day consists principally of the inter-breeding of the blood of four progenitors not long since disappeared from the stage—Axworthy, Bingen, McKinney and Peter the Great, all male-line descendants of Hambletonian. Of these the Axworthy line leads in the production of extreme speed, its chief representative being Guy Axworthy (2:08½), which has sired no less than four different two-minute trotters, viz., Lee Axworthy (1:58½), Guy McKinney (1:58½), Mr. McElwyn (1:59½) and Arion Guy (1:59½). No other sire is credited with more than one. Peter the Great has been the most prolific sire of harness speed ever known and is credited

with no less than 661 standard-record performers, almost double the number by any other stallion. His son Azoff (2:14½) is the sire of the trotting champion Peter Manning (1:56½). The family of Bingen is, however, in its totality, larger than that of either Axworthy or Peter the Great and his son Uhlan (1:58), the trotting champion from 1912 to 1921, is considered the most finished, elegant and versatile harness performer yet produced. McKinney's fame is due to a great racing daughter, Sweet Marie (2:02), and to a son Belwin (2:06½) and a grandson, San Francisco (2:07½), that are among the most successful sires of race horses of the present day.

A grand total of 1,220 different harness race meetings were held in the United States and Canada in 1927, the same number as in 1926. The great majority of these were held in conjunction with State, County or other agricultural fairs and expositions, at which the thorough-bred has never been able to gain a foothold, owing to the fact that betting is prohibited. In the United States harness racing reigns as their paramount entertainment feature. It has never been and never will be "the sport of kings," but as a democratic open-air diversion enjoys a popularity with the masses of the people that is secure. (J. L. HE.)

HORSERADISH, known botanically as *Cochlearia Armoracia*, a perennial plant of the family Cruciferae, having a stout cylindrical rootstock from the crown of which spring large radical leaves on long stalks, 4 to 6 in. broad, and about a foot in length with a deeply crenate margin, and coarsely veined; the stem-leaves are short-stalked or sessile, elongated and tapering to their attachment, the lower ones often deeply toothed. The flowers, which appear in May and June, are ½ in. in width, in flat-topped panicles, with purplish sepals and white petals; the fruit is a small silicula, which does not ripen in the climate of England. The horseradish is indigenous to eastern Europe. Into western Europe and Great Britain, where it is to be met with on waste ground, it was probably introduced. It has extensively escaped from cultivation in North America.

The root, the *armoraciae radix* of pharmacy, is ½ to 2 in. or more in diameter, and commonly 1 ft., sometimes 3 ft. in length; the upper part is enlarged into a crown, which is annulated with the scars of fallen leaves; and from the numerous irregular lateral branches are produced vertical stolons, and also adventitious buds, which latter render the plant very difficult of extirpation. From the root of Aconite (*q.v.*), which has occasionally been mistaken for it, horseradish root differs in being more or less cylindrical from a little below the crown, and in its pale yellowish (or brownish) white hue externally, acrid and penetrating odour when scraped or bruised, and pungent and either sweetish or bitter taste. Under the influence of a ferment which it contains, the fresh root yields on distillation with water about .05% of a volatile oil, butyl sulphocyanide, C_4H_9CNS . In common with other species of *Cochlearia*, the horseradish was formerly in high repute as an antiscorbutic. The root was, as well as the leaves, taken with food by the Germans in the middle ages, whence the old French name for it, *moutarde des Allemands*.

HORSE-SHOES. The horny casing of the foot of the horse and other solidungulates, while quite sufficient to protect the extremity of the limb under natural conditions, is found to wear away and break, especially in moist climates, when the animal is subjected to hard work of any kind. This, however, can be obviated by the simple device of attaching to the hoof a rim of iron, adjusted to the shape of the hoof. The animal itself has been in a very marked manner modified by shoeing, for without this we could have had neither the fleet racers nor the heavy and powerful cart-horses of the present day. Though the ancients were sufficiently impressed by the damage done to horses' hoofs to devise certain forms of covering for them (in the shape of socks or sandals), the practice of nailing iron plates or rim-shoes to the hoof does not appear to have been introduced earlier than the 2nd century B.C., and was not commonly known till the close of the 5th century A.D., or in regular use till the middle ages. The evidence for the earlier date depends on the doubtful interpretations of designs on coins, etc. As time went on, however, the profession of the farrier and the art of the shoemaker gradu-

ally grew in importance. It was only in the 19th century that horse-shoeing was introduced in Japan, where the former practice was to attach to the horse's feet slippers of straw, which were renewed when necessary, a custom which may indicate the usage of early peoples.

In modern times much attention has been devoted to horse-shoeing by veterinary science, with the result of emphasizing that methods formerly adopted caused cruel injury to horses and serious loss to their owners. According to modern principles (1) shoes should be as light as compatible with the wear demanded of them; (2) the ground face of the shoe should be concave, and the face applied to the foot plain; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase foothold; (4) the excess growth of the wall or outer portion of horny matter should only be removed in re-shoeing; care being taken to keep both sides of the hoof of equal height; (5) the shoe should fit accurately to the circumference of the hoof, and project slightly beyond the heel; (6) the shoe should be fixed with as few nails as possible, six or seven in fore-shoes and eight in hind-shoes, and (7) the nails should take a short thick hold of the wall, so that old nail-holes may be removed with the natural growth and paring of the horny matter.

HORSETAIL (*Equisetum*), the sole genus of the botanical class Equisetaceae, consisting of a group of vascular cryptogamous plants (see PTERIDOPHYTES) remarkable for the vegetative structure which resembles in general appearance the genera of flowering plants *Casuarina* and *Ephedra*. They are herbaceous plants growing from an underground much-branched rootstock from which spring slender aerial shoots which are green, ribbed, and bear at each node a whorl of leaves reduced to a toothed sheath. From the nodes spring whorls of similar but more slender branches. Some shoots are sterile while others are fertile, bearing at the apex the so-called fructification—a dense oval, oblong conical or cylindrical

THE CORN HORSETAIL (*EQUISETUM ARVENSE*), A TROUBLESOME WEED

- A. Fertile shoot, springing from the underground root-like stem, which also bears tubers; the vegetative shoots have not yet unfolded
- B. A spore bearing leaf
- C. Spore showing the two spiral bands of the perinium
- D. Dry spores showing the expanded spiral bands
- E. Sterile vegetative shoot

spike, consisting of a number of shortly-stalked peltate scales, each of which has attached to its under surface a circle of spore-cases (*sporangia*) which open by a longitudinal slit on their inner side. The spores differ from those of ferns in their outer coat (*exospore*) being split up into four club-shaped hygroscopic threads (*elaters*) which are curled when moist, but become straightened when dry. In most species the fertile and sterile

shoots are alike, both being green and leaf-bearing, but in a few species the fertile are more or less different, e.g., in *E. arvense* the fertile shoots appear first, in the spring, and are unbranched and not green. Any portion of the underground rhizome when broken off is capable of producing a new plant; hence the difficulty of eradicating them when once established. There are 25 known species of the genus which is universally distributed, 9 of which occur in Great Britain.

The common horsetail *E. arvense*, one of the best-known species, is sometimes a troublesome weed in clayey fields. The fructification appears in March and April, terminating in short unbranched stems. It is said to produce diarrhoea in such cattle as eat it. The bog horsetail, *E. palustre*, is said to possess similar properties. It grows in marshes, ditches, pools and drains in meadows. The fructification in this species is cylindrical, and in that of *E. fluviatile*, which grows in similar situations, it is ovate in outline. The largest British species, *E. Telemateia*, grows in wet sandy declivities by railway embankments or streams, etc., and is remarkable for its beauty, due to the abundance of its elegant branches and the alternately green and white appearance of the stem. In this species the fructification is conical or lanceolate, and is found in April on short, stout, unbranched stems which have large loose sheaths. *E. hyemale*, commonly known as the Dutch rush, is much more abundant in Holland than in Great Britain; it is used for polishing purposes. *E. variegatum* grows on wet sandy ground, and serves by means of its fibrous roots to bind the sand together. The horsetails are remarkable for the large quantity of silica they contain in the cuticle (hence their value in polishing), which often amounts to half the weight of the ash yielded by burning them; the roots contain a quantity of starch.

In North America the majority of the known species of horsetail occur, several of which, as the common horsetail (*E. arvense*), the bog horsetail (*E. palustre*), the swamp horsetail (*E. fluviatile*), the sedgelike horsetail (*E. scirpoides*), the smooth scouring-rush (*E. laevigatum*) and the tall scouring-rush (*E. prealtum*) are found widely across the continent. The giant horsetail (*E. Telemateia*), widely distributed in the Old World, with sterile stems occasionally 10 ft. long, occurs in the Pacific States, sometimes in pestiferous abundance.

HORSHAM, a town in Sussex, England, 38 m. S. by W. from London by the S.R. Pop. (1921) 11,406. Some early remains have been found at Horsham. The town is not mentioned in Domesday Book, but the Rape of Bramber, in which it lies, belonged at that time to William de Braose. His descendants held the borough and the manor of Horsham, which passed to the family of Mowbray, afterwards dukes of Norfolk. Fairs are held on April 5, July 18, Nov. 17 and 27. Market days are Monday and Wednesday. "Glovers" of Horsham are mentioned in a patent roll of 1485. It is situated near the source of the Arun. The church of St. Mary is mainly Early English and Perpendicular, with remains of Norman work, having a lofty tower surmounted by a spire. The grammar school was founded in 1532 and rebuilt in 1893. In the vicinity are several fine mansions. Christ's Hospital (q.v.) at West Horsham was opened in 1902, the school being removed hither from London. The town has industries of founding, carriage-building and the manufacture of bricks and pottery.

HORSLEY, JOHN (c. 1685-1732), British archaeologist. There is evidence that he was settled in Morpeth as a Presbyterian minister as early as 1709. At Morpeth Horsley opened a private school. Respect for his character and abilities attracted pupils irrespective of religious connection, among them Newton Ogle, afterwards dean of Westminster. He gave lectures on mechanics and hydrostatics in Morpeth, Alnwick and Newcastle, and was elected F.R.S. on April 23, 1730. Horsley's great work, *Britannia Romana, or the Roman Antiquities of Britain* (1732), is one of the scarcest and most valuable of its class. There is in the British Museum a copy with notes by John Ward (c. 1679-1758), biographer of the Gresham professors. Horsley died on Jan. 12, 1732.

HORSLEY, JOHN CALLCOTT (1817-1903), English painter, was born in London on Jan. 29, 1817. He studied at

Sass's academy and at the Academy schools. In 1844 he was selected as one of the six painters employed to decorate with frescoes the walls of the new palace of Westminster, where two of his large works, "The Spirit of Religion" and "Satan surprised at the ear of Eve," are to be found. But his real gift was for domestic scenes conceived in the Dutch style. He also painted some portraits, notably an admirable one of Martin Colnaghi, now in the National gallery, London. Horsley became A.R.A. in 1855 and R.A. in 1856. He died in London on Oct. 18, 1903. See his *Recollections of a Royal Academician* (1903).

HORSLEY, SAMUEL (1733-1806), English divine, was born in London on Sept. 15, 1733. Entering Trinity college, Cambridge, he became LL.B. in 1758, and in 1759 succeeded his father as rector of Newington Butts, Surrey. Horsley was elected F.R.S. in 1767; and secretary in 1773, but, in consequence of a difference with the president (Sir Joseph Banks) he withdrew in 1784. In 1781 he became archdeacon of St. Albans. Horsley now entered in earnest upon his famous controversy with Joseph Priestley, who, in his *History of the Corruptions of Christianity*, had included among those corruptions the orthodox doctrine of Christ's divinity. Horsley sought to show that Priestley was "altogether unqualified to throw any light on a question of ecclesiastical antiquity" (*Tracts*, 1789, p. 85). The controversy was prolonged until 1790 when Priestley published his maturer book on the *History of Early Opinion*, which Horsley refused to read. In 1788 Lord Thurlow procured Horsley's promotion to the see of St. David's. As a bishop, Horsley was energetic both in his diocese, where he strove to better the position of his clergy, and in parliament. On Jan. 30, 1793, a few days after the death of Louis XVI., he preached before the House of Lords a famous sermon at Westminster Abbey on the dangers of the revolutionary spirit. At his eloquent peroration the whole assembly rose involuntarily from their seats. His support of the government was acknowledged by his successive translations to Rochester in 1793, and to St. Asaph in 1802. With the bishopric of Rochester he held the deanery of Westminster. He died at Brighton on Oct. 4, 1806.

See H. Horsley Jebb, *Life of Bishop Samuel Horsley* (1909).

HORSLEY, SIR VICTOR (1857-1916), English physiologist and surgeon, was born in Kensington, London, on April 14, 1857. He studied medicine at University college, London, and, after qualifying in 1880, became house-surgeon to John Marshall. He then became professor-superintendent of the Brown Institution in the university (1884-90), assistant surgeon at University college hospital (1885), F.R.S. (1886), professor of pathology at University college (1886), surgeon to the National Hospital for the Paralyzed and Epileptic, Queen square, London (1886). In the World War he served in the military hospitals in France, Egypt and Mesopotamia. He put up a strong fight for better arrangements in the hospitals in the eastern theatre of war, and died at Amarah of heat-stroke on July 16, 1916.

Few men worked harder than Horsley in the two departments of surgery and physiology, but he had many outside interests. He was a passionate reformer, and a leader in the campaign against intemperance. His famous *Alcohol and the Human Body* (1907) was written in collaboration with Dr. Mary Sturge.

As a surgeon his most original work was done at Queen square. There he conducted successfully the first operation (June 9, 1887) for the removal of a tumour from the spinal cord; the paper on cerebral surgery read before the meeting of the British Medical Association at Toronto (1906) is one of the most important of his many writings. Before he went to the Queen square hospital he had made important researches in the localization of function in the brain and spinal cord in conjunction with Sir E. Sharpley Schäfer, Sir Felix Semon and others. Other subjects of his investigations at the Brown Institution were the action of the thyroid gland and protective treatment against rabies, and he was secretary of the commission appointed by the Local Government Board in 1886 to study the adoption of the Pasteur treatment.

See Stephen Paget, *Sir Victor Horsley, a study of his Life and Writings* (1919).

HORSLEY, WILLIAM (1774-1858), English musician, was born in London on Nov. 15, 1774, and died there on June 12, 1858. He was organist successively of Ely chapel, Holborn; the Asylum for Female Orphans; Belgrave chapel; and the Charterhouse. His compositions include three symphonies, but of greater importance are his delightful glees, such as "By Celia's Arbour," "O Nightingale," "Now the Storm begins to Lower."

HORST, the term used in geomorphology more definitely for a block of the earth's crust that has remained stationary while the land has sunk on either side of it, e.g., the Vosges. The word is also applied to those larger areas, such as the Deccan of India, where the continent remains stable, with horizontal beds forming a table-land, in distinction to the folded region such as the Himalaya mountains.

HORT, FENTON JOHN ANTHONY (1828-1892), British theologian, was born in Dublin on April 23, 1828, and was educated at Rugby school and at Trinity college, Cambridge, where he was the contemporary of E. W. Benson, B. F. Westcott and J. B. Lightfoot. The four men became lifelong friends and fellow-workers. In 1850 Hort took his degree, and two years later became fellow of his college. In 1854, in conjunction with J. E. B. Mayor and Lightfoot, he established the *Journal of Classical and Sacred Philology*, and plunged into theological and patristic study. In 1857 he married, and accepted the college living of St. Ippolyts, near Hitchin, Herts., where he remained for fifteen years. In 1870 he was appointed a member of the committee for revising the translation of the New Testament, and in 1871 he delivered the Hulsean lectures before the university. In 1872 he became fellow and lecturer at Emmanuel College; in 1878 he was made Hulsean professor of divinity, and in 1887 Lady Margaret reader in divinity. In the meantime he had published, with his friend Westcott, the reconstructed Greek text of the New Testament. The Revision Committee had very largely accepted this text, even before its publication, as a basis for their translation of the New Testament. The text was vehemently attacked, but on the whole it was received as being the nearest approximation yet made to the original text of the New Testament (see BIBLE: *New Testament*, "Textual Criticism"). Hort died on Nov. 30, 1892, worn out by intense mental labour. Next to his Greek Testament his best-known work is *The Christian Ecclesia* (1897).

See A. F. Hort, *Life and Letters of Dr. Hort* (2 vols. 1896).

HORTA, the capital of an administrative district comprising the islands of Pico, Fayal, Flores and Corvo, in the Portuguese archipelago of the Azores. Pop. (1920) 5,718. Horta is a seaport on the south-east coast of Fayal. The harbour, a bay 2 m. long and nearly 1 m. broad, affords good anchorage in 5 to 20 fathoms of water, but is dangerous in south-westerly and south-easterly winds. It is the headquarters of profitable whale, tunny, bonito and mullet fisheries. Its exports include sperm-oil, fruit, wine and grain.

HORTEN, a seaport and watering place of Norway, in Jarlsberg-Laurvik, amt (county), beautifully situated on the west bank of the Oslo Fjord, opposite Moss, 38 m. by water and 66 by rail S. of Oslo. Pop. (1927) 11,000. It is practically united with Karl-Johansvaern, which is defended by strong fortifications, is the headquarters of the Norwegian fleet, and possesses an arsenal and shipbuilding yards. There are also an observatory and a nautical museum.

HORTENSE (EUGÉNIE HORTENSE DE BEAUHARNAIS) (1783-1837), queen of Holland, was born in Paris on April 10, 1783. She was the daughter of the empress Josephine by her first marriage, and in 1802 married Louis Bonaparte, who was proclaimed king of Holland on June 6, 1806. The marriage was an unhappy one, and Louis endeavoured unsuccessfully to obtain a divorce, but Napoleon at length agreed to allow them to separate. Hortense was involved in the fall of Napoleon, and wandered from country to country, finally settling in Arenenberg, Switzerland, where she died on Oct. 5, 1837.

She was the mother of Napoleon Louis Charles, who died in infancy; Louis Napoleon (1804-31), crown-prince of Holland; and Charles Louis Napoleon afterwards Napoleon III. (q.v.).

She was the author of several songs, including "Partant pour la Syrie." Queen Hortense's *Mémoires* passed into the possession of Prince Napoleon who died in 1926 before he had finished editing them. The work was completed by Jean Hanoteau: *Les Mémoires de la reine Hortense* (3 vols., 1928; Eng. trans., 2 vols., 1928).

See d'Arjuzon, *Hortense de Beauharnais* (3 vols. 1902); Taylor, *Hortense de Beauharnais* (2 vols., 1927); C. G. de Taurines, *La Reine Hortense en exil* (1914); J. Turquan, *La Reine Hortense* (2 vols., 1927).

HORTENSIVS, QUINTUS, dictator of Rome 286 B.C. When the people, pressed by their patrician creditors, "seceded" to the Janiculum, he was commissioned to put an end to the strife. He passed a law (*Lex Hortensia*) whereby the resolutions of the multitude (*plebiscita*) were made binding on all the citizens, without the approval of the senate being necessary. He is said to have died while still dictator.

See Aulus Gellius xv. 27; Pliny, *Nat. Hist.* xvi. 15; Macrobius, *Saturnalia* i. 16; Livy, *Epit.* ii.

HORTENSIVS, QUINTUS (114-50 B.C.), surnamed Hortalus, Roman orator and advocate. At the age of nineteen he made his first speech at the bar, and shortly afterwards successfully defended Nicomedes III. of Bithynia, one of Rome's dependants in the East, who had been deprived of his throne by his brother. From that time his reputation as an advocate was established. As the son-in-law of Q. Lutatius Catulus he was attached to the aristocratic party. The senatorial control of the courts reintroduced by Sulla helped him, as many of his clients were ex-governors accused of extortion. He became quaestor in 81, aedile in 75, praetor in 72 and consul in 69. In the year before his consulship he came into collision with Cicero in the case of Verres, and from that time his supremacy at the bar was lost. But after 63 Cicero joined the party to which Hortensius belonged. Consequently, in political cases, the two men were often engaged on the same side (e.g., in defence of Rabirius, Murena, Publius Cornelius Sulla and Milo). After Pompey's return from the East in 61, Hortensius withdrew from public life and devoted himself to his profession. In 50, the year of his death, he successfully defended Appius Claudius Pulcher when accused of treason and corrupt practices by P. Cornelius Dolabella.

Hortensius's speeches are not extant. His oratory, according to Cicero, was of the Asiatic style, a florid rhetoric, better to hear than to read. He had a wonderfully tenacious memory (Cicero, *Brutus*, 88, 95), and could retain every point in his opponent's argument. His action was highly artificial, and his manner of folding his toga was noted by tragic actors of the day (Macrobius, *Sat.* iii. 13. 4). He also possessed a fine musical voice, which he could skilfully command. He was very rich, and noted for the luxury of his houses and table. He wrote a treatise on general questions of oratory, erotic poems (Ovid, *Tristia*, ii. 441), and an *Annales* (Vell. Pat. ii. 16. 3).

In addition to Cicero (*passim*), see Dio Cassius xxxviii. 16, xxxix. 37; Pliny, *Nat. Hist.* ix. 81, x. 23, xiv. 17, xxxv. 40; Varro, *R.R.* iii. 13. 17.

HORTHY DE NAGYBANYA, NICHOLAS (1868-), Hungarian admiral and regent, was born June 18, 1868 at Kenderes, in the family mansion in the county of Szolnok (Eastern Hungary). His family belonged to the landed gentry, and from 1635 ranked amongst the nobility. After studying at the naval academy at Fiume he entered the navy of the Dual Monarchy. After considerable sea service he was appointed A.D.C. to the Emperor Francis Joseph, and served in the naval department of the War Ministry in Vienna. At the outbreak of the World War he was appointed to command the cruiser "Novara." After Italy joined the Allies Horthy distinguished himself in the naval raids on Porto Corsini and San Giovanni di Medua, and particularly at Otranto, where on May 14, 1917, with the cruisers "Novara," "Saida" and "Helgoland," he broke through the ship cordon blockading the Straits of Otranto. Horthy, although severely wounded, remained on deck and continued the fight until he succeeded in returning safely with his ships to his home port, despite the enemy's heavy fire. He was awarded the military cross of Maria Theresa. Near the end of the War Horthy was appointed commander-in-chief of the Austro-Hungarian fleet.

After the collapse of the Monarchy and when revolution broke out in Hungary Admiral Horthy returned to organize the counter-revolutionary forces in southeastern Hungary, where his popularity added considerably to the influence of the unofficial counter-revolutionary Government formed by Count Julius Károlyi in Hungarian territory occupied by French troops. When it became obvious that the fall of Bolshevism was imminent, the second "Szeged Government" appointed Horthy commander-in-chief of the national army, which, after the flight of the people's commissioners (Aug. 1919), entered Transdanubia, entering Budapest, with Horthy at its head, on Nov. 16, 1919, after the withdrawal of the Rumanian troops.

The severity with which order was restored subjected Horthy to many attacks for failing to restrain the extremist leaders. The national assembly which met in Feb. 1920, however, elected Horthy, then still commander-in-chief of the Hungarian forces, to be regent of Hungary (March 1, 1920).

The only question on which opinion among influential Hungarian circles was sharply divided was that of the advisability or possibility of a legitimist restoration. The two attempts of the ex-king Charles (q.v.) to recover his throne placed Horthy in a dilemma between his oath to his king as Admiral and Privy Councillor and his oath as regent. In April 1921 he refused to obey Charles's summons to hand over the government and persuaded him to leave the country by peaceful means. In Oct. 1921, when the king marched on Budapest with an armed force, Horthy employed Hungarian troops against him, disarmed and, under pressure, handed him over to the Entente representatives. As the Hungarian Government was then forced to declare the Habsburg dynasty forfeit of the throne, Horthy was placed in the peculiar position of regent to a legally non-existent king. The legitimist question was, however, seldom raised openly by its partisans and Horthy, who invariably performed his duties with constitutional correctness, had an easier task to fulfill.

HORTICULTURAL AND BOTANICAL SOCIETIES.

For Linnean and other societies dealing with both zoology and botany, see LEARNED SOCIETIES. The *Congrès International d'Horticulture* first met at Brussels in 1864, and the *Congrès International de Botanique* at Amsterdam in 1865.

BRITISH ISLES: The *Royal Botanic Society of London* (inc. 1839) has gardens in the inner circle of Regent's Park and issues a *Quarterly Summary* (1880, etc.). The *Royal Horticultural Society* (1804, inc. 1809) has gardens at Chiswick, and publishes a *Journal* (1846, etc.). Other London societies include the *Brit. Mycolog. Soc.* (1896), *Trans.*; and *Empire Forestry Assoc.* (1921), *Emp. For. Journ.* The chief provincial societies are: Birmingham, *Bot. and Hort. Soc.* (1829), gardens. Oxford, *Bot. Soc. and Exch. Club* (1836), *Rept.* (1856, etc.). Dublin, *Roy. Hort. Soc.* (1830). Liverpool, *Bot. Soc.* (1906), *Proc.* (1910, etc.). Edinburgh, *Roy. Scot. Arboricult. Soc.* (1854), *Scot. For. Journ.* (half-yearly); *Bot. Soc.* (1836), *Trans. and Proc.* (1841, etc.) gardens est. 1670. Corstorphine, *Scot. Soc. for Res. in Plant Breeding* (1921), *Rept.* CANADA: Quebec, *Soc. pour la protec. des Plantes*. Ottawa, *Canad. Forestry Assoc.*, *Canad. HORTICULTURE. This term is derived from the Latin, *hortus*—a garden, and *cultura*—cultivation; and horticulture originally meant the cultivation of a garden in contrast to agriculture or the cultivation of fields. Field culture related originally to the production of cereals, grass and roots for fodder, while the garden was cultivated for the production of vegetables, fruit and nuts for use in the house and of flowers to beautify it. In early days, horticulture and gardening were synonymous terms, but horticulture has come to mean more than gardening. With the development of the town areas in the industrial ages, all the necessary fruits, flowers and vegetables could not be produced in the gardens, and in consequence these crops came to be grown in the fields, where they displaced cereals, roots or grass, in varying quantities. In places like England and Belgium, it would seem that this development increased simultaneously with the rise and intensification of industry; but it spread in advance of industry in North America, South Africa, Australia and New Zealand, for horticultural products, even for export, found a better market than the ordinary agricultural crops. Present day horticulture still means gardening, i.e., gardening in the home gardens, on the allotments and in the public parks, but the term also embraces the production of crops of fruit, flowers and vegetables wherever grown. It has developed into an industry of magnitude in England, Belgium, France, the Netherlands, United States and Canada, New Zealand and Tasmania, while in other countries, such as the South American republics, it has barely secured a footing.

In all these countries the departments of agriculture deal with horticulture usually through a separate department. Admittedly horticulture deals with crop production, and therefore has a close relationship to agriculture, but yet there is a distinction which is officially recognised in many acts of parliament. In some acts

the term agriculture is defined specially as including horticulture, but where no such definition is made horticulture often has been deemed to be excluded. Horticulture, of course, is of intense interest to large numbers of people, and its work is seen everywhere. Fruit, flower and vegetable production in the fields, private gardens and allotments, floriculture in the public parks, gardens and wayside places; even in the hearts of the great towns it may be seen practised in window boxes or roof gardens.

The Nursery Trade.—One of the important branches of horticulture is the nursery trade, for it supplies the industry and the public with plants, shrubs and trees for growing. The members of the trade have to be very skilled and technical, for theirs is the responsibility to choose and propagate the best varieties, true to name, to care for and develop the best strains, and to propagate and raise the baby plants until they reach the stage when they can leave the nursery grounds and fend for themselves in the fields of the market gardeners and fruit growers or in the private gardens of the public.

The nurserymen of to-day look far afield, making their purchases and selling their stocks in all countries where plant importation has not been forbidden. At times they assist collectively in sending explorers to wild and remote places to collect new plants of beauty.

Plant Raising.—All plants may be raised from seed, though some may be propagated more easily in other ways. The seeds of some yield a plant which flowers, produces seed and dies, all in the same year. Such one-year plants are called *annuals*, and include asters, balsam, calceolaria, candytuft, clarkia, cinerarias, eschscholtzia, annual delphiniums, linaria, annual lupins, mignonette, nasturtium, nigella, nemesia, annual poppies, sunflowers, stocks, sweet peas and zinnias. Seeds of these should be sown on good land. For earlier plants seed may with advantage be sown in sandy loams during January in heat, a practise specially recommended for asters, stocks and zinnias.

Other flowers, and for that matter vegetables, take one year to produce the plant, which gives flowers and seeds in the following year; these are known as *biennials*. Canterbury bells, antirrhinums, scabious and wallflowers are well-known biennials. Seed sown during the summer or autumn should be transplanted to single plants in the autumn to flower the following spring and summer.

There is a third class of plants which, after flowering, does not die; the foliage may ripen and die away in the autumn, but the roots persist so that with each spring and summer foliage and flowers are sent forth. Plants of this class are known as *perennials*, and they embrace most of our important plants of the herbaceous border. Aquilegia, auricula, begonia, calceolaria (bedding), campanula, carnations, Michaelmas daisies, delphiniums, peonies, lupins, phlox, perennial poppies, pyrethrums, are examples of perennial plants. Stocks of these may be raised from seed sown any time during the summer. Transplanted single roots increase in size annually and these may be divided to make more plants, a form of propagation usually adopted for perennials.

Some plants—antirrhinums, carnations, chrysanthemums, geraniums, calceolarias, arabis and aubretia, heaths, etc.—are increased by planting stem cuttings in pure sand in heat under moist conditions. They soon take root and make fresh plants. For plants like the phlox and seakale it is preferable to use a root cutting which on planting develops aerial branches.

Some plants give of their best when grown on roots which are not their own. Thus, varieties of roses are grown on the dog rose, the *manetti*, or the *rugosa*; the rhododendron on the common *R. ponticum*; apple trees on the crab or paradise stock; pears on the quince; cherries and plums on the wild stocks. This is a very convenient method of increasing plants, for the stocks may be grown and got ready to receive the particular variety which is joined on by grafting or budding. Grafting is a spring operation usually done for apples, pears, rhododendrons and many flowering shrubs. Budding is done in mid-summer and is more commonly used for roses, plums, peaches, etc. Where plants are difficult to propagate from seed or from cutting or by budding or grafting they are often layered, i.e., a stem slightly cut is pegged down to the ground and the cut part covered with soil. The ob-

nate plants may be coaxed by such means to send out roots.

In England the land devoted to nursery work is estimated at 10,000 acres, with an annual output of stock valued at £1,000,000. Holland, France and Germany have very large and important nursery trades. Those of the United States and Canada are fast developing.

Seed Production and Harvesting.—To a very large extent the flowers and vegetables of the gardens and fields are raised from seed sown annually. The horticulturist needs supplies true and of good germination. To secure seed that when sown will give good germination, it must be grown in certain localities and harvested during special weather conditions; in consequence localities became famous for certain seeds. Home seed saving fell out of fashion, and a special horticultural seed industry has taken its place. Horticultural seed firms of world-wide reputation exist in many countries. Perhaps the locality of first importance as a horticultural-seed district is California. The Californian climate is especially suitable for seeds of onion, lettuce, carrot, radish, sweet peas, zinnias and many flower seeds.

Similarly France, and especially the south of France round St. Remis, is suitable for just the same kinds, and these are produced in considerable quantities. The island of Vancouver, B.C., seems favourable for seeding flowers and a small industry has developed. There are many other places where the climate seems suitable and where important seed areas may develop, as for example South Africa. To seed the cauliflower a mild winter season is essential, for which reason Italy proves very desirable. In the neighbourhood of the bay of Naples field upon field of cauliflowers are seeded, from whence supplies go to all parts.

In the Netherlands the climate is more suitable for seeding culinary peas, of which there is a large and important production. England's climate is none too kindly for seed production, but is suitable for seeding peas and sweet peas in some quantity and such vegetables as cabbage, savoys, broccoli and Brussels sprouts. English raised seed of these vegetables enjoys a good reputation and finds markets in the United States, Canada, India and many other countries. In England about 4,850 occupiers of holdings are engaged in producing crops for seed.

The seed is formed on the plant after the female portion of the flower has been fertilised, and it is important that the pollen should come from flowers of the same variety, for if they do not crossing will occur. Many vegetables and flowers are fertilised by wind blown or insect carried pollen, so that the difficulties in keeping stocks pure are many. In practice, blocks of the same kind are grown in isolation and far removed from any foreign source. In addition, the parent plants are rogued very carefully at the time when differences in growth disclose the intruders. Seed saving of *Brassicæ* present a most difficult feature, for all kinds of cabbage will fertilise each other and also the Brussels sprouts, savoys, broccoli and wild mustard; so that the isolation of each kind of these plants needs great care.

The seed has to be harvested ripe and dry, threshed from the haulm and stored under appropriate conditions or good germination is not retained. Purity and good germination are the important essentials. In consequence of this several countries, the United States, Canada, England, Scotland, Ireland, Switzerland, Denmark, France, Holland, etc., have established official seed testing stations where seeds have to be tested before they may be offered for sale to the public. Legislative measures compelling this are embodied in "seeds acts" which generally lay down standards of purity and germination for each class of seed. For England the standards of germination must not be less than: peas 70%, dwarf and broad beans 75%, runner beans 60%, turnips 75%, cabbage 70%, kale 70%, kohlrabi 60%, swede 70%, Brussels sprouts 70%, broccoli 60%, cauliflower 60%, carrot 50%, parsnip 45%, beet 50%, onion 60%. Somewhat similar standards are in existence in other countries. The Government of Canada has gone further with control measures, so that it is illegal to sell seed of any varieties unless the name has been registered by the Canadian Government as that of a distinct variety. Trial grounds are maintained at the central experimental farm at Ottawa for testing all kinds under the plant registration scheme.

THE PRIVATE GARDEN

The present forms of the private garden have been evolved from many greatly differing styles. Very formal gardening with its neat beds and trimmed hedges and trees, landscape gardening which removed walls and boundary fences and took gardening into the parks and fields, wild gardening, the Victorian gardens of geranium beds in green smooth lawns all surrounded with laurel hedges,—all have held sway in their time, and parts of each are embodied in the gardening of the twentieth century. Changes have occurred in that laurels and evergreen shrubs have largely given way to flowering shrubs; the lawn is still kept but often is in part set with groups of daffodils, crocuses and snowdrops; trees and hedges are no longer cut and trimmed to weird shapes; the geraniums have given way to herbaceous plants and often a rock garden finds place. Sometimes provision is made for semi-aquatic plants.

In creating a good effect, the appearance of the lawn is all important. The lawn should be well drained to remove surplus water, and constantly rolled and mown and kept free of daisies and plantains. Grass may be encouraged to grow by repeated applications of small quantities of sulphate of ammonia. The best time of the year to prepare for making a new lawn in England is directly after the hot summer weather ceases, about the middle of August, to ensure a sowing of grass seeds at the end of the month. The soil is then warm, and heavy dews may be expected to help the germination of the seed. The young grass will have plenty of time to develop roots, and become properly established before frosts come. It is advisable to sow between one and two ounces of seed to the square yard, so that the amount for a lawn the size of a tennis court—forty yards by twenty yards—would be one hundred pounds. Patches of snowdrops, crocuses, daffodils and scillas planted in the lawn make a delightful spring effect, but the grass in these patches cannot be cut till June or the bulbs become weakened.

Bulbs are exceedingly popular, especially those of the narcissi and daffodils; of these new and improved kinds are introduced annually. Golden Spur, Emperor and King Alfred are really good yellow daffodils, whilst Orantus, Horace, Sunrise, Lucifer, Flame, Croesus are good narcissi. Crocus breeding has developed kinds that flower throughout the autumn, winter and spring.

The Herbaceous Border.—This is now found in every garden and often takes the form of a long bed, not too wide, running the whole length at one side of the lawn or even surrounding it. Herbaceous borders should be dug in the autumn when roots can be lifted or if necessary new kinds planted. Herbaceous plants give the best effect when planted in groups. As each group comes into flower that part is a blaze of colour. Herbaceous plants die down in the autumn and old stems and leaves need clearing but the plants grow again in the spring and usually get bigger with age. When overcrowding occurs the roots may be lifted, divided and replanted. Peonies, delphiniums, phloxes, campanulas, funkias (plantain lily), kniphofias (red hot poker), Michaelmas daisies, lupins are valuable herbaceous plants for any garden border. Occasional spring dressings with bone meal give good results.

Flowering Shrubs.—Lilacs, laburnum, Jasmine and rhododendrons are old friends that for generations have found their places in gardens. This group of flowering shrubs has been much enriched by collectors, and a fine variety of beautiful flowering shrubs and trees is now available. Of the shrubs the best are *Berberis Lycium*, *Berberis stenophylla*, *Buddleia alternifolia*, *Ceanothus Gloire de Versailles*, *Ceanothus Veitchianus*, *Cistus Cyprius*, *Cistus purpureus*, *Cornus Mas*, *Cotoneaster frigida*, *C. horizontalis*, *C. rotundifolia*, *Cydonia japonica*, *Cytisus albus*, *Deutzia scabra magnifica*, *Erica carnea*, *E. vagans*, *Escallonia langleyensis*, *Forsythia intermedia spectabilis*, *Genista virgata*, *Hammelis mollis*, *Jasminum nudiflorum*, *Magnolia stellata*, *Osmanthus Delawayi*, *Philadelphus grandiflora*, *Plagianthus Lyallii* (the best of all), *Prunus subhirtella*, *Pyracantha coccinea Lalandei*, *Pyrus floribunda*, *Rhododendron praecox*, *Ribes sanguineum*, *Rubus biflorus*, *Viburnum Carlesii* and *Viburnum fragans*.

These desirable shrubs need protection from severe frosts during exceptionally cold winters, and very occasional dressings with dung or leaf mould. Some need careful pruning, others trimming;

particulars can be obtained from any national horticultural society.

Rock Gardening.—In modern rock gardens Alpine plants predominate; in fact the gardens are constructed to make suitable sheltered spots and crevices, dry patches and wet places for these plants, for Alpines only grow well if given just the right places, soil and shelter. Some need peaty soil, others leaf mould and loam, while others need just scree or limestone rubble. The aim of the rock gardener must be to give each its natural environment. Some of the most charming Alpine plants for a rock garden are *Alyssum saxatile citrinum* (sheet of sulphur yellow), *Androsace* (rock jasmine, should be planted on gritty soil), *Anemone angulosa* (blue) and *A. Pulsatilla* (purple), *Aubrietia Dr. Mules* (purple), *Campanula Allionii*, *C. Alba* and *C. Miss Wilmott*, *Cotyledon simplicifolius*, *Cyclamen europaeum* and *C. neapolitanum*, *Daphne Cneorum*, *Dianthus alpinus*, *Gaultheria procumbens* (miniature shrub with white blossoms), *Gentiana acaulis*, *G. Sino-ornata*, and *G. verna*, *Iberis sempervirens*, Snowflake, *Iris pumila*, *Oxalis enneaphylla*, *Phlox stellaria*, *Primula auricula Bulleyana* (splendid bog species), *P. a. Juliae* and *Ramondia pyrenaica*, *Saxifraga Cotyledon*, *S. Myra*, *S. burseriana*, *Sedum acre*, *S. murale*, *Sempervivum arachnoideum*, *Silene acaulis*, *Thymus nitidus*, *Veronica*, *Viola Bertoloni*.

Of dwarf trees and shrubs the following are good, *Berberis Thunbergii purpurea*, *Cotoneaster horizontalis*, *Cupressus Fletcheri*, *Cytisus Kewensis*, *Daphne album*, *Erica carnea*.

The seeds of Alpine rock plants should be sown in pots in the autumn and exposed to the winter's frosts and snows and then in the spring put in cold frames. They may be pricked out as soon as large enough to handle and planted in their permanent quarters.

The Rose Garden.—Roses do best in heavy soils, but they can be grown on the lightest if the surface is mulched with dung during hot and dry periods. Roses can be grown on pergolas or poles, as dwarf bushes in beds, or as standards. There is now a form and kind suitable for almost every taste.

Some of the best climbing roses are American pillar (pink), Paul's scarlet climber (scarlet), Tausendschoen (pink), Coronation (crimson), Blush rambler, Dorothy Perkins (pink), Minnehaha (deep rose). These climbing roses need tying to the poles on which they climb, and each year the old wood needs cutting leaving only the new growths.

As bush roses the following kinds are noteworthy: *Polyantha varieties* (very dwarf): *Crimson Orleans* (crimson), *Kirsten Poulsen* (scarlet), *Nurse Cavell* (red), *Coral Cluster* (coral pink), *Else Poulsen* (rose pink). *Bush roses, semi-double and doubles*: *Betty Uprichard* (pink and carmine), *Christine* (yellow), *Halmark* (crimson), *Independence day* (yellow), *Lady Pirrie* (salmon pink), *Mme. Butterfly* (pale pink), *Mrs. Herbert Stevens* (white), *Red Letter day* (crimson-scarlet). *Singles*: *Pink Delight* (pink), *Ethel James* (bright pink), *Irish Elegance* (bright apricot), *Irish Fireflame* (orange pink). Good Roses for *Standards* are *Mrs. Henry Morse*, *Frau Karl Druschki*, *Lady Pierre*, *Mme. Herriot*, *Ophelia*, *General McArthur*, *Hugh Dickson*, *Golden Emblem*, *Lady Hillingdon*, *Los Angeles*, *Caroline Testout*, *Mme. Abel Chatenay*.

Young shoots give the best blooms, and these are encouraged by liberal manuring and by cutting well back in late spring when danger of frost has disappeared.

Roses are propagated on many different types of stocks, the briar, the manetti, the *rugosa*, and the Seedling *Polyanthus* rose, but beyond doubt those on the briar give the best results and last the longest.

Roses need careful pruning, though each kind of rose needs different treatment. The rambler roses should be autumn pruned by cutting out the old shoots and leaving the young growth. The *Wichuraianas* (*Dorothy Perkins*, *Minnehaha*, etc.) may be similarly treated as soon as flowering has finished. The *Noisettes* (*William Allen Richardson*, *Marechal Niel*, etc.) should be cut hard back in April. Bush roses should be left alone or just thinned when necessary. The perpetual roses, the *rugosas*, should be trimmed into shape during February. The hybrid perpetuals are cut back moderately in late March. The hybrid teas (*Mrs. W. T. Grant*, etc.) may be pruned in mid-March. Never prune roses until the kind has been ascertained.

Vegetable Gardening.—The purpose of the vegetable garden is to supply the larder with fresh vegetables throughout the year as far as possible. In temperate climates it is possible to secure a full twelve months' supply, but where the winter and summer temperature vary greatly, the supply falls short. To secure successful crops there must be thorough and deep cultivation, intensified manuring, and a proper rotation of crops. The soil at all times needs digging a good spade deep, and if done two spades deep or even three the results are much better for soil drainage and aeration is then better and roots penetrate deeper. The manuring should be liberal, of the right kinds and properly balanced. No doubt farmyard dung or green manure should form the basis, for when incorporated into the soil these work down to humus, and improve the physical properties of all soils. If sufficient dung is not available, it can be supplemented with artificials in much more generous quantities than is used generally. A good annual dressing for the garden would be 5 cwt. of dung per perch before digging and then an application of 3 lb. sulphate of ammonia, 9 lb. of superphosphate and 2 lb. of sulphate of potash, all scattered on the top of the soil as a spring dressing before planting or seeding is done. All gardens need lime as the soil becomes acid. Seedlings fare badly in soil short of lime and grow badly, especially when the drought comes. Peas and beans are very sensitive and grow indifferently on acid soils. On the other hand, potatoes and beets are resistant. Burnt lime, chalk or limestone should be applied in the spring just before the garden soil is dug. For the cultivation of the garden crops see articles on (a) GREEN VEGETABLES and (b) POTATOES.

Fruit in the Garden.—However small the garden, there should be room for a few fruits such as strawberries, gooseberries, currants, plums, apples and pears. One hundred plants of strawberries of the Royal Sovereign variety should yield sufficient for a small household. Lancer is the best gooseberry where only one kind is grown. It is good to eat or cook and a regular cropper of large berries. The Baldwin is the best garden currant, for its bushes are small and the crop large.

The tree fruits should be propagated on the dwarfing stocks, for only small trees are needed. For pears the quince stocks should be used and for apples the Jaune de Metz stock. If these stocks are used the trees never grow very large and begin early to give good crops of high quality fruits.

Gardening in the Public Parks.—The public parks of this generation are something more than public playgrounds of green fields, for in their management the horticulturist has secured a footing. Trees that bear beautiful flowering blossoms, such as the chestnut, acacia, tulip tree, catalpa and the beams now take the place of some of the commoner non-flowering trees. Banks of flowering shrubs have been planted and in addition beds of flowers are now quite common.

The London parks (Hyde park and St. James' park) have excellent trials each year of dahlias and tulips in which the public takes great interest. The Japanese flowering cherry trees in Washington park, U.S.A., are another striking example of the advance of horticulture in public parks. The public parks of Edinburgh, Paris, Vienna, Berlin, Ottawa, Montreal, Sydney and Melbourne are similarly made attractive. Each group of plants bears its name on a label. The park horticulturist in some instances has gone further, as for example in Hyde park and St. James' park, London, where notice boards displayed alongside the beds of trial dahlias and tulips set out the history of these particular flowers and the methods adopted for their classification.

Horticultural Instruction.—Horticulture has now become a recognised subject for a degree course at many of the universities. In England, for example, horticultural courses for degrees are given at the universities of Leeds, London (South Eastern Agricultural college, Wye), Cambridge and Reading. At the colleges, horticultural instruction courses are given at the Midland Agricultural college, East Anglian institute, Chelmsford, and at the farm schools of many county councils. The Royal Horticultural Society have a horticultural school at their gardens at Wisley, where a two year course of instruction is given for male students. The society holds annually examinations in horticulture for the award

of the national diploma in horticulture (N.D.H.). Women horticulturalists have special colleges for their instruction. The Horticultural college for Women, Swanley, Kent, can accommodate 80 resident students. The Studley college, Warwickshire, also a residential horticultural college for women, has 340 acres. Each English county council employs one or more skilled horticulturalists to teach in the villages.

In France, Belgium, the Netherlands and Europe generally the land and agricultural schools also give special horticultural courses, though no special degree for horticulture is made.

A recent development has been made in New Zealand, where official recognition has now been given to the awarding of a national diploma in horticulture. In the United States progress in the development of horticultural courses and instruction has been very rapid, for many universities not only award degrees specially for horticultural subjects but some have on their staff professors of horticulture, floriculture, pomology and vegetable crops.

HORTICULTURAL RESEARCH STATIONS

Great Britain.—Many European and American countries have recently established special research stations for the study of some special horticulture crop. In England the following are important:

Cambridge University Horticultural Station.—This was established in 1924 under the direction of Sir R. H. Biffen for special research into vegetable crops.

Cheshunt Experimental and Research Station.—Started in 1915 by growers' associations, the station carries out research and experimental work concerning the production of glass-house crops. Much research work in tomato, cucumber and chrysanthemum culture has been done and papers published.

East Malling Horticultural Research Station.—Started in 1912, this station now has extensive laboratories and over one hundred acres of land. Pomology, pathology and plant pests and hop culture have been made special features for study. The station's work on the vegetative propagation and standardisation of root stocks for fruit tree culture is known the world over.

John Innes Horticultural Institution.—This institution primarily concerns itself with pure research, genetics and plant breeding. Fruit, flower and vegetable breeding has been done and pollination questions studied.

Long Ashton Research Station.—Started nearly thirty years ago as the National Fruit and Cider institute, the station has much developed its work on cider-making and taken up research in fruit culture generally. The fruit lands exceed two hundred acres. Cider making, fruit nutrition and pathology are important subjects.

United States.—In the United States, the stations dealing with horticultural research are very numerous. That of New York State at Geneva has a world wide reputation primarily for its pomological work, and for the reports which give a complete classified and described list of fruits. In California, at the university and at the experimental farm at Davis, much good work is done. Cornell university and the State universities of Oregon, Washington, Michigan and Pennsylvania have experimental farms and extension plots.

In Canada experimental work is being undertaken at the Dominion experimental farms at Ottawa where are located the offices of the Dominion horticulturist. Linked up with this work are the branch farms and stations located in every province in Canada. In New Zealand, Australia and South Africa research departments have recently been created.

Horticultural Organisation.—Organisation in the horticultural world is of three main types, (a) general, (b) official and (c) trade. The general organisation takes the form of national horticultural societies with their numerous smaller, local affiliated societies. The Royal Horticultural Society, London, was founded in 1804 with a small following and now consists of over 25,000 fellows and associates. Similar national bodies exist in most European countries. In the United States there are upwards of 1,500 horticultural societies, including many important State organizations, together with numerous county, city and other local societies. In Canada, New Zealand and South Africa move-

ments are working in the same direction.

At intervals of from about three to five years, international horticultural congresses are held at which papers are read, discussions held and demonstrations made. In 1920 the first was held in the Netherlands. In 1927, a second was held at Vienna (Austria), following which arrangements were made to hold a third in London in 1930. Such congresses are planned and arranged by an international committee consisting of members nominated by the Governments of Austria, Belgium, England, France, Germany, Hungary, the Netherlands, Poland and Switzerland. Other countries have been invited to appoint representatives. In 1928 Dr. M. J. Sirks of Wageningen (Holland) was acting as secretary to the international committee. At the 1927 conference in Vienna there was some discussion in favour of establishing an international bureau for horticulture, a matter referred for consideration to the international committee.

(b) England, Canada and New Zealand have horticultural councils which have been officially set up and recognised as the proper bodies to give advice to the Government on horticultural matters. The Horticultural Advisory Council of England, which has been set up by the Ministry of Agriculture, is composed of members representing the Government, the scientific research workers, amateur horticulturalists, commercial growers and distributors with the Government horticulture commissioner as chairman. The Council holds not less than two meetings each year.

The Canadian Horticultural Council was formed in 1922. It consists of officers nominated by fruit growers, distributors, jam manufacturers and canners, together with officials from the Department of Agriculture. The *Canadian Horticulture Review* is published by the Council.

As to (c) horticultural traders in many countries have formed associations mainly for the purposes of local trade protection. By arrangement between the Horticultural Associations of Belgium, France, Great Britain, Holland, Luxemburg, an international body known as the *Fédération Horticole Professionnelle Internationale* has been established (general secretary, M. Turbat, Orleans, France). This international body holds annual meetings in rotation in the different countries. The F.H.P.I. deals only with horticultural matters as affecting international trade.

UNITED STATES (CHIEFLY FOR THE LATITUDE OF NEW YORK)

JANUARY

Flower Garden and Greenhouse.—Little is to be done in either. In the greenhouse care must be used to protect against frost. Ventilate little, and with care; raise the ventilating sash only high enough to let the heated air from the greenhouse drive back the outer air so as not to chill the plants. To destroy the red spider, syringe the plants copiously at night, and splash the paths with water. The aphid, or "green fly," must also be destroyed; tobacco may be used. Various new preparations are coming on the market for the destruction of greenhouse pests. Several new effective preparations of tobacco have been brought into use. The white-fly is now a common pest in greenhouses, the nymphs being greenish scale-like objects on the under sides of the leaves, and adults very small white flies. The remedy is to spray with kerosene emulsion or whale-oil soap; or, if on cucumbers or tomatoes, it is best to fumigate with hydrocyanic acid gas, using 1 oz. of potassium cyanide to each 1,000 cu. ft. of space. (This material is very poisonous.) Many greenhouse insects can be kept more or less in check by careful and effective hosing of the plants at proper times. At this season roses, grape-vines and other plants are often affected by mildew; an effectual remedy is to paint the hot-water pipes with a mixture of sulphur and lime, put on as thick as ordinary whitewash, once each week until it is checked; but care must be taken not to apply it on any surface at a higher temperature than 212°. Hyacinths and other bulbs that have been kept in a cellar or other dark, cool place may now be brought into the light of the greenhouse or sitting-room, provided they have filled the pots with roots. If they are not well rooted, leave them until they are, or select such of them as are best, leaving the others. In the outside flower garden little can be done except that shrubs may be pruned, or new work, such as making walks or grading, performed, if weather permits. See that the ornamental plants and trees are not injured by heavy weights of ice or snow.

Fruit Garden.—Pruning, staking up or mulching can be done if the weather is such that the workmen can stand out. On all warm or comfortable days the fruit trees may be pruned.

Grapery.—Graperies used for the forcing of foreign grapes may be started, beginning at a temperature of 50° at night, with 70° or 15° higher during the day. The borders must be covered sufficiently deep with leaves or manure to prevent the soil from freezing, as it would be destructive to the vines to start the shoots if the roots were frozen; hence, when forcing is begun in January, the covering should be put on in November, before severe frosts begin.

Vegetable Garden.—But little can be done in the northern States except to prepare manure, and get sashes, tools, etc., in working order; but in sections of the country where there is little or no frost the hardier kinds of seeds and plants may be sown and planted, such as asparagus, cabbage, cauliflower, carrot, leek, lettuce, onion, parsnip, peas, spinach, turnip, etc. In any section where these seeds can be sown in open ground, it is an indication that hotbeds may be started for the sowing of such tender vege-

tables as tomatoes, egg and pepper plants, etc.; though, unless in the extreme southern States, hotbeds should not be started before the beginning or middle of February. Make orders for the spring seeds.

FEBRUARY

Flower Garden and Greenhouse.—The directions for January will in the main apply to this month, except that now some of the hardier annuals may be sown in hotbed or greenhouse, and also the propagation of plants by cuttings may be done rather better now than in January, as the greater amount of light gives more vitality to the cutting.

Fruit Garden.—But little can be done in most of the northern States as yet, and in sections where there is no frost in the ground it is likely to be too wet to work; but in many southern States this will be the best month for planting fruit trees and plants of all kinds, particularly strawberries, raspberries, blackberries, pear and apple trees, while grape-vines will do, though they will also do well quite a month later. Continue the pruning. Fruit trees for spring planting should be ordered.

Grapery.—The graperies started last month at 50° at night may now be increased to 60°, with a correspondingly higher day temperature. Great care must be taken to syringe the leaves thoroughly at least once a day, and to deluge the paths with water, so as to produce a moist atmosphere. Paint the hot-water pipes with sulphur mixture, as recommended in January.

Vegetable Garden.—Leaves from the woods, kitchen manure or refuse hops from breweries may be got together towards the latter part of this month, and mixed and turned to get "sweetened" preparatory to forming hotbeds. Cabbage, lettuce and cauliflower seeds, if sown early this month in hotbed or greenhouse, will make fine plants if transplanted into hotbed in March. This is preferable to the use of fall-sown plants. Manure that is to be used for the crop should be broken up as fine as possible, for the more completely manure of any kind can be mixed with the soil, the better the crop will be, and, of course, if it is dug or ploughed in in large unbroken lumps it cannot be properly commingled.

MARCH

Flower Garden and Greenhouse.—The long days and bright sunshine will now begin to tell on the plants under glass. Examine all plants that are vigorous and healthy; if the roots have matted the "ball" of earth they must be shifted into a larger-sized pot. Plants from cuttings struck last month may now be shifted, and the propagation of all plants likely to be wanted should be continued. Hardier annuals may be sown; it is best done in shallow boxes, say two inches deep.

Lawns can be raked off and mulched with short manure, or rich garden earth where manure cannot be obtained. Flower-beds on light soils may be dug up so as to forward the work of the coming busy spring season. Lawns may be benefited by a good dressing, in addition to the manure, of some reliable commercial fertilizer. If the lawn is thin in spots, these places may be raked over heavily and new grass seed sown.

Fruit Garden.—In many sections, planting may now be done with safety, provided the soil is light and dry, but not otherwise. Although a tree or plant will receive no injury when its roots are undisturbed in the soil, should a frost come after planting, the same amount of freezing will, and very often does, greatly injure the plant if the roots are exposed.

Grapery.—The graperies started in January will have set its fruit, which should be thinned by one-third. The temperature may now be further advanced to 70° at night, with 15° higher in the daytime. The same precautions must be used against mildew and insects as given in January. Graperies wanted for succession may be started in February or this month.

Vegetable Garden.—This is a busy month. In localities where the frost is out of the ground, if it is not wet, seeds of the hardier vegetables can be sown. The list of seeds given for the southern States in January may now be used for the northern, while for most of the southern States tender vegetables, such as egg plant, okra, sweet potatoes, melon, squash, potatoes, tomatoes, etc., may be sown and planted. All hotbeds must now be started.

In March flower seeds and vegetable seeds may be sown in boxes or flats in the greenhouse, or in residence windows, or near the kitchen stove. Unless one has space under glass, or in hotbeds, in which the plants may be transplanted before they are set in the open ground, it is well not to start the seeds too early, inasmuch as the plants are likely to become too large or to be pot-bound, or to become drawn.

APRIL

Flower Garden and Greenhouse.—Window and greenhouse plants require more water and ventilation. Due attention must be paid to shifting well-rooted plants into larger pots; and, if space is desired, many kinds of hardier plants can safely be put out in cold frames. Towards the end of the month it may be necessary slightly to shade the glass of the greenhouse. All herbaceous plants and hardy shrubs may be planted in the garden. The covering of leaves or litter should be taken off bulbs and tender plants that were covered up for winter, so that the beds can be lightly forked and raked. Sow tender annual flower seeds in boxes inside.

Fruit Garden.—Strawberries that have been covered up with straw or leaves should be relieved around the plants, leaving the covering between them. Special care must be exercised that the mulch be not left on too long; the plants should not become whitened or drawn. Raspberries, grape-vines, etc., that have been laid down may now be uncovered and tied up to stakes or trellises, and all new plantings of these and other fruits may now be made. Fruit trees may be grafted.

Vegetable Garden.—Asparagus, rhubarb, spinach, etc., should be uncovered, and the beds hoed or dug lightly. Hardier vegetable seeds and plants, such as beets, cabbage, cauliflower, celery, lettuce, onions, parsley, parsnips, peas, potatoes, radishes, spinach, turnip, etc., should all be sown or planted by the middle of the month if the soil is dry and warm, and in all cases, where practicable, before the end of the month. It is essential, in sowing seeds now, that they be well firmed in the soil. Any who expect to get early cabbage, cauliflower, lettuce or radishes, while planting or sowing is delayed until the time of sowing tomato and egg plant in May, are sure to be disappointed of a full crop. Frequent rotation of crops should be practised in the vegetable garden, in order to head off insects and diseases; and also to make the best use of the land. Every three or four years the vegetable garden should be laid out in some new place; but if this cannot be done, the crops should be rotated on different parts of the old garden.

MAY

Flower Garden and Greenhouse.—Window and greenhouse plants should be in their finest bloom. Firing may be entirely dispensed with, though care must still be exercised in ventilating. If weather is cold and backward, however (and in the case of very northern regions), care must be taken not to stop firing too soon, or the plants will mildew and become stunted. The air must be kept moist. "Moss culture" may be tried, the common sphagnum or moss of the swamps, mixed with one-twentieth of its bulk of bone-dust, being laid as a mulch on the top of the earth of the flower-pots; its effect is to shield the pots from the sun, and at the same time stimulate the roots to come to the surface. By the end of the month all the plants wanted for the summer decoration of the flower border may be planted out, first loosening a little the ball of earth at the roots. If the weather is dry, water freely after planting. When the greenhouse is not to be used during the summer months, camellias, azaleas and plants of that character should be set out-of-doors under partial shade; but most of the other plants usually grown in the conservatory or window garden in winter may be set in the open border. Flower-beds should be kept well hoed and raked, to prevent the growth of weeds next month.

Pelargoniums, pinks, monthly roses and all half-hardy flowering plants should be planted early, but coleus, heliotrope and the more tender plants should be delayed until the end of the month. Annuals that have been sown in the greenhouse or hotbed may be planted out, and seeds of such sorts as mignonette, sweet alyssum, Phlox Drummondii, portulaca, etc., may be sown in the beds or

borders. The china aster is now one of the most popular of summer and fall plants. The seed may be sown in the north as late as the middle of May, or even the first of June, with good results for fall blooming. If the plants are started early in the greenhouse, they are likely to spend themselves before fall, and therefore a later sowing should be provided.

Lawns should be mown, and the edgings trimmed.

Fruit Garden.—The hay or leaf mulching on the strawberry beds should be removed and the ground deeply hoed (if not removed in April in the more forward places), after which it may be placed on again to keep the fruit clean and the ground from drying. Where it has not been convenient before, most of the smaller fruits may yet be planted during the first part of the month. Tobacco dust will dislodge most of the numerous kinds of slugs, caterpillars or worms that make their appearance on the young shoots of vines or trees. Fruit trees may be planted this month, if not planted in March or April. If they have been kept fresh and dormant, they should still be in good condition. The broken roots should be cut back to fresh wood, and the tops headed back in proportion.

Vegetable Garden.—Attention should be given to new sowings and plantings for succession. Crops sown last month will have to be thinned out if large enough. Hoe deeply all transplanted crops, such as cabbage, cauliflower, lettuce, etc. Tender vegetables, such as tomatoes, egg and pepper plants, sweet potatoes, etc., can be planted out. Seeds of Lima beans, sweet corn, melon, okra, cucumbers, etc., should be sown; and sow for succession peas, spinach, lettuce, beans, radishes, etc., every ten days.

JUNE

Flower Garden and Greenhouse.—Tropical plants can now be used to fill up the greenhouse during the summer months. The house should be well shaded; specimens of fancy caladiums, dracaenas, coleus, crotons, palms and ferns and other plants grown for the beauty of their foliage will make a very attractive show. If these cannot be had, common geraniums may be used. The "moss culture" will be found particularly valuable for these plants. Hyacinths, tulips and other spring bulbs may be dug up, dried and placed away for next fall's planting, and their places filled with bedding plants, such as coleus, achyranthes, pelargoniums, and the various white and coloured leaf plants. It will be necessary to mow the lawn once a week, and sometimes oftener.

Fruit Garden.—The small fruits should be mulched about the roots, if this has not yet been done. If the fruit garden is large enough to admit of horse culture, it is best to keep the bush-fruits well cultivated during the season; this tillage conserves the moisture and helps to make a full and plump crop of berries. In small areas the mulching system is sometimes preferable.

Vegetable Garden.—Beets, beans, carrots, corn, cucumbers, lettuce, peas and radishes may be sown for succession. This is usually a busy month, as many crops have to be gathered, and, if hoeing is not promptly seen to, weeds are certain to give great trouble. Tomatoes should be tied up to trellises or stakes if fine-flavoured and handsome fruit is desired, for if left to ripen on the ground they are apt to have a gross earthy flavour.

JULY

Flower Garden and Greenhouse.—Watering, ventilating and fumigating (or the use of tobacco in other forms for destruction of aphides) must be attended to. The atmosphere of the greenhouse must be kept moist. Watch the plants that have been plunged out-of-doors, and see if any require repotting. All plants that require staking, such as dahlias, roses, gladioli and many herbaceous plants, should now be looked to. Carnations and other plants that are throwing up flower stems, if wanted to flower in winter, should be cut back, that is, the flower stems should be cut off to perhaps five inches from the ground.

Fruit Garden.—If grape-vines show any signs of mildew, dust them over with dry sulphur, selecting a still, warm day. The fruit having now been gathered from strawberry plants, if new beds are to be formed, the system of layering the plants in small pots

is the best. In general, field strawberries are not grown from potted layers, but from good strong layers that strike naturally in the field. In the north, spring planting of strawberries is generally advised for market conditions; although planting in early fall or late summer is successful when the ground is well prepared and when it does not suffer from drought. Where apples, pears, peaches, grapes, etc., have set fruit thickly, thin out at least one-half to two-thirds of the young fruit.

Vegetable Garden.—The first ten days of this month will yet be time enough to sow sweet corn, beets, lettuce, beans, cucumbers and ruta-baga turnips. Such vegetables as cabbage, cauliflower, celery, etc., wanted for fall or winter use, are best planted this month, though in some sections they will do later. Keep sweet potatoes hoed to prevent the vines rooting at the joints.

AUGUST

Flower Garden and Greenhouse.—But little deviation is required in these departments from the instructions for July. See that sufficient water is applied; the walks may be wet in the houses.

Fruit Garden.—Strawberries that have fruited will now be making "runners," or young plants. These should be kept cut off close to the old plant, so that the full force of the root is expended in making the "crowns" or fruit buds for next season's crop. If plants are needed for new beds, only the required number should be allowed to grow, and these may be layered in pots as recommended in July. The old stems of raspberries and blackberries that have borne fruit should be cut away, and the young shoots thinned to three or four canes to each hill or plant. If tied to stakes and topped when 4 or 5 ft. high, they will form three or four branches on a cane, and will make stronger fruiting plants for next year.

Vegetable Garden.—Hoe deeply such crops as cabbage, cauliflower and celery. The earthing up of celery this month is not to be recommended, unless a little very early supply is wanted. Onions in many sections can be harvested. The proper condition is when the tops are turning yellow and falling down. They are dried best by placing them in a dry shed in thin layers. Sow spinach for fall use, but not yet for the winter crop. Red top, white globe, and yellow Aberdeen turnips should now be sown; ruta-baga turnips sown last month will need thinning, and in extreme southern States they may yet be sown.

SEPTEMBER

Flower Garden and Greenhouse.—The flower-beds in the lawn should be at their best. If planted in "ribbon lines" or "massing," strict attention must be given to pinching off the tops, so that the lines or masses will present an even surface. Tender plants will require to be put in the greenhouse or housed in some way towards the end of this month; but care should be taken to keep them as cool as possible during the day. Cuttings of bedding plants may now be made freely if wanted for next season, as young cuttings rooted in the fall make better plants for next spring's use than old plants, in the case of such soft-wooded plants as pelargoniums, fuchsias, verbenas, heliotropes, etc.; with roses and plants of a woody nature, however, the old plants usually do best. Dutch bulbs, such as hyacinths, tulips, crocus, etc., and most of the varieties of lilies, may be planted. Violets wanted for winter flowering will now be growing freely, and the runners should be trimmed off. Sow seeds of sweet alyssum, candytuft, daisies, mignonette, pansies, etc. Visit the roadsides and woods for interesting plants to put in the hardy borders.

Fruit Garden.—Strawberry plants that have been layered in pots may yet be planted, or in southern districts the ordinary ground layers may be planted. The sooner in the month both are planted the better crop they will give next season; and, as these plants soon make runners, it will be necessary to trim them off. Attend to raspberries and blackberries as advised for last month, if they have not already been attended to. All fruit trees should be gone over for borers before cold weather sets in; they also should have been gone over for the same purpose in May and June.

Vegetable Garden.—If cabbage, cauliflower and lettuce are wanted to plant in cold frames, the seed should be sown from about the 10th to the 20th of this month; but judgment should be exercised, for, if sown too early, cabbage and cauliflower are apt to run to seed. The best date for latitude of New York is Sept. 15. The main crop of spinach or sprouts that is wanted for winter or spring use should be sown about the same date. The earth should be drawn up to celery with a hoe preparatory to earthing up with a spade. Onions not harvested and dried last month must now be attended to. Turnips of the early or flat sorts may yet be sown the first week of this month in the northern States, and in the south from two to four weeks later.

OCTOBER

Flower Garden and Greenhouse.—In northern sections of the United States, tender plants that are still outside should be got under cover as early as possible. Delay using fire heat as long as possible, unless the nights become so cold as to chill the plants inside the house. Roses, carnations, camellias, azaleas, pelargoniums and the hardier plants will do better in a cold frame or pit until about the middle of November than they would in an ordinary greenhouse. Look out for insects. Fall bulbs of all kinds may be planted. Take up summer-flowering bulbs and tubers, such as dahlias, tuberose, gladioli, cannas, caladiums, tigridias, and dry them off thoroughly, stowing them away afterwards in some place free from frost and moisture during the winter. Before winter sets in see that the lawn is freely top-dressed. Be careful not to mow the grass too short in the fall.

Fruit Garden.—Strawberries grown from pot-grown layers may yet be planted in southern States; keep the runners trimmed off. Fruit trees and shrubs may be set out; but, if planting is deferred to the last of the month, the ground around the roots should be mulched to the thickness of 3 or 4 in. with straw, leaves or rough manure, as a protection against frost. The fruit garden must be protected from the ravages of mice in winter. Mice will nest about the plants if there is straw or other litter around them. Before winter, all tall grass and loose litter should be taken away; if this is not done, then the first snow should be tramped heavily around the plants, in order to destroy any nesting-places.

Vegetable Garden.—Celery will now be in full growth, and will require close attention to earthing up, and during the last part of the month the first lot may be stored away in trenches for winter. All vegetable roots not designed to be left in the ground during the winter should be dug up, such as beets, carrots, parsnips, sweet potatoes, etc. The cabbage, cauliflower and lettuce plants grown from seed sown last month should be pricked out in cold frames. If lettuce is wanted for winter use, it may now be planted in the greenhouse or cold frame, and will be ready for use about Christmas. If asparagus or rhubarb is wanted for winter use, it should be taken up and stowed away in pit, frame, shed or cellar for a month or two. It may then be taken into the greenhouse and packed closely together under the stage, and will be fit for use from January to March, according to the temperature of the house. Vegetable gardens often become infested with diseases carried over from year to year in the old plants and litter; this is especially true of watermelons and of some diseases of tomatoes. It is well, therefore, to burn the tops of the plants in the autumn, rather than to plough them under or to throw them on the compost heap.

NOVEMBER

Flower Garden and Greenhouse.—All plants intended to be grown inside should now be indoors. Keep a sharp look-out for cold snaps, as they come very unexpectedly in November, and many plants are lost thereby. In cases where it is not convenient to use fire heat, 5° to 10° of cold can be resisted by covering the plants over with paper, and by using this before frost has struck the plants valuable collections may be saved. When fire heat is freely used, be careful to keep up the proper amount of moisture by sprinkling the paths with water. Little can be done in the flower garden, except to clean off all dead stalks, and straw up tender roses, vines, etc., and, wherever there

is time, to dig up and rake the borders, as it will greatly facilitate spring work. Cover up all beds in which there are hyacinths, tulips and other bulbs with a litter of leaves or straw to the depth of 2 or 3 inches. A good sprinkling of thoroughly decayed manure spread over the lawn may help towards a finer growth next spring.

Fruit Garden.—Strawberry beds should be covered (in cold sections) with hay, straw or leaf mulching, to a depth not exceeding 2 inches. Fruit trees and grape-vines generally should be pruned; and, if the wood of the vine is wanted for cuttings, or scions of fruit trees for grafts, they should be tied in small bundles and buried in the ground until spring. They may be taken in December or January if preferred.

Vegetable Garden.—Celery that is to be stored for winter use should be put away before the end of the month in all sections north of Virginia; south of that it may be left in most places where grown throughout the winter if well covered up. The stalks of the asparagus bed should be cut off, and burned if there are berries on them, as the seeds scattered in the soil sometimes produce troublesome weeds. Mulch the beds with 2 or 3 in. of rough manure. All vegetable roots that are yet in the ground, and not designed to be left there over winter, must be dug up before the middle of the month or they may be frozen in. Cover up onions, spinach, sprouts, cabbage or lettuce plants with a covering of 2 or 3 in. of leaves, hay or straw, to protect them during the winter. Cabbages that have headed may usually be preserved against injury by frost until the middle of next month by simply pulling them up and packing them closely in a dry spot in the open field with the heads down and roots up. On approach of cold weather in December they should be covered up with leaves as high as the tops of the roots, or, if the soil is light, it may be thrown over them, if leaves are not convenient. Cabbages will keep this way until March if the covering has not been put on too early. Plough all empty ground if practicable, and, whenever time will permit, do trenching and subsoiling. Cabbage, cauliflower and lettuce plants that are in frames should be regularly ventilated by lifting the sash on warm days, and on the approach of very cold weather they should be covered with straw mats or shutters. In the colder latitudes, and even in the middle States, it is absolutely necessary to protect cauliflower in this way, as it is much more tender than cabbage and lettuce plants.

DECEMBER

Flower Garden and Greenhouse.—Close attention must be paid to protecting all tender plants, for it is not uncommon to have the care of a whole year spoiled by one night's neglect. Vigilance and extra hot fires will have to be kept up when the thermometer falls to 34° or 35° in the parlour or conservatory. It is well to set the plants under the benches or on the walks of the greenhouses; if they are in the parlour move them away from the cold point and protect them with paper; this will usually save them even if the thermometer falls to 24 or 26 degrees. Another plan in the greenhouse is to dash water on the pipes or flues; this causes steam to rise to the glass and freeze there, stopping up all the crevices. With plants outside that require it, strawing up or mulching must now be finished.

Fruit Garden.—In sections where it is an advantage to protect grape-vines, raspberries, etc., from severe frost, these should be laid down as close to the ground as possible, and covered with leaves, straw or hay, or with a few inches of soil. Grapes may be pruned. Fruit trees may be pruned from now till March in the north.

Vegetable Garden.—Celery in trenches should receive the final covering for the winter, which is best done by leaves or light stable litter; in the latitude of New York it should not be less than 12 in. thick. Potatoes, beets, turnips or other roots in pits, the spinach crop in the ground, or any other article in need of protection, should be attended to before the end of the month; manure and compost heaps should be forwarded as rapidly as possible, and turned and mixed so as to be in proper condition for spring. Remove the snow that accumulates on cold frames

or other glass structures, particularly if the soil which the glass covers was not frozen before the snow fell; it may remain on the sashes longer if the plants are frozen in, since they are dormant, and would not be injured if deprived of light for eight or ten days. If roots have been placed in cellars, attention must be given to ventilation, which can be done by making a wooden box, say 6 by 5 in., to run from the ceiling of the cellar to the eaves of the building above. (L. H. BA.; P. H.)

HORTON, ROBERT FORMAN (1855–), British Nonconformist divine, was born in London on Sept. 18, 1855. He was educated at Shrewsbury school and New college, Oxford, where he was president of the Union in 1877. He became a fellow of his college in 1879, and lectured on history for four years. In 1880 he became pastor of the Lyndhurst Road Congregational church, Hampstead. He delivered the Lyman Beecher lectures at Yale in 1893; in 1898 he was chairman of the London Congregational Union; and in 1903 of the Congregational Union of England and Wales. In 1909 he took a prominent part in the 75th anniversary celebration of Hartford Theological seminary. His numerous publications include books on theological, critical, historical, biographical and devotional subjects.

HORTON, a city of Brown county, Kan., U.S.A., near the north-east corner of the State, in a rich agricultural and stock-raising region. It is on Federal highway 73, and is served by the Rock Island railroad. The population in 1925 (State census) was 4,212. The Rock Island has large repair and manufacturing shops here. The municipal water supply has been obtained by damming Mission Creek, near the city. Horton was founded in 1886.

HORUS, the name of an Egyptian god, if not of several distinct gods. To all forms of Horus (Egyptian *Hôr*), the falcon was sacred; the name *Hôr*, written with a standing figure of that

bird,  is connected with a root signifying "upper," and probably means "the high-flyer." The tame sacred falcon on its perch  is the commonest symbol of divinity in early hieroglyphic writing; the commonest title of the king in the earliest dynasties, and his first title later, was that which named him Horus. Hawk gods were the presiding deities of Poi (Pe) and Nekhen, which had been the royal quarters in the capitals of the two primeval kingdoms of Upper and Lower Egypt, at Buto and opposite El Kab. A principal festival in very early times was the "worship of Horus," and the kings of the prehistoric dynasties were afterwards called "the worshippers of Horus." The Northern Kingdom in particular was under the patronage of Horus. He was a solar divinity, but appears very early in the Osiris cycle of deities, as son of Isis and probably of Osiris, and opponent of Sêth.

As a sun-god Horus not only worsted the hostile darkness and avenged his father, but also daily renewed himself. He was thus identical with his own father from one point of view. In the mythology, especially that of the New Kingdom, or of quite late times, we find the following standing epithets applied to more or less distinct forms or phases: Harendotes (Har-ent-yotf), i.e., "Hôr, avenger of his father (Osiris)"; Harpokrates (Harpokrat), i.e., "Hôr the child," with finger in mouth, sometimes seated on a lotus-flower; Harsiesis (Har-si-Ësi), i.e., "Hôr, son of Isis," as a child; Har-en-khêbi, "Hôr in Chemmis," a child nursed by Isis in the papyrus marshes; Haroeris (Har-uêr), i.e., "the elder Hôr," at Ombos, etc., human-headed or falcon-headed; Harsemteus (Har-sem-teu), i.e., "Hôr, uniter of the two lands," and others.

See EGYPT: Religion; Meyer, art. "Horus" in Röscher, *Lexicon der Griech. und Röm. Mythologie*.

HORWICH, urban district, Westhoughton parliamentary division, Lancashire, England, 18 m. N.W. of Manchester by L.M.S. railway. Pop. (1921) 15,621. Rivington reservoir of Liverpool corporation is near. It has important locomotive works for the L.M.S. railway as well as large stone quarries. Other industries are cotton spinning, bleaching and finishing and the manufacture of fire-bricks and tiles.

HOSANNA. A word cried in salutation of Christ when He entered Jerusalem (Mk. xi. 9 sq.; Mt. xxi. 9, 15; John xii. 13). We find in Ps. cxviii. 25 *Hôshî'ah nâ*, "Save, Oh!" and in Ps. lxxxvi. 2 the shortened form *Hôsha'*. In Zech. ix. 9 the Messiah is said to be *nôsha'* "saved" or "victorious," and thus to enter Jerusalem on an ass. Perhaps the multitudes, and certainly the primitive Christians (Matt. xxi. 5, 9), connected the cry of Hosanna with this. In John xii. 13 it may have to do with the palm branches in the hands of the multitude who went out to meet Him. For the term Hosanna is used (Bab. Talmud *Sukka* 30 b) of the festive posy (*lulab*, a palm-shoot, myrtle and willow) carried with a citron (*ethrog*) on the Feast of Tabernacles, and possibly at the original Feast of the Dedication (2 Macc. x. 7). The origin of this custom is unknown, and perhaps goes back to a primitive celebration in nature-worship.

See further F. C. Burkitt, *J. Th. St.*, xvii. (1916), pp. 139-152. (A. L. W.)

HOSE, the name of an article of dress used for various forms of a long stocking, covering both the foot and leg (see *HOSIERY*).

HOSEA, a Hebrew prophet of the 8th century B.C., whose oracles are addressed to the northern kingdom (Israel), to which he seems to have belonged (vii. 5). The Old Testament book bearing his name is the first in order of "the twelve prophets," a unity from at least the beginning of the 2nd century B.C. (Ecclus. xlix. 10). The (editorial) title dates his work as done under Jeroboam II. (d. 743) and subsequently; there is no evident reference to the Syro-Ephraimitic war of 734, and the fall of Damascus in 732, though some would find one in v. 8 *et seq.* The general character of the book seems to reflect the closing

decades of the northern kingdom, so that we may regard Hosea's work as belonging to the third quarter of the 8th century. The book, in its present form, consists of three introductory chapters, the first and third being biographical and autobiographical respectively, followed by eleven chapters of short "oracles," more or less detached, so that no marked sequence of thought can be discerned, except that the closing chapter describes Israel's repentance, in response to the passionate appeal of the prophet. The text is often corrupt, and this is one of the most difficult books of the Old Testament to interpret in detail, though the main themes are sufficiently clear.

Hosea's Marriage.—The most interesting and important problem of the book relates to the marriage of Hosea, which is closely related to the form and content of his message. According to the first chapter, Hosea is commanded to take a harlot for his wife and children of harlotry; he therefore marries Gomer bath Diblaim, who subsequently has three children, to whom the prophet gives symbolic names that he may make them the texts of prophetic messages concerning Israel. According to the third chapter, Hosea is commanded to love an unnamed woman, loved by a paramour, and an adulteress. He obeys by purchasing her, apparently from some kind of undescribed servitude, and by setting her apart for what seems to be a probationary period. There is no reason to doubt that these events actually happened, though they were interpreted as "prophetic symbolism"; Ezekiel similarly employs actual events (the death of his wife, xxiv. 15 *et seq.*). The phrase "wife of whoredom and children of whoredom" is sufficiently explained by the supposition that Hosea eventually discovered his wife's infidelity; it does not require us to suppose that she was unchaste before her marriage. But what is the relation of the first and third chapters? The natural and *prima facie* view is that the unnamed woman of the third chapter is still Gomer of the first, that after leaving her husband she has passed into other hands, possibly of the priests of a local sanctuary, at which she may be serving as a "religious" prostitute. On this view we are left with the idea that Hosea means to take Gomer back to his home after the necessary period of probation. It is, however, argued that the third chapter is really parallel to the first, since Gomer's departure from her husband ought not to be left to the imagination, and Gomer ought to be definitely named, if this were a sequel; whereas the use of the third person in the first chapter and the first person in the third suggests that they come from different hands. Against this view, however, the dissimilarity of the two narratives is a strong argument. Even if this be evaded by making the third chapter a prelude to the first (Lindblom), the supposition of a double unchastity is artificial and confuses the allegorical application. The ordinary view, therefore, seems justified, with the important consequence for exegesis that the record of Hosea's experience closes optimistically and not pessimistically, and leaves us free to credit him with such oracles of hope as those of the closing chapter of his book. There is no ground for supposing that Hosea was made a prophet by this experience of domestic sorrow; we should rather say that, being a prophet, he was led to interpret it as a divinely ordained "parable" of the relation of Yahweh to Israel. His oracles are deeply coloured by the experience, and he employs throughout the figure of a wife's infidelity to describe and condemn the sin of Israel. It may even be, as Professor Hans Schmidt has recently argued (*Zeitschrift für alttest. Wissenschaft*, 1924, pp. 245 *sqq.*) that the bitterness of the prophet's attack on the immorality of the high places and of the priests connected with them is due to a personal element—that it was from one of these sanctuaries that he had, in the literal sense, to "redeem" the temple-prostitute, Gomer, because she had left her husband for professional connection with a sanctuary, after having been first led astray by the licensed sexuality of its festivals (*cf.* iv. 8 *et seq.*). There is certainly a depth of personal emotion in this book which can be paralleled nowhere else save in the greater prophet so like Hosea—Jeremiah, who knew the sorrows of a lonely life as Hosea did those of an unhappy marriage. Hosea is the first to make a profoundly ethical application of the figure of marriage to the relation between God and man.

Of course, the sex element had already taken a great place in primitive religion, including the Canaanite. But the moral side of the sex relation, the higher principles which lead to its sublimation in human experience, so that human love becomes capable of reflecting the love of God and preparing man to understand and respond to it—all this great line of thought was initiated by Hosea, with the result that it transformed an anthology of love lyrics (Song of Solomon, *q.v.*) into an allegory of the history of Israel, and culminated in the Gospel of the New Testament and the Pauline figure of the Church and her divine Bridegroom. The most moving passage of the book of Hosea (xi. 8, 9), "How shall I give thee up?", ascribes to God a human sympathy that suffers and cannot rest until it redeems a love as passionate as Hosea's for Gomer.

Hosea's Message.—Hosea ascribes the contemporary moral corruption of Israel to the neglect of true religion, and to priestly encouragement (iv. 1-19); priests and rulers have misled the people (v. 1-7); hence the coming punishment, though it is intended to produce penitence (v. 8-15). Israel's return to Yahweh (vi. 1-3), however, is too shallow for the depth of her sin (vi. 4-11). The capital city and its rulers are wicked, and their foreign policy will deservedly fail (vii.). The punishment will be the absorption of Israel by the nations (viii.). These coming sorrows of desolation and exile will be due to the false worship of Yahweh, as at Gilgal (ix.). Israel's altars and idols will be overthrown, and the harvest of wickedness will be reaped (x.). But Yahweh is Israel's father, unable to destroy utterly (xi. 1-11). How different is Israel from the ancestral figure, Jacob (xi. 12-xii.)! The ingratitude of Israel for Yahweh's providential care fully warrants His anger (xiii.). The book closes with Israel's promise to abandon other aids and gods (xiv.). We have seen that the final attitude of Hosea towards Gomer warrants us in ascribing to him this expression of hope; the temper of the prophet is different from that of Amos, in whose experience there is no ground for a similar view of the closing section of his book. In fact, the logic of Hosea's position, if we have rightly construed his personal history, requires us to regard his message as finally optimistic. He penetrated more deeply than Amos into the idea of religion as a right "spirit" (iv. 12, v. 4), *i.e.*, a right relation of loyalty to God; such an emphasis makes "repentance" at once more fundamental and more conceivable.

BIBLIOGRAPHY.—The chief German commentaries are those by Nowack (1897; 1904), Wellhausen (1898), Marti (1903), Sellin (1922), Lindblom, *Hosea Literärisch. Untersucht* (1927); in French there is A. Van Hoonacker (1908); amongst English books the following can be recommended:—T. K. Cheyne, *Hosea in the Cambridge Bible* (1884); W. R. Smith, *The Prophets of Israel* (1895); G. A. Smith, *The Book of the Twelve Prophets*, vol. i. (1896 and 1927); W. R. Harper, *Amos and Hosea, International Critical Commentary* (1905); A. C. Welch, *The Religion of Israel under the Kingdom*, v. (1912); G. H. Box, in *Peake's Commentary* (1919); Melville Scott, *The Message of Hosea* (1921); T. H. Robinson, *The Clarendon Bible*, O.T., vol. iii.: *Decline and Fall of the Hebrew Kingdoms* (1926). (H. W. R.)

HOSE-PIPE, or simply "hose," the name given to flexible piping by means of which liquid (generally water but occasionally petrol etc.) may be conveyed. One end of the pipe is connected to the source of the water, while the other end is free, so that the direction of the stream of water which issues from the pipe may be changed at will. The method of manufacture and the strength of the materials used depend naturally upon the particular use to which the finished article is to be put. Simple garden hose is often made of india-rubber or composition, but the hose intended for fire brigade and similar important purposes must be of a much more substantial material. The most satisfactory material is the best long flax, although cotton is also extensively used for many types of this fabric.

The flax fibre, after having been carefully spun into yarn, is boiled twice and then beetled; these two processes remove all injurious matter, and make the yarn soft and lustrous. Several threads may be twisted together to secure uniformity and strength, and then the compound yarns are wound on to large bobbins, and made into a chain or warp; the number of threads in the chain depends upon the size of the hose, which may be anything from half

an inch to 15 in. or even more in diameter. When the chain is warped, it is beamed upon the weaver's beam, and the ends—either double or triple—are drawn through the leaves of the cambs, heads or heddles, passed through the reed and finally tied to the cloth beam. The preparation of the warp for any kind of loom varies very little, but the weaving may vary greatly. In all cases the hose fabric is essentially circular, although it appears quite flat during the weaving operation.

There are very few hand-made fabrics that can compete with the machine-made article, but the very best type of hose-pipe is

FIGS. 1 AND 2.—COMMON DESIGNS IN WEAVING SEAMLESS HOSE-PIPES. Point-paper design (left) and (right) diagrammatic section of cloth

certainly one of the former class. The cloth can be made much more cheaply in the power-loom than in the hand-loom, but, up to the present, no power-loom has been made which can weave as substantial a cloth as the hand-loom product; the weak part in all hose-pipes is where the weft passes round the sides from top to bottom of the fabric or vice versa, that is, the side corresponding to the selvages in an ordinary cloth; the hand-loom weaver can draw the weft tighter than is possible in the power-loom, hence the threads at the sides can be brought close together, and by this means the fabric is made almost, but not quite, as perfect here as in other parts; in addition, the ends of weft can be made to overlap in hand-loom weaving—thus preventing a weak spot. It is essential that the warp threads be held tightly in the loom, and to secure this, they pass alternately over and under three or four back rests before reaching the heddles or cambs, which are almost invariably made of wire. Although the warp yarn is made very soft and pliable by boiling and beetling, the weaver always tallows it in order to make it work more easily.

Structure of Fabric.—The commonest type of hose-pipe is made on the double-plain principle of weaving, the cloth being perfectly plain but woven in such a manner that the pipe is without seams of any kind. Fig. 1 is a design showing two repeats or eight shots in the way of the weft, and six repeats or 24 threads in the way of the warp, consequently the weave is complete on four threads, or leaves, and four picks. Fig. 2 illustrates the method of interlacing the threads and the picks: this figure shows that 23 threads only are used, the first thread—shown shaded in fig. 1—having been left out. It is necessary to use a number of threads which is either one less or one more than some multiple of four—the number of threads in the unit weave. The sectional view (fig. 2), although indicating the crossing of the warp and the weft, is quite different from an actual section through the threads: the warp is almost invariably two, three or more ply, and in addition two or more of these twisted threads pass through the same heddle-eye or mail in the camb; moreover, they are set very closely together—so closely, indeed, that the threads entirely conceal the weft; it is, therefore, impossible to give a correct sectional view with satisfactory clearness, as the threads are so very rank, but fig. 3 gives some idea of the structure of the fabric. This view shows ninety-nine threads and one complete round of weft; this round is, of course, equal to two picks or shots—one pick for the top part of the cloth and one for the bottom part. A comparison of this figure with fig. 2 will, perhaps, make the description clearer. The weft in fig. 3 is thinner than the warp, but, in practice, it is always much thicker, and may consist of from two to seventy threads twisted together.

FIG. 3.—SECTION THROUGH WARP OF HOSE-PIPE SHOWING 99 THREADS AND ONE COMPLETE ROUND OF WEFT

Hose-pipes are also woven with the three-leaf twill on both sides, and occasionally with the four-leaf twill. These pipes, woven with the twill weaves, are usually lined with a pure rubber tube which is fixed to the inside of the cloth by another layer of rubber after the cloth leaves the loom. Such pipes have usually, but not invariably, a smoother inner surface than those which are unlined, hence, when they are used, less friction is presented to the flow of water, and there is less tendency for the pipe to leak. They are, therefore, suitable for hotels, public buildings and similar places where their temporary use will not result in undue damage to articles of furniture, carpets and general decoration.

The greatest care must be observed in the weaving of these fabrics, the slightest flaw in the structure rendering the article practically useless. After the cloth has been woven, it is carefully examined, and then steeped in a chemical solution which acts as an antiseptic. The cloth is thus effectively preserved from mildew, and is, in addition, made more pliable. Finally the hose-pipe is dried artificially, tested for strength and resistance to pressure of water, and finally, fitted with the necessary couplings and nozzles.

HOSHANGABAD, a town and district of British India in the Nerbudda division of the Central Provinces. Founded by Hoshang Shah, a Malwa king in the 15th century, the town came into prominence after its capture by Bhopal in 1720. Between then and 1818, when it came under British rule, it was the scene of many conflicts between the Mahrattas and the Bhopal rulers. It has never been a big trading centre, but has enjoyed some importance as a district headquarters, and its position on the Nerbudda River and on the G.I.P. Railway (Indian Midland section) is a favourable one. Pop. 12,048, is a decline of some 3,000 on 1901, due to serious epidemics of plague and the influenza mortality of 1918.

The District of Hoshangabad, area of 3,681 sq.m., lies in the Nerbudda valley between the Vindhya on the north and the Satpura range on the south. The central plain contains rich black soil, wheat being the principal crop. The G.I.P. Railway from Bombay to Jubbulpore runs up the valley and at Itarsi, near Hoshangabad two branches take off, the northern to Delhi through Bhopal and Gwalior, the southern to Nagpur across the Satpuras.

The population was 445,000 at the last census, Hindus predominate, but there are 40,000 Animists and only 20,000 Mohammedans. The district had a wheat boom in 1888, and in 1891 its population was 493,000, but had years followed by plague and influenza caused a serious temporary decline; the people are, however, now generally prosperous and very fond of litigation. Cotton is grown in the west, and in the poorer tracts in the south and east there are millets and oil seeds. Apart from these it is one of the principal wheat-growing districts of the Province.

Wheat, cotton and oil seeds are largely exported. Dyeing, brass work and weaving are the chief local industries. There is a large area of Government forest on the south and the Bori teak forests are very valuable. The town of Harda, in the west, which had a population of 16,000 in the wheat boom, has since declined to 11,000.

HOSHEA (Heb. for "deliverance"), the last king of Israel, in the Bible. The attempt of his predecessor Pekah to take Jerusalem with the help of his ally Rasun (Rezin) of Damascus was frustrated by the intervention of Tiglath-Pileser III. (see AHAZ), who attacked Gilead, Galilee and the north frontier, and carried off some of its population (*cf.* 1 Chron. v. 26). Pekah's resistance to Assyria led to a conspiracy in which he lost his life, and Hoshea the son of Elah became king (2 Ki. xv. 27-30). The Assyrian king held him as his vassal (and indeed claims to have set him on the throne), and exacted from him a yearly tribute. After the death of Tiglath-Pileser, Israel regained confidence (Isa. ix. 8-x. 4) and took steps to recover its independence. Its policy vacillated—"like a silly dove" (Hosea vii. 11)—and at length negotiations were opened with the Egyptian So, possibly Shabaka or one of the Delta princelets. The annual payment of tribute ceased and Shalmaneser V. (who began to reign in 727 B.C.) invaded Israel, imprisoned Hoshea, and laid siege to Samaria, which fell at the end

of three years (722 B.C.). The achievement is claimed by his successor Sargon. The land was again partly depopulated and a governor appointed (2 Ki. xviii. 9-12; cf. xvii. 1 seq.). For other allusions to this period see HOSEA, ISAAH.

HOSHIARPUR, a town of British India, in the Punjab. Pop. (1921), 21,285. It was founded, according to tradition, about the early part of the 14th century. In 1809 it was occupied by Ranjit Singh. The maharaja and his successors maintained a considerable cantonment 1 m. S.E. of the town, and the British government kept it up for several years after the annexation of the Punjab in 1849. There are manufactures of cotton goods, inlaid woodwork, lacquered ware, shoes and copper vessels.

The DISTRICT OF HOSHIARPUR comprises an area of 2,247 sq.m.; pop. (1921) 927,419. It falls into two nearly equal portions of hill and plain country. Between the two chains of hills on the east, stretches a valley of uneven width, known as the Jaswan Dun. Its upper portion is crossed by the Sohan torrent, while the Sutlej sweeps into its lower end through a break in the hills, and flows in a southerly direction till it turns the flank of the central range, and debouches westwards upon the plains. This western plain consists of alluvial formation, with a general westerly slope owing to the deposit of silt from the mountain torrents in the sub-montane tract. Rice is largely grown in the marshy flats along the banks of the Beas. Several religious fairs are held, at Anandpur, Mukerian and Chintpurni, all of which attract an enormous concourse of people. Cotton fabrics are manufactured, and sugar, rice and other grains, tobacco and indigo are among the exports.

The country around Hoshiarpur formed part of the old Hindu kingdom of Katoch in Jullundur. The state was eventually broken up, and the present district was divided between the rajahs of Ditarpur and Jaswan. They retained undisturbed possession of their territories until 1759, when the rising Sikh chieftains commenced a series of encroachments upon the hill tracts. By the close of the year 1818 the whole country from the Sutlej to the Beas had come under the government of Lahore, and after the first Sikh war in 1846 passed to the British government.

HOSIERY. This familiar term originally referred to articles worked in the knitted stitch used for footwear and underwear, but it has come gradually to embrace a much larger range of knitted products than those specified. The knitted stitch has greatly extended its field of usefulness and through all those developments hosiery has stood as the main generic term which covers all classes. The hosiery trade includes generally the production of all classes of articles worked in the knitted stitch. Knitted fabric is used to an increasing extent for intermediate and outer garments and there is an increasing tendency to subdivide hosiery into footwear to denote stockings and socks, underwear for articles worn next to the skin; intermediate knitted wear is applied to articles worn under the outer garment but not next the skin, outerwear is used to indicate articles such as coats and costumes. In America the

term hosiery has been retained as referring to articles of knitted footwear only, the other classes just mentioned being often known as knitwear.

Plain Knitted Fabrics.—

There is probably no class of textile which has undergone greater recent development in its scope and uses, and the knitted texture is supplying an ever-increasing proportion of our textile requirements.

Basically, knitted fabrics fall into two groups: weft and warp fabrics. These are again divided into the classes of plain stitch and rib or ribbed stitch. A third group, one which is not so widely used as the first two, is the tuck stitch, which can be better considered as a modification of plain stitch, being a repetition of needle loops forming half stitches to the front and to the back of the fabric. The plain knitted fabric is constructed from a single thread which runs crosswise and is intersected into a series of loops which hang upon each other in sequence. Fig. 1 gives a diagrammatic view of the right side of a plain knitted fabric employed

for the vast majority of hosiery articles and the stitch in black shows one convolution of a loop of which all the other loops are simply repeats. In following this crosswise, we have what is termed a course of loops, hence this type of knitted fabric is termed a weft texture as it is formed by looping a thread which runs horizontally in the fabric, similar to the weft of a woven fabric. But it has another dimension, which is the loop regarded in the width, a wale representing an upward plus a downward curve of the stitch. These wales are measured in the width and each wale is formed on one needle, so that in the machine the needles per inch give the wales per inch. For a well-balanced knitted fabric the courses per inch should in general exceed the needles or wales per inch by 40% to 50%. An examination of fig. 1 will show that the looped structure has a characteristic elasticity in the width, as a pull in this direction has the effect of straightening out the courses and the knitted fabric can in some varieties of stitch be increased from 75% to 80% in width by stretching. This extreme stretch is found particularly in the rib stitch fabrics. In the length the normal stretch seldom exceeds a 25% increase, but there is much greater tensile strength in the direction of the length than in that of the width. In the width the strain comes on to the individual threads in the course, whilst in the length the succeeding layers of loops support each other. Knitted fabric sold in lengths for cutting into garments is often termed stockinette or tubing; if it is of especially firm or dense structure, it is loosely described as a "cloth."

Texture.—In hosiery there are three types of texture: (a) A lean variety which is gauzy in appearance and lacks consistency and stability due to the fact that the yarn is too thin for the gauge or allotted space, and the available space is too open for the thickness of the yarn employed. Fig. 1 illustrates a fabric which would come into this category. (b) Fabrics which are correct for the gauge have the spaces between the needles adequately filled with yarn, but the spacing still allows for the natural elasticity of the fabric to operate. Fig. 2 shows a fabric worked in the same sett or gauge of needles as fig. 1 but with the yarn much thicker to fill out the interspaces of the loops.

(c) A full fabric is one where the yarn is too thick for the available loop space, so that the texture is stiff and stodgy in nature. Such a fabric although thicker and heavier in weight will give less satisfactory service in wear as it lacks resilience, and when strain is applied the stitches soon wear each other out and holes appear.

This interdependence of loops is at once a great advantage and a considerable drawback. It is a benefit to have elasticity for such articles as underwear when the stretch adds to the comfort as the garment yields to the movements of the limbs. It is a disadvantage to have those loops so intimately dependent on each other, because when a thread breaks the loops connected with it give way all round and a large opening is created. This accentuates what is known as the laddering tendency, for if a stitch gets broken strain will cause this loop to unravel and run right down the fabric. The elasticity of the knitted fabric is a great asset in sports' wear, when free action of the limbs is required; it has also another advantage in that articles can be made in a smaller range of sizes, for the material within certain limits stretches to fit an ample figure and contracts to drape a more slender form. In the more rigid woven cloth the garments have to be much more accurately cut to fit each wearer. The fact that large numbers of wearers can be accommodated with the same size of garment accounts for the readiness with which those articles are taken up by the public; they can secure the article on the spur of the moment, without the tedium of fitting-on.

The plain knitted fabric owes much of its versatility to the fact that it has a different appearance on the wrong side and on the right, for this is used in many ways to vary the stitch, increase its weight and give ornamental results. The characteristic of back or wrong-side fabric is that the stitches form a series of intersecting semi-circles. Fig. 3 illustrates the well-known rib stitch so

FIG. 1.—RIGHT SIDE OF PLAIN KNITTED FABRIC, SHOWING SLACK TEXTURE

FIG. 2.—RIGHT SIDE OF PLAIN KNITTED FABRIC, SHOWING FULL TEXTURE

indispensable on knitted articles. The vertical rows of stitches marked 2, 3, 6 and 7 show two needles or wales with their stitches of right-side fabric. Alternating with those two wales are two (4 and 5), which have their stitches reversed to show the back or wrong side of the fabric. The whole setout in fig. 3 would be termed a 2-and-2 rib stitch, and machines can be arranged to give 1-and-1, 2-and-1, 3-and-3 and so on rib stitches. The 1-and-1 or plain rib stitch is the best known as being largely used for the rib tops or bottoms of garments. This stitch has a greatly increased latent elasticity or stretch over the plain fabric, and it grips the limb more firmly so as to retain the sleeves and garment extremities in position. But the rib stitch gives articles of heavier weight and bulkier to handle, because a larger amount of material can be absorbed by this type of loop than the plain variety. Rib

FIG. 3.—TWO-AND-TWO RIB STITCH

stitch imparts to the fabric an enormously increased elasticity in the direction of the width, and certain grades of hosiery base their appeal to the public to this feature. What is known as the "Swiss" vest for example is cut from continuous lengths worked in a slack rib stitch, which has such an enormous elasticity as to fit the body without shaping the parts. It is thus possible to produce the material in circular form at high speed of production at one uniform width. The plain rib is employed largely for cuffs or legs of men's underwear, while the 2-and-2 rib, as shown in fig. 3, is often used for the cuffs of knitted gloves. The famous Derby rib is usually a 6-and-3, that is 6 face stitches alternating with 3 back fabric stitches in the direction of the width. This style of rib is often used for stockings, ribbed hosiery being an important branch of the trade. Children's hosiery are often made in the rib stitch on account of the greater grip which is exerted, and also because rib knitting lays more yarn into the body of the fabric which makes for greater durability. It is also largely used in stout textures for men's socks. The rib stitch and its derivatives are also most useful for outer garments; what is known as the half-cardigan is a variation of the 1-and-1 rib stitch, where on one side two threads are drawn into the same loop thus decreasing the intersections and allowing a greater weight of yarn to be inserted. This is the stitch of the well-known cardigan jacket, and whenever it is required to increase the weight and bulk of a fabric over what is possible with the plain stitch, the cardigan principle is employed.

Purl Stitch.—Fig. 4 gives an illustration of what is known as the pearl or purl variety of stitch, where the same principle of right-side and wrong-side loops

FIG. 4.—TWO-AND-TWO PURL OR PEARL STITCH

is adopted to produce the pattern, but this occurs in the horizontal direction. This is the 2-and-2 purl stitch where the upper and lower pairs A, B and E, F are set in wrong-side stitches and the centre pair C and D are face fabric loops. Now this change in direction produces quite a different appearance in the fabric to either the flat or the rib. The needles build needle loops on the front bed or on the back bed of the machines to form the design instead of shifting continuously from front to back as in knitting plain purl stitch. The manner in which purl stitches erect themselves on the face of the fabric accounts for the great effectiveness of designs wrought on this principle, for quite a small disturbance in the loop direction produces a striking result in the fabric, and very ornamental designs can be made by arranging these wrong-side stitches in some simple pattern. Variation in the levelness of the texture naturally debars this type of fabric from being worn next to the skin, but for outer

garments these raised effects yield embossed designs where the surface shows an effect in light and shade, the high portions being the needle loops forming the pattern with the plain fabric in the base. The interesting play of light on the surface of the knitted fabric accounts for its popularity in such mediums as artificial silk. The plain stitch on the face side resolves itself into a series of thread sections which hang towards the left alternating with a series which have a bias towards the right. This variation in direction gives an interesting and attractive sheen to the fabric, and in fine gauges creates twilled and satin-like effects with the delicate play of reflected light.

Fabric Grades.—Knitted fabrics are classified into two grades: (a) fabrics produced on machines using the bearded or spring needle, and (b) those knitted by means of the latch needle. A view of the bearded or spring needle is shown at fig. 5 and is seen to consist of a piece of wire flattened at the upper end and turned round to form a beard or spring; the stem and grooves into which the spring is pressed

FIG. 5.—BEARDED OR SPRING NEEDLE USED FOR MACHINE KNITTING

are shown. The term beard was given to the needle in the old handframe, but this is gradually giving place to the term spring in the modern power knitting frame. In the handframe days of the industry there was a pronounced tendency to give the parts of the machine names which corresponded to parts of the body. Can this be wondered at when one considers the arduous nature of the work on the handframe, when every limb was brought into use at each course of loops; the machine in fact became part and parcel of the worker, hence there are such parts as the sinker nose, the belly of the sinker and its throat. The fashioning points were the ticklers, whilst the sinker had its

FIGS. 6, 7 AND 8.—CHIEF STAGES IN THE PROCESS OF KNITTING A COURSE OF LOOPS BY THE SPRING NEEDLE

tail. It is remarkable that with all the advances in modern knitting practice as regards speed of production, the products of the spring needle machines are still held in the highest esteem as regards quality of texture and fineness of mesh. This needle can work thicker yarns relatively to the latched needle, and the texture is close and therefore, less liable to run and ladder. The term "spring" knit indicates goods made on spring needle machines. Until recently the making of spring needles was a typical European industry, while latch needle manufacture was an American invention and product. In 1928 large quantities of spring

needles were made in America. The world's largest producer of full-fashioned hosiery knitting machines, located in America, makes its own spring needles.

The Spring Needle.—The system of making a course of loops by means of the spring needle may be learned from examination of figs. 6, 7 and 8 which represent successive stages in the process. The needle is there shown, on the lower stem is the fabric with the last-made loop hanging on the needle, the new thread is indicated, just passing under the spring or beard of the needle. To the left is shown a member usually known as the presser, which must always figure in any system of making loops by means of the spring needle. In fig. 6 the needle has just received its new yarn, at fig. 7 the needle has descended and the new thread reaches the extremity of the needle inside the needle spring. The needle at this stage is being acted upon by the presser, which is pushed forward to force the spring into the groove carved out for it in the needle stem. In this position the needle slides still further downwards, so that in fig. 7 the old stitch is noticed to be sliding on to the needle spring and over it. This is called the landing of the stitch and is the crux of the whole knitting action, for in fig. 8 the needle has descended to its lowest extremity, drawing through the new thread, and discharging the former loop from the needle which now takes its place normally in the fabric.

The two needle types spring and latch are shown in comparison in figs. 9 and 10, where the spring needle is shown cast in its lead, and this is the usual form in which this needle is housed in the machine. Each frame has its mould according to the sett of the needles, which are laid in pairs in grooves of the mould; molten lead is then poured into the shape shown above. This forms a convenient way of handling the needles in the machine, and it is by counting the number of such leads in a space of 3 in. which constitutes the gauge in flat machines using the spring needle. Thus a 21 gauge frame would have 21 such leads, each with two needles = 42 needles on three inches = 14 needles per inch. Spring needles are made with butts at the lower end to fit into the machine and are thus locked into place in the needle bar instead of being leaded. In working fabrics "to the gauge," therefore, this system enables one to say 24 gauge has 24 courses per inch, 18 gauge has 18 courses per inch, which corresponds to the general dictum regarding texture that the courses per inch should number 50% more than the needles or wales per inch.

Latch Needle.—Examination of fig. 10 will show the details of a standard type of latch needle, the various parts, viz., the latch, hook, stem and heel or butt being illustrated. The hook is used to take the thread from the guide, and the hook is closed and opened by the latch, which hinges on a rivet. The heel or butt, is that part of the needle to which the movement is imparted in the needle tricks of the machine, moving it up and down during the stitch formation. To form the stitch the old stitch rests on the lower stem of the needle, whilst the new yarn is taken by the needle hook. The needle is then drawn towards the right, which brings the latch against the old stitch to close the hook. The needle proceeds still further in the same direction, and the old loop slips off the needle end with the new thread drawn through the old one. Examination of the latch needle will show that there are many fine points to be mastered in its manufacture. The provision of the latch and its hollow or spoon to fit over the hook is a very delicate piece of engineering, whilst the poising of the latch on its rivet presents a number of problems in minute measurement. The butt, with its curious bend, also presented many difficulties in tempering of the metal, owing to the proneness shown by the wire to break at the peak of the butt. In many types of needles this bending is now eliminated by constructing a different form of butt, whereby the wire is flattened out at that end to give a heel which can be acted upon in the required manner.

FIGS. 9 AND 10.—(TOP) SPRING NEEDLE CAST IN ITS LEAD. (BOTTOM) TYPICAL LATCH NEEDLE USED FOR MACHINE KNITTING

Examination of the needles shown in fig. 9 and 10 explains many of the defects which are to be found in hosiery goods. In the spring needle a delicate point is the spring, which after many pressings loses its potency and becomes flattened. This gives rise to defects known as "split" stitches, where half of the yarn goes over the spring and another half gets underneath during stitch formation. Machines are being built of 54 gauge with the spring needle, which means they have to be set with 36 needles to the inch. They have to stand at exact distances apart in the machine, or what are known as needle lines will appear and irregular stitches will be formed where one narrow loop is seen side by side with one which is correspondingly larger, the narrowness of the one contrasting markedly with the wideness of the other. The secret of success in producing level meshed goods from the spring needle is constant pliaring of the needles into perfect alinement in every direction, in which operation the mechanic develops a very fine sense of judging minute distances. Any mixing of needles so that finer or coarser gauge needles merge is reflected in the regularity of the fabric. Latch needles are subjected to expert examination by the manufacturer on the following points: (a) size of hook, (b) length of latch, (c) the needle backs are examined for sharp corners of the rivet which may project, (d) the height and breadth of the butt. Latches which project at the back cause what are known as "whiskered" wales, because the tiny latches act as small scissors to cut the filaments or fibres of the yarn as it passes over the needles. When these severed fibres occur on the same needle right down the material they constitute a serious defect, and stitches weakened in this way easily go into holes at early stages of wear.

On any particular gauge of wire there are several sizes of head which may be made according to the type of fabric which it is sought to produce. The needle manufacturers produce a standard size for their needles according to gauge, but particular manufacturers obtain needles with heads larger or smaller than the standard type. The larger head allows greater space in the fabric, whilst a smaller head allows the yarn to be packed more closely in the cloth to give a denser texture.

Rib Fabric.—In figs. 11 to 14 the process of making rib fabric through the agency of the latch needle is illustrated, the needles representing the relative positions they would occupy in a machine such as a circular rib frame where the vertical needles are arranged round the circumference of a cylinder and the horizontal needles are set around the circumference of a dial, these two parts acting together during the knitting process. The fabric is so seen to be passing down the inside of the machine on the left, and in fig. 11 the needles are in the act of moving into their respective positions to receive the new yarn to form a stitch. In so doing the old stitches open the latches, the horizontal needle moves to the right, the vertical, upwards.

FIGS. 11, 12, 13 AND 14.—FOUR STAGES IN THE PROCESS OF MAKING THE RIB STITCH BY USING THE LATCH NEEDLE

In fig. 12 the thread makes its appearance and is taken into the hook of the upright needle, which begins to slide downwards. At the same time the adjoining piece of yarn is laid over the stem and in the hook of the horizontal needle. In fig. 13 the two needles are in possession of the thread and the old stitches on both sets of needles have closed their respective needle latches. In fig. 14 the movement is complete; the horizontal needle has moved left to draw its new stitch through, the vertical having made a similar movement by dropping lower down. If the vertical needles are arranged two and two with the horizontal needles, then a fabric as illustrated in fig. 3 would be

the result, the vertical needles giving the face-fabric stitches and the horizontal needles the back-fabric stitches.

Trade Divisions.—The hosiery trade is divided into sections such as the full fashioned, circular knit or seamless and the cut, according to the manner in which the articles are constructed and assembled. Similar divisions hold in the underwear and in the knitted outerwear industries. In the latter two, however, most goods are made of the cut type, and by comparison not much of the full-fashioned type. In the underwear trade most of these goods are made of the tubular knitted fabrics which are tailored to shape by cutting and sewing. The sweater and knitted outerwear industry employs similar methods in the fabrication of garments, excepting fabrics made on flat knitting machines which are also largely employed. In making full-fashioned goods fashioning is done in the same way at the needles of the machine as in the hosiery industry, the difference being, however, that single unit or section machines which are more satisfactory are usually employed.

In the full-fashioned trade the garments are made in flat pieces and afterwards joined together with a perfect selvedge, as the edge loops can be used to connect the seaming thread. With goods cut from tubular web the cut edge is raw and the stitching needle has to penetrate a little way from the edge to obtain a hold, which gives a rather rough seam, although great improvement has been effected in this respect by the invention and widespread adoption of flat seams. Here the cut edges abut on each other or slightly overlap and are annealed in a manner by close intersection of from five to nine threads with a seam of some neatness. The perfecting of this method of seaming has contributed enormously to the greatly enhanced status which such cut-up goods now enjoy on the market. The fabric for this trade is produced on the latch or spring needle circular web machines, and in cutting out many plies of fabric can be dealt with at one and the same time on the lines of mass production for garments for wearers of moderate means. The great virtue of the full-fashioned article is that exact interpretation can be given to any size, dimension or physical abnormality and the fabric texture is identical all the way through the garment.

The seamless trade is also a most important one, particularly in the production of knitted footwear and gloves. By the modern seamless automatic machine a hose can be produced in a few minutes entirely seamless except for a small seam, which has to be made across the toe. In the case of stockings, the leg is shaped from calf to ankle by altering the size of the stitch; the top is worked in an open stitch to give greater width, whilst from the calf to the ankle the fabric is worked in degrees of increasing smallness of loop to give a constricted shape to the stocking. This method of shaping the article suits an average wearer of moderate dimensions, but it does not stretch to fit a more ample figure. In seamless hosiery the same number of needles are in the knitting of the leg proper as in the calf of the stocking. In the full-fashioned stocking the decreased width is obtained by reducing the number of stitches in action, and the foot of the stocking is made at right angles to the leg which insures a better fit at that point. Variation in width is obtained by reducing the number of stitches in work so that the texture remains identical throughout.

Warp Loom Knitted Fabrics.—Warp loom fabrics may be regarded as taking an intermediate place between the knitted and the woven texture. They resemble the woven fabric in having a warp arranged in with parallel threads side by side on a beam or roller, but these threads are given a sidewise shogging motion so that the threads interloop with each other. A view of this type of texture is given in fig. 15, where the pattern is arranged one black, one white, and five threads are shown intersecting and marked 1 to 5, whilst the needles are given from A to E. Crosswise the courses of loops are marked from 1 to 6 and tracing thread number 1; it will be noted that it makes a loop on needles A and B alternately, thread number 2 moves alternately from needle B to needle C and back again; thread number 3 moves from needle C to needle D and back again alternately, and so on throughout the entire fabric. This is the simplest form of warp

loom stitch, termed the "Denbigh" lap, and these threads are accommodated in a single bar. The lap of the thread guide bars can be greatly diversified, and the lap in one direction may be extended to a large number, say 40 or 50 needle spaces, which gives the characteristic zig-zag edge which is so attractive for the extremities of garments. The side-to-side lap of the threads also gives a unique intermingling of the colours of the warp, and, using black and white, one can obtain intermediate blends of grey by the manner in which the sidewise movement mingles the colours. Greater diversity of pattern is obtained by the use of two or more bars as each bar can be given a different kind of lap. The warp loom is constructed with spring and latch needles and what is known as the "Raschel" type is built with latch needles after the manner of a rib machine, in that there are two needle bars differently set so as to give contrary knock-over to the threads similar to a rib effect. The two bars do not act together, however, but rise to knit alternately. In this branch of the industry practically any type of fabric can be produced, as the two needle bars enable the texture to be greatly increased in bulk or density and in stiffness. By this means also double face fabrics can be made as for mantle fabrics, plain style on the face with fancy tartan patterns on the back. Men's suiting and overcoating fabrics as well as muffler and necktie fabrics have also been largely worked on this machine to the required density and firmness. The warp loom, by reason of its lap at an angle, is specially adapted for making diamond styles of patterns where the figure stands on its edge, and quite a simple form of design arrangement produces a maximum of effectiveness. Imitation lace styles, cellular fabrics and openwork designs can be made in this style of fabric, and by having the bars crossing in the direction of their motion, two stitches can be worked on the same needle which greatly reduces the laddering propensity of the fabric and practically makes it run-proof. In fact various types of two-bar work having this form of lap are definitely placed on the market under a guarantee that the fabric will not ladder, as the threads in the two bars are made to lock each other. The jacquard machine is readily adaptable to the use of the jacquard harness for controlling the individual yarn ends and is accordingly used extensively for making lace fabrics of several types and weights. The tricot type of warp knitting machine is used for the production of glove silk fabrics for the glove and silk underwear trades. This particular cloth is referred to as tricot and differs from Milanese in that it stretches in only one direction.

FIG. 15.—WARP LOOM FABRIC ARRANGED 1-BLACK 1-WHITE IN THE PLAIN ONE-AND-ONE LAP

Another interesting variety of the warp loom fabric is known as the elastic stitch, also referred to as "Swiss" muffler stitch, which is worked in cellular form and possesses a wonderful elasticity, particularly in the length. This is a suitable fabric for such items as hat bands, and it is also used largely for scarves. The fabric is worked at full width, and afterwards divided by severing a thread which is drawn down leaving the fabric with a perfect selvedge at the scarf widths. Warp loom fabrics have limitless scope as regards colours, as each thread can be of a different colour if desired.

Milanese Texture.—One of the most famous warp loom fabrics is the Milanese texture, which is figuring more and more in textile requirements. It is made on the special loom of the same name, and there is no other textile fabric exactly like it. The Milanese machine has one warp, wound on large spools which are mounted in a carriage in the bottom of the machine and which travel around a flat elliptical track in unison with the transference of their respective warp ends to the neighbouring needles in stitch progression of courses. There are two tiers of threads, one on the face and another on the back; the face threads lap

needle by needle from left to right continuously from one side to the other, whilst the back threads similarly lap needle by needle at succeeding courses towards the left on the lower tier. Thus in a fabric with 4,000 threads it would require 4,000 courses for thread number one to travel to the 4,000th needle. At each course one thread reaches the last needle on the right, and is promptly transferred to the leftward-moving needles underneath; similarly one thread in the lower tier arrives at its last needle moving leftwards at each course, and is promoted from the lower to the upper tier to repeat its journey. At every course each needle holds two stitches, so that if one gets broken the remaining thread holds the loop and prevents laddering. This is a great asset in such fabrics when made into garments and accounts for its increasing popularity. A further advantage is that the edge is more stable than the plain knitted fabric when cut, and a smaller seam can be made, as one does not require to take such a large bite from the fabric on either side. Thinner seaming threads can also be used which gives a small neat join very much prized in a cut undergarment. The fabric is made in gauges with about 30 face stitches per inch, which, counting the back, gives actually 60 stitches per inch, and Milanese lends itself to working in the popular artificial silk. This is also the texture adopted for the well-known fabric glove which is usually worked in fine counts of single cotton, and the already dense mixture is rendered more so by a shrinking process, which consists in steeping the material in caustic soda so that it swells and fills out the loop interspaces, thus giving it, when finished, a fine dense skin-like fabric referred to as cotton suede, ideal for gloves. A Milanese fabric is usually heavier than a tricot fabric and, therefore, usually more expensive.

Multi-feed Machines.—Fig. 16 gives a view of what is known as the multi-feed frame, which is provided with latch needles and is set to give a colossal production of fabric, in fact the multi-feed knitting machine ranks as the fastest textile-producing machine in existence. It owes its high speed to the circular

BY COURTESY OF MESSRS. GEO. BLACKBURN & SONS, LTD.

FIG. 16.—MULTI-FEED FRAME FOR MAKING MEAT-BAG FABRIC AND NIGHTWEAR FABRICS

principle of construction, which provides for a large number of stitching-forming units being housed round the circle. They follow each other in close succession right round, so that in the large diameter machines 80 feeds are arranged, which means that for every revolution of the needle cylinder 80 courses of loops are inserted, and if there are 10 courses of such loops per inch, this gives 8 in. of fabric at each turn of the cylinder. If there are 10 cylinder revolutions per minute, this gives 80 in. of fabric

produced per minute, and allowing for stoppages this would yield about 2 yd. per minute. Naturally, with such a large number of stitch-producing sets round the circle the texture is not of the most regular description, but such gauzy fabric is useful for many purposes, notably for meat bags in which the carcasses of animals are wrapped for transport, particularly in connection with the meat-packing trade. In lesser number of feeds than described above it is also a machine well adapted for the football jersey

trade where bold cross stripes are required, and the threads are arranged in due colour order on the machine platform.

FIG. 17.—LATCH NEEDLE CIRCULAR KNITTING MACHINE FOR FANCY STRIPED FABRICS OR ARTIFICIAL SILK GOODS

Fig. 17 gives a view of another circular machine, where the number of stitch-forming elements are greatly reduced to provide fabric of perfectly regular texture suitable for the outer garment trade. The usual number of feeders for such machines runs from 8 to 12 in the circle, and the adjustments are specially designed to make each course of loop equal in length and tension. This machine is specially designed to provide for fancy coloured stripes and for the taking of several colour feeders in the circle. It has played a vital part in developing the knitted artificial silk fabrics. For stripes and pattern effects design wheels are added which are provided with bits to make selection of needles in the circle in accordance with the pattern.

The Flat Knitting Machine.—Fig. 18 gives a view of the flat knitting machine, as it is termed, which in some ways is one of the most remarkable types of knitting mechanism. It was invented by the Rev. J. W. Lamb in 1863 and is also known as the Lamb knitter. The machine shown in the figure is a hand type, and it is remarkable for its versatility, as most types of articles can be produced on it. From its simplicity of construction and ease of manipulation it has proved a valuable asset to the small manufacturer, particularly for the production of knitted outer garments. The machine can also produce circular fabric, which is a useful point in the production of knitted gloves, in that the small bags or pockets for the hand and fingers can be made entirely seamless and in a perfect circle of loops. The

FIG. 18.—THE LAMB HAND FLAT KNITTING MACHINE

needles can be arranged to give all kinds of rib patterns, and these can be shogged or given a zig-zag appearance producing the rack stitch, which is a desirable feature of designs used for sweaters and sports goods. The hand operator can make the articles shaped as required by moving stitches to increase or decrease the width, and this facility enables novelties to be more readily produced than is the case with the larger and more cumbersome machines. It is also largely employed for knitted coats and costumes. This industry is found in many places far from the recognized centres, and is a suitable occupation for seaside resorts and for mining communities where the normal labour conditions allow little scope for the activities of women.

Miscellaneous Knitted Articles.—The circular principle of knitting is adapted to many purposes of smallwear. For example, in the making of ribbons and tapes a circular machine having only a few needles in the circumference is employed. For cords there may be only three or four needles in the circle, for narrow bands and tapes 16 to 20. When colours are introduced, attractive trimmings and millinery adjuncts are produced. With the circle a little larger, gas mantles are worked in the knitted stitch in the ramie or China grass yarn, and slightly greater widths bring in fabrics suitable for knitted ties, where a number of colour feeders are added along with patterning devices to give attractive motives. From 3 in. to 4½ in. diameter the circular machine is used for the production of hosiery on the seamless principle, and the gauge is given as the number of needles in the circumference of the cylinder. The leg, foot, heel and toe can be produced entirely automatically except for a short join across the toe, the time required for a pair of full-length stockings of medium gauge being about ten minutes. One operator minds eight to ten of these machines, and this unit will produce from 40 to 50 dozen pairs of stockings per day. Taking 3½ in. as a normal diameter, the gauges range from 68 needles in the cylinder to 300. A number of mills are now operating 300 and 320 needle ¾ and ¾ in. machines.

Cotton's Frame.—Fig. 19 gives a view of the Cotton's patent frame where the articles are made exactly to size and shape. This frame can be built to make 12 full-width garments at one and the same time, or 28 full-fashioned stocking legs. It has acquired a remarkable number of attachments to produce cross stripes of colours, vertical lines and patterns after the manner of added embroidery, openwork or imitation lace designs. Tuck patterns are also made, so-called because of the way in which certain stitches are tucked into the fabric unintersected by a new loop. In hosiery manufacture, the machines are divided into those which are adapted for producing the leg portions termed "leggers" and another set, the "footers," are specially equipped to produce the foot. These are usually grouped in "sets" of three leggers and one footer, as the footer having a lesser amount of knitting to do produces relatively three times as fast. Production of normal goods (not lace clocks or fancy effects) is from 40 to 45 dozen pairs per day per set.

The French Foot.—In the hosiery trade two divisions arise under the term of English foot and French foot. In the English type, the foot is made in two pieces, one-half covering the upper foot and the second portion the under foot, these being joined by seams along each side of the hose. In the making of this type of hosiery a sole machine is employed instead of a footer. The French foot portion is made on the footer in one piece, which is wrapped round the foot with a seam or join along the centre of the foot. By this system the pattern can be continued right round the foot, whilst in the English style the pattern formed in the rest of the hose is interrupted by this join at the side. Nearly all of the full-fashioned hosiery produced in America is of French foot type, which allows greater production. Splicing is a term adopted to indicate the extra thread of hard-wearing yarn inserted as an extra yarn at the heel and toe and along the foot bottom. This splicing also extends in many types about 2½ in. up the back of the heel, and is often found halfway round the circle. This begins in a straight line which rather spoils the effect, and what is known as the tapered splicing has been introduced after the manner of a pyramid standing on its base, so that what is normally an objectionable feature is transformed into an item of ornamentation. Many variations of this pointed high splice are in use.

Circular Frames.—The English loop-wheel circular frame is constructed with spring needles arranged with the springs facing outwards round the circumference, and the fabric proceeds upwards to be coiled round winding-up rollers. This machine is specially adapted for making what is known as fleece-lined fabrics, as it has facilities for making fabrics where a thick thread floats on the back and is afterwards brushed and rendered fleecy. The machine can also be adapted for working imitation astrachan and fur-like fabrics, and it is also used for the thicker and denser

textures suitable for suitings and overcoatings, the fabric having the knitted origin obscured by the brushing operation.

The French or German circular frame is another type of spring needle circular, where the needles radiate from a centre and are set in a circle with the fabric proceeding downwards. This machine has been adapted for the production of plush and velvet fabrics, mostly in artificial silk, where the lustrous yarn is brought to the surface with a longer length of loop which forms itself into a pile which can be cut or left uncut as desired. American machine builders have worked steadily forward production of both spring and latch needle machines of finer gauge or cut. The results are borne out by the 30, 34 and even 40 cut machines in use—the latter having 40 needles to the inch. Due to the wide-spread use of rayon, or artificial silk, and the resultant tendency toward finer fabrics, machines, such as 32 and 36 gauge are considered obsolete while the 42 gauge (28 cut) machine ranks supreme for underwear fabrics of quality. These fabrics have a wide popularity for dress goods, and they afford one more instance of the way in which the knitted fabric is invading the realm of the older woven texture. The finer denier of artificial silk combined with the delicately set mesh of the fine-gauge knitting machine make it possible to produce fabrics of gossamer-like consistency for every textile use. In the newer adaptations of the Jacquard principle to the circular machines all limits to the scope of knitted design have been broken down, and it is now possible to produce fabrics with a repeat extending the full width of the fabric.

Development of hosiery machinery in America was principally along the lines of circular machines of the automatic type. An example of such machines is found in one type which starts knitting, and after finishing the garter welt, turns, knits it into the body of the stocking, knits in an imitation seam at the back (in simulation of full-fashioned goods), enters the splicing yarns in heel, sole and foot, and automatically knits in gores in the heel and toe sections. The stocking leaves such a machine fully completed except the toe join or seam and dyeing and boarding. Fully automatic hosiery machines, although imported in large numbers, are manufactured in America in two plants, one of them being the largest manufacturers of this type of machines in the world.

(W. Ds.)

HOSIUS or **OSIUS** (c. 257–c. 359), bishop of Cordova, was born probably at Cordova. He was elected to that see before the end of the 3rd century and narrowly escaped martyrdom in the persecution of Maximian (303–305). In 305 or 306 he attended the council of Illiberis or Elvira, and upheld its severe canons concerning the treatment of the lapsed and clerical marriages. In 313 he appears at the court of Constantine, and 10 years later, as the bearer of Constantine's letter to Bishop Alexander of Alexandria and Arius his deacon, bidding them cease disturbing the peace of the church. He was present at the council of Nicaea in 325, and powerfully influenced the judgment of the emperor in favour of the orthodox party. Hosius presided in 343 at the fruitless synod of Sardica, which showed itself so hostile to Arianism; and afterwards he supported Athanasius in such a way as to bring upon himself a sentence of banishment to Sirmium (355). From his exile he wrote to Constantius II. a letter now his only extant composition. Under pressure, he signed the formula adopted by the second synod of Sirmium in 357, which involved communion with the Arians but not the condemnation of Athanasius. He was then permitted to return to his diocese, where he died in 359.

See S. Tillemont, *Mémoires*, vii. (1700); Hefele, *Conciliengeschichte* (2nd ed., 1873, etc.), vol. i.; H. M. Gwatkin, *Studies of Arianism* (1882, 2nd ed., 1900); A. W. W. Dale, *The Synod of Elvira* (1882); Duchesne, *Histoire ancienne de l'Eglise* (1908), and Herzog-Hauck, *Realencyklopädie* (3rd ed., 1900).

HOSIUS, STANISLAUS (1504–79), Polish cardinal, was born in Cracow on May 5, 1504. He studied in his native town, in Padua and Bologna, and, entering the church, became in 1549 bishop of Kulm, in 1551 bishop of Ermland, and in 1561 cardinal. Hosius had Jesuit sympathies and actively opposed the Protestant reformation, his *Confessio fidei christiana catholica* being adopted by the synod of Piotrkow in 1557. He was, however, supreme as a diplomatist and administrator. Besides carrying through

many difficult negotiations in Brussels, Prague and Vienna, he founded the lyceum of Braunsberg, which still exists. He died at Capranica near Rome on Aug. 5, 1579.

The best edition of his works appeared at Cologne in 1584. Hipler has published separately his letters (1879, 10ll.) and his sermons (1885). See his *Life* by A. Eichhorn, 2 vols. (Mainz, 1854).

HOSKINS, JOHN (d. 1664), English miniature painter. His finest miniatures are at Ham House, Montagu House, Windsor castle, Amsterdam and in the Pierpont Morgan collection. Vertue stated that Hoskins had a son, and Redgrave added that the son painted a portrait of James II. in 1686 and was paid £10, 5s. for it, a statement for which there must have been some evidence, although it is not supported by any reference in the State Papers. Some contemporary inscriptions on the miniatures at Ham House record them as the work of "Old Hoskins," but the fact of the existence of a younger artist of the same name is settled by a miniature in the Pierpont Morgan collection, signed by Hoskins, and bearing an authentic engraved inscription on its contemporary frame to the effect that it represents the duke of Berwick at the age of 29 in 1700. The elder Hoskins was buried on Feb. 22, 1664, in St. Paul's, Covent Garden, and, as there is no doubt of the authenticity of this miniature or of the signature upon it, it is evident that he had a son who survived him 36 years and whose monogram we find upon this portrait.

See: Roger de Piles, *The Art of Painting, and the lives of the painters* (3rd ed., with additions by B. Buckeridge, 1750); J. L. Propert, *A History of Miniature Art* (1887); Horace Walpole, *Anecdotes of Painting in England* (ed. R. N. Wornum, 1888). (G. C. W.)

HOSMER, HARRIET GOODHUE (1830-1908), American sculptor, was born at Watertown (Mass.), on Oct. 9, 1830. She early showed an aptitude for modelling, and studied anatomy with her father, a physician, and afterwards at the St. Louis medical college. She then studied in Boston until 1852, when she went to Rome. From 1853 to 1860 she was the pupil of the English sculptor, John Gibson, and lived in Rome until a few years before her death. There she was frequently associated with Nathaniel Hawthorne, Thorwaldsen, Flaxman, Thackeray, George Eliot, George Sand and the Brownings. Among her works are "Daphne" and "Medusa," ideal heads (1853); "Puck" (1855); "Oenone" (1855), now in the St. Louis Museum of Fine Arts; "Beatrice Cenci" (1857), for the Mercantile library of St. Louis; "Zenobia, Queen of Palmyra, in Chains" (1859), now in the Metropolitan Museum of Art, New York city; "A Sleeping Faun" (1867); "A Waking Faun"; a bronze statue of Thomas H. Benton (1868) for Lafayette park, St. Louis; bronze gates for the earl of Brownlow's art gallery at Ashridge Hall; a fountain for Central park, New York city; a monument to Abraham Lincoln; and for the Columbian exposition, Chicago, 1893, statues of the queen of Naples as the "heroine of Gaëta," and of Queen Isabella of Spain. Miss Harriet Goodhue Hosmer died at Watertown (Mass.), on Feb. 21, 1908.

HOSPICE, the name frequently given to the guest-houses established for the reception of pilgrims and travellers within the precincts or upon the property of religious houses. It is specially associated with the hospices of the Great and Little St. Bernard Passes in the Alps; but the word *hospitium*, as used in the middle ages, had no exclusively religious connotation, and was applied to any kind of lodging or inn, not only to houses of public entertainment, but to the "inns" or mansions of noblemen, prelates and bodies of lawyers in London and on its outskirts.

HOSPITAL, a term now in general use for institutions in which medical treatment is given to the sick or injured. The place where a guest was received was in Lat. *hospitium* (Fr. *hospice*), but the adjective *hospitalis* came into use in the same sense. Hence were derived on the one hand the Fr. *hospital*, *hôpital*, applied to establishments for temporary occupation by the sick for the purpose of medical treatment, and *hospice* to places for permanent occupation by the poor, infirm, incurable or insane; on the other, the form *hôtel*, which became restricted (except in the case of *hôtel-Dieu*) to private or public dwelling-houses for ordinary occupation. In English, while "hostel" retained the earlier sense and "hotel" has become confined to that of a superior

inn (q.v.), "hospital" was used both in the sense of a permanent retreat for the poor infirm or for the insane, and also for a regular institution for the temporary reception of sick cases; but modern usage has gradually restricted it mainly to the latter, other words, such as almshouse and asylum, being preferred in the former cases.

The Origin of Hospitals.—In spite of contrary opinions the germ of the hospital system may be seen in pre-Christian times (see CHARITY). The temples of Saturn are known to have been in existence some 4,000 years before Christ; and that these temples were medical schools in their earliest form is beyond question. But though hospitals cannot be claimed as a direct result of Christianity, no doubt it tended to instil humanitarian views, and as civilization grew men and women of many races came to realize that the treatment of disease in buildings set apart exclusively for the care of the sick was, in fact, a necessity in urban districts. As the knowledge of hygiene increased hospitals were found to be of even greater importance, if that is possible, to the healthy in crowded communities, than to the sick. So the history of the world shows, that, whereas a few of the larger towns in most countries contained hospitals of sorts, up to and including the middle ages, it was not until the commencement of the 18th century that towns of from 50,000 to 100,000 inhabitants began to provide themselves with hospitals for the care of the sick. Thus, 23 of the principal English counties appear to have had no general hospital prior to 1710, while London itself at that date was mainly, if not entirely, dependent upon St. Bartholomew's and St. Thomas's Hospitals.

In Great Britain hospitals for the treatment of general and special diseases are generally maintained upon what is known as the voluntary system. On the European continent, hospitals as a rule are maintained by the state or municipalities, and this system is so fully developed in Sweden and elsewhere that the poor-law and voluntary institutions are brought into intimate association, although they may be managed by separate governing bodies. The plan pursued is to demand payment from all patients who are admitted to the hospital under a scale of charges graduated according to their means. In the United States most large towns have city hospitals, administered and mainly supported by the municipality. Many such institutions have pay wards and they are rapidly being instituted in Great Britain. The great argument for their establishment is that whereas the very rich and very poor can command the best of medical treatment, the middle classes are unprovided for. As a result many persons who could afford to pay for medical advice and treatment used the hospitals without payment, and it became necessary early in the present century for the larger hospitals to appoint almoners who should question the patients or their friends as to their financial fitness to receive hospital relief without payment. While necessitous patients are treated as formerly without payment, others pay according to their means, the actual weekly sum being arranged between the almoner and the patient or his friends. Since national insurance came into force the funds for sickness benefit have accumulated till they amount to many millions of pounds. The hospitals maintain that they should receive a substantial portion of this sum in return for the services they render to the insured and the question is still under discussion between the interested parties. In 1923 the Hospital Saving Association was formed in London whereby for threepence a week contribution full medical treatment in hospital was assured. In 1926 it had attracted 370,000 persons, had an income of over £200,000 a year, had paid to the hospitals over £127,000 for treatment given to 100,000 persons and had a surplus on the hospital budgets of £250,000.

Comparison of Voluntary and Rate-supported Systems.—As to the relative merits and demerits of the systems of government of municipal hospitals and voluntary hospitals a few words may be useful. The voluntary hospital in Great Britain has had a remarkable effect for good upon all classes in modern England. The management is frequently representative of all classes, while the Hospital Sunday and other similar collections unite all creeds in the good work of caring and providing for the sick and injured members of each community. Again, the voluntary system makes

for efficiency in administration; an ill-managed voluntary hospital is sure to disappear in due course. Each voluntary hospital has to live by competition, a fact which guarantees that everything in the way of new treatment and scientific development shall find its proper place within its walls. Open as they are to the full inspection of everybody whose knowledge and presence can promote efficiency, they have shown, especially since the last quarter of the 19th century, a continuous development and improvement.

The voluntary hospitals are attended, however, by certain disadvantages which do not attach to municipal institutions. A municipality which undertakes the provision of hospitals for the entire community is largely able to plan out the urban area, and to provide that each hospital site selected shall not only be suitable for the purpose, but shall contribute to make the whole system of hospital provision easily accessible to all classes who may require its aid. The voluntary hospitals, on the contrary, have grown up without any comprehensive plan of the districts or any real regard to the convenience or necessities of their poorer inhabitants. The best municipal systems provide a central office where the number of vacant beds in each hospital is known, so that the average of occupied beds in all the hospitals can be well maintained from an economical point of view. This inter-communication between all rate-supported hospitals in a city, which might be secured under the voluntary system, prevents delay in the admission of urgent cases, and makes for economy by keeping the average of beds occupied in each establishment high and uniform. On the other hand, the absence of competition, and the freedom from continuous publicity and criticism such as the voluntary hospitals enjoy, make for inefficiency and indifferent work. Of course it is essential to have rate-supported hospitals where cases of infectious disease and the poorest of the people can be cared for, and of late years the administration of both these types of rate-supported hospitals has greatly improved, largely owing to the importance now accorded to medical officers of health. The poor-law infirmary in large cities, so far as the buildings and equipment are concerned, very often leaves little to desire. Poor-law infirmaries lack, however, the stimulus and the checks and advantages which impartial criticism continuously applied brings to a great voluntary hospital.

The Evolution of the Modern Hospital.—The evolution of the modern hospital affords one of the most marvellous evidences of the advance of scientific and humanitarian principles which the world has ever seen. Formerly the hospital was merely a building or buildings, very often unsuitable for the purposes to which it was put, where sick and injured people were retained and more frequently than not died. The hygienic condition, the methods of treatment and the hospital atmosphere were all so relatively unsatisfactory as to yield a mortality in serious cases of 40%. At the present time in all large cities, great hospitals have been erected upon extensive sites which are so planned as to constitute in fact a village with many hundreds of inhabitants. This type of modern hospital has common characteristics. A multitude of separate buildings are dotted over the site, wards for male and female patients, residential blocks for medical officers, nurses, servants, administration block, store-rooms, kitchens, etc., and the whole institution may cover 20 acres or upwards. In one such institution, within an area of 20 acres, there are 6m. of drains, 29m. of water and steam pipes, 3m. of roof gutters, 42m. of electric wires.

Classification of Hospitals.—Hospitals may be described as general or special. At the larger institutions of both kinds there are more or less extensive facilities for education in medicine and in nursing. The general hospital should be fully equipped in all respects to cope with any variety of disease or injury, even though early transference of the patient to a special hospital may be found necessary in some cases. Special hospitals began to come into existence about 1860. Some of these; e.g., for cancer, diseases of women, consumption, diseases of children, etc., have fully established themselves by reason of their efficiency. Others have been, and are being, grouped or merged into larger special hospitals of the same kind. At the same time the large general hospitals are extending their special departments so that the present tendency is towards centralization. At the present day the largest special hospitals are those for infectious fevers and for mental disease.

Cottage Hospitals.—A particular variety of general hospital is that introduced in England in 1859. It contains a small number of beds, and although originally pre-existing buildings were adapted for hospital purposes, nowadays a cottage hospital is built for the purpose and usually is efficient, though small. The local medical practitioners, as a rule, constitute the visiting staff, and often one or more consultants are appointed from the great general hospitals who operate when requested. Cottage hospitals are on a voluntary basis but they may receive financial help from the local authority or from the great hospital funds.

Convalescent Homes.—The disadvantages of treating patients in a building situated, as are most great general hospitals, in the working part of a city, together with the pressure on their accommodation, has led to the founding of ancillary convalescent homes in the country or at the seaside. Many of the chief hospitals in England have such convalescent homes. An extension of the idea consists in the provision of country hospitals for open-air and sunlight treatment, especially for chronic diseases; e.g., surgical tuberculosis. Some eminent authorities favour the removal of hospitals to the country altogether, small first-aid centres alone being kept up in the working city and an efficient ambulance system being set up between them and the hospitals. It is difficult to see how such a system could work satisfactorily in a city the size of London or New York, but for far smaller communities it has much to recommend it.

The Problem of Hospital Administration.—A study of the hospital problem in various countries, and especially in different portions of the English-speaking world, indicates that, apart from local differences, the features presented are everywhere practically identical. A number of hospitals under independent administration, dependent in whole or in part on voluntary contributions, administered under different regulations originally representing the idiosyncracies of individual managers for the time being, without any standard of efficiency or any system of co-operation, must mean in practice overlapping and wastage on economical, scientific and other grounds. These evils are present almost everywhere, despite many and varied attempts to grapple with and remove them. Amongst these attempts are the assembling of hospital conferences, the establishment of special funds and committees and the holding of enquiries of various kinds in London and other British cities and also in the United States. One of the most valuable contributions towards their solution is insistence by the great distributing funds that institutions wishful to receive grants in aid shall keep their accounts on a uniform specified plan. By this means it has become possible for the participating institutions and the central distributing funds to compare individual items of expenditure, and thus indicate directions in which economies may be effected as well as to compare sources of revenue and indicate directions in which efforts should be made towards obtaining the large sums of money necessary yearly for the efficient upkeep of the hospitals in accordance with advances gained in medical, constructional and administrative knowledge.

At the same time there is produced a healthy rivalry between all the bodies concerned which, upon the whole, reacts favourably on the treatment of patients within the hospital walls.

(W. S. L.-B.)

Twentieth Century Development.—At the beginning of the century two special points are to be noted:—

1. The development of operating and clinical methods led to an increasing specialization in the departments of general medicine and surgery in hospitals.

2. From the architectural point of view, simplicity and comfort were being increasingly sought and buildings and hospital premises were being to an increasing extent adapted to the necessities of sanitation and hygiene.

General Features.—Attempts to create large hospitals outside urban centres and in favourable climatic conditions have been to a large extent successful. In the case of old hospitals, where it was difficult to make rapid changes, the various services have been installed in special buildings and annexes, divided one from another, each dealing with a special subject; e.g., surgery, clinical

MEDICAL CENTER, NEW YORK CITY

View of the Medical Center in New York, a group of buildings in which eleven schools and hospitals are associated. The plan was proposed in 1921 by the Presbyterian Hospital and the Columbia University College of Physicians and Surgeons, which were the two original units in the enterprise. The buildings were designed by James Gamble Rogers, and show a fine mass treatment, and a modern emphasis on perpendicular line. They were completed in 1928. On the left of the illustration is the New York State Psychiatric Institute, in the center, the Neurological Institute, and on the right, the Nurses' home, and on the right, a rear view of the main group

work, ophthalmic work, otolaryngology, children's diseases, gynaecology, epidemics, etc. Whereas in Anglo-Saxon hospitals the principle of placing hospitals under independent management maintained by voluntary aid has been adhered to, in continental countries there has been an increasing tendency to centralize hospitals by placing them under municipal, local or national authority.

Statistics.—Hospitals were more frequented in 1912 than in previous years. This fact must be attributed not to the increase in the tendency to disease, but to the addition of a large number of buildings and wards which allowed of a larger number of patients being received. The dissemination of the principles of hygiene has familiarized the public with medical methods and has caused a marked increase in the number of patients under treatment. Various statistics show the movements of patients in hospitals during the years preceding the war. In 1913, 106 hospitals in London (general hospitals, children's clinics, gynaecological hospitals, anti-tubercular hospitals, etc.), with 9,171 beds, dealt with 134,749 patients and were attended by 1,329,567 persons.

In 1912, the Paris Department of Public Relief (*l'administration générale de l'assistance publique*) admitted to its general hospitals (Andral, Beaujon, Boucicaut, Broussais, Charité, Cochin, Hôtel-Dieu, Laennec, Lariboisière, Necker, Pitié, St. Antoine, St. Louis and Tenon) 147,828 patients, and 46,601 patients to the special hospitals (St. Louis, Maternité, Broca, etc.). Germany, in 1912, had 9,054 hospitals with 535,579 beds. This figure includes general hospitals, military and naval hospitals, lunatic asylums, sanatoria, maternity homes, special clinics, children's hospitals, homes for the blind, etc. In 1912, the medical institutes of Vienna dealt in all with 82,939 patients. In the United States there was a noticeable increase in the number of hospitals and clinics, and there was a considerable development of the specialization of medical and surgical departments.

In 1924, the number of hospitals in London was 118, the number of beds, 13,460, the number of patients treated 177,300 and the number of consultations 6,677,000 (as against 5,020,000 in 1913). Among the principal hospitals included in these general figures, St. Thomas's Hospital alone received 10,139 in-patients and gave 488,600 consultations; St. Bartholomew's Hospital received 8,648 in-patients and had 344,226 out-patients, the London Hospital 17,331 in-patients and 553,965 out-patients, Guy's Hospital 9,495 in-patients and 487,452 out-patients. In Paris, the number of sick persons received was 238,912 in 1923, of whom 153,794 were in the general hospitals, 43,403 in the special hospitals, 29,329 in the children's hospitals, 2,071 in the mental hospitals and 10,315 in various homes and asylums.

War Conditions.—The World War of 1914 compelled hospitals to adapt themselves rapidly to new requirements. Existing hospitals were transformed, large numbers of extra establishments were improvised and various other special measures were adopted:—

(a) Permanent military hospitals, already existing in time of peace, were specially adapted for the reception of sick and wounded soldiers;

(b) Civil hospitals were placed, together with their staff, under the direction of the military authorities;

(c) Hospitals were installed in public or private buildings, such as hotels, schools, private houses, etc., to receive and deal with the flow of wounded from the front.

(d) Hospitals in the zone of military operations were carried on in permanent premises or under canvas, even underground, nursing posts and relief posts dealing with first aid to the wounded before their evacuation to the rear;

(e) As described in the article **MEDICAL SERVICE (ARMY)**, ambulances of every type were employed. Trains, barges, liners and even aeroplanes, specially built or converted and equipped, were used for the transport of sick and wounded to base and home hospitals.

(f) Special hospitals for orthopaedic, tuberculous, neurasthenic, paralysed and gassed cases were organized. Electro-therapeutical, hydro-therapeutical, helio-therapeutical, massage and special sections were also developed.

(g) Convalescent homes were set up and many private mansions were used for this purpose. Convalescent camps were formed near the base hospitals overseas.

(h) Temporary hospitals were erected to receive influenza patients, and malaria camps were organized.

Quarantine Stations.—Quarantine stations, which before the war were limited to maritime ports, were, after the war, set up on the borders of Poland, Czechoslovakia, Rumania, Hungary and the Baltic States, for the supervision of travellers arriving from countries contaminated by exanthematic typhus and relapsing fever. Three model stations, set up by the International Red Cross Committee at Narwa in Estonia, Riga in Latvia and Inio in Finland, dealt with the reception, supervision and disinfection of thousands of prisoners arriving from Russia on the convoys of repatriated prisoners between 1919-22.

Special Hospitals.—The Italian Red Cross has been most active in districts affected by malaria, and with this end in view has organized the anti-malaria sanatorium of Massalubrense, together with a number of motor ambulances. In Georgia, the tropical institute of Tiflis is engaged in centralizing the work of the various clinics and hospital stations. In 1913 12,500 malaria patients were treated in the hospitals of Tiflis. In the case of Oriental countries may be mentioned the leper hospitals (the Indies and Siam), hospitals for the treatment of snake bites (Siamese Red Cross at Bangkok), and the anti-epidemic and summer hospitals of the Chinese Red Cross at Shanghai. Hospitals have been supplemented by dispensaries, preventive homes, consulting offices, convalescent homes and mountain sanatoria and seaside hospitals. Venereal disease and dermatological hospitals have considerably developed. Cancer hospitals have improved especially as regards radio-therapeutic services. (E. Mv.; X.)

UNITED STATES

During the 20th century, and more particularly in the period from 1914 to 1925, the development of hospitals in the United States has been unprecedented. This development may be considered under the heads of (a) the present trend of hospitals as a social factor, (b) the present day construction, (c) specific examples and (d) statistics of 1925 and the increase during the period in question.

Hospitals as a Social Factor.—While there is a continued development and refinement of the care of the sick in the hospital to-day, the conception of the function of this institution has materially broadened, with a rapidly increasing tendency to regard it as a community health centre from which to radiate all health activities, particular emphasis being placed upon the development of out-patient departments (this as a means of teaching and practising preventive medicine and thereby obviating the necessity of the hospital bed), district nursing and social service. In the larger cities medical centres are being developed, in which case the foregoing community functions are associated with the instruction of student bodies in various branches, including medicine, nursing, public-health work, social service, and, in many instances, dentistry. The tendency to develop isolated speciality hospitals is being replaced by provisions for the specialities as departments of the general hospital or by the affiliation of already existing speciality hospitals with existing general hospitals. The different types of schools teaching health work, with the various hospitals, form these medical centre groups, in which are included convalescent homes as an integral or co-ordinated part.

Present-day Construction.—While in the earlier period hos-

pital development in the United States was largely patterned after the developments in Europe, the present trend of large institutions is toward the "skyscraper hospital"—as St. Luke's Hospital Annex, in Chicago, with 19 storeys; the Jefferson hospital in Philadelphia, with 17 storeys; and the new Presbyterian hospital of the medical centre (opened March 16, 1928) of New York city, with 22 storeys. This tendency is extending even into the country districts where the value of land is not a factor, for example, the University hospital at Ann Arbor, Mich., with its nine storeys, and the Charlotte Hungerford hospital at Torrington, Conn., with its eight storeys, the former being a teaching hospital and the latter a community hospital serving 35,000 people.

Economy and effectiveness of administration is claimed by the promoters of the multi-storey hospital movement. This type of construction and administration, which is distinctly American, is not being followed in the United States to the entire exclusion of the methods commonly pursued in Europe. The hospital movement in the large American cities is typified in the medical centre in the City of New York, in which the Columbia University College of Physicians and Surgeons, Columbia University School of Dental and Oral Surgery, Presbyterian hospital, Sloane hospital for women, Squier Urological Clinic, Vanderbilt Clinic, The Babies' hospital, Neurological institute, State Psychiatric institute and hospital, Presbyterian Hospital school of nursing and the Harkness Pavilion for Private Patients have reconstructed their institutions on a single plot of ground, having jointly undertaken all the branches of medical teaching, research and care of the sick, their simultaneous constructional programmes involving \$25,000,000.

Increase in Recent Years.—At the close of the year 1927 a complete census of all the hospital facilities in the United States, however owned and controlled and for whatever type of patient, showed that there were 6,807 hospitals. Of the total number of institutions of this character in the world, approximately 50% are in the United States. These hospitals provided a total of 895,279 beds, of which 41,961 were bassinets. This represents an increase of 59,000 beds and bassinets in two years. Of the total number specified 373,364 beds were devoted to the care of mental and nervous diseases,—an increase of 32,000 since 1925. This would seem to indicate that more than half of the increase in hospital beds in the past two years has been for mental cases. The total figures given for 1927 should be compared with those of 1914 which were: 5,037 hospitals with 532,481 beds.

There have been omitted from the foregoing figures 462 institutions with a bed capacity of 11,379 which, for one reason or another, have not come in the class of so-called "registered hospitals."

While the development of the large institutions has made unusual progress, the growth of the small institutions in the smaller communities seems to have a special significance and to be indicative of the popularisation of the hospital in the public mind. In 1920 44% of the 3,027 counties in the United States had community hospitals; the record for 1925 shows an increase to 56%. Nearly 52% of all the hospitals in the United States are of 40 beds or less. The close of 1927 finds recorded 408 new buildings planned, with \$109,179,000 involved in a year's construction; the total value of hospital properties being variously estimated between \$4,000,000,000 and \$5,000,000,000.

In the year 1926 the 55 privately owned hospitals of all types in New York city receiving partial support from the United Hospital Fund reported 11,978 hospital beds of which 78% were used, 232,157 cases, 3,446,176 days of hospital care, the average number of days' stay being 14.1; treated 710,297 cases in out-patient departments and had a total of 2,616,226 out-patient department visits,—this being independent of the State and municipal hospitals in New York city. All types of hospitals in New York city, excepting those for the insane, proprietary and United States Government hospitals, provided 32,097 beds of which 76% were used, treated 519,222 patients and gave 8,381,763 days of hospital care, the average number of days' stay being 17; treated 1,151,871 cases in out-patient departments and had a total of 3,960,204 out-patient department visits.

HOSPITAL PLANNING. The world-wide advance in medical science and public health in recent years has effected a

AFTER AN ETCHING BY A. SCHUTZ

similar growth in the scope of hospital work and the demand for adequate hospital service. The more varied and complex requirements of diagnosis, treatment and research, and medical and nursing education have also complicated the architectural problem. England, since 1926, has erected many new buildings—the Guardians at Manchester, the Woolwich Memorial and the Torquay General are good examples. Australia and New Zealand have advanced hospital programmes. In Scandinavia, the Ullevål Sykehauser in Oslo, Norway, is a noteworthy example of balanced hospital organization and architectural conception. Denmark, with its progressive social programme for public relief, has supplemented its widespread health insurance with exceptional hospitals. The Bispebjerg in Copenhagen, a group of charming vine-clad buildings in a spacious park, within and without, is one of the most beautiful modern institutions for the sick in the world. Holland and Sweden have many fine hospitals of post-war construction.

America, too, has contributed somewhat of its hospital experience to Europe. The maternity pavilion of the University of London hospital, a gift of the Rockefeller Foundation, is a fine example of dignified design. The American hospital in Paris transplants American organization, policies and standards, and its beautiful buildings represent an interesting architectural transition between the modern compact type of multi-storey hospital of the United States and the spacious Continental tradition. Western influence has likewise spread into the Orient. In China, the Peking Union Medical college, the Yale Medical school and hospital, the new Country hospital in Shanghai, and many splendid

9. St. Bartholomew's Hospital, London. "Barts," famous in English history and the Empire's oldest hospital. View of the Square

mission hospitals; in Japan the new St. Luke's, Tokyo, among others, harmonize the spirit of oriental architecture with modern hospital efficiency. Outstanding among the many new hospitals in India are the Mirraj hospital in west India, an American missionary institution, and the Neve Brothers' in the Vale of Kashmir, a private English enterprise.

In America itself the trend in hospital architecture has been away from the dreary institutional type to buildings symbolizing a greater aesthetic blending of warm colours in walls and furnishings; fire-proof construction is almost universal; in the mass the tendency is from the horizontal to the vertical, from the pavilion type of Europe to the multi-storey. The Rudolph Virchow hospital in Berlin, with some 36 two-storey pavilions housing more than 2,500 beds, and the Columbia Presbyterian Medical centre in New York, some 20 storeys high with 1,700 beds, represent the two poles.

Social and Economic Changes.—As a result of social and economic changes, the demands of the private and semi-private patient have come increasingly to the fore and brought about an administrative revolution. The public hospital, where poverty as well as sickness has been the basis for admission, is being supplemented by the community hospital where the patient is given such degree of privacy and individual attention as he needs or can afford. The economic middle class, requiring moderate-priced service with no stigma of charity, has become a large and important group. Since 1913 the cost of building hospitals in the United States has increased more than 100%, the cost of operation over 135%. This has made economy imperative, and challenged the ingenuity of the architect, engineer and hospital consultant. Hospitals of the past have been notorious in their extravagant proportions, with high ceilings, broad corridors and spacious rooms, frequently averaging from 10,000 to 12,000 cu.ft. for each patient bed. The compact hospital of to-day makes possible the accomplishment of more varied work with an average of from 7,500 to 9,000 cu.ft. per bed. The mechanical plant has been simplified; labour saving methods have been adopted from industry; more consideration is being given to economy in operation and maintenance.

THE RUDOLPH VIRCHOW HOSPITAL, BERLIN

The flexible plan of the modern hospital, with its small wards and semi-private rooms, represents a major step in operating economy; the broader scope of hospital service and the impelling necessity for economy have effected many radical changes in the traditional plan. The 24-bed ward with its service and utilities at one end no longer meets requirements. Instead, four, six and eight-bed wards, with doubled service units to save nursing effort,

are becoming common. Beds must be arranged, yet without rigid lines, so that medical patients may be treated apart from the surgical, and maternity apart from both, with separate provision for the contagious, the noisy, the delirious and the dying. Formerly new patients were placed wherever there was a vacant bed. New practice, for convenience in nursing, groups the acutely ill together and places those recovering where they will not be disturbed by very sick neighbours. The modern hospital bed, which is easily and silently moved on its large casters, makes this possible.

The needs of the general service also are being more carefully studied, so that the nurse is not compelled to walk long distances to accomplish frequent routine tasks. With small wards a utility room seems justified for every ten patients. Nor is it generally realized how relatively small is the proportion of floor space devoted to the actual housing of patients. In one compact 100-bed hospital, out of a total available floor area of 62,000 sq.ft., less than 20% was used for patients' rooms, wards and solaria; 6% for professional units, operating, delivery and treatment rooms, laboratories and X-ray department; while the balance, 74%, was required for the general service—corridors, elevators, kitchen, laundry, engineer's department and housing of personnel. Ideal provision also calls for open porches and enclosed solaria to which all patients can be conveniently wheeled in their beds.

BIBLIOGRAPHY.—The best sources of information on hospital planning are the various magazines devoted to hospitals; among these may be mentioned *Hospital Management* and *The Modern Hospital* (Chicago), *Hospital Progress* (Milwaukee), and *The Hospital Gazette* (London). (See article HOSPITAL.) (C. F. N.)

HOSPODAR, a term of Slavonic origin, meaning "lord" (Russ. *gospodar*). It is a derivative of *gospod*, "lord," and is akin to *gosudar*, which primarily means "sovereign." In Little Russian the title *hospodar* is specially applied to the master of a house or the head of a family. The rulers of Walachia and Moldavia were styled *hospodars* from the 15th century to 1866. At the end of this period, as the title had been held by many vassals of Turkey, its retention was considered inconsistent with the growth of Rumanian independence. It was therefore discarded in favour of *domn* (*dominus*, "lord"), which continued to be the official princely title up to the proclamation of a Rumanian kingdom in 1881.

HOST. (1) One who provides another with lodging and entertainment (Lat. *hospes*, a guest or host). In biology, an animal or plant upon which a parasite lives. (2) An army, and generally any multitude (Lat. *hostis*, a stranger or enemy). In biblical use the word is applied to the company of angels in heaven; or to the sun, moon and stars. (3) The sacrifice of Christ's body and blood in the eucharist, the consecrated wafer used in the service of the mass in the Roman Church (from Lat. *hostia*, a victim or sacrifice). (See EUCHARIST.)

HOSTAGE, a person handed over by one of two belligerent parties to the other or seized as security for the carrying out of an agreement, or as a preventive measure against certain acts of war. The practice of taking hostages is very ancient, and has been used constantly in negotiations with conquered nations, and in cases such as surrenders, armistices and the like. The Romans were accustomed to take the sons of tributary princes and educate them at Rome, thus holding a security for the continued loyalty of the conquered nation and also instilling a possible future ruler with ideas of Roman civilization. This practice was also adopted in the early period of the British occupation of India, and by France in her relations with the Arab tribes in North Africa. The position of a hostage was that of a prisoner of war to be retained till the negotiations or treaty obligations were carried out, and liable to punishment (in ancient times), and even to death, in case of treachery or refusal to fulfil the promises made. The practice of taking hostages as security for the carrying out of a treaty between civilized states is now obsolete. The last occasion was at the treaty of Aix-la-Chapelle in 1748 when two British peers, Henry Bowers Howard, 11th Earl of Suffolk and Charles, 9th Baron Cathcart, were sent to France as hostages for the restitution of Cape Breton to France.

In modern times the practice may be said to be confined to

two occasions: (1) to secure the payment of enforced contributions or requisitions in an occupied territory and the obedience to regulations the occupying army may think fit to issue; (2) as a precautionary measure, to prevent illegitimate acts of war or violence by persons not members of the recognized military forces of the enemy. (See REPRISALS.) The Franco-Prussian War of 1870-71 and the 2nd Boer War saw many instances of the holding of hostages while the Germans took the same precautions in invaded territory early in the World War.

See W. E. Hall, *A Treatise on International Law* (1880, 8th ed., by A. P. Higgins, 1924); F. L. Oppenheim, *International Law*, 2 vol. (1905-06, 4th ed., by A. D. McNair, 1926, etc.).

HOSTE, SIR WILLIAM (1780-1828), British naval captain, was born on Aug. 26, 1780 at Ingoldsthorpe, and entered the navy in April 1793, under the special care of Nelson, who had a lively affection for him. He served in the naval campaigns of the Napoleonic wars. His most brilliant feat was performed on March 13, 1811. A Franco-Venetian squadron of six frigates and five small vessels, under the command of a French officer named Dubourdieu, assailed Hoste's small force of four frigates near the island of Lissa. The French officer imitated Nelson's attack at Trafalgar by sailing down on the English line from windward with his ships in two lines. But the rapid manoeuvring and gunnery of Hoste's squadron proved how little virtue there is in any formation in itself. Dubourdieu was killed, one of the French frigates was driven on shore, and two of the Venetians were taken. He died on Dec. 6, 1828.

See Lady Harriet Hoste, *Memoirs and Letters of Sir William Hoste* (2 vols. 1833; abridgment entitled *Service Afloat*, 1887).

HOSTEL, the old name for an inn (see HOSPITAL, *ad init.*); also employed at Oxford and Cambridge to designate the lodgings which were in ancient times occupied by students of the university. In some of the English public schools the "hostel" system provides the lodging accommodation under separate masterships.

HOSTIUS, Roman epic poet, probably flourished in the 2nd century B.C. He was the author of a *Bellum Histricum* in at least seven books, of which only a few fragments remain. The poem is probably intended to celebrate the victory gained in 129 B.C. by Gaius Sempronius Tuditanus (consul and himself an annalist) over the Illyrian Iapydes (Appian *Illyrica*, 10; Livy, *epit.* 59). Hostius is supposed by some to be the "doctus avus" alluded to in Propertius (iv. 20, 8); the real name of Propertius's Cynthia, according to Apuleius (*Apologia* x.) and the scholiast on Juvenal (vi. 7), being Hostia (perhaps Roscia).

Fragments in E. Bährens *Fragmenta poetarum Romanorum* (1884); A. Weichert *Poetarum Latinorum reliquiae* (1830).

HOSUR, town, British India, in the Salem district of Madras, 24 m. E. of Bangalore. Pop. (1921) 5,519. It contains an old fort, frequently mentioned in the history of the Mysore wars. Close by is a large remount dépôt.

HOT BLAST. The apparently insignificant idea, introduced by Neilson in 1828, of sending hot air instead of cold into a blast furnace created a revolution in smelting practice, for it enabled a much greater quantity of ore to be smelted for a given amount of fuel, while furnaces could be made of larger size than hitherto. The air temperature employed was at first low, but now ranges from about 650° F to 1,500° F. Hot blast stoves for the heating were originally fired with coal, but now the waste gases from the furnaces are utilized by means of combustion chambers in the stoves. These are of regenerative type, tall structures containing a mass of brick checker-work.

Stoves vary considerably in regard to the interior arrangement. (See IRON AND STEEL.)

HOTCH-POT or **HOTCH-POTCH**, in common law, the name given to a rule of equity whereby a person, interested along with others in a common fund, and having already received something in the same interest, is required to surrender what has been so acquired into the common fund, on pain of being excluded from the distribution. The same principle is to be found in the *collatio bonorum* of the Roman law: emancipated children, in order to share the inheritance of their father with the children

unemancipated, were required to bring their property into the common fund. It is also found in the law of Scotland.

HOTEL. There is no legal definition in Great Britain of the word "hotel," and the term is loosely applied to a wide variety of establishments having very little in common—to the more pretentious public-house and to the larger type of boarding-house, as well as to the luxuriously appointed, fully licensed house affording sleeping accommodation and catering facilities for hundreds of visitors.

English law admits the existence of houses licensed for the sale of intoxicating (or, in the Scottish terminology, "excisable") liquor; and recognizes, too, the existence of "inns." But a licensed house may or may not have sleeping accommodation, and an inn may or may not have a licence. An inn has been judicially defined as "a house where a traveller is furnished with everything he has occasion for while on his way."

In the eyes of the British law, the proprietors and general managers of the greatest of modern luxury hotels are but "inn-keepers," and the licence by virtue of which they conduct that part of their business concerned with the sale of liquor is the ordinary publican's licence. This failure of the law to recognize the existence of the modern hotel and to differentiate between it and the public-house is bitterly resented by those who direct and conduct what, for want of an accurate term, we must call the legitimate hotel industry.

The unsatisfactory state of the law in this respect has a direct and adverse bearing on the condition of the *bona fide* hotel industry of Great Britain. Both directly and indirectly the efficiency of the industry is impaired. Hotel operation is hedged about by antiquated laws and modern restrictions. The latter are, for the most part, legacies of the World War and of the Defence of the Realm Act regulations; the former are an anachronism, being laws passed centuries ago and framed to meet conditions infinitely removed from those which we know to-day. In the words of the earl of Bessborough, who is president of the Hotels and Restaurants Association, the law regards even the highest class of hotel as "little more than an inn and little less than a disorderly house."

Higher Status in America and Continental Europe.—In other European countries and in the United States the status of hotels is very much higher; and Governments have been quick to recognize the national importance of the industry, and the fact that highly efficient hotels are indispensable to the development of the ever-growing tourist traffic, and are closely associated with a country's commercial prosperity.

The direct bearing of unfavourable laws on the development of the hotel industry is seen in the discouragement to the investment of new capital in an enterprise so hampered by obsolete laws, and so much at the mercy of the casual occupants of licensing benches. By-laws, also, do not, for the most part, encourage hotel development in England. The limitation of building heights and the regulations which apply to bathroom design and to the placing of lavatories may be alluded to as typical of conditions which impose on British hotel construction more severe restrictions and heavier obligations than are encountered by hotel designers in America or elsewhere in Europe. When comparing British hotels with hotels in other lands these facts should not be overlooked; nor should it be forgotten that, in comparison with the hotels of the United States (which are in a class by themselves), the great majority of hotels in Great Britain are "elderly." It is much more difficult entirely to "modernize" an old hotel than to build a new one embodying all the most up-to-date ideas. On the other hand the cost of building is to-day so greatly in excess of pre-war charges that the old hotel—despite its lack of modernity—has a very big economic advantage over its new competitor. That fact again tends to discourage competitive building.

British provincial hotels suffer by comparison with the provincial hotels of France in their lack of hot and cold water laid on to the bedrooms and of central heating. The catering in the smaller and more remote British hotels is also frequently of poor quality by comparison. It is only fair, however, to bear in mind, when considering the former criticism, that, under a Government sub-

sidized scheme, French provincial hotels have of late years enjoyed special credits enabling them to spend large sums on reconstructions and on modernizing equipment. The Credit National Hôtelier, as it is called, is responsible very largely for the high rate of efficiency of the average French country hotel. No corresponding benefits are enjoyed by provincial hotels in Great Britain.

National Characteristics.—The leading authorities on the subject incline to the view that hotel design will continue to be influenced by the aim not to evolve a standard "international" form of hotel which would render the *de luxe* hotel in London an exact replica of those in Paris, New York, Berlin and Rome, but rather to develop national distinctions which are already apparent. Whereas the luxury hotels of France and Austria, for example, are of what is known as the "palace" type, aiming at sheer magnificence, and those of the United States are gigantic buildings designed for the mass ministration of standardized services, organized on highly scientific and largely mechanical lines, the ideal of the great British hotel is to reproduce, while greatly extending, the characteristic amenities of the private town mansion or country house, and to recapture its traditional air of culture, courtesy, quiet dignity and hospitality. Certain new hotels in Mayfair exemplify how successfully that ideal may be expressed by British architects and a management policy imbued with those principles.

The typical American hotel tends to become vaster and vaster. The 2,000 room caravanserai is succeeded by others of 3,000 rooms, and the accommodation of even those giant erections is already greatly exceeded by yet more recent building. In Great Britain and Ireland the 500 room hotel is deemed a large one. It is questionable whether the resources of any single hotel in Great Britain exceed 1,000 rooms; nor is any tendency towards building very much larger hotels apparent. The huge American style of hotel is also unknown on the Continent of Europe. Anywhere in Europe a hotel containing as many as 600 rooms is regarded as very large indeed.

Kitchen Design.—There can be no uniformity in the lay-out of hotels, but certain widely approved principles may be noted. Ideally, the actual kitchen should, most hotel authorities are agreed, be on the top floor, both for hygienic reasons and to obviate any odour of cooking penetrating into the public or private rooms. Considerations of rapid and efficient service, however, incline the *chef-de-cuisine* to regard the ideal arrangement as being both kitchen and restaurant on the same level. In point of fact all the kitchen departments are usually found in the basement, where the "brigades" work by artificial light and in conditions of artificial ventilation. Economy of space on the floor devoted to the public rooms is the governing factor. A compromise is often effected by placing the kitchen in the basement, the dining room on the ground floor, and a service room adjacent, on the same level, and served directly by service lifts from the kitchen. Grill rooms are often placed in the basement.

The chef's domain, over which he rules as an autocrat, comprises not only the kitchen proper, but also the larder, pastry-cook's department, vegetable preparation corner, pantry, scullery and service room. Each sub-division of the kitchen proper, where are carried on the preparation of sauces, fish, roasts, etc., is in the immediate charge of a *chef-de-partie*. The lay-out of the kitchen department and the arrangement of the apparatus call for skilful and experienced treatment by the specialist kitchen engineer, in consultation with the chef, the aim being to secure the maximum co-ordination possible, visible to the chef's watchful eye, to keep check of all outgoing, to facilitate the work of the cooks, and to expedite the service to the dining room. Good ventilation and lighting are of prime importance.

Public Rooms in British Hotels.—Almost invariably, the ground floor of a modern hotel is divided between the vestibule, in which are placed the various offices, reception, cashier, hall porter, enquiry, etc., and a series of public rooms. There is increasingly noticeable a tendency for the elimination of corridors on the ground floor, and the arrangement of commodious lounges *en suite* with no dividing walls. The old style of separate drawing rooms, reading and writing-rooms and the rest, is rapidly becoming obsolete. The bar, if any, is, or should be, kept as separate as

possible from the ordinary residential part of the hotel. Billiard-rooms are at a discount; and, except in definitely "commercial" hotels, travellers' stock-rooms and the old-time "commercial rooms" are becoming scarce. In the lay-out of the ground floor of a modern hotel revolving doors to the street, an installation of central heating in the entrance hall and public rooms, and provision for a passenger lift are indispensable features.

It is a well-established principle of hotel design to keep private rooms entirely apart from public rooms. From the first floor upward the house is usually devoted entirely to private rooms and suites, with, of course, the necessary provision of bathrooms and lavatories, chamber maids' service rooms, and, usually, on the top floor, sleeping quarters for the resident staff.

Modern Bedroom Design.—Visitors' private accommodation is either in the form of single bedrooms or double bedrooms, or suites of rooms including a sitting-room and private bathroom. The proportion between the number of each of these classes of accommodation will depend on the class and style of hotel. In double bedrooms there is a tendency to substitute "twin" single beds for the large double bed. The well-equipped bedroom has, in addition to the usual furniture and fittings, a writing table, a telephone, electric lights over the dressing table and the bed, a radiator under the window and either a gas or electric fire controlled by a coin-meter, and a basin bracketed to the wall, with hot and cold water laid on. The last mentioned convenience, in particular, is coming to be regarded as a *sine qua non* in the modern hotel.

Bathrooms and Sanitary Equipment.—The American ideal of a private bathroom to every bedroom is impracticable in the majority of existing British hotels, although several recently built hotels in London are equipped in this manner. There can be no doubt, however, that in many British country hotels the bathroom accommodation is insufficient. Where private bathrooms are provided it is usual to place a water-closet in the bathroom. By-laws in many places, however, forbid the architect to allow the "complete" bathroom to lead directly out of a bedroom, thus necessitating the construction of a lobby into which both rooms must open. Moreover, water-closets must be affixed to an external wall of the building, and bathrooms must be ventilated by being given direct access to the open air. The net result of these admittedly hygienic requirements is to confront the hotel owner who wishes to modernize an old hotel with a set of almost impossible conditions, compelling such a sacrifice of space where it is most valuable, that he simply cannot afford to make provision for numerous additional bathrooms. On the European Continent the conditions imposed are much less onerous. The built-in tub bath and the "bidet" or sitz-bath are now found in the private bathrooms of leading British hotels.

Hotel Organization.—The organization scheme of a typical great modern hotel follows approximately the following lines: At the head is the managing director, the link between the executive officers and the board. The manager is the chief executive officer of the organization; the assistant-manager helps and deputizes for him when required, but has no specified independent function. The organization is divided into three main departments, house, food, drinks. All are controlled ultimately by the manager.

House.—This comprises three distinct but related sub-departments, viz., reception; housekeeper; hall porter. The reception clerks are responsible for the letting of rooms, cash transactions, letters, keys, safe-deposits, enquiries, telephones, and keep all appropriate records. The housekeeper is responsible for the condition of rooms, public and private, corridors and staircases, and all equipment in her department; she supervises bedroom service, valets, vacuum cleaning and window cleaning; controls the linen room, and orders supplies of linen and house cleaning material. The hall porter supervises all uniformed staff, including footmen, liftmen, luggage porters, parcel porters, pages and cloakroom attendants.

Food.—The *chef-de-cuisine* is in charge of the kitchen and orders food supplies. The restaurant manager supervises the service for restaurant, grill room, floors and banqueting rooms, and orders supplies for those departments.

Drinks.—The cellar manager is responsible for stock of wines,

spirits and minerals; supervises service of the dispense bars and American bar, and orders supplies for those departments.

Directly responsible to the management on the administrative side are also the following special departments and services. These exercise control over, or perform services for, the house, food, or drinks departments.

Accounting.—Keeping of visitors' accounts and general book-keeping.

Control.—This department checks all bookkeeping; controls all financial transactions; checks all goods received; handles accounts with suppliers; takes periodically stock of food, drinks and equipment; places orders for supplies of food, drinks and equipment, stationery and printing; supervises receiving clerks, storemen and cashiers; and keeps all connected records.

Engineering and Maintenance.—Responsible for mechanical plant; supervises electrician, plumber, carpenters, painters, upholsterers, French polishers; is responsible for maintenance of building and equipment; keeps all connected records; and orders supplies for these departments.

Staff Manager.—Engages staff, except where this function is performed directly by heads of departments; keeps all connected records.

House Detective.—Protects house and guests' property; supervises firemen, watchmen and timekeepers.

As illustrative of the complexity and comparative size of the organization of a big first-class hotel it may be mentioned that a hotel with accommodation for 500 visitors may have a staff of 600 or 700 employees.

Hotels and Social Life.—The place of the hotel in social life has increased greatly in importance. As a rendezvous of business men, as a headquarters of conferences, as the setting for social gatherings and for "bazaars" and banquets, the well-appointed, well-managed hotel to-day enters very largely into the life and activities of the community. Most first-class hotels have ball-rooms, and dances and even cabaret performances are now normally provided for the entertainment, not only of their resident visitors, but of the general public. Orchestras of a high order play in the restaurant or lounge and for dancing; and by the wizardry of broadcasting they also provide free entertainment for millions of listeners who have neither the opportunity nor the means of seeking their amusement in a sumptuous hotel.

(W. B. CA.)

UNITED STATES

A hotel in America is defined as a residence building which is occupied as a temporary abiding place by individuals who seek lodging, with or without meals. The hotel building contains a general public dining room, a café or both, and a general kitchen. An apartment hotel is a building in which the apartments are rented in suites, usually for periods of not less than one month, and in which a common dining room may be provided. Hotels never permit cooking or the preparation of food in their guest rooms. Apartment hotels on the other hand may provide within the living suite a small room for the preparation of meals. In America this is known as a kitchenette or pullman kitchen and is equipped with a stove, refrigerator, sink and storage space. Tenants of an apartment hotel look upon the building as their permanent home, and the introduction of commercial features is considered an intrusion tending to destroy its privacy and domestic qualities. The problems of designing apartment hotels are so different and so much simpler than those of transient or commercial hotels that they need not be considered here.

Hotels may be classified as: (1) country and resort hotels, (2) club hotels, (3) working men's and working women's hotels, (4) community hotels, (5) hotels of 300 rooms or less, (6) hotels of 300 to 600 rooms, (7) hotels of more than 600 rooms.

Country and Resort Hotels.—This classification includes those catering entirely to a seasonal business. Their needs are highly specialized. In these days of enormous tourist shifts of population during seasons, a single management will operate seasonal hotels in the larger tourist centres in conjunction with hotels in the all-year centres. By shifting their employees, they

are able to reduce overhead considerably during the off-season. Then there is the type of resort hotel depending entirely on the tourist seasons for its business and catering only to seasonal guests. By operating a chain of hotels, located entirely according to climate, the same help may be retained and sent from one hotel to another, thus avoiding the necessity of building up a new organization each season. From June to October, the management operates a hotel at some popular northern summer resort. The summer season over, this hotel is closed and the organization shifted to the far south or the northern winter resorts.

The summer resort hotel should be built where the location can be featured as an attraction. The guest bedrooms must be spacious and airy, ceilings high, corridors wide and public spaces large and roomy. Operation of this type of hotel includes a social manager who plans sight-seeing parties, dances, concerts, athletic meets and various other social functions much as on an ocean voyage. The country hotel is really an Apartment Hotel with club features such as accommodations for golf, tennis and other leisure sports.

Club Hotels.—This classification includes buildings that are primarily designed to give university, athletic or other clubs, society or fraternal bodies, both headquarters and sleeping rooms. Fraternal organizations of a national character find that buildings of this type in the larger cities increase the friendliness of their members and help them to live congenially while visiting strange cities. Due to the club's other revenues, the rates of rooms to members are reasonable. Hotels in this classification can offer their members facilities that the commercial hotel cannot. Site and location are not essential and large profits are not expected, but membership dues are needed to assure the financial success of club hotels.

However, few club or fraternal hotel buildings can support themselves financially without additional revenue than that derived from bedrooms. In transient hotels the public or non-revenue space rarely exceeds one-third of the total floor space of the building, while in the club hotel non-revenue producing spaces will frequently be 75% of the total area. The prohibition law in the United States has taken away from Club Hotels one of their greatest sources of income. Non-religious clubs are able to augment income from card rooms, but this must not be confused with unlawful gambling. Hotels of the fraternal type cannot be big income producers, unless the guest bedrooms are sufficiently numerous to carry most of the financial fixed charges.

Working Men's and Working Women's Hotels.—Buildings designed to meet the requirements of people whose incomes are limited. These hotels are graded according to the scale of wages of the middle class, and a worker can almost always find one of these hotels to suit his purse. In the higher class may be placed the Y.M.C.A., semi-philanthropic and kindred organizations. Below these are the rooming or lodging houses, with the minimum of accommodations and containing the greatest possible number of rooms in the smallest space.

The Y.M.C.A. hotels are really modified club hotels. So much of their space is given over to club, social, and religious phases that it is very difficult for them to be self-supporting without outside financial aid. Bedrooms average 70 to 80 sq.ft. in area, and have a closet, but few rooms have private baths or private toilet facilities. Yearly membership dues and voluntary contributions help defray maintenance costs.

Under this classification may also be placed what is known as the "white collar" hotels. This type of building is highly successful financially. They contain almost all the usual conveniences of a transient hotel except a Ball Room and the larger open spaces. The rooms are comfortable, and average from 90 to 110 square feet. Numerous bath rooms are provided, though they are reduced in area to an absolute minimum. It is possible to place this type of building in close proximity to business centres and rent rooms at ten to fifteen dollars per week. The architecture is good and the maintenance is on a high plane.

Community Hotels and Hotels of 300 Rooms or Less.—Hotels of this class are grouped together in this article because their problems are identical. The community hotel is financed

by the citizens of the city in which it is to be placed, while the other may be privately financed to meet a community's special needs. The committee in charge of building usually has in mind a hotel to meet certain local conditions, but beyond that point things are usually hazy and only an unbiased expert hotel consultant can suggest definite methods of procedure. In general it may be said that no corner in any small city is too expensive for a community hotel. Proximity to the railroad station is important but far more so are store rentals. The more people that pass in front of the hotel the greater becomes the value of rental space. Street noises do not disturb the average guest. No hotel has ever been known to close its doors because it was on the most prominent and busiest street. It is advisable to consider the possibility of future expansion, and if land values are not prohibitive additional space should be purchased.

The number of guest bedrooms depends on the number of similar modern hotel rooms already existent. Consideration must be given to the city's social activities and needs, and its recreational facilities. It is unsound finance to project a hotel of this classification of less than one hundred guest bedrooms, or one in which the active income producing rooms do not equal a minimum of 65% of the total floor area.

Hotels of 300 to 600 Rooms.—In this class come those types of hotels that are in cities of a population up to 250,000. The problems involved are a combination of the community and the largest hotels.

Hotels of More Than 600 Rooms.—This class of hotel is found only in the cities of large population where the competition is keen. City and State building, zoning, labour and other ordinances are continually confronted, limiting and designating the type of construction, light and air, courts and yards, fire regulations, and other similar restrictions. The problems involved in the design of this type of hotel call for the highest skill for their solution and involve many difficult features.

(H. Pr.)

HÔTEL DE VILLE, the town hall of a French municipality. The most ancient example still in perfect preservation is that at St. Antonin (Tarn-et-Garonne) dating from the middle of the 12th century. Other fine town halls are those of Compiègne, Orléans, Saumur, Beaugency and St. Quentin. The Hôtel de Ville in Paris, built in the 16th century, burnt by the Commune in 1871, has since been rebuilt on an extended site, the central portion of the main front being a reproduction of the old design. There is only one town hall in a French town, those erected for the mayors of the different arrondissements in Paris being called *mairies*. (See GOVERNMENTAL ARCHITECTURE.)

HÔTEL-DIEU, the term applied in France to any hospital in the middle ages, now reserved to those whose history goes back to mediaeval times. Many examples from the Gothic period still remain, notably that of Angers (1153-84), the so-called *salle des morts* at Ourscamps (early 13th century), and that of Tonnerre (c. 1300). In all of these, the most important feature is a vast hall in which were placed the beds for the sick. In the two earliest the hall is divided into three aisles by pillars and vaulted so that four rows of beds on either side of the pillars were possible. At Tonnerre the great hall, nearly 60 ft. wide and 300 ft. long, was roofed with wooden trusses and had a wooden barrel vault ceiling. The beds were in little chambers along the sides, open to supervision from a gallery that ran continuously around the side-walls immediately below the window sills. At Beaune, the Hôtel-Dieu, founded in 1443, is of quite different character, occupying three sides of a courtyard, in two storeys. In addition to the halls for the sick, various other rooms for the use of the nuns were furnished. The whole is a picturesque Gothic timber construction.

HOTHAM, WILLIAM HOTHAM, 1ST BARON, CR. 1797 (1736-1813), British admiral, son of Sir Beaumont Hotham (d.

1771), was educated at Westminster School and at the Royal Naval Academy, Portsmouth. He entered the navy in 1751 and served with distinction through the Seven Years' War. In 1776, as a commodore, Hotham served in North American waters, and shared in the brilliant action in the Cul de Sac of St. Lucia (Dec. 15, 1778). In 1781, when he was sent home in charge of a large convoy of merchantmen, he fell in with a powerful French squadron off Scilly, against which he could effect nothing, and many of the merchantmen went to France as prizes. In 1782 Hotham was with Howe at the relief of Gibraltar. As Hood's second-in-command in the Mediterranean he was engaged against the French Revolutionary navy, and when his chief retired to England the command devolved upon him. On March 12, 1794, he fought an indecisive fleet action, in which the brunt of the fighting was borne by Captain Horatio Nelson, and some months later, now a full admiral, he again engaged, this time under conditions which might have permitted a decisive victory; of this affair Nelson wrote home that it was a "miserable action." He died in 1813.

See Charnock, *Biographia navalis*, vi. 236.

HOTHOUSE: see HORTICULTURE.

HOTI-MARDAN or **MARDAN**, a frontier cantonment of British India in the Peshawar district of the North-West Frontier Province (q.v.), situated 15 m. N. of Nowshera. Pop. (1921), 10,930. It was long famous as the permanent headquarters of the Corps of Guides, now placed in the Line of the Army.

HOTIN, a fortified town and capital of a department of Bessarabia, Rumania, situated on the right bank of the Dniester, on the frontier of the Ukraine and near that of Poland. Pop. (1928) 19,400. Hotin possesses manufactures of leather, candles, beer, shoes and bricks, and does an export trade in local products, but its main importance has always been as a military post defending a much-frequented crossing of the Dniester. It was a mediaeval Genoese colony, and has been held by Moldavians, Poles, Austrians, Russians and Turks. The population of the department of Hotin is mainly Ukrainian.

HOTMAN, FRANÇOIS (HOTOMANUS) (1524-1590), French jurist, was born on Aug. 23, 1524, in Paris, of a family of Silesian origin. He took his doctorate in law at Orleans, practised for some time at the Paris bar, and in 1546 became professor of Roman law in the university. But in 1547 he was converted to the Reformed church, and left Paris for Lausanne, where, on the recommendation of Calvin, he became professor of belles-lettres and history, and married Claudine Aubelin, a Huguenot refugee. Returning to Geneva in 1584 he dabbled in alchemy and the research for the philosopher's stone. He died in Basle on Feb. 12, 1590, and was buried in the cathedral.

Hotman did much for 16th-century jurisprudence, having a critical knowledge of Roman sources, and a fine Latin style. He broached the idea of a national code of French law. His numerous works include *De gradibus cognationis* (1546); *Anti-Tribonian* (1567), a treatise arguing that French law could not be based on Justinian; a life of Coligny (1575); *Brutum fulmen* (1585), a polemic directed against a bull of Sixtus V. His most important work, the *Franco-Gallia* (1573), was in advance of his age, and found favour neither with Catholics nor with Huguenots in its day; yet its vogue has been compared to that obtained later by Rousseau's *Contrat Social*. It presented an ideal of Protestant statesmanship, pleading for a representative government and an elective monarchy. It served the purpose of the Jesuits in their pamphlet war against Henry IV.

See R. Dareste, *Essai sur F. Hotman* (1850); Blocaille, *Étude sur François Hotman* (1902).

HOT SPRINGS, a city of Arkansas, U.S.A., at the eastern base of the Ozark mountains, 55m. W.S.W. of Little Rock. It is on Federal highway 70; is served by the Rock Island and the Missouri Pacific railways; and has a municipal airport. The resident population was 11,695 in 1920 (24% negro), and was estimated locally at 23,000 in 1928. The transient population numbers 300,000 in the course of a year. The city lies amid scenery of great beauty, and the climate is delightful. The envioning hills reach an altitude of 1,200ft. above the sea. The economic

life of the city is centred in providing for the thousands of visitors who come seeking health or recreation. On the border of the city is the Hot Springs National park, a tract of 912ac. enclosing all the 46 curative hot springs which issue from the slope of Hot Springs mountain, and many cold-water springs also of medicinal value. There are 9 bath-houses on "Bath-House Row" and 12 more in the city all under government regulation, and the govern-

BY COURTESY OF THE NATIONAL PARK SERVICE

VIEW OF CENTRAL AVENUE, HOT SPRINGS, IN THE EARLY DAYS OF WESTWARD EXPANSION

ment maintains an army and navy general hospital in the reservation. The waters are tasteless and odourless, and contain over 20 chemical constituents. Tradition says that their curative properties were known to the Indians long before the Spanish explorations; that they warred for their possession, finally making an agreement whereby all tribes had access to them. Probably the springs were known to De Soto. They were visited about 1800 by French hunters, and by members of the Lewis and Clark expedition in 1804, under instructions from President Jefferson. Permanent settlement here began in 1828. In 1832 Congress created a reservation (classified as a National park since 1921) to prevent exploitation of the healing waters for private gain, but litigation ensued, which was not ended until the U.S. Supreme Court made its decision in 1876. Hot Springs was incorporated as a town in 1876; was almost destroyed by fire in 1878; and was chartered as a city in 1879. In the suburbs are an alligator farm and an ostrich farm.

HOT SPRINGS, a village of Bath county, Va., U.S.A., near the western boundary of the State, in a lovely valley of the Allegheny mountains, 2,200ft. above sea-level. It is served by the Chesapeake and Ohio railway. The population was about 1,100 in 1928. It has long been a health and pleasure resort. The medicinal springs contain magnesia, soda-lithia and alum, and some of them have a temperature as high as 106°F. Other resorts in the vicinity are Warm Sulphur Springs (98°F), 5m. N.; Healing Springs (85°F), 2.5m. S.; and Rockbridge and Jordan Alum Springs, a few miles south-east.

HOTTENTOTS, a nomadic pastoral people inhabiting the western half of South Africa. They are closely allied to the Bushmen (*q.v.*) in racial characteristics and in language, but seem to have been affected in culture and in certain features of language by Hamitic admixture. They comprise a number of tribes, each occupying its own territory under its own chief. They all keep cattle and sheep, and also practise hunting. Socially they are organized into exogamous patrilineal clans, and they practise cross-cousin marriage. Their religion consists mainly in the worship of mythical heroes, derived partly from animistic beliefs and partly from the personification of the natural forces producing rain.

See L. Schultze, *Aus Namaland und Kalahari*, 1907.

(I. S.)

LANGUAGE

Hottentot is the name given by Europeans to the languages known to their speakers as Nama, !Kora, etc., to the number of 14 or 15 subdivisions of the main Hottentot speech. Of these, the Nama is the most important and will be taken as illustrating all the others.

The Hottentot tongue has the five vowels *a e i o* and *u*. They are long and short; when a small circle appears below a vowel (ë) the letter is almost elided in pronunciation. The consonants are as in English without *c, g, v, x*, a true *d, l, f, y*, and a true *r*; there are compound letters *gh* and *kh* and the sound represented usually by *r* is one intermediate between *l, d* and *r*. Vowels are nasalized by the mark ~ written above them.

The outstanding characteristics of the Hottentot languages are (a) the presence of clicks (*q.v.*), (b) the monosyllabic nature of the vocabulary and (c) the presence of tones (*q.v.*). The clicks are represented in most works hitherto published by the following signs: / (dental, old *c*); ≠ (palatal, old *v*); ! (cerebral, old *q*); // (lateral, old *x*). These clicks are initial and begin 75% of the Hottentot words.

The languages are remarkably regular and the nouns show considerable latitude in their origin. Word-building is simple and regular; gender is marked by the terminal letter, e.g., masc. -*b*, (*Khoib*, a man); fem. -*s* (*Khois*, a woman); com. -*i* (*Khoi*, a person), etc. Nouns have singular, dual and plural forms and undergo declensions for objective and vocative cases only. Adjectives are not inflected and can be formed from nouns.

Numeration is decimal and the first ten numbers are; (1) /*gui*, (2) /*gam*, (3) /*nona*, (4) /*haga*, (5) /*goro*, (6) /*lnani*, (7) /*hū*, (8) //*khaise*, (9) /*goisi*, (10) /*disi*. The form *disi* for ten is interesting to the Indo-Aryan philologist.

The languages are rich in pronouns and have suffixed forms in singular, dual and plural, in masc., fme. and common genders. The verb is simple, the root is the infinitive; /*nam*, to love; /*mū*, to see; /*ku*, to go. The relative form is made by the addition of -*ba* to the root //*nāu* to hear, //*nāuba*, to hear for somebody, etc. The reflexive adds -*sin*, //*nāu-sin*, to hear oneself; the causative adds -*kei*, //*nāu-kei*, to cause to hear; the reciprocal adds -*ku*, //*nāu-ku*, to hear one another; the diminutive adds -*ro*, //*nāu-ro*, to hear a little; the negative is formed by adding -*tama*, -*dama*, //*nāu-tama*, not to hear; the potential adds -//*kha*, //*nāu-//kha*, to be able to hear, and the optative adds, -≠*kau*, //*nāu-≠kau*, to wish to hear.

The verb has present, past, perfect, pluperfect, future and future perfect tenses. There are no irregular verbs and no exceptions to grammatical rules.

Adverbs, prepositions, conjunctions and interjections are numerous and are not declined. Adverbs of manner are especially numerous and are largely derived from adjectives. See C. Meinhof, *Lehrbuch der Nama-Sprache* (1909). See BUSHMAN LANGUAGES. (A. N. J. W.)

HOUBRAKEN, JACOBUS (1698–1780), Dutch engraver, was born at Dort, on Dec. 25, 1698, the son of Arnold Houbraeken (1660–1719). In 1707 he settled in Amsterdam. He commenced the art of engraving by studying the works of Cornelis Cort, Suyderhoef, Edelinck and the Visschers. He devoted himself almost entirely to portraiture. Among his best works are scenes from the comedy of *De Ontdekte Schijndeugd*, executed in his eightieth year, after Cornelis Troost, who was called by his countrymen the Dutch Hogarth. He died on Nov. 14, 1780.

See A. Ver Hull, *Jacobus Houbraken et son oeuvre* (Arnhem, 1875), in which 120 engraved works are fully described.

HOUDENC or **HOUDAN, RAOUL DE**, 12th-century French *trouvère*, takes his name from his native place, generally identified with Houdain (Artois), though there are other places bearing the name in one or other of its variants. It seems probable that he followed the trade of jongleur and recited his chansons in the houses of the great. He seems to have spent a great part of his life in Paris. His undoubted works are *Le Songe d'enfer*, *La Voie de paradis*, *Le Roman des eles* (pr. by A. Scheler in *Trouvères belges*, new series, 1897) and the romance of *Méragis de Portlesguez*, edited by M. Michelant (1869) and by Dr. M. Friedwagner (Halle, 1897). Houdenc was an imitator of Chrétien de Troyes; and Huon de Méry, in his *Tournoi de l'antéchrist* (1226), praises him with Chrétien in words that seem to imply that both were dead.

See Gaston Paris in *Hist. litt. de la France*, xxx. 220–237; W. Zingerlé, *Über Raoul de Houdenc und seine Werke* (Erlangen,

1880); and O. Boerner, *Raoul de Houdenc. Eine stilistische Untersuchung* (1885).

HOUDETOT, a French noble family, taking its name from the lordship of Houdetot, between Arques and St. Valéry. Louis de Houdetot went with Robert, duke of Normandy, to Palestine in 1034, and the various branches of the family trace descent from Richard I. de Houdetot (fl. 1229), who married Marie de Montfort. Charles Louis de Houdetot received a marquisate in 1722, and on his son Claude Constance César, lieutenant-general in the French army, was conferred the hereditary title of count in 1753. His wife (*see below*) was the Madame de Houdetot of Rousseau's *Confessions*. Their son César Louis Marie François Ange, comte de Houdetot (1749-1825), was governor of Martinique (1803-1809) and lieutenant-general (1814) under the Empire. His son Frédéric Christophe, comte de Houdetot (1778-1859), was director-general of indirect imposts in Prussia after Jena, and prefect of Brussels in 1813. He acquiesced in the Restoration, but had to resign from the service after the Hundred Days. He became a peer of France in 1819, and under the Second Empire he was returned by the department of Calvados to the Corps Législatif.

HOUDETOT, ELISABETH FRANCOISE SOPHIE DE LA LIVE DE BELLEGARDE, COMTESSE DE (1730-1813), married the comte de Houdetot (*see above*) in 1748. In 1753 she formed with the marquis de Saint Lambert (q.v.) a connection which lasted till his death. Mme. de Houdetot has been made famous by the chapter in Rousseau's *Confessions* in which he describes his unreciprocated passion for her. When questioned on the subject she replied that he had much exaggerated. A view differing considerably from Rousseau's is to be found in the *Mémoires* of Mme. d'Épinay, Mme. de Houdetot's sister-in-law.

See Bussennoir, La comtesse d'Houdetot (1901).

HOUDON, JEAN ANTOINE (1740-1828), French sculptor, was born at Versailles on March 18, 1740. At the age of twelve he entered the École Royale de Sculpture, and at twenty, having learnt all that he could from Michel Ange Slodtz and Pigalle, he carried off the Prix de Rome and left France for Italy, where he spent the next ten years of his life. His brilliant talent, which seems to have been formed by the influence of that world of statues with which Louis XIV. peopled the gardens of Versailles rather than by the lessons of his masters, delighted Pope Clement XIV., who, on seeing the "St. Bruno" executed by Houdon for the church of S. Maria degli Angeli, said "he would speak, were it not that the rules of his order impose silence." In Italy Houdon had lived in the presence of that second Renaissance with which the name of Winckelmann is associated, and the direct and simple treatment of the "Morpheus" which he sent to the Salon of 1771 bore witness to its influence.

Houdon executed busts of Catherine II., Diderot and of Prince Galitzin which were remarked at the Salon of 1773; and at that of 1775 he produced, not only his "Morpheus" in marble, but busts of Turgot, Gluck (in which the marks of smallpox in the face were reproduced with striking effect) and Sophie Arnould as Iphigeneia (now in the Wallace Collection, London), together with his well-known marble relief, "Grive suspendue par les pattes." He took also an active part in the teaching of the academy, and executed for the instruction of his pupils the celebrated Écorché still in use. To every Salon Houdon was a chief contributor; most of the leading men of the day were his sitters; his busts of d'Alembert, Prince Henry of Prussia, Gerbier, Buffon (for Catherine of Russia) and Mirabeau are remarkable portraits; and in 1778, when the news of Rousseau's death reached him, Houdon started at once for Ermenonville, and there took a cast of the dead man's face, from which he produced the grand and life-like head now in the Louvre. In 1779 his bust of Molière, at the Théâtre Français, won universal praise. The draped statue of Voltaire, in the vestibule of the same theatre, was exhibited at the Salon of 1781, to which Houdon also sent a statue of Marshal de Tourville, commissioned by the king, and the "Diana" executed for Catherine II. This work was refused; the jury alleged that a statue of Diana demanded drapery; without drapery, they said,

the goddess became a *sui-vante de Vénus*, and not even the proud and frank chastity of the attitude and expression could save the "Diana" of Houdon (a bronze reproduction of which is in the Louvre) from insult.

Three years later Houdon made an important visit to America, there to carry out a statue of Washington. With Franklin, whose bust he had recently executed, Houdon left France in 1785, and, staying some time with Washington at Mount Vernon, he modelled the bust, with which he decided to go back to Paris, there to complete the statue destined for the capitol of the State of Virginia. After his return to his native country Houdon executed for the king of Prussia, as a companion to a statue of "Summer," "La Frileuse," a naive embodiment of shivering cold, which is one of his best as well as one of his best-known works. The Revolution interrupted the busy flow of commissions, and Houdon took up a half-forgotten project for a statue of S. Scholastica. He was immediately denounced to the Convention, and his life was saved only by his instant and ingenious adaptation of S. Scholastica into an embodiment of Philosophy. Under Napoleon, of whom in 1806 he made a nude statue now at Dijon, Houdon received little employment; he was, however, commissioned to execute the colossal reliefs intended for the decoration of the column of the "Grand Army" at Boulogne (which ultimately found a different destination); he also produced a statue of Cicero for the senate and various busts, amongst which may be cited those of Marshal Ney, of Josephine and of Napoleon himself, by whom Houdon was rewarded with the Legion of Honour. He died in Paris on July 16, 1828.

See Hermann Dierks, Houdons Leben und Werke (Gotha, 1887); H. Giacometti, *Le statuaire J. A. Houdon et son époque* (1918-19).

HOUFFALIZE, a small town nearly 1,100 ft. above sea level in the extreme south-east of the province of Luxemburg, Belgium. It is a summer resort with fine bracing air. There are the ruins of an old castle, and some remains of the still older abbey of Val des Ecoliers. The parish church dates from the 13th or 14th century. Houffalize is on the eastern Ourthe, and is connected by tramway with Bourcy on the line of Libramont to Bastogne, Spa and Liège. Pop. (1920) 1,355.

HOUGHTON, ALANSON BIGELOW (1863-), American diplomat, was born at Cambridge, Mass., on Oct. 10, 1863. He was educated at Harvard (B.A. 1886), subsequently studying at Göttingen, Berlin and Paris. He associated himself with the Corning Glass Works, N.Y., in 1889, becoming successively vice-president and president, and, in 1918, chairman of the board of directors. He was elected a member of Congress in 1919 and re-elected in 1921, resigning in 1922 on his appointment by President Harding as U.S. ambassador to Germany, a position which he held until 1925, when he was appointed ambassador to Great Britain in succession to F. B. Kellogg. In 1928 he was nominated Republican candidate for senator of the State of New York.

HOUGHTON, ARTHUR BOYD (1836-1875), English illustrator and engraver, was the leader of a group of artists who drew their inspiration from the pre-Raphaelite movement in its second period. The bulk of his work is in black and white, although he also painted. He was the son of Captain M. Houghton.

He is among the first British artists to give a vivid and colourful interpretation of the mystery and poetry of the East. His line is delicate, direct, and sure, and his illustrations full of dramatic power and imagination. From boyhood he had the sight of one eye only, and he suffered considerably from the weakness of the other. In spite of this disability he was a quick and tireless worker, drawing invariably straight upon the wood with a wonderful knowledge of the engraver's technique. The British Museum and the Art gallery of Melbourne both possess one engraved woodblock by the master. The Victoria and Albert museum contains one oil picture, "Don Quixote," and two water-colours, "An Oriental with Performing Monkeys" and "The Transformation of King Beder"; also a number of drawings. The Tate gallery has an oil picture, "Punch and Judy."

See Arthur Boyd Houghton, A Selection from his Work in Black and White, with introd. by Laurence Housman 1896.

HOUGHTON, RICHARD MONCKTON MILNES, 1ST BARON (1809–1885), English poet and man of letters, son of Robert Pemberton Milnes, of Fryston Hall, Yorkshire, and the Hon. Henrietta Monckton, daughter of the fourth Lord Galway, was born in London and educated privately and at Trinity college, Cambridge. There he became a member of the famous "Apostles" Club, which then included Tennyson, Hallam, Trench and others. After taking his degree, Milnes travelled in Germany, Italy and Greece. He returned to London in 1837 and was in that year elected M.P. for Pontefract. In the House of Commons he interested himself particularly in the question of copyright and the conditions of reformatory schools. He left Peel's party over the Corn Law controversy, and joined Palmerston, at whose instance he was made a peer in 1863. His chief title to remembrance rests on the part he played in moulding public opinion on literary matters and on the assistance he gave to many young writers. He secured a pension for Tennyson, helped to make Emerson known in Great Britain, and was one of the earliest champions of Swinburne. He helped David Gray (*q.v.*) and wrote a preface for *The Luggie*. Milnes married in 1851 the Hon. Annabel Crewe (d. 1874). He died at Vichy on Aug. 11, 1885. His son, the second Baron Houghton, was created earl of Crewe (*q.v.*) in 1895.

See Sir T. Wemyss Reid, *The Life, Letters and Friendships of Richard Monckton Milnes, first Lord Houghton* (1890).

HOUGHTON, WILLIAM STANLEY (1881–1913), English playwright, was born at Ashton-upon-Mersey, Cheshire, on Feb. 22, 1881, and was educated privately and at the Manchester grammar school. He became a cotton-broker, employing his leisure in dramatic criticism for the *Manchester Guardian*, and in writing plays. *The Dear Departed* was played in Manchester on Nov. 2, 1908, and afterwards in London. In 1912, with the success of *Hindle Wakes*, which had a long run in London, he left his business career and went to London, settling in Paris in the following year. His other plays include *The Younger Generation* (1910), *The Master of the House* (1910), *Trust the People* (1911), *Fancy-Free* (1911). Houghton's early death in Manchester on Dec. 11, 1913 cut short a career of much promise. His *Works* were edited by H. Brighouse in 1914.

HOUGHTON, a town of Michigan, U.S.A., in the productive copper region of the Upper Peninsula, on Portage Lake, opposite Hancock; a port of entry, the county seat of Houghton county, and the seat of the Michigan school of mines (opened 1886). It is on Federal highway 41, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Copper Range, the Duluth, South Shore and Atlantic, and the Mineral Range railways, and by steamboats through the Portage Lake ship-canal. The population was 4,466 in 1920 (83% native white) and was estimated locally at 5,000 in 1928. Houghton was founded in 1841 and incorporated in 1867.

HOUGHTON-LE-SPRING, market town, urban district, in the Houghton-le-Spring parliamentary division, Durham, England, 6 m. north-east of the city of Durham. Pop. (1921) 10,203. It is situated at the head of a small tributary of the Wear. St. Michael's church is an Early English and Decorated building, with an embattled rectory. Bernard Gilpin was rector from 1556 to 1583, and founder of the grammar school. Houghton Hall is a fine mansion of the late 16th century. The main road from Durham to Sunderland here passes through a cutting in the limestone 80 ft. deep. The population is mainly dependent on the neighbouring collieries, and on limestone quarrying.

HOUMA, a city of southern Louisiana, U.S.A., on Bayou Terrebonne, 50m. S.W. of New Orleans, in a natural gas field; the parish seat of Terrebonne parish. It is served by the Southern Pacific railway and by water transportation. The population was 5,160 in 1920 (27% negroes) and was estimated locally at 7,600 in 1928. It is primarily an agricultural centre (sugar-cane and potato crops predominating), and is a large muskrat-fur market. It has shrimp, oyster and vegetable canneries, a cypress planing-mill and an oyster-shell crushing plant. Three-fourths of the world's supply of dried shrimp comes from the parish. Houma was founded about 1810, was incorporated in 1846, and became a city in 1898. The name is an Indian word, meaning "mound."

HOUND, a dog; now used only of dogs of the chase, and especially of fox-hounds. Other breeds have a defining word prefixed; e.g., boar-hound, stag-hound, etc. (See Dog.)

HOUND'S-TONGUE (*Cynoglossum*), a widely distributed genus of the family Boraginaceae, including several species native to Great Britain and North America. The common hound's-tongue or gypsy flower (*C. officinale*), a native of Europe and Asia and found in waste grounds in the British Isles, is widely naturalized as a weed in eastern North America. It is an erect biennial, 1½ ft. to 3 ft. high, with large, oblong, pointed leaves, purplish-red flowers, ¼ in. across, and a conspicuous burlike fruit, which splits into four prickly nutlets. The wild comfrey (*C. virginianum*) or dog-bur, native to woods in the south-eastern United States, is a similar but slenderer plant with blue flowers. The western hound's-tongue (*C. grande*), also with blue flowers, grows in woods from California northward to Washington. (See BORAGINACEAE and FLOWER.)

HOUNSLOW, a town in Middlesex, England, 12½ m. W. by S. of St. Paul's Cathedral, London. Pop. (1921) 23,506. It is a residential suburb of London at the junction of two great roads from the west of England and was an important coaching station. A priory of friars of the Holy Trinity was founded at Hounslow in 1296. Hounslow Heath had, according to the survey of 1546, an area of 4,293 ac. It was the site of Roman and British camps and a few centuries ago was a resort of highwaymen. In 1784 the base-line of the first trigonometrical survey in England was laid down on the heath. It began to be enclosed towards the end of the reign of George III. In Osterley Park, north-east of Hounslow, Sir Thomas Gresham built a mansion in 1577, and this was rebuilt about 1770. Hounslow is divided between the parishes of Heston and Isleworth. Pop. (1921) of this urban district, 46,664.

HOURL, the 24th part of a civil day, a space of time of 60 minutes' duration. The word is derived through the O.Fr. *ure*, from Lat. *hora*, Gr. *ᾠρα*, season (see CALENDAR).

HOURL ANGLE, the angular distance of a heavenly body from the meridian, as measured around the celestial pole. It is equal to the angle at the pole between the hour circle through the body and the meridian, but is usually expressed in time.

HOURL-GLASS, a device for measuring intervals of time, also known as sand-glass, and as log-glass when used in conjunction with the common log for ascertaining the speed of a ship. It consists of two pear-shaped bulbs of glass, united at their apices and having a minute passage formed between them. A quantity of sand (or occasionally of mercury) is enclosed in the bulbs, and the size of the passage is so proportioned that this sand will completely run through from one bulb to another in the time it is desired to measure—e.g., an hour or a minute. Instruments of this kind, which have no great pretensions to accuracy, were formerly common in churches. In the British House of Commons, as a preliminary to a division, a two-minute sand-glass is still turned, and while the sand is running the "division bells" are set in motion in every part of the building, to give members notice that a division is at hand.

HOURL, the term for a beautiful virgin who awaits the devout Muhammadan in Paradise. The word is the French representative of the Pers. *hūrī*, Arab. *hawrā'*, a black-eyed virgin, from *hawira*, to be black-eyed, like a gazelle. See J. Horowitz, *Das koranische Paradies* (1923, bibl.).

HOURS, CANONICAL, certain portions of the day set apart by rule (canon) of the church for prayer and devotion. The Jewish custom of praying three times a day, i.e. at the third, sixth and ninth hours, was perpetuated in the early Christian Church (Acts ii. 15, iii. 1, x. 9), and to these were added midnight (when Paul and Silas sang in prison), and the beginning of day and of night. Ambrose, Augustine and Hilary commended the example of the psalmist who gave praise "seven times a day" (Ps. cxix. 164). The seventh (Compline, *Completorium*) was added by Benedict. These hours were adopted especially in the monasteries as a part of the canonical life, and spread thence to the cathedral and collegiate chapters.

Since the 6th century the number and order of the hours have

been fixed thus: matins, lauds, prime, terce, sext, none, vespers, compline. See BREVARY.

HOURS OF LABOUR. The apprentice of the middle ages was bound under the terms of his indenture to obey his master in all things and to devote, if need be, all his time to his master's interests. When he became a journeyman he was little better off, except that he was free to seek a less exacting master at times, which as apprentice he was not. But in general the only restrictions on the working hours of either journeyman or apprentice were the possibilities of the physical body and the absence of an adequate artificial light, and the only alleviations were the frequent holy days (much restricted later as holidays).

The advent of the factory system at once intensified the evil and initiated the revolt against it. Soon after the grouping of workers in factories came first the machine, which had no special reason for ceasing to work at any point of the 24-hour day, and then a satisfactory artificial light. It was probably the invention of gas and its use in factories which precipitated the movement for restricting the working day.

The revolt began not with, but for, the victims. The factory system massed together machines and *children*, with effects well-known to the student of the early 19th century in England. There was no cry from them; they were dumb in their factory prisons. They were plentiful in the workhouses of the agricultural south, whence they were taken by lorry loads to the industrial north; there was no particular economic reason for conserving them; the supply was ample.

It was for the children that the cry was made, by Shaftesbury, Oastler and others. The movement was in its first stages purely humanitarian, seeking to ameliorate the lot of the factory lads and lassies. It was slow in action. "Laissez-faire" economic doctrine questioned the wisdom of interfering with "the laws of supply and demand"; the children came from that stratum of society that as yet was hardly recognised as a part of the nation in a political or social sense, and there remained the hard fact that a machine can run 24 hours a day, and that when it does not it represents waste.

The humanitarian appeal was heard, however, and in the early 19th century the hours of children in factories were restricted by law, and somewhat later, those of women also, though these, being adult, and capable of the "free bargaining" that was considered to be so important a factor in securing the most fruitful economic results, were legislated for with much hesitation. As for men, they remained outside the scope of restrictive legislation until the century was three-quarters through.

Not that they had waited for legislation. The factory system and large scale industry had rendered them service in getting them together; they became vocal and unitedly powerful, and their defensive trade union movement took new roots and a new orientation. From the first they protested against the long working day, and by the thirties had formulated (largely under Robert Owen's influence) their demand for 8 hours. From then onwards the movement kept the 8-hour day in the forefront of its programme, both in Great Britain and on the Continent. Progress, however, was slow until public opinion had been educated firstly by a gradual realisation of the importance of the social welfare of the working portion of the community, and secondly, by the experience of the World War of 1914-18. This latter gave an enormous impetus to the movement, and the expressed ideals of the workers as to the hours of labour were very rapidly approached in the years following 1914. This was due to three causes in the main. Firstly, the workers realised as never before their importance in the community, and the community as a whole realised it; consequently, their demands fell on less inattentive ears. Secondly, the huge demands made upon labour brought into high relief a matter hitherto little considered, namely, the necessity of husbanding labour resources; though some thought had been given to the question of productivity in relation to working hours, it was only now for the first time that the question of preserving the labour available and making the most economic use of it became a serious problem. Hours of labour, after being inordinately lengthened after the outbreak

of war, were later reduced to limits calculated to conserve the efficiency of labour, and the doctrine that production varied directly with hours was definitely killed. In its place in general acceptance came the notion, often previously advocated, it is true, that the efficiency of labour depended upon the general welfare of the workers, and in that general welfare the daily working hours played a large part.

The rapidity of the change in opinion may be illustrated from the resolutions of international congresses interested in the question. Down to 1913, international conferences of workers and the successive Socialist internationals adopted resolutions calling in general terms for the 8-hour day. They were little more than expressions of an aspiration, and when such resolutions hardened out into precision in later years they scarcely seemed to be indicative of any rapid advance. In 1916, for instance, the congress of inter-allied trade unions at Leeds asked for the 10-hour day, and the international trade union congress at Berne in 1917 demanded merely a gradual reduction to 8 hours.

The semi-official International Association for Labour Legislation (in which certain continental governments were represented, as well as groups of workers, employers and private persons interested in social matters) proposed in 1912 an 8-hour day for certain of the more laborious or dangerous trades, but the official delegates at the 1913 conference arranged by this association contented themselves with the suggested limitation of the working hours of women and children to 10 daily. Between the conclusion of the war and 1921, however, many of the European industrial states adopted legislation laying down the 8-hour day and the 48-hour week as normal, and since that year, though the extension of the movement has been less rapid, it has continued, and of the many attempts again to lengthen the working day none has been more than temporarily successful.

Limitation by Law.—National legislation for the limitation of the hours of labour has taken various forms. In some cases, *e.g.*, France, Spain, Portugal, acts or decrees have prescribed a general limitation for all workers, or for all workers in large groups of occupations such as "industry," or "commerce," whilst the detailed application has been left to be elaborated by administrative decrees or orders. Usually these decrees are issued after consultation with the organized workers and employers concerned. In other cases (*e.g.*, Netherlands, Czechoslovakia, Belgium) the act itself is made to apply to a detailed list of industries, and the exceptions are usually indicated. Again, as in the case of Great Britain (Coal Mines Act) a special act may regulate the hours worked in a particular industry.

Another group of legislative measures deals with the hours of labour of specified classes of workers, women and children, and men engaged in hazardous occupations. In Great Britain the Factory Acts have attempted to regulate the hours of women and children, who were regarded as being less favourably situated for "free bargaining" than men, but it was not until 1908 that legal restrictions were directly placed upon the working hours of the latter, and then only in the case of a single industry, coal-mining.

A third type of legislation secures the aim of limiting hours of labour by indirect means. In the commonwealth of Australia, for example, and in its constituent states, the arbitration laws provide for the settlement of disputes in labour matters (including disputes about the hours of labour) by a process of arbitration and the legal enforcement of arbitration awards. Again, in the case of Germany and some other countries, collective agreements arrived at voluntarily between employers' and workers' organizations may under certain conditions be given the force of law.

There remains to be noted the huge mass of collective agreement upon hours of labour which, though not always possessing the force of law, does in fact regulate hours very successfully in many countries. This is the method adopted for most industries in Great Britain, but the practice is common even in countries where legislative limits are enforced. In these cases the collective agreement is usually an advance, from the workers' point of view upon the provisions of the existing legislation.

Exceptions to the General Rule.—All national legislation on the subject of hours provides for exceptions of a general nature, affecting the whole field of application of the legislation, as well as for exceptions in particular cases.

To provide for the former class of exceptions, which may be classified as those arising from national necessity, clauses are usually inserted which give the administration power to suspend or relax temporarily the regulations normally in force. In the case of the draft international convention (*see later*) it is provided that "the operation of the provisions of this convention may be suspended in any country by the Government in the event of war or other emergency endangering the national safety" (Article 14). Exceptions in particular cases may be classified as those which arise (1) from considerations of the *worker* himself or herself, (2) from the *size of the industrial undertaking*, (3) from the *nature of the work*, (4) from the *situation of the country concerned* with regard to climatic conditions, character of population, or other factor rendering it abnormal from an industrial point of view, and (5) from *exceptional circumstances*.

(1) In the first class may be placed those exceptions which are provided for domestic industries and small establishments where only members of the same family are employed. Managers and persons holding posts of responsibility or of confidence are generally exempt.

(2) As to the *size of the industrial undertaking*, different standards have been adopted. Whilst in Sweden concerns employing not more than four workers are exempt from the application of the Eight-hour Act of 1919 (save where such concerns are situated in towns with a population of over 1,500) in Japan 15 is the number of employees requisite to bring an undertaking within the scope of the Factory Act, and in India it was 20 until 1921, when the number was reduced to ten.

(3) The third class of exceptions is connected with the *nature of the work*. The case which appears to have presented most difficulty in national legislation is the *continuous process*. In many industries processes are employed which take long periods for their completion, and which cannot be intermitted without damage to or total loss of the material operated upon. In such cases a shift system is adopted, and a certain elasticity is required to facilitate changes. In other cases the process, whilst not being continuous in the strict sense of the word, is yet longer than the normal working day of 8 hours. The arrangement of shifts for such cases presents further difficulties for which exceptions must be provided.

The international convention on hours permits a 56-hour week in "those processes which are required by reason of the nature of the process to be carried on continuously by a succession of shifts."

The opposite case is where the work is of so *intermittent a nature* that it is felt that a longer day may be worked without injury to the worker. It is difficult to define exactly what is meant by this "intermittence." The work of a gatekeeper or watchman who has no other duties may be instanced, but there are borderline cases which are treated differently in different legislations. The Washington meeting of the International Labour Conference tried to meet such cases by permitting the legislative authorities, under certain safeguards, to allow permanent exceptions where the work is "essentially intermittent."

Seasonal industries form a further category under this heading. Both national and international legislation permit extension of the working day in industries engaged upon material susceptible of rapid deterioration, or material which is available at certain seasons only and which must be treated immediately. Similarly, industries dependent upon weather conditions are usually allowed considerable elasticity in the daily or weekly total of working hours. In this connection a device of averaging the weekly hours over a period is fairly common, and has been adopted in international legislation.

Exceptions are usually provided in connection with what is known as "*preparatory and complementary*" work. There is frequently the necessity of the earlier attendance in factories of a certain number of the personnel whose work must be done before

the general work can commence; there are others, similarly, who must continue after the conclusion of the general work. Cases in point are the engineers and other workers in the engine-room of a factory. In some national legislation, and in international legislation, exceptional provision is made for such workers.

(4) The fourth class of exceptions arises in international legislation, where it has been found necessary, in order to attempt a rough equation between countries dissimilarly situated with regard to climate, character of population or other industrial factor, to permit a longer working day in the one than in the other. Thus in the Washington Convention, a 57-hour (60 hours in the raw silk industry) week is permitted for Japan, and a 60-hour week for British India, and elasticity is provided in the application of the Convention to "colonies, protectorates and possessions not fully self-governing" for "such modifications as may be necessary to adapt its provisions to local conditions."

(5) The circumstances which, under national and international legislation, permit of the temporary suspension of the general application of the limitation of hours have already been treated. Some national legislations consider that the danger to an industry arising from the pressure of foreign competition is a sufficient warrant for the relaxation of rules in its particular case.

The existing position in the more important industrial States, including those of the British empire, may be summarised as follows:

I. Working Hours in Industry. Great Britain.—The working hours of certain classes of workers are restricted by the Coal Mines Regulation Act of 1908 and the subsequent amending Acts, the Factory and Workshops Consolidation Act (1901), the Shops Act (1912), the Employment and Closing Order Act (1912), and by regulations issued under the Trades Boards Act. Outside the mines, a relatively small proportion of the industrial population is touched by this legislation; the factories in general are governed, as regards hours, rather by collective agreement than by law, which permits a 56-hour week, a figure not often attained. Under the Trade Boards Act the hours laid down in regulations appear never to exceed 48 per week.

In all other organised industry, hours are regulated by collective agreement. With small exceptions, affecting relatively few workers, the weekly hours are 48 or less (railways, 48; railway workshops, 47; building, 44; constructional engineering, 49½ summer, 44 winter; shipbuilding, 47; thread manufacture, chocolate, 44). In one or two specially trying occupations the hours are even less (*e.g.*, glass-blowing, 35 to 37; kaolin quarries, 42) and there are a few unimportant cases where the hours by agreement exceed 48 per week.

Since Aug. 1919, when a bill for the general introduction of the 8-hour day was introduced, successive attempts to legislate on the question have been defeated. In 1927 a Government bill for the amendment of the Factory Acts which would have had the same effect in so far as the factory population is concerned was, for political reasons, not introduced.

Australia.—The 8-hour day and 48-hour week, or less, are practically universal in industry, and are secured by a series of Factory Acts, Early Closing Acts, special mining legislation, and, in the case of New South Wales, a more general Eight-hours Act (1916). In addition, hours are regulated under awards of arbitration courts and boards (first established in 1912). In Nov. 1920 for example, the Federal arbitration board awarded the 44-hour week to a large group of industries. A special court set up under the New South Wales Eight-hours (Amendment) Act of 1920 reported in favour of the 44-hour week for most employees in the building, furniture and iron trades, the manufacture of food, and in printing. This report was given effect in the following year.

Canada.—The 48-hour week is, by legislation or collective agreement, the rule in mining, on railways, in the public utility services, building, the manufacture of chemicals, tobacco, food-stuffs, paper, textiles, oil, in printing, in shipbuilding, carriage building, and, with minor exceptions, in the metal trades.

India.—The hours question in India is of first rate importance not only by reason of its repercussion on Indian social conditions, but because of the continual discussion, at times somewhat

bitter, between the workers and employers in India and those in her great industrial rival in the East, Japan.

In certain organised industries, including factory industries, mines and plantations, hours are regulated by law. The Factories Act of 1911 (amended 1922, 1923 and 1926) defines a factory as any establishment in which mechanical power is used and where 20 or more persons are employed, and further gives the local Government powers to extend the definition to cover establishments employing more than 10 persons, whether mechanical power is used or not. In 1926, 7,251 establishments, employing over a million and a half of persons, were classed as "factories" in the meaning of these acts.

Following upon the special clause adopted for India in the international convention on hours of labour at Washington in 1919 (a convention which India has ratified) hours in factories are limited to 11 per day and 60 per week for adults, and to 6 per day for children between ages of 12 and 15. These legal maxima, however, are not reached in many cases. In 1926, for instance, 40% of factories employing men and 43% of those employing women worked 54 hours per week or less, and 30% of the establishments employing children worked 30 hours per week or less.

The law provides further for rest periods, and for the weekly rest day. Overtime is not permitted for children and women (except, for the latter, in fish-curing and canning). Nor are children and women (with the same exception) permitted to work at night between 7 P.M. and 5.30 A.M.

Hours in mines are governed by the Mines Act of 1901, amended in 1923. About a quarter of a million workers are covered, including 120,000 underground workers, over thirty thousand of whom are women. Their legal hours are 54 per week underground and 60 on the surface, but as in the case of factories these maxima are not general. On the other hand, the fact that there is no restriction on the *daily* working hours means that at times inordinately long "shifts" are worked. A bill to remedy this, and to check the night work of women in mines is under consideration.

Tea, coffee and rubber plantations employ roughly a million persons, whose hours were, until recently, regulated by the law concerning contracts of labour. Since the abolition of these contracts, the hours have remained approximately the same, namely 9 per day for a 6-day week. But the prevalence of task-work in this industry renders it impossible to give any exact account of the hours actually worked.

There is no general legislation governing hours in transport work, but they appear to be influenced by the hours worked in factories especially in the larger ports, and to follow them fairly closely. In Government service the postal and telegraph workers' hours are regulated in the same manner as those of other lower grade Government employees, and are approximately the same as in factories. With regard to the railways, the Government has expressed its intention of applying the 60-hour week principle to all workers except the running staff.

New Zealand.—By successive Factory Acts, the working hours of men were fixed at 8½ per day and 48 per week, of women and boys at 8½ per day and 45 per week. Awards of the court of arbitration, or collective agreements have reduced these to 8 per day and 48 or less per week, and in many cases (gold-mining, brick-laying, brewing, electricity, furniture, plastering, stone-work, tail-resses, wharf-labourers, etc.) the maximum week is 44 hours. Coal-miners work an 8-hour day ("bank to bank") and an 11-day fortnight. Bootmakers have a 45-hour week, typographers 42.

South Africa.—Legislation here provides for the working hours of *white* employees only. The Mines and Works Act of 1911 lays down the 8 and 48 rule for underground workers in gold mines. The Factory Act of 1918 prescribes limits of 9½ hours daily and 50 weekly for adults, 45 weekly for young persons. As in other countries, agreements with trade unions have modified these hours, and surface workers in gold mines, underground workers in coal and other mines, have secured the 48-hour week. Generally speaking, however, working hours in South Africa are probably longer than in other members of the British empire.

Belgium.—Belgian legislation on working hours is probably the most complete and detailed in existence. The fundamental act

of June 14, 1921 (which in point of fact did little more than give legal sanction to the existing situation) provides for the application of the 8 and 48 rule to practically all industrial and to most commercial undertakings, and by subsequent royal orders it has been even still further extended. The student of these matters will find in the act and orders the best material for the study of the application of the limitation of hours in all exceptional circumstances. Especially noteworthy are the provisions made to ensure that in almost all cases, including continuous processes and seasonal industries, the average hours *over the year* shall not exceed 8 and 48. For example, in the royal order of May 15, 1923, applicable to the automobile and bicycle industries, it is permissible to work 9 hours per day during the busy months from December to March, but only on condition that the daily hours from June to September inclusive are reduced to 7. Similarly (royal order of May 22, 1923) increases are permissible in the hand manufacture of firearms between April 1 and Sept. 30 on condition that an equivalent reduction is made during the rest of the year. Analogous detailed regulation, which in Belgium appears to be more than usually well applied, covers practically every branch of industry.

Czechoslovakia.—An ambitious act established the 8 and 48 rule in this important industrial State very soon after the cessation of the European war. Subsequent experience has shown that some of its provisions were too rigid for certain branches of industry, and more elasticity has been introduced without, however, impairing the rule of an *average* 8 and 48. Practically the whole of industry is covered by the act (Dec. 19, 1918) as well as most branches of commerce and even agriculture. (*See below.*) So far as industry is concerned, the act appears to be well-administered, and permits for overtime are issued only when justification is shown.

France.—The Eight-hour Act of April 23, 1919 laid down that "the effective working time of work people or employees of either sex and of any age shall not exceed 8 hours per day or 48 hours per week, or an equivalent limitation based upon a period of time other than the week, in industrial and commercial establishments or in business premises of any kind connected with them, whatever their nature, whether public or private, secular or religious, even where they are of a technical educational or religious nature." The application of the law was to be by administrative decrees. A considerable number of these, applying the act usually to certain industries, have been issued. The one of Dec. 12, 1919, in reference to the textile industries will serve as a type. It allows the weekly total of 48 hours to be so distributed as to permit of a shorter working day on Saturdays. To achieve this, a maximum of 9 hours per day may be worked. In the bleaching, dyeing and finishing branches of the industry it is possible to distribute the 48 hours over 5 days only, with a maximum of 10 hours per day. The decree goes on to make provision for the extension of hours to make up for lost time due to slackness of trade (for which a maximum of 100 additional hours per year may be worked), for exceptional pressure of work (maximum 150 additional hours), and for the provision of rest periods. All important trades are now covered by similar orders, but a recent tendency to abolish the additional permissible hours must be noted.

Germany.—The legislation of the revolutionary period rapidly established the 8 and 48 rule in most industries and attempted further to limit hours in agriculture. Collective agreements, generally speaking, tended to reduce hours even below the legislative limits. This movement was however checked by the serious economic situation of 1921 onwards, when the workers generally agreed to work longer hours (*Mehrarbeit*) in an attempt to meet reparations payments. The legislation of 1918 became thus for a time non-effective, but a reaction set in a little later, and from 1923 onwards new collective agreements almost invariably went back to the old standards. In 1926 an enquiry showed that less than a half-million of the twelve million workers covered by collective agreements were working longer than a 48-hour week. Since that time the authorities have been preparing new legislation covering not only hours but labour conditions in general. It is understood that the hours provisions were to be drafted

carefully in accord with the Washington 8-hours convention. Hesitation as to what other countries, and particularly Great Britain, intended to do in regard to the ratification of this convention apparently delayed the progress of general legislation, but a number of recent measures have instituted or provided for the institution at an early date of the 8-hours rule fixed by the legislation of 1918 and temporarily abandoned since that date. In the important case of the metallurgical workers, the ordinance of July 16, 1927 led to the threat of a lock-out, but the Government nevertheless persisted in its action, and the whole of the major industries were under the 8 and 48 rule by 1928.

Italy.—The Corporations Law of 1927 under the Fascist régime put an end to the effectiveness of all previously existing law on the question of hours, and led to a revision of collective agreements which were by far the most important regulating instrument. Under the new system the "corporations," which comprise workers and employers, are to conclude agreements covering hours among other conditions of labour. The first of these agreements, applicable to over two hundred thousand metal workers, establishes the 8-hour day.

Japan.—The controversy between the two leading industrial states of the East has been mentioned above, in relation to India. The restriction of hours in Japan virtually begins with the adoption of the Washington convention in 1919, when Japan was given the privilege, if she ratified the convention (which she has not done) of working a 57-hour week (60 hours in the raw silk industry). Since that event Japan has moved rapidly in regard to social legislation, but appears to have followed British practice in dealing first with the conditions of labour of women and children. As to hours, the most important legislation is the act of March 29, 1923, which amends the original Factory Act of 1911. By it the working hours of women and young persons under 16 are limited to 11 daily, though an extension of two hours beyond this maximum is permissible, "according to the nature of the work in each instance." These terribly long hours are roughly equivalent to those obtaining in India. In some other industries, though relatively few, they have been reduced by collective agreements, but the rapid expansion of the trade union movement has as yet hardly touched the factory women, and the agreements do not affect their hours. Statistics of actual hours worked are available in certain cases and for limited areas. See e.g. the *Monthly Report of the Osaka chamber of commerce*, which shows the daily working hours during 1927 to vary from 8 to 12 in that town with an average of about 10.

Netherlands.—Dutch legislation on the question of industrial hours comprises a general act of Nov. 1, 1919, amended in 1920, and a number of special acts dealing with particularly dangerous or unhealthy trades. The general act of 1919 laid down maxima of 8 hours per day and 45 per week. The amending act of 1920 extended these to 8½ and 48 respectively, with detailed exceptions on the usual lines. There is a special system of permissible temporary exceptions to meet cases of exceptional stress of work, recourse to which appears to be diminishing under pressure from the workers' unions. Collective agreements in increasing numbers are more narrowly limiting hours of work than does legislation: certain of them still maintain the 45 hour week. Netherlands statistics on hours of labour, it may be pointed out, are amongst the best and most reliable issued. (See *Statistical Year Book of the Netherlands*.)

Switzerland.—The Federal Act of June 27, 1919 on hours of work in factories still form the basic law. Railway hours are governed by an act of March 6, 1920. The former establishes the 48-hour week for factories, and the latter the average 8-hour day over a period of not more than 14 days. Smaller establishments (employing less than 6 workers, or less than 11 if mechanical power is used) are excluded from the scope of the law, owing chiefly to the difficulty of supervising them, and the building industry generally is also not covered. To some extent the defect in the latter case is made up by collective agreements. An attempt to amend the law on hours of work in the direction of permitting a general extension to a 54-hour week "in times of grave economic crisis," or for individual industries for serious reasons even in the

absence of such a crisis, was heavily defeated at a referendum in 1924. (H. A. Gr.)

The United States.—The legal regulation of the hours of labour, like most other forms of labour legislation in the United States, has been tardy and shows a considerable degree of diversity. This has been due to several, not wholly unrelated, causes: the general spirit of individualism that has prevailed in a newer country; the imperfect organization of the wage-earners themselves, both industrially and politically, and their consequently feeble voice in legislative matters; the Federal form of government with its multiplicity of jurisdictions; State and sectional differences and rivalries and the fear, if labour laws are too advanced, of interstate competition; and, not least of all, written constitutions often strictly interpreted by courts of last resort.

The Federal Government naturally has control over the working conditions of its own employees and of those of contractors doing Government work. An act passed by Congress in 1868 set a standard of eight hours per day for this group, and, by amendments added in 1892, 1912 and 1913, this has gradually been made more effective for both direct and indirect employees of the Government.

Congressional authority over interstate and foreign commerce has also been belatedly extended to the limitation of hours for railroad employees and seamen. By an act passed in 1907 the maximum hours for men operating trains on railroads in the District of Columbia, in the territories or on interstate lines were fixed at 16 per day, with provision for consecutive hours of rest between work-periods; and the hours of telegraphers and train despatchers, whose functions were regarded as still more intimately connected with the public safety, were limited to nine per day in all places kept open day and night. The Adamson Law of 1916, passed to forestall a general strike of the railway brotherhoods, went still further and established eight hours as the standard working-day for the operating force with overtime pay when this number of hours is exceeded. The hours of officers and seamen when their vessels are in port, by acts passed in 1913 and 1915, have been limited to nine. The efforts, however, of Congress to extend Federal authority over labour conditions in manufacturing establishments within the confines of the respective States, either under the power over interstate commerce or under the taxing power, as in the child-labour laws of 1916 and 1920, have been quashed by the Supreme Court; and the child labour amendment to the Constitution, submitted in 1924, has so far made little headway toward approval by the States.

More than half of the States and a large proportion of the municipalities have adopted laws or ordinances fixing the eight-hour day for public work, often with certain exceptions for firemen, policemen and certain workers in public institutions. The States have likewise availed themselves in varying degrees of their unquestioned power to regulate the hours of minors; and, principally within the past 15 years, the eight-hour day and the 48 hour week, usually with a total prohibition upon night work, have been set as the standard for all children under 16 in about three-fourths of the States. The right to limit the hours of women has not been so readily admitted by the courts and has been less fully exercised, although there are now only five States wholly without such laws. The movement for shorter hours for women antedated the Civil War and was taken up again in earnest in the '70s when the Massachusetts ten-hour law was passed. A severe set-back was given in 1895 when the Illinois supreme court decided that an eight-hour law for women in factories was a violation of freedom of contract and hence unconstitutional. But all doubts as to the reasonableness and legitimacy of such measures would seem to have been removed by the favourable decisions of the U.S. Supreme Court in a case involving the Oregon ten-hour law in 1908 and another involving the California eight-hour law in 1915. Some States content themselves with fixing the length of the working-day, while a considerable number also limit the hours per week. Some nine States, together with the District of Columbia and the territory of Porto Rico, several of them admittedly of slight industrial importance, have eight-hour laws for women; and six States, including Massachusetts and New York

of the first industrial rank, require the 48 hour week. The New York law of 1927 is weakened by troublesome exceptions. Fifteen other States provide for a working-day of less than 10 hours, while 18 States in 1926 permitted women to be employed for 10 hours or more per day, North Carolina setting the generous limit of 11 hours per day or 60 per week. More than 12 States forbid night work for women in some occupations, several others place stricter requirements respecting hours upon night work and a few, like Wisconsin, Oregon and Kansas, have delegated this and some other features of labour law to their industrial commissions.

State legislation upon the hours of labour for men, aside from that regulating public employment, already mentioned, is still in a much more dubious constitutional position. Where men, women and children work in the same establishments the adult male contingent has benefited from restrictions upon the hours of the other two parties. More than half of the States place limitations upon the hours of men engaged in transportation, similar to those in the Federal act of 1907 (a 16 hour maximum for the operating force and usually eight hours for telegraphers and train despatchers). The courts have held that where Federal and State regulations come in conflict State legislation must give way. About 12 States also have limited the hours of street-car motormen and conductors (usually to 10 or 12) and fix the maximum time during which these hours shall fall. Next to railroading mining is the industry most often regulated; and some 16 States now have eight-hour laws applying to some or all classes of workers in and about mines and smelters. That of Arizona, a great copper-producing State, is probably the broadest, and that of Pennsylvania, where coal and iron predominate, is probably the narrowest in its scope. Colorado in 1927 followed Arizona and Nevada in extending the eight-hour limit to cement and plaster mills. Beginning with the Utah case in 1898 such laws have been upheld by the Supreme Court because of the dangerous character of the work and because of the inequality of bargaining power between employers and employees. The decision of the Supreme Court in 1917 in a case involving the Oregon ten-hour law also appears to establish the right of State legislatures to restrict in some degree the hours of all workers in factories. But whether judicial leniency would extend to general eight-hour laws is not yet determined.

The principle of one-day-of-rest-in-seven had by 1926 been recognized for one or more industries by six States. The most effective acts are those of Massachusetts (1913), New York (1913) and Wisconsin (1919) and the latter State has since sought to secure greater elasticity by transferring this power to the State industrial commission.

The hours actually worked in American industries vary somewhat less widely than do the laws attempting to regulate them and are commonly fewer than would be permitted by the letter of the law. The relative scarcity of many grades of labour as compared with resources and the demands of industry, especially in periods of prosperity, has made for both shorter hours and higher wages. The Census of Manufactures in 1923 indicated that over 46% of all workers in this group of occupations enjoyed the 48 hour week or better, and this was a slight drop-back from the more prosperous conditions represented by the previous census in 1921. Although neither Alabama nor Iowa has legal restrictions upon the hours of women, the Women's Bureau in 1925 found that only one-sixteenth of the women workers covered in their survey in Iowa were employed as much as ten hours per day, and that Alabama had less than half as many ten-hour women workers as South Carolina with its ten-hour legal limit. The labour laws of North Carolina permit a 60 hour week but a study of the cotton goods manufacturing industry by the Federal Bureau of Labour Statistics in 1926 showed that North Carolina women were actually working only two hours longer per week than the women of Maine under the protection of a 54-hour law.

In well-organized trades, such as printing and publishing, the building industry and men's clothing, the method of collective bargaining rather than resort to legislation has been dependent upon and a majority of the workmen have the 44 hour week—an eight-hour day with Saturday half-holiday. Several of these trades,

notably the painters, the fur workers and others in the clothing trades have already made great progress toward a 40-hour week of five days, and this is now the announced goal of all organized labour. That neither strong organization nor legislation is always necessary to secure shorter hours is proved by the week of approximately 50 hours that generally prevails in the thriving motor industry. Here, also, Mr. Ford in 1926 declared his adherence to the five-day week. In the iron and steel industry, where formerly the 12 hour day and the seven-day week were prevalent, the average full-time hours for all departments in 1926 were 54.4 per week and those in the blast furnace department, which had previously been the worst offender, were 59.8 as compared with 76.9 in 1913. These reductions, made chiefly in 1923, were in part the result of popular pressure and criticism, in part a concession to manifestations of discontent among the workers, and in part due merely to enlightened self-interest. (W. B. Cn.)

II. Working Hours at Sea.—The seafarers' hours are still more difficult to regulate and relatively little national legislation on the question exists.

The vast majority of seamen, including the British, have obtained regulation of hours by means of collective agreements, but in some cases the legislatures have intervened. The most interesting, and probably the most successful interventions, are the acts of Finland (1924), Norway (1919) and Sweden (1919). These divide the personnel of a vessel according to the nature of its work: the engine-room staff is required to do not more than 16 hours work in two consecutive days, whilst the ordinary seaman works not more than 24 hours in the same period. Other arrangements are made for small vessels, for cases where the crew is not divided into watches, for coastal traders and for work whilst in port. These acts seem to have been fairly satisfactory in application, though the seamen concerned demand a reduction of the hours prescribed. A French decree of 1925 extending the application of the 1919 general act to the sea service provides alternative methods: either an 8-hour day may be worked, or a 48-hour week, irregularly divided as regards the daily limit, or an averaging of hours over a month, the 8-hour average being conserved. These hours are subject to exceptions to meet sea emergencies. In Greece, Portugal, Spain and the Argentine legislation prescribes the 8-hour day with varying details of application.

In Great Britain the matter is dealt with solely by collective agreements, which are exceedingly complicated and not universally applicable. They are not so much intended to limit the hours of labour directly as to secure that overtime rates are paid after a daily "normal" has been reached, and thus to penalise employers who exact the longer day. Emergency cases are not usually affected by these overtime pay arrangements. In general, the agreements provide for overtime rates when the working day in port exceeds eight hours, with special arrangements for Saturday (five or six hours) and Sunday (ordinary necessary routine work up to four hours), and for days of arrival and sailing. At sea the ordinary system of watches results in a longer day being worked, except for the categories known as day-workers (*i.e.*, those who normally work only during the day) who have similar hours to those detailed above.

This may be taken as fairly typical of the terms arranged by collective agreement, not only in Great Britain but elsewhere in countries where legislation has not been adopted. The Australian and New Zealand seamen however have secured better terms. By agreement they have a strict 8-hour system which is probably the most favourable to the workers yet obtained anywhere; the question of its consecration in legislation is stated to be under consideration.

III. Working Hours in Commerce.—The regulation of working hours in commerce is less complete and general than in industry. Among European States, however, Austria, Czechoslovakia, Finland, France, Germany, Italy, the Netherlands, Poland, Portugal and Russia have adopted general legislation on hours which covers commercial workers also. In Belgium most classes have been gradually brought under the law. In all the above cases the normal working week is limited to 48 hours,

with the exception of the Netherlands, where the limits are 10 daily and 55 weekly. But it should be noted that whilst 48 hours is the "normal," in almost all cases a great variety of exceptions is permissible and the hours actually worked are certainly longer. In Czechoslovakia complaints have been put forward that the law is not respected. The great difficulty is of course the control of small establishments, including shops. The latter are dealt with in many countries by means of closing regulations—the only method so far employed in Great Britain. The Shops Act of 1912 for example fixes a maximum week of 72 hours for young persons under 18 employed in shops. Similar legislation exists in many States of the United States. As in the case of industry, collective agreements have secured terms in many countries much more favourable than those fixed by legislation.

IV. Working Hours in Agriculture.—In a few countries only are hours of labour in agriculture directly limited by law, and it would appear that in the majority of cases the experiments made have not been particularly successful, at least in the object primarily aimed at. In Czechoslovakia (act of Dec. 19, 1918), for instance, the provisions of the law have been overridden by collective agreements, which permit a day of longer than eight hours, provided that overtime rates of wages are paid for the excess. In this sense the act has been beneficial to the workers. In Germany a scientific attempt has been made to meet the difficulty of the seasons by dividing the year into three periods, during which the normal daily hours vary. The Italian system of collective agreements and the decree of Sept. 10, 1923, which limited hours (in the latter case to 8 per day except during 3 months yearly, when the maximum was 10), have come to an end under the Fascist régime, and new agreements are under negotiation. The Agricultural Wages (Regulation) Act of Aug. 7, 1924, indirectly regulates the hours of agricultural workers in Great Britain, since the district committees set up under the act have the power to fix weekly wage rates, and have usually done so upon a basis of a week of 48 to 52 hours, any hours worked in excess being paid for as overtime, and consequently tending to be reduced to a minimum.

International Action.—The "labour part" of the treaties of peace which followed the World War gave international sanction to a number of "principles," among which was "the adoption of an 8 hours' day or a 48 hours' week as the standard to be aimed at where it had not already been attained." The most important task of the first conference of the International Labour Organization created by this part of the treaty was the application of this principle. In the preparatory work for the conference, which was held at Washington in 1919, of the 35 Governments consulted the great majority indicated their readiness to adopt a convention on the question, and of the States not consulted it was known that Finland, Germany, Austria and Russia had already legislation enforcing the 8-hour day. The evidence therefore tended to the conclusion that the general adoption of a convention on the question was possible, and the Washington Conference proceeded to elaborate such a convention. Its discussions turned for the most part on the exceptional cases which have been treated above.

The draft convention was adopted on Nov. 28, 1919. Since a large number of the industrial States had already adopted, by legal enactment, or otherwise, the 8-hour day, it might have been expected that the ratification of the draft convention would be rapid and practically universal. But this was not the case. For some time, difficulties of procedure delayed progress. An international labour convention was a new diplomatic instrument and the conservatism of certain Foreign Offices, notably Downing Street and the Quai d'Orsay, raised difficulties of procedure which were eventually overcome easily enough, but which delayed ratification of the hours convention until the enthusiasm of post-war public opinion had cooled and the economic slump of 1922 and onwards had set in. Up to that time, the countries which had ratified were not those of the highest industrial importance. The movement however continued under the pressure of trade union action and of the more liberal sections of public opinion, and by May 1928 Belgium, Bulgaria, Chili, Czechoslovakia, Rumania

and India had ratified unconditionally, whilst Austria, France, Italy and Latvia had ratified conditionally upon the ratification of other countries.

This system of conditional ratification, begun by Italy, had resulted in making the attitude of Great Britain the key to the situation. Recognising this and evidently somewhat uneasy in mind, the Government of J. R. MacDonald in 1925 and that of Stanley Baldwin in 1926 convoked meetings of the ministers of labour of Great Britain, Belgium, France and Germany at Berne and again (with the addition of Italy) in London with a view to the examination of matters in the convention alleged to be susceptible of diverse interpretation and, if possible, to the conclusion of an agreement upon them. At Berne no insuperable difficulty appears to have been raised, and the more important meeting in London settled a number of matters considered to be decisive. (See *Times*, March 20, 1926.) This meeting was prepared for by the circulation by the British Government of the points considered to be under doubt, and it appears, from the *Times* report, that the same Government raised further points during the course of the meeting. On all these points but one agreement was unanimous, but on the question as to what was to be understood by the article of the convention which permitted its suspension "in the event of war or other emergency endangering the national safety," the British minister reserved approval pending consultation with his Government. No final decision on this matter has been made public.

The proceedings of the meeting of ministers were private, but it is possible to deduce from the official communication to the press that every minister of labour present had conceded some point in his national legislation or practice to meet the British difficulties, and it might have been considered therefore that the "London agreement" gave the British Government all it wanted in the way of guarantees and that its ratification would follow, and thus bring about the general effective ratification by the European industrial States which the network of conditional ratifications had made to depend upon Great Britain.

Of the States represented at London, Italy had already ratified conditionally. Belgium proceeded at once to unconditional ratification (her existing legislation permitted that course); France ratified in 1927 contingent upon the ratification of Germany and Great Britain. Germany, in course of codifying and amending her labour legislation in general, was adapting her hours legislation to the requirements of the convention, and making reductions in existing working hours where they were not in accord with it. In Great Britain, an amended Factory Act was in preparation, and it was understood that a general bill for the enactment of the 8-hour day was to be introduced. At that stage, however, the employers' organisations undertook a campaign in the public press and elsewhere, the cabinet appears to have been impressed, and neither bill saw the light. Questioned in the House of Commons, the minister of labour and the under-secretary cited as reasons for the inaction of the Government the same objections which had been raised at London in 1926 and which, it was thought, had been overcome, and stated that the question of the revision of the convention would be raised at Geneva.

In effect, one clause of the convention provides that the Governing Body "at least once in ten years . . . shall consider the desirability of placing on the agenda of the conference the question of its revision or modification," and in Feb. 1928 the under-secretary of State, representing Great Britain on the Governing Body, demanded that the latter should take the question of revision into consideration. Accusations of bad faith, under these circumstances, may be mistaken, but are easy to understand. The Governing Body refused to decide at that session; in the May following it rejected the British proposal and decided that the procedure for the revision of conventions should follow its normal course.

Working Hours at Sea.—The Washington draft convention was applicable to "industrial undertakings," and the question of the application of the 8 and 48 rule to maritime and inland navigation was deferred for the consideration of a special meeting of the conference. The principal maritime countries, con-

sulted beforehand, replied unanimously in favour of international regulation of the hours of labour on board ship, but in most cases with considerable caution with regard to the 8 and 48 rule, which is clearly more difficult of application under sea conditions. On the whole, however, the evidence was again in favour of the possibility of the conclusion of a convention upon the subject.

The special meeting of the conference took place at Genoa, June 15–July 10, 1920. The draft prepared by the International Labour Office was referred as at Washington to a special commission, and after being amended was submitted to the full conference, which approved it by a vote of 48 to 25; the two-thirds majority necessary for formal adoption thus was not attained, though by a very narrow margin.

The questions of the hours of labour in the fishing industry and in inland navigation were dealt with separately by the conference. In both cases a recommendation was agreed upon, by the terms of which the States members were urged to adopt legislation limiting in the direction of the 8-hour day and 48-hour week the duration of the labour concerned.

Working Hours in Commerce.—The question of international regulation of the hours of salaried workers in industry and commerce has been raised and was examined by the Governing Body of the International Labour Office in 1928. It has not yet been discussed by the International Labour conference.

Working Hours in Agriculture.—The International Labour conference decided in 1923 that the time was not ripe for the international regulation of hours in agriculture.

BIBLIOGRAPHY.—The texts in English, French and German of most of the acts cited above, and in general of acts relating to hours of labour, are published by the International Labour Office in its *Legislative Series*. Monographs on the hours situation in a number of important countries have been issued from the same source. For the general situation in regard to the Convention of Washington, see the directors' *Reports* to the successive sessions of the International Labour conference since 1919.

(H. A. GR.)

HOUSE, EDWARD MANDELL (1858–), American statesman and diplomat, was born at Houston, Tex., July 26, 1858, the seventh son of Thomas William House and Mary Elizabeth Shearn. His father, who had left England as a boy, came to Texas when it formed part of Mexico, joined the revolution, helped to free it and bring it into the Union. The younger House was educated at the Hopkins grammar school and Cornell university, and returned to Texas in 1880, where he lived for more than 30 years as planter. His chief interest, however, was public affairs. He took an influential part in the successful campaigns of Governors Hogg, Culberson, Sayers and Lanham, and during the period 1894–1904 his political influence in Texas was regarded as decisive.

He refused invariably to become a candidate for office himself, but acted as the intimate adviser of the several governors named. Although frequently urged to participate in national politics he remained aloof from the disastrous Democratic campaigns that followed the Bryan candidacy of 1896; but in 1912 he played a major rôle in securing the nomination of Woodrow Wilson, and at the time of the election Wilson had come to put full trust in him, offering him a choice of cabinet positions. Following his custom, House refused any office, but politically as well as personally he remained closer to the President than any member of the official family. It was upon his recommendation that Wilson chose a number of his cabinet; after the inauguration both President and cabinet utilized his wide knowledge of men and his shrewd estimate of political effects to help them in meeting legislative and administrative problems; he exercised a great influence in the framing of the Federal Reserve Act and also played an important part in the organization of the original Federal Reserve Board. Wilson spoke of him as his "independent self."

House's chief interest lay in foreign affairs, and through close contact with American ambassadors abroad and his intimacy with European statesmen, as well as the confidence of the President, he was able to influence the course of American foreign policy. In 1913 he helped to tide over the crisis in relations with Great Britain over the Panama tolls exemption until Wilson secured

the repeal of the exemption. In 1914 he undertook informal negotiations with the diplomatic representatives of Argentina, Brazil and Chile, which led to the drafting of a pan-American pact designed to guarantee peace in the Western Hemisphere. In the spring of 1914, House, apprehensive lest war should break out in Europe, sailed for Germany to offer the assistance of the United States in reaching some arrangement between England and Germany which might avoid war. He talked with high officials of the civil Government, the army and navy, and had a conference with the Kaiser, in which he received some encouragement. William II. later said:—"The visit of Colonel House to Berlin and London in the spring of 1914 almost prevented the World War." At London he found Sir Edward Grey ready to entertain any feasible plan to preserve peace. This, House wrote to the Kaiser on July 7, 1914. The murder of the Archduke Francis Ferdinand, however, precipitated war before the plan could be developed.

Returning to the United States, House maintained close intimacy with the British and German ambassadors and thus helped to smooth American relations with the belligerents. In Jan. 1915 Wilson sent him abroad to study the possibility of American mediation. He suggested the principle of the "Freedom of the Seas," after visits to London, Berlin and Paris, as a possible step towards a compromise; but the sinking of the "Lusitania" ruined all chances of success. In the autumn, House proposed that Wilson suggest to the Allies that a peace conference should be summoned; if Germany refused the conference or rejected terms calculated to ensure a just settlement, the United States would enter the war on the side of the Allies to enforce such terms. House left for Europe again in Dec. 1915, visited England, Germany and France, and finally made the aforesaid offer to the British, the substance of which was incorporated in a memorandum drafted by Grey and himself. The Allies, however, refused to take advantage of it.

In the summer and autumn of 1916 House took an influential part in the campaign which led to Wilson's re-election. After the United States entered the war, he kept in close touch with the chiefs of the war-making agencies, and was in consultation with the special envoys of the Allies: Balfour, Northcliffe, Tardieu, Reading. In the autumn of 1917 Wilson named him chief of the special American mission designed to co-ordinate Allied war needs, especially the problems of finance, supply, tonnage and man-power. The conferences in London and Paris which he attended proved to be the turn of the tide. After his return he was intimately concerned in Wilson's drafting of the Fourteen Points, and at the request of the President he drafted a tentative covenant for a League of Nations, which formed the basis of Wilson's later plan. In Oct. 1918 Wilson sent him to Paris to represent the United States at the Allied Council, which granted an armistice to Germany.

After some difficulty, House succeeded in pledging the Allies to Wilson's Fourteen Points as a programme for peace. He had previously organized "the Inquiry," a body of experts for collecting authentic data for the use of the Peace Conference. House was one of the U.S. peace commissioners signing the Treaty of Versailles, and although ill at the opening of the conference he played an important rôle by reason of his intimacy with European statesmen. He was a member of the commission that drafted the League of Nations' Covenant, and ultimately most of the details connected with the formation of the League were settled with his co-operation. In July and Aug. 1919 he represented the United States in the organization of the Mandates system. After his return to the United States he urged President Wilson, by letter, to compromise with the Senate so as to secure ratification of the Versailles Treaty and the entrance of the United States into the League. A serious illness, coming at the same time as the physical breakdown of Wilson, combined with other factors to interrupt the close relations between the two men which had persisted since 1911.

Col. House had won a reputation for such sagacity and disinterestedness that his advice was continually sought by political leaders even after the overthrow of the Democratic Party in

1920. He continued his interest in international questions and maintained close relations with the chief statesmen of Europe.

In 1912 House published, anonymously, a political romance, *Philip Dru*; in 1921 he edited (with Charles Seymour) *What Really Happened at Paris*, a series of essays on the Peace Conference written by members of the American Delegation. He also wrote, after 1920, a number of articles upon contemporary politics and political leaders for *The Philadelphia Public Ledger*, *Foreign Affairs*, *Harper's* and *The Encyclopædia Britannica*.

BIBLIOGRAPHY.—*The Real Colonel House*, by A. D. Howden Smith (1918), a brief but accurate biography covering House's career to 1918; *The Intimate Papers of Colonel House*, arranged as a narrative by Charles Seymour (Boston, 1926-28). (C. SEY.)

HOUSE, HOMER DOLIVER (1878-), American botanist, was born at Oneida, N.Y., on July 21, 1878. He graduated at Syracuse university in 1902 and pursued further study at Columbia university from which in 1908 he received the degree of doctor of philosophy. He was professor of botany and bacteriology at Clemson Agricultural college (S.C.) 1906-07, and associate director and dendrologist of the Biltmore Forest school in 1908-13. In 1913 he became assistant State botanist and in 1914 State botanist of New York. Besides numerous papers, chiefly on systematic botany, oecology and dendrology, his writings include *Wild Flowers of New York* (1918) illustrated with colour plates and *Annotated List of the Ferns and Flowering Plants of New York State* (1924), a valuable floral catalogue.

HOUSE, originally any structure built for human habitation; by extension the word is used at the present time in a much wider sense, as of a building which is the centre of activity of an organization (e.g., houses of parliament). Thus in certain universities, schools and colleges, dormitories are sometimes known as houses; and the term house mother or house doctor is used of the matron or physician of any group of people resident together. Owing to the close association, in feudal times, of a family with its place of residence or fief, the word house is frequently used of a family (e.g., house of Habsburg), and by a still further transference, of any group of people gathered together for any specific purpose (e.g., a theatre audience).

Prehistoric Dwellings.—The origins of the house as a human habitation can only be surmised. It is obvious that Stone age man, at least in the temperate climates, dwelt frequently in natural caves, and even at this early time, made distinct attempts to decorate his residence as the cave paintings along the Garonne in France and some in northern Spain prove. There are evidences, also, that forest dwelling tribes and those in tropical countries early developed some sort of hut construction, probably by planting sticks in the ground, in a circle, binding their tops together to form a cone, and covering the framework with thatch or leaves. Such primitive constructions are still used in many parts of the world, as in Central Africa; the wigwam type, common to many American Indian tribes, in which the covering was of skins rather than brush or leaves, or the dome shaped huts of the Indians of Tierra del Fuego preserve the same forms.

At some ancient time the primitive cave dweller discovered that his cave could be enlarged and strengthened by constructing in front of it a wall of piled rocks, and roofing the space between the cave and the wall with logs or skins. Growing skill in this type of construction led to the development of such elaborate cave dwellings as those found on certain river banks in the south-west of the United States, whose date is unknown, but which are obviously far earlier than the pueblo culture. Viollet-le-Duc (*Histoire de l'habitation humaine*, 1875) hypothesized similar combinations of cave and masonry dwellings as one of the universal primitive forms of Aryan houses. Thus the hut is the parent form of all timber houses, and the cave dwelling of those of masonry. Most of these houses were of one room, but with the development of a more complex civilization, sub-division became necessary and the plan was articulated. At first this seems to have been accomplished by merely combining several hut units within a single enclosure. Many remains of floors and foundations of such groups of round huts, probably of straw in some cases and of unbaked brick in others, dating from the Neolithic age, have

been found throughout the Aegean world. Later, elliptical forms with sub-dividing partitions appeared, like that at Chamaizi in Crete, of about 2000 B.C., and the so-called *tholos* of the lowest stratum at Tiryns, perhaps even earlier. It is noteworthy that the richest tombs of the Mycenaean culture were of the *tholos*, or beehive type, and there is a universal tendency to make house forms follow contemporary or earlier culture.

Another form of development characterizes late Stone and Bronze age villages of northern and Central Europe, the so-called lake dwelling in which many rectangular houses, some of two or more rooms, were built upon a pile-supported platform over a lake. Modern examples of precisely similar types occur along many of the rivers in Siam, Cambodia and the neighbouring countries. In European lake dwellings, not only does primitive frame construction, a development of the hut type, appear, but also the use of crossed logs overlapping at the corners—the typical log cabin construction.

Egypt and Western Asia.—In the much more civilized culture in the vicinity of the Aegean two types of house plan made their appearance. The first is the block house, with all of the rooms under one roof and in a compact block; the second is the house with a court, in which the rooms open on to a court with or without a colonnade or open corridor. Egyptian models of houses dating back to the early empire show both types, but in Egypt the court type seems never to have been developed as it was in Europe and China, and the court appears most frequently as a garden or stable yard enclosed by walls on two or more sides, with the house proper often forming an L-shaped mass on the other two sides. Outside stairs to a flat roof are frequently shown in these models, and it is probable that houses of two or more storeys were common in the cities. Excavations of various town sites in Egypt, particularly in the Fayoum, have proved the accuracy of these models, and are continually revealing new details. The larger houses of the country-dwelling aristocracy are shown in many tomb paintings which reveal a general type in which a central residential block, with or without a colonnaded court, is surrounded by a formal garden, around whose enclosing walls are built the stables and storehouses. There is much use of large windows, columns, awnings and a great luxuriance of decoration; the construction seems to have been largely of clay or unbaked brick reinforced with a framework of timber or reeds.

In the Aegean culture, both court houses and those in a single block are found. The great palaces of Cnossus, Phaistos (both c. 2000-1500 B.C.), like the more highly developed and architectural palace at Tiryns (c. 1200 B.C.) all have a court as their most important feature, but the plan of the town of Gournia shows simply a maze of crowded, close built rooms. Moreover, many paintings and terra cotta plaques show Cretan houses as cubicle blocks, often in two storeys, with flat roofs and many windows.

The early Mesopotamian house, which remained fairly constant in form over at least 2,000 years, and probably more, throughout the Chaldean and Assyrian periods, was of three types. The first, represented frequently in Assyrian bas-reliefs, is a development of the conical hut, constructed, apparently, in unbaked brick, and consists of a tall, narrow, dome form, sometimes set on a small square base. The second, also known from the reliefs, was probably the country residence of the well-to-do and is shown as a rectangular building or group of buildings with flat roofs, battlemented parapets, arched doorways and many long, low windows close to the roof, sub-divided by colonnettes. The third type, the city house, consisted of an assemblage of long, narrow rooms, with walls of immense thickness arranged around one or more courts. Some of these rooms may have been barrel vaulted in brick. Architectural decoration is of the simplest. What richness they possessed must have been produced by a lavish use of textiles.

The most complete idea of early Semitic houses is given in the description of Solomon's palace in the Bible (I. Kings, vii.). Timber was much used. Flat roofs were universal, and in the larger chambers they were supported by rows of wooden columns. Decoration was by means of *repoussé* metal work applied to the wooden surfaces.

PRIMITIVE TYPES OF DWELLINGS ARE ILLUSTRATED IN THE AMERICAN INDIAN HUTS AND CONICAL TEPEES; THE DEVELOPMENT OF THE HOUSE WITH A COURT, IN THE SERIES STARTING WITH THE EGYPTIAN, EMBRACING THE GREEK AND ROMAN TYPES, AND SUCH A MONUMENTAL GOTHIC STRUCTURE AS THE HOUSE OF JACQUES COEUR. THE ROMAN APARTMENT HOUSE IS STRANGELY MODERN IN APPEARANCE; THE SIMPLE MEDIAEVAL EXAMPLES STARTED A TRADITION THAT IS STILL ALIVE

Classical.—In both classic Greece and Rome, the court type of house, that had appeared in Assyria, was brought to its highest point of development. Extensive remains of Greek houses have been investigated, especially at the Peiraeus, Priene and Delos. In almost all of these the house consisted of a group of rooms around a central colonnaded court or peristyle. In some there is indication of the existence of an upper storey. In the larger houses there was frequently a gallery across the front. There are only few evidences of the division between the *andron* and the *gynaecium*, the men's and women's quarters; either the women's apartments were on the second floor, or else the division was only architecturally expressed in the largest houses through the existence of two or more courts. The most important position, at the end of the court opposite the entrance, was reserved for the reception room and the chief bedroom or the *thalamos*, the official centre of the house life. The remains of a large house of late Greek date exist at Palatitza in Macedonia. Here, not only were there multiple courts, but also long wings, or ranges of rooms, with colonnades along the front.

In the Roman house the court idea was superimposed upon an earlier tradition of a single room dwelling with a hole in the centre of the roof for the emission of smoke—the primitive atrium (*q.v.*). Prehistoric cinerary urns in the shape of these early houses have been found in various places in Italy, particularly in the Alban hills. In the historic period, the atrium had already become primarily a court, with the living rooms around it, and the excavations at Pompeii have proved that by the 2nd century B.C., at least in southern Italy, the typical Roman house comprised a colonnaded court as well. In the imperial period, the atrium, with its surrounding rooms, was reserved for business and official functions. Family life centred in the peristyle. Apart from detail, the general appearance of the large Roman house of the imperial era is almost perfectly reproduced in many of the cities of northern and central China to-day. Indeed, so close is this resemblance that Münsterburg (*Chinesische Kunstgeschichte*) claims the presence of definite classical influence.

Variant types of Roman houses were the great country houses or villas, so well described in the famous letters of Pliny the Younger concerning his villas at Tusculum and Laurentium, of which many restorations have been brought together by H. Tanzer (*The Villas of Pliny the Younger*, 1924). Remains of such buildings are found frequently throughout the Roman empire. Another type is the farm-house, such as that discovered at Boscoreale, in which barns, oil and wine presses, storage rooms and the house proper were in one building around one main court. A vast provincial farm establishment in N. Africa, that of the Laberii at Uthina (dating from various periods from the 1st to the 4th centuries) shows a palatial central residence with many wings to take advantage of the view and prevailing winds, and separate small buildings for the farm. Another variant form was the great apartment house of several storeys which was the usual residence of the poorer free classes, not only in Rome, but in many of the more crowded centres. Indications on the marble plan of Rome which was prepared under Septimius Severus suggest that these structures frequently surrounded a court in which was placed the stair tower that gave communication to the various storeys. The fronts of these buildings were surprisingly modern in appearance; usually there were shops on the ground floor and rows of simple windows, often with projecting balconies above. The whole was usually faced with brick, unstuccoed, with the mouldings, etc., worked on the face of the brick itself. Recent excavations at Ostia have at last rendered possible definitive restorations (see G. Mars, ed., *Brick Work in Italy*, 1925).

Roman tradition continued unbroken through the Gallo-Roman time up to the Merovingian empire, and at Martres-Tolosanes, in south France, remains of large villas of this date, similar to those of Roman times, have been studied. Other interesting provincial derivations from the Roman stem are seen in the stone houses of Syria, vast numbers of which exist, dating from the 3rd to the 7th centuries, when the villages and towns seem to have been suddenly abandoned at the time of the Mohammedan conquest. These Syrian houses are sometimes roofed in stone and all of

them are remarkable in the extent to which stone is used, not only for walls, but for doors, railings, screens, etc. There is generally an enclosing wall around a forecourt, with the house in a block at the rear, fronted with a colonnaded gallery.

Mediaeval.—In Europe the growth of towns and villages during the 11th and 12th centuries produced a new development of house planning. Country house design, on the other hand, outside of feudal castles and manors (see CASTLE), remained almost stagnant; as far as is known the serfs' dwellings were mere huts with low walls, perhaps of masonry, or banked with earth and sods, and the roughest kind of thatched roofs. This type, evidently once common, persisted into the 19th century in the huts of transient workers like charcoal burners or bark peelers in England, and the sod house or dug-out of the western plains of America. By the 13th century this condition was beginning to change, at least in France, and the hut was replaced by stone farmhouses and cottages, often divided into two or more rooms, with chimneys and fire-places and roofs sometimes of slate and sometimes of thatch. The further feudalism retreated the more the country house developed, and by the late Gothic period, all over north Europe, the wealthier peasants lived in highly developed farms, usually taking the form of a rectangular enclosure, entered by a gateway and bordered by barns, storage sheds and the house proper which was often in two storeys and well finished with windows and chimneys. In France such buildings were usually of stone, but in Switzerland, Germany and Scandinavia wood was the common material, either in half-timber (*q.v.*) or in "log cabin" or chalet (*q.v.*) construction. In towns the smallness of the lots forced an early development of compact planning in several storeys. Existing houses of the 12th century in Cluny show the scheme. Each floor is divided into two rooms separated by a light court and connected by a gallery. On the first floor was a shop with the kitchen behind, and stairs leading directly to the living quarters above. On the next floor was the main living room, with sleeping quarters behind, and above this, attics, under the roof. Usually there was a well in the courtyard and toilet accommodations are frequently found. In general standard of comfort, these houses of the 12th and early 13th centuries compare well with any built during the next 500 years, and it is noteworthy that the development during the 13th, 14th and 15th centuries was merely one of increased size and greater elaboration of the façade. Examples of such houses with masonry fronts exist in France in many of the fortified towns of Gascony, such as the Bastide at Mon Pazier, and at Amiens, S. Antonin, Avalon, Provins; and in England at Lincoln, the rectory at West Dean in Sussex and elsewhere. Especially noteworthy are the Musicians' House at Rheims (c. 1240), famous for its niched statues of musicians and the simple elegance of the treatment throughout, with tall, mullioned windows and an arcaded cornice, and the 12th century Jews' House at Lincoln with delicate Norman detail.

In Italy, where cities were more highly developed, town houses were even further advanced, and it was during this period that the typical north Italian city palace, built around an arcaded court, with enormously high storeys, and many small coupled windows, and frequently with a projecting battlemented parapet, took form. The special conditions of Venice produced there a more open type of design, with a great use of long ranges of windows under Gothic tracery, rich projecting balconies and walls sheathed in coloured marbles. These, like the French houses, were often long and narrow in plan, but one or two rooms deep, with a court at the back. In all Italian examples, and in most of those in France, the main living floor was one storey above the entrance and the ground floor was reserved for shops and service rooms. In north Europe, in the 14th and 15th centuries, more and more houses, both city and country, were being built of half timber (*q.v.*), so that although stone or brick seemed to predominate in the 13th century town it was half timber which predominated in the 15th century town, as may be seen to this day in portions of Rouen, Beauvais, Strasbourg, Hildesheim and Chester. The same period, moreover, saw the origin of the great burgher or wealthy free peasant's house, and the development of types for the nobility which were no longer mere castles or

DEVELOPMENT OF HOUSE DESIGN

NOTE: THE CAPTIONS HAVE BEEN ARRANGED IN THEIR HISTORICAL SEQUENCE

1. A model of the House of the Tragic Poet, Pompeii, restored; a medium sized Roman house of the early 1st century. The upper view shows the entrance corridor at the left; then the simple, high, two-storeyed atrium; then the reception room, or tablinum; and lastly, at the right, the garden in the private court with colonnade on three sides, and a little niche fountain. Model in the Naples Museum. 6. The so-called Jew's House, Lincoln, England; a wealthy man's town house of the 12th century, late Norman Romanesque. The house as shown is much altered; the shop fronts are comparatively modern, and the windows are new. The left window on the upper floor shows the original window scheme—two small lights divided by a colonnette, under one large richly moulded arch. 3. The Palazzo Cavalli (Franchetti), Venice. Venetian freedom from civil disturbances during the late middle ages is reflected in the open and lavish exteriors of the great Gothic palaces, of which the 15th century Palazzo Cavalli is representative. The chief feature is usually, as here, the decorative enrichment of the large windows of the important central rooms.

5. A characteristic farm house in Normandy. Half-timber work, with the posts, beams and braces exposed, and the spaces between filled with bricks or stucco, was a frequent material for these houses, particularly in Germany, northern France, and England, in the 15th and 16th centuries. 4. Azay-le-Rideau, near Tours, France. This exquisite little château is but one of many built in the reign of Francis I. (1515–47) which show the gradual transition from fortified castle to rich country mansion, and from Gothic to Renaissance. Here moat, machicolations, battlement-like windows and general scheme are traditionally mediaeval in spirit, but large windows and Renaissance detail show alike a new sense of security and the court's love of classic forms. 2. Villa Rotonda, near Vicenza, Italy. The developed classicism of the later 16th century is well expressed in the palaces and large country houses or villas designed by Andrea Palladio (1518–80) in and near Vicenza. The Villa Rotonda designed by him and completed by V. Scamozzi (1552–1616) is characteristic. Perfection of proportion and unwonted delicacy of detail distinguish its austere form

EUROPEAN AND AMERICAN HOUSES

NOTE: THE CAPTIONS ARE ARRANGED IN THEIR HISTORICAL SEQUENCE

1. Hôtel de Bourgtheroulde, Rouen, France; a flamboyant Gothic town house, late 15th and early 16th c. 2. Chantrey House; Castle Donington, England. Gabled composition and half-timbered work characterized English town and village houses of the 16th c. 3. Great Maytham, Kent, Sir Edwin Lutyens, architect; a modern re-creation of a large Georgian manor house. 4. Compton Wynates (c. 1520), a larger manor house of Tudor England.

5. A house in Ruhpolding, Bavaria. Spreading low-pitched roofs and balconies are found in many country houses of the last three centuries in Switzerland and southern Germany. 6. The Cabot-Endicott-Low House, Salem, Mass., an 18th century American example of an English and colonial type; the gambrel roof is characteristically American

châteaux, but like the English manor houses, designed primarily for comfort. Of the important town houses, two still exist in perfect preservation, that now used as the Cluny museum at Paris (1485-90), and the house of Jacques Coeur at Bourges (c. 1450). In both of these there is to be observed a growing subdivision of the areas to give greater privacy and to separate the various functions of eating, sleeping and the social life. The planning is still, however, embryonic, with no grasp of corridor circulation and many stairs.

The same sub-division and the same struggle for convenience and privacy characterizes the entire history of the English house from 1400 to 1700. At first merely a great hall (*q.v.*) with service rooms at one end and private rooms at the other, the house rapidly developed into a plan which in all main respects is modern, with parlours, dining rooms, sleeping rooms, etc., all carefully differentiated. The beautiful manor of Compton Winyates (c. 1520) shows the type; Kirby hall, by John Thorpe (begun 1570), and Hardwick hall, Derbyshire (early 17th century, John Smithson architect), show the complexity and growing symmetry of the English plan as well as the introduction of Renaissance ideas, and Speke hall, near Liverpool (17th century), shows the similar type treated in half timber. In all of these, lavishness of interior finish, by means of plaster and wood panelling, is a noteworthy feature.

The Renaissance.—The Renaissance house throughout Europe was a compromise between two conflicting influences; the traditional development of convenient plan ideas and the desire for classic symmetry. In Italy, where the mediaeval large house had always been designed on monumental lines, the conflict was not strong, but in north Europe late Gothic plans were definitely asymmetrical, and the conflict was bound to lead to compromise. The best of the compromises was that achieved by the English during the late 17th and 18th centuries under the influence of Inigo Jones and his followers. In France, through the craze for classicism and the influence of the court, convenience markedly suffered, so that there the average large 14th or 15th century house had infinitely more real comfort than that of the 17th or 18th century. There was, however, a corresponding gain in elegance, and individual staircases, rooms, etc., reached a standard of excellence of design, charm of detail and beauty of execution which has seldom been equalled. There was also an enormous ingenuity in planning, a growing elimination of waste space and a remarkable integration of interior arrangement and exterior effect. The greater number of these large houses, or *hôtels*, which give the character to so many French towns, were built between the street and a large garden, with an impressive gateway leading to a courtyard and the house rooms beyond. The Hôtel d'Amelot, in Paris, by Boffrand and the Hôtel Lambert, Paris, by Levau (1640), are examples of the typical "Louis" house. The finest of the interiors, outside the royal palaces, are those of the Hôtel Soubise (early 18th century) and the Hôtel de Sévigné (c. 1660), now respectively the National Archives and the Carnavalet museum, both in Paris.

Meanwhile, in America, different conditions were developing from English precedent a slightly different type of house, more compact, and usually less monumental. In the north, the house of a single block, with two or four rooms to the floor and a central chimney (e.g., Capen house, Topsfield, Mass., 1693), or the larger houses with end chimneys (e.g., Warner house, Portsmouth, N.H., c. 1720) became the accepted type. In the south, where social conditions were more like those in England, the houses more closely resembled those of the mother country. Thus Mt. Airy, Va. (1758), of cut stone, and Westover, Va. (c. 1730), could be almost duplicated in many English counties, and Washington's home at Mt. Vernon, Va., with its multitude of service out-buildings, slave quarters, etc., is but a version in wood of a common English type. Close contact with France during and after the American Revolution, French architects working in America (e.g., l'Enfant), and the fact that many early American architects travelled widely in France (e.g., Bulfinch), led to the development in America of the French monumental house plan, as in Woodlands, Philadelphia (remodelled 1788), and the Gore house, Waltham, Mass. (1799-1804, possibly by Bulfinch).

Modern.—The industrial revolution produced a synchronous

revolution in house design all over the western world, especially in towns and cities. The influences at work were confused—increased land values, due to sudden city growth, congestion of population and a generally rising standard of comfort, with the additional facilities provided by the coincident development of plumbing, lighting systems, etc. Up to the middle years of the 19th century the house of western civilization had been but a development in a direct line going back to the 12th century. Since the industrial revolution ideals and aims have been totally different (*see* SOCIAL ARCHITECTURE). In general, the area for each family has diminished, while the number and differentiation of rooms has increased. An inevitable result has been the complete alteration of the appearance of modern cities as apartment or tenement dwellings have, to a large extent, replaced the individual house. Equally significant is the development in the outskirts of all great industrial and commercial centres of suburbs characterized by the crowding together of small individual houses on small lots.

In the design of these houses (*see* HOUSE PLANNING) as well as in the industrial housing surrounding many factories, and in the larger country houses of the more well-to-do, there has been a general advance. Waste spaces have been reduced and the problem of furnishing adequate communication, and at the same time preserving privacy, has been to a great extent solved. Moreover, the service arrangements have been simplified and perfected so that every possible waste of time may be avoided in serving meals or caring for the house. The lack of an inhibiting tradition in much of America has remarkably aided this development and, more and more, such originally American ideas as a multiplicity of bath rooms, the use of a central heating system, and the evolution of space-saving kitchens and kitchenettes are appearing in the newer houses, not only of England, but of the entire continent of Europe. No such development or standardization of architectural treatment has occurred. A chaos of varying styles is evidenced in contemporary American building; colonial, "English," "Italian" and modernist houses stand on the same street. In England, the stronger traditionalism characterizes the greater number of modern houses, with Georgian or Tudor forms predominating, but both frequently coloured by a modern style freedom. On the continent of Europe, generally, the present (1928) tendency seems to be almost universally towards the most radical and modernistic treatment, with cubicle directness and simplicity replacing any search for a more esoteric or sentimental beauty. In apartment house design (*see* SOCIAL ARCHITECTURE) the stringent limiting conditions have exerted a controlling influence that is more and more producing a similarity of type, whatever the architectural style.

In areas not deeply affected by the industrial revolution, as in most of the Mohammedan world (*see* MOHAMMEDAN ARCHITECTURE), and in Asia generally, house design carries on traditions frequently centuries old. Thus the modern Moroccan house, with its colonnaded court and flat roof, is a direct descendant of the court type of ancient Rome and Syria. Even the separation of the house into a public and private portion, or harem, bears a similarity to the old double centre in the atrium and peristyle of Rome. In Egypt and Turkey, however, the court type has largely gone out of existence, and has been replaced by the single block type of house, frequently with a large central hall, often containing a fountain which recalls the use of water in ancient courts. In Japan, also (*see* JAPANESE ARCHITECTURE), the single block type of house is found to be universal; the house is usually a long and rambling structure, tile-roofed, sometimes in several storeys. The sliding interior partitions, the matting floors, and the exquisite use of wood make interiors of delicate and sophisticated charm. In China, on the other hand (*see* CHINESE ARCHITECTURE), the court type is the rule where European influence has not modified native ways. The use of colonnaded galleries and large symmetrical halls often gives a markedly classic appearance. *See also* ARCHITECTURE, ATRIUM, HALL, HOUSE PLANNING, PERISTYLE, SOCIAL ARCHITECTURE, and the various articles on the history of architecture, described under the heading ARCHITECTURAL ARTICLES.

HOUSE BOAT. In its simplest form a house boat consists of a cabin of one or two rooms built on a flat bottom scow, drawing only from 12 to 24 in. of water, and usually with a platform or porch at either end. In the East wherever water is found the house boat is an established institution as the residence for a number of inhabitants, owing to overcrowding. In the West such boats are found in great numbers on small rivers or streams especially where there is good fishing and shooting, on the shallow waters of inland lakes and on the numerous harbours along the coasts. When used as summer homes, house boats have been developed into quite elaborate craft, having four or more rooms, with a broad porch or veranda on top protected by awnings, the hull construction still retaining the characteristics of a flat bottomed scow, having great stability. In this form the boats have no motive power and have to be towed from place to place when it is desired to change their position. With the introduction of the internal combustion engine, power house boats have been developed and have become very popular by reason of the facts that they can be moved from place to place easily and combine the roominess and comfort of the house boat with the convenience of the power cruiser. They are for the most part screw driven, and range in length from 45 to 100 ft. or over. Being of shallow draft the living quarters are in the superstructure, with large windows giving plenty of light and ventilation, and they have broad decks, making ideal summer homes. In the United States many of these power house boats are used in northern waters during the summer months and taken South under their own power, to be used in Florida or along the Gulf coast during the winter months.

(H. L. Sr.)

HOUSE-FLY (*Musca domestica*), a two-winged insect belonging to the family *Muscidae* of the order *Diptera* (*q.v.*), common in dwellings and practically cosmopolitan, being found wherever man has established himself. It is most abundant during the hotter parts of the year, and in Europe and North America attains its greatest numbers from July to September. Its chief breeding place is in accumulations of horse manure, but it also utilizes various kinds of fermenting animal and vegetable matter, including the contents of ash bins, etc., where the eggs are laid and the larval life is passed. A single female usually lays 600-1,000 eggs in her life-time, but higher numbers are known. The cycle, from egg to fly, varies in different parts of the world with temperature and other factors. Under favourable conditions it may only occupy 10 or 12 days, and there is opportunity for a number of successive generations in a season. During the winter house-flies disappear: a few, however, maintain themselves in warm buildings, and perhaps continue to reproduce, but further information is needed on this point. The house-fly has an important bearing upon human welfare since it acts as a carrier of the germs of summer diarrhoea, typhoid and other diseases; consequently its suppression is of great significance in public health. The omnivorous nature of its diet contributes to its efficacy as a germ-carrier. The treatment or abolition of all material wherein it can breed and the destruction of the flies by adhesive fly-papers, poison baits or other means is very important.

See C. G. Hewitt, *The House-fly* (1914); also W. B. Herms, *Medical and Veterinary Entomology* (1923).

(A. D. I.)

HOUSEHOLD, THE ROYAL, or CURIA REGIS (king's court), was the source of most English offices of State, for the early kings, like their continental neighbours, did not discriminate between public and private business, but used the same means to rule both home and kingdom. Their household system, on which the households of their greater subjects were modelled, was no insular invention. It showed traces of Carolingian, papal and imperial influence. The king's *familiares*, members of his household, were by turns domestic servants and ministers of State with advisory, secretarial, financial, judicial and military functions. The first extant list of them, with their wages and perquisites, occurs in the *Constitutio domus regis* (1135). The chief dignitaries were the chancellor, master of the scriptorium, chaplain, master dispenser, stewards, chief butler, master chamberlain, treasurer, tallycutter, constables and master marshal. In addition to the menials of pantry, buttery, spicery, kitchen, larder and mews, there were intermediate clerks, chamberlains, stewards, marshals, serjeants, ushers, huntsmen, archers and watchmen. While the demands of the State were light a simple organization sufficed, but when they grew heavier some division of labour was imperative. From the king's chamber (*q.v.*) in the 12th century there sprang the Exchequer (*q.v.*) to deal with public finance. Between the 12th and the 15th centuries the chancery, wardrobes, king's council and parliament, king's bench and common bench, king's chamber as the privy purse, privy seal, signet and secretary (*q.v.*) similarly differentiated themselves. Yet the separation of departments was rarely absolute, and there was constant overlapping of national and domestic offices. During the 15th century the household, no longer a *camera clericorum* (chamber of clerks) or a training ground for the civil service, but superseded by its greater offspring, relapsed into its primitive condition, content to busy itself with the sovereign's domestic welfare only. In addition to the *Constitutio domus regis*, regulations for the better direction, economy and security of the household have been passed periodically since at least 1279. Besides being the mainspring of government, the royal household, in the middle ages, was the king's most effective weapon against aristocratic and popular opposition, largely because wardrobe and chamber had the use of the king's small seals (*q.v.*). The royal household of to-day is a modification of its mediaeval prototype, for even Burke's act of 1782 did not destroy continuity. Two of the three chief departments, the lord chamberlain's and the lord steward's, are direct links with the past, while the third, that of the master of the horse, can claim importance from Tudor days and descent from a mediaeval minor office.

See Society of Antiquaries, *Collection of Ordinances and Regulations made for the Government of the Royal Household from Edward III. to William and Mary* (1790); W. Stubbs, *Constitutional History of England* (1873); H. Hall, *Red Book of the Exchequer*, iii. (1896); L. M. Larson, *King's Household in England before the Norman Conquest* (1904); T. F. Tout, *Place of the reign of Edward II. in English History* (1914, bibl.), *The English Civil Service in the Fourteenth Century* (1916), *Chapters in the Administrative History of Mediaeval England* (1920, etc., bibl.); J. C. Davies, *Baronial Opposition to Edward II.* (1918, bibl.).

(D. M. B.)

HOUSEHOLD APPLIANCES. Domestic help, previously plentiful and cheap in most countries, is now, especially in the industrial centres, difficult to obtain. As in industry, when labour is difficult to obtain, more efficient methods must be introduced to obtain the same volume of work. Labour- and time-saving appliances must be employed if homes are to be run smoothly under changed social conditions.

Modern household appliances developed to meet this need can be divided into two main headings, electrical and non-electrical appliances. Under the classification of electrical appliances are grouped: irons, toasters, waffle irons, heaters, coffee percolators, vacuum cleaners, washing machines, floor polishers, refrigerators, dish washing machines, cookers and stoves, ventilators, water heaters. In the non-electric group may be noted: gas cookers, stoves and furnaces, gas refrigerators, hot water heaters, kitchen cabinets and tables, fireless cookers, pressure cookers, service lifts, tray wagons, tradesmen's service ways, aluminium ware, steam cookers, oven cooking glass, oil burning furnaces. Under the spur of necessity and demand, inventors, manufacturers and house-

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

THE COMMON HOUSE FLY (*MUSCA DOMESTICA*)

1. Adult house fly; greatly enlarged
2. Detail of the foot, showing a cluster of typhoid germs on the claw; highly magnified
3. Pupa; greatly enlarged. The mature insect emerges from the pupa in about six days, except in the case of the autumn brood which remains over winter as puparia

holders are devoting their energies to the elimination of unnecessary work.

The movement commenced in the United States about 1910, where it has enjoyed its greatest popularity. A discussion of conditions in America is given below and constitutes the more general treatise on the subject of household appliances. In Great Britain and European countries it was not until after the World War that any particular progress was made in household efficiency. A description of the progress in Great Britain follows that of America. (G. E. W. C.)

UNITED STATES

The general adoption of improved working equipment for the home has been relatively slow, even in the United States, and dependent upon social and economic factors which have exerted their chief influence only since 1918. Essential to the use of mechanical home equipment is electric or gas service and it was not until 1908 that electricity began to be generally adopted for home use. Even by 1918 the use of domestic appliances employing electricity had made no substantial progress, being confined mainly to electric irons and minor cooking devices; although the electric washing machine had been on the market since 1905 and the electric vacuum cleaner since 1909. From 1918, the adoption of household appliances utilizing power, as well as heat, increased rapidly. One reason for this is to be found in the educational and marketing activities of light and power companies. With increasing generating capacity, these companies felt the need of developing a domestic market for their service. By the aid of advertising and selling methods hundreds of thousands of old and new homes were yearly wired for electricity.

Gas appliances were at the same time being energetically marketed. Although gas had by 1918 practically passed from use for illumination in America, it had become the most generally used fuel for cooking. The successful result of these marketing activities were partly due to the rising standards of living. An American study of the weekly money earnings in 25 industries over a period from July 1914 to July 1917 compared with the cost of living over the same period, shows clearly that the increase in the sale of mechanical home devices follows the increase of the family income in the wage and salaried classes.

The rapid disappearance of the domestic servant, in all but the homes of the wealthy, is a factor of less importance in the increasing use of mechanical housekeeping appliances. Equipment has had its greatest acceptance and use in localities where a part at least of the domestic service has always been performed by the housewife herself. In the cities an important factor in the adoption of these devices has been the apartment house and the resultant necessity for utilizing space to the greatest possible advantage. A modern apartment offers gas or electric ranges of an improved type, automatic refrigeration, an electric dish washer built into the sink, incinerators and an adequate provision of wall outlets for the connecting of portable electrical devices in every room. Education in the use of mechanical housekeeping equipment has been a necessary part of its public acceptance. Gas and electric companies, manufacturers, schools, colleges and government departments have all given this matter a place in their programme. Another factor of great importance has been the educational work by home magazines and newspapers which have established bureaux where domestic equipment is tested for electrical and mechanical design and construction and where experiments with a wide variety of equipment in practical use are continually carried on.

Standardization of Electric Wiring.—The virtual standardization of electric service voltage and frequency has been important to the sale and use of motor-driven electrical equipment. In all but a few large cities, where direct current is economically practicable, alternating current at 60 cycles, 110 to 120 volts, is the standard for domestic use. A standardized attachment plug with parallel blades and standardized wall or base-board receptacles also have been important factors in promoting the use of portable types of electrical appliances. With this type of attachment plug now almost universally employed, electrical

heating and motor-driven appliances are as completely interchangeable as the incandescent lamp. The increase in the use of all kinds of electrical equipment has had a pronounced effect on electrical wiring in the home. The wiring in all but a small proportion of dwellings provided with electricity is inadequate. Due to the restrictions of regulatory bodies in the interest of safety, facilities for wiring—once installed—cannot be easily or cheaply expanded. A majority of homes have been wired for the single purpose of providing light from permanently installed fixtures. To provide for the convenient use of either portable lamps or appliances, additional wall outlets have to be provided or makeshifts, not always of a safe character, contrived. Organizations within the electrical industry are attempting to improve this condition by educational means. Through a national body, the Society for Electrical Development in the United States, a standard for adequate wiring has been developed.

Small Electrical Devices.—The flexibility and safety of electric heating has brought the small electrical appliance into great popularity. The electric iron, one of the first home electrical devices, has long led the list. The electric toaster is only second in popularity. Coffee percolators, waffle irons and small stoves or grills permit an entire meal to be cooked at the table. For room heating in spring and autumn, the portable electric heater has met wide favour. Wall heaters are permanently installed in bathrooms where the climate is mild and a small amount of quick heat is required.

The development (about 1910) of resistance wires of nickel and chromium gave an impetus to the manufacture and use of these devices since this alloy can be heated to redness in the air without oxidation. Prior to that time heating units had to be sealed or enclosed. A recent development is the automatic operation of many small appliances. By means of thermostats irons are maintained at a constant temperature; toasters shut off the heat and eject the toast after a predetermined interval; warming pads limit the heat to a desired temperature. The extent and use of the more common of these appliances in the United States is shown by the following figures. Appliances in use as of Jan. 1929 (estimated): irons, 17,700,000; toasters, 5,325,000; heaters, 2,985,000.

Small Motor Applications.—Small motors of a high degree of reliability and good efficiency have played an essential part in developing the application of domestic power. Simplicity and operation over long periods, with little attention, are characteristic of small motors in use in 1929. Lubrication is cared for by grease cups or oil wells of large capacity, providing for extended use without replenishing. In addition to the vacuum cleaner, washing machine and refrigerator, motors are applied to a wide variety of household uses. The sewing machine equipped with electric motor has largely replaced the older type of foot-operated machine in America. Electric sewing machines are light in weight, portable and easy to operate. General utility motors, with a variety of attachments, are applied to buffing and polishing silver, sharpening knives, freezing ice cream, operating a coffee mill, mixing and grinding food and many other culinary operations.

Kitchen Equipment.—The plan of the kitchen has come to depend on the relation, arrangement and proportions of refrigerator, range, sink and working-cabinet. Architects, educational and government institutions and manufacturers have all influenced the design of the modern kitchen. The height of working surface has been given much study; sink and range cabinet have been raised to the height best adapted to the worker; 34 in. measuring from the working bottom to the floor has been found most suitable for the height of the sink. The kitchen cabinet has grown steadily in favour. Providing food storage and a place for utensils, it brings the work table and materials into the most convenient working relation. Increasingly used in a built-in form, they often provide space for refrigeration, for storage and broom cupboard.

The modern electrical dish washer, as a part of the sink, has overcome much of the indifference felt toward the earlier types of this appliance. It is easily filled and drained and the washing action is provided by a motor-actuated propeller throwing hot water into and over the suitably arranged china and glassware.

Less expensive means for dishwashing is provided by a rubber tube with spray, dependent on water pressure from the tap, over wire baskets in which the dishes are arranged. The electric heating and mixing machine has many uses in the kitchen. In modern apartments and in many homes, the garbage incinerator has become important. In its most highly developed type this is a small furnace built directly under a wide chimney. This chimney is provided at each kitchen level with a door through which trash and garbage are dropped directly to the furnace below. Periodically fire is kindled and the accumulated mass burned. Along with the transformation of the old kitchen into a new laboratory has come a demand for decoration. Until recently white or light shades of gray and blue have been considered most suitable for this room. There was in 1928, however, an active demand for kitchen equipment in the most brilliant of primary colours. Enamelled small utensils are of solid colour. Nickel-plated appliances have coloured handles of wood or bakelite, while ranges, refrigerators and kitchen cabinets have their flat surfaces relieved with bands of colour.

Ranges.—There have been marked improvements in gas, electric and oil ranges within recent years. In oil ranges these improvements have been mainly the construction of the burners making for better combustion. In gas ranges the development of controlled oven temperatures and the insulated oven have been most notable. The electric range has developed both an automatic temperature control and an automatic time control. This time control is a clock which can be set to turn the heat on or off in the oven at any pre-determined hour. Both gas and electric ranges use porcelain enamelled iron for the frame and exterior of the ranges. Some have ovens lined in enamel; aluminium is frequently used for the oven interiors of electric ranges. In general, both have the oven at the same level as the cooking top. In some electric ranges a fireless cooker forms a part of the range. The oven also can be used as a fireless cooker since its construction is heat retaining. (See GAS STOVES.) Gas for fuel in movable metal containers is a recent development. These containers are stored outside the house and connected by an approved piping system to a range similar to the ordinary gas range, but with special burners suitable to the combustion properties of the fuel gas. The electric range has made relatively slow progress toward general use. One reason has been the cost of installing the heavy wiring necessary. A smaller type electric range has been developed which can be operated on the ordinary house lighting circuit. This range contains an oven and one or two surface heating units and is so designed that it cannot at any one time employ more than the permissible limit of current from a wall outlet.

Electric cookers of the fireless and pressure types are also used to a considerable extent. These are valuable mainly as auxiliaries to other cooking equipment. An improvement over former fireless types, these cookers not only give an oven heat for baking, but can within limits perform a wide variety of other cooking. Because of double walls, on the vacuum bottle principle, they maintain food at high temperatures for some hours. In the pressure cooker the steam is confined within the utensil and by increasing the pressure raises the boiling point of the liquid. This cooker is

SECTIONAL VIEW OF DESTRUCTOR, SHOWING FLUE AND COMBUSTION CHAMBER

chiefly used for canning and for cooking in high altitudes.

In spite of the development of these improved types of cooking ranges a large number of families still employ coal and wood as cooking fuel. The following figures as of Jan. 1, 1929 (estimated) show the primary cooking methods of the United States; cooking by gas (manufactured) 9,500,000 families; by gas (natural) 3,470,000 families; by coal and wood 8,290,000 families; by oil 6,000,000 families; by electricity 725,000 families.

Refrigeration.—The adaptation of mechanical refrigeration to the home has been an outstanding development of recent years. Research and mechanical development have been carried on for many years; units successful in operation were marketed as early as 1917. In 1925, in America, intensive marketing methods were applied and domestic refrigeration has since shown a great and increasing popularity. (See REFRIGERATION AND ICE MANUFACTURE and REFRIGERATION, HOUSEHOLD for a description of various types.) The electrically operated type has met with the widest favour, but gas refrigerators are also very popular. Mechanical domestic refrigeration is also available in a model actuated by oil heat. This device is water cooled and is not completely automatic.

In addition to the wide use of automatic refrigerators with a self-contained operating unit, there are several systems where one or more units, located at a central point, operate freezing units in a number of cabinets throughout an apartment house. This multiple type of installation sometimes follows the design of the individual electrical units, and in other systems is an adaptation of the brine circulation refrigeration systems in use commercially.

One of the results of the introduction and development of automatic refrigeration has been a general improvement in the type of refrigerator cabinets. Wooden cabinets, unless exceptionally high-class construction, have been found to be less desirable than metal cabinets for use with electrical or other automatic units.

Vacuum Cleaners.—The electric vacuum cleaner of to-day had as predecessors the hand-operated carpet sweeper with two or more roller brushes and the hand-operated pump type cleaner. Practically all modern vacuum cleaners divide themselves into two classes—those relying on suction or air movement only, and those depending on a motor-driven brush, as well as a degree of suction. (See VACUUM CLEANER.) All types of cleaners are provided with attachments, consisting of flexible tubing, 6 or 8 ft. in length, with suitable nozzles for cleaning tufted furniture, cushions and other surfaces. Very small cleaners, so light in weight as to be in effect suction brushes, are coming into use. Vacuum cleaners and suction sweepers are among the most popular household appliances and were sold in 1929 in America at the rate of approximately 1,200,000 units a year.

Floor Polishers.—The tendency toward polished floors with scattered rugs instead of completely carpeted floors has developed a market for floor scrapers and polishers operated by an electric motor. These consist, usually, of heavy revolving or rotating brushes or a revolving drum equipped with sand-paper or other abrasive and attachments of suitable character for polishing and waxing. Because these floor polishers are more expensive than vacuum cleaners and because they need to be used less frequently, many people prefer to rent these devices for a brief period rather than buy them outright.

Laundry Equipment.—The hand-operated washing machine and the washing machine operated by the pressure from the water faucet had both come into wide use before the adoption of the electrically driven washing machine. The electric washing machine found its active market from 1918 on and since that time, large numbers have been sold and many types have been developed with much technical improvement. (See WASHING MACHINE.) Whatever the type of clothes washer—agitator, cylinder, vacuum cup, oscillator or dolly—its function is to drive soapy water through soiled clothes with enough force to remove dirt. For farm districts, where no electrical power is available, washers driven by a small light weight gas engine have come into use. The electric washer sold in 1928 in America at the

MODERN ELECTRIC AND GAS HOUSEHOLD EQUIPMENT

1. Electric refrigerator; freezing chamber upper left, motor below
2. Electric range, with automatic temperature and time controls
3. Semi-enamel gas range with automatic heat control for oven
4. Electrical device for squeezing fruit, beating eggs or whipping cream
5. Electric toaster and coffee percolator
6. Incinerator for apartment-house
7. Kitchen cabinet, combined with refrigerator and broom closet, designed for use where economy of space is essential

rate of 750,000 to 800,000 units per year.

Accessory Heat and Ventilation.—Although the small electric fan has a certain popularity in the south of the United States and sells rapidly during a few weeks or months in the very warm weather, elsewhere electrical ventilation has never received the public response or use that is possible. Manufacturers provide domestic ventilating fans in a variety of units. They are usually reversible, so that used air from within the house may be exhausted or fresh air from without drawn in. These fans require no elaborate installation, being provided with adjustable frames which may fit into a partly opened sash window. (See HEATING AND VENTILATION.) For accessory room heating portable gas heaters are most popular. Many types of portable gas heaters, including gas grates, are widely sold. Electric heaters of the radiant type are also in general use. These, however, produce but a small amount of actual heat, since they are limited to the amount of current which can be taken from a wall outlet. Portable kerosene heaters also find a considerable market, the common type being a large wick burner set in a steel cylinder for radiating heat.

Water Heaters.—One of the prime necessities in the modern home is a continuous and abundant supply of hot water. A common method of heating water is a coil or pipe in the fire box of the heating furnace or boiler connecting with a storage tank. This method, while perfectly satisfactory during the winter months, makes no provision for a hot water supply when the furnace is not in use. Hot water heating systems independent of the house heating systems are, therefore, very generally employed. Where gas is available, it leads all other fuels in popularity for water heating. There are a number of types of gas water heaters, the simplest of which is the side-arm heater. This consists of a gas burner below a coiled pipe or water container attached to a tank by two pipes which provide circulation through either the container or the coil. In general this side-arm heater has to be lit whenever hot water is desired. It can, however, be thermostatically controlled, maintaining water at a constant temperature in the storage tank. Time clock control is also possible.

The instantaneous gas water heater provides hot water at the turning on of any hot water tap on the pipe line attached to the heater, operating by means of a hydrostatic valve. When all the taps on the hot water line are closed, the pressure on both sides of the hydrostatic valve is such that the latter remains closed. When any tap is opened, the release of the pressure operates the valve, which, in turn, opens the gas valve supplying the burner. Kerosene water heaters are in use in many districts where gas is not available. These heaters are generally similar to the gas water heater. Electric water heaters, flexible and easy to operate, have been in use for many years. Until recently they have been comparatively expensive, even where electricity rates were low. However, development of a type employing low-wattage consumption indicates a broad use of this equipment for water heating in the future. The storage electric water heater cannot furnish an immediate supply of hot water, requiring several hours for sufficient amount to be heated. The efficiency of the electric water heater, however, is very high, owing to the fact that the heating element is mounted directly in water.

(L. E. M.)

GREAT BRITAIN

In 1920 in London the first post-war Ideal Home Exhibition began the movement in Great Britain. The time payment or hire purchase method of selling has been utilized by makers of household appliances with astonishing success. In Great Britain and other English-speaking countries increasing numbers of housewives are purchasing household appliances out of their housekeeping allowance, setting aside sums—equal to the amount formerly paid for a human assistant—to purchase mechanical aids.

Vacuum cleaners are becoming increasingly popular, and it was estimated in 1928 that more than 150,000 are sold annually of the electrically operated and non-electric types. Electric floor polishers are not as widely used in Great Britain as in the United States and in a lesser degree in European homes. The educational propaganda of companies interested in marketing mechanically operated refrigerators has caused similar activity by companies making

artificial ice, and householders are realizing that a good refrigerator is a necessary appliance in the modern home.

Large capacity dish washers are available for hotels and restaurants and several reliable and efficient dish washers for household use are marketed but the cost in 1928 was high and a considerable amount of human attention necessary. A household ventilator has recently been marketed in England which may considerably change the method of house planning. Whereas architects had to exercise great care in the location of the kitchen—especially in flats or boarding houses—by this ventilator, cooking smells, steam, etc., can be satisfactorily dispersed, no matter where the kitchen is placed. This device consists of an electrically driven fan, either set into the wall of the kitchen, bathroom, etc., or placed in the window. The motor is reversible, so that the fan will either exhaust cooking smells, fumes, steam, etc., or bring fresh air into the room. It is particularly useful to prevent discolouration of walls by fumes, or condensation of steam.

Washing Machines and Heaters.—While dish washing by mechanical means cannot be said to have had a great popular response, clothes washing by machine has proved to be both practical and labour saving. (See WASHING MACHINES.)

The increasing use of steam or hot water central heating has in many modern homes meant that the kitchen fire has been supplanted by gas, electricity or oil. In Great Britain, although central heating has not become universal in the ordinary home, hot water heaters, known as independent boilers, are being used not only to supply hot water but also to heat two or three radiators. These independent boilers burn coke, anthracite or soft coal and are also used as incinerators for kitchen refuse. Owing to the general use of gas-coke, which is a by-product obtainable at a reasonable price, for an ordinary three- to five-bedroom house these independent boilers can be operated at a cost of 6d. or 12 cents per day, and give ample supplies of hot water from three or more outlets. When installing an independent boiler it is very necessary that the "flow and return" or "two pipe" system is employed. Gas is also widely used in Great Britain for water heating, either by a specially constructed gas-boiler or a "geyser." The latter consists of a coil, through which the water passes, heated by a number of gas burners; it is thus able to deliver quickly a large volume of water at high temperatures. A similar form of coil heater is also in general use in France, in which, when the water is turned on at any outlet, a pressure valve is released and the gas supply is turned on, a pilot jet lighting the burners. When the gas boiler, of which there are many economical and excellent types, is employed the water is passed through a storage tank, the burners being controlled by a thermostat. By using heavily insulated storage tanks it is possible, where current is cheap, to heat water electrically at a cost competitive with other methods. Some electricity supply companies have special "off-peak" rates which enable morning bath water to be heated at an exceptionally low cost. As it is controlled by a thermostat, no attention is necessary.

Methods of Cooking.—A single century has seen greater improvement in methods of cooking than in all the previous years during which man has had to eat to live. Coal has replaced wood as a fuel, gas has replaced coal, and electricity, wherever supplies are available at reasonable cost, is replacing coal and gas. The spit and grill were replaced by the coal and wood stove, which have themselves been replaced by the gas or electric range, and these may be partially replaced by steam and pressure cookers. In the 20th century, greater developments have been made with various forms of new cookers and adaptations of existing methods of cooking, than in any other household appliances. Automatic oven controls for electric and gas ranges are now in general use. The burners of gas stoves have been improved and hot plates for electric stoves have been perfected.

Two new forms of cooking are now claiming attention. One is the inducer or transformer system of electric cooking and the other is a 20th century adaptation of Denis Papin's "Marmite," invented in 1685. This system of steam pressure cooking has been attracting attention for several years and although entirely successful is not in general use largely owing to lack of public information. In France, cooking by pressure is increasing in popularity

rapidly. At recent exhibitions of household appliances, pressure cookers have been freely exhibited. With the French cookers, cooking is done at temperatures of 260° to 275° F and at pressures of from 20 to 30 lb. to the square inch.

The transformer or inducer system of electric cooking can hardly be termed, as yet, commercially successful. Contingent factors which may mar its ultimate success are that it is restricted to use on alternating current, and, the utensil itself forming part of the heating unit which is made of the relatively costly stainless steel (*q.v.*), the initial outlay is heavy. The frying pan, kettle or saucepan is arranged to act as the opposite side of the transformer, taking current at low voltage. On a 3.7 kw. inducer a pint of water can be boiled in one minute. Twenty minutes after switching on, a 4.5 kw. heater will supply 5 gal. of boiling water at the rate of 4 pints per minute, or provide for a 20 gal. bath at a cost of 2½ units. The electric inducer provides a method of cooking whereby the entire quantity of heat generated by the amount of current consumed is actually transmitted to the food through the walls of the container, there being no escape to the atmosphere. The power factor of the inducer is usually well above .9. It seldom falls as low as .85. The maximum loading of a complete inducer equipment is less than that of a corresponding electric equipment; although the loading of one or more units may be much lighter than is customary in other equipments. For instance, an oven and grill with one large (3,700 watts) and two small inducers (750 watts each), will have a maximum loading of 5,200 watts as against a maximum loading of 6,000 to 8,000 watts on other electrical cookers. The heat is induced in the vessel itself, the inducer remains cool, no surrounding metal parts are heated along with the vessels. The action being instantaneous, this method of cooking will, if successful, do much to eliminate one of the present disadvantages of electric cooking.

Other Labour-saving Devices.—There are many appliances which will save labour in the home but in this short article detailed descriptions are impossible. The tradesmen's delivery hatchway is an appliance which is invaluable. It consists of a series of compartments mounted on a frame which rests in hydraulic tubes. The compartments are inside the house and communication with these compartments is obtained by the tradesman opening a door in the wall and depositing his parcel. When the door is closed, the inside series automatically descends one notch, making another empty compartment available for the next tradesman. This hatchway and similar types have been adopted in many restaurants and hotels. In hard water districts, a water softener is a particularly useful appliance. It can be arranged for the particular supply required, *e.g.*, for the bathroom, or large models can be obtained through which the complete household supply can pass. Oil burners for furnaces are becoming increasingly popular. Wherever they are used, being automatic in action and controlled by thermostats, they enable the whole house to be heated with little human attention. (*See OIL HEATING, DOMESTIC.*) In Great Britain, the general absence of cellars or basements and the more stringent insurance regulations regarding the storage of oil fuel, have restricted the sale even to those homes which have central heating. A cheaper device which, although not eliminating the necessity of stoking, enables an even temperature to be obtained automatically, consists of an electric blower which is arranged in the furnace. A thermostat, which is set at the temperature required, controls the motor in the blower.

Aluminium ware has now become almost universal for saucepans, kettles, etc. It has been found to be serviceable, easy to clean and light in weight. Enterprising manufacturers have devised many interesting and useful vessels in this metal. Porcelain enamelled table tops, sink draining boards and tray tops are now widely used in the kitchens of both American and British houses. The perfection of a 99% pure iron has enabled vitreous porcelain to be satisfactorily applied to this metal, giving a white smooth surface easily cleaned and hygienic. Linings for refrigeration are also made of this material.

Trolleys or dinner waggons are found to be the best solution of clearing or setting the dinner table. The best type of waggon has 4" swivel acting, rubber tyred wheels, which enable the trolley to

run over rugs, etc. without jarring.

(G. E. W. C.)

HOUSEHOLD TROOPS: *see* GUARDS and HOUSEHOLD TROOPS.

HOUSEKEEPING. The control or management of household affairs, including (1) the provision of sufficient and suitable food for all members of the household, (2) the control of household expenditure, (3) the engaging and supervision of servants and (4) the responsibility for the cleaning, warming and lighting of the house, and the care, laundering and renewal of the linen.

Organization and Routine.—Housekeeping is one of the most comprehensive occupations that a woman can undertake, for there are few other careers which demand a knowledge of such widely different subjects as child welfare, dietetics, marketing, cooking, elementary finance, mending, home nursing and entertaining, and many people undertake this exacting work without any previous experience. It is therefore not surprising that difficulties frequently arise.

Just as the heads of commercial undertakings run them methodically and on strict business lines, the housekeeper must make full use of her organizing ability if she wants to make a success of her work. She should regard herself as the managing director and should aim at reaching a high standard of efficiency by careful and methodical planning, and by keeping her ideas up to date.

Whilst it is unwise to introduce unnecessary rules into the home, the first duty of the housekeeper should be to draw up a budget for her own guidance, so that expenditure may not exceed the allowance, and a daily and weekly plan of work for herself and maids. By this means, mismanagement and confusion will be avoided.

Budgeting the Income.—The sum to be allotted for housekeeping expenses should be agreed after due consideration, bearing in mind not only the income but all fixed expenses. For example, parents willingly forego some of the amenities of life in order that their children may have a liberal education. Therefore, during the period that educational expenses are high it may be necessary to cut down the housekeeping expenditure considerably. This can be achieved by the reduction of domestic staff, curtailment of entertainment, and in other ways, but it is false economy to reduce either the quantity or quality of the food.

When the income is strictly limited, ill health and other contingencies demand the practice of strict economy, and frequently the cutting down of the housekeeping allowance is the only way by which this may be achieved.

Although space will not permit a discussion of family finance at great length, sufficient has been said to show that it is difficult to make a hard and fast rule, or to state definitely with any degree of accuracy what proportion of the total income should be allocated to housekeeping in any particular ménage.

After making careful study of a number of budgets, it would appear that incomes above £400 may be apportioned as follows:

- 40% Housekeeping Expenses including wages.
- 15% Rent, rates and taxes or mortgage.
- 10% Education.
- 10% Clothing.
- 10% Holidays.
- 8% Insurance and Saving.
- 2% Charity.
- 5% Incidental.

N.B. Considerably more than 15% of incomes under £400 will be required for rent, etc.

Cost of Food.—It is possible to feed a family of three adults on 10/6d per head per week, at prices ruling in Britain in 1928. This sum provides a balanced diet and one which—at least physiologically—is sufficient in quantity, although the fare would not be particularly interesting. If an attractive diet and good quality food are desired, at least 17/- to 20/- per head per week must be allowed when catering for as small a number as three adults. If the numbers are increased, the cost can be reduced to 15/- to 17/- per head, although it is impossible to provide luxuries for this sum.

Housekeeping Expenses.—Not only is it necessary to decide the sum to be allocated to housekeeping expenses, but it is also

very important that the person responsible for spending the money should have definite knowledge as to her responsibilities.

In large establishments it is customary for a paid housekeeper to receive an allowance from which she pays all tradesmen's accounts for food, cleaning materials, laundry, renewals, servants' wages and small incidental expenses. Accounts for repairs to the fabric of the house, charges for gas, electricity and water and local rates are usually dealt with by the head of the house.

In small households the housewife often prefers—particularly if she has any business ability—to be responsible for every cost incurred in connection with the management of the home, including rates, monthly or quarterly tradesmen's accounts, wages, etc. When this arrangement is decided upon it is advisable to open an account at a local bank, and utilise it entirely for household expenses, the head of the house paying in the agreed sum of money either monthly, quarterly or half yearly and the housewife drawing the cheques herself.

When circumstances are such that it is not convenient or necessary to adopt this method, or when the housekeeper does not wish to shoulder the responsibility, she should receive an allowance in cash weekly out of which tradesmen's bills, laundry, small incidental expenses and weekly wages should be paid, the husband settling monthly and quarterly accounts, rates, taxes and rent as they become due.

The keeping of a simple system of household accounts is strongly advised, in which money expended on clothes and personal items should be kept entirely separate.

Housekeeping in the Servantless Home.—Owing to the scarcity and relative inefficiency of domestic help combined with the increased cost of living and wages, a very large number of housewives who previously kept one or two maids now prefer to do their own work, and provided the members of the family appreciate the changed conditions, the running of a servantless house need not deprive the housewife of her outside interests, friends and pleasures.

Labour Saving Houses and Equipment.—Having decided to dispense with paid labour, those who are living in old-fashioned houses which appear to have been designed with the object of making work, will naturally endeavour to obtain a modern dwelling better suited to the new conditions. Such houses are not difficult to find, for builders are now providing houses in which a serious attempt is made to reduce labour to a minimum. When selecting a house to be run with little or no paid labour, attention should be paid to the following points:—

1. The wiring of the house for electric power as well as for lighting and, if power is not available, when it is likely to be in the near future. Only those who regularly use such efficient and tireless servants as electric cleaning and washing machines, floor polishers, toasters, kettles and irons can appreciate the labour they save.
2. The elimination of all unnecessary mouldings on windows, etc., dust collecting cornices, and tarnishable metal fittings.
3. The proximity of the kitchen to dining-room and the provision of a serving-hatch. The absence of steps, not only at the front entrance but between the kitchen and living room, so that full use can be made of a tray wagon, thus eliminating the carrying of trays.
4. The provision of built-in cupboards, the shelves of which can be reached without strain or inconvenience.
5. The position of the sink in relation to the cooking stove and larder, for step saving is worthy of much greater attention than it receives.

These few points are sufficient to indicate that the actual planning and design of a house affects very largely the possibilities of saving labour.

Planning the Work of a Servantless House.—It is presumed that the house consists of two living rooms, hall, kitchen and scullery, four bedrooms, bathroom and staircase.

Housewife's Daily Duties

7.00	Rise.
7.20	Unlock, light fire if necessary, prepare breakfast.
8.00	Breakfast.

8.30	Clear away and wash up. Open beds.
9.00	Sweep porch, clean steps and letterbox, and shake mats.
9.15	Daily work in dining- and sitting-rooms.
9.45	Make beds. Sweep or vacuum and dust bedrooms, bathroom, landing, stairs and hall.
10.40	Prepare for lunch and evening meal. Shopping when necessary.
11.30-12.45	Weekly work.
12.45	Cooking.
1.15	Lunch.
1.50	Washing up. Sweep and dust kitchen, etc.
3.00-4.30	Free time.
4.30	Tea and free time.
6.00	Prepare evening meal.
7.00	Supper or dinner.
8.00	Clear away.

Weekly Work.—Monday, Laundrywork; Tuesday, Ironing; Wednesday, turning out dining-room and lounge alternate weeks; Thursday, turning out two bedrooms; Friday, bathroom, landing and kitchen; Saturday, stairs and hall.

The One-Maid House.—Where one maid is kept and there are no children, the arrangement of work given above could be adhered to. The mothers of young children generally prefer to take complete charge of them, leaving the maid free to do the housework.

The mistress of a one-maid house must organise the work of the house so that the maid has at least two hours a day free, one evening or half-day a week and every Sunday afternoon and evening.

The conditions of domestic service will then more nearly resemble those of industrial work, and dissatisfaction is less likely to occur.

Homes with More Than One Servant.—A mistake commonly made by inexperienced housewives is to attempt to run their house with too small a staff, and failing to give assistance when it is required. Therefore, it is most important that a plan of work and time tables similar to that given for the servantless house, be drawn up, in which the duty of each maid is stated. If, after it has been tried, it does not prove satisfactory the matter should be discussed with the senior maid and the time table modified. If dealt with sympathetically few maids prove unwilling to co-operate with a mistress who is interested in their welfare.

Another duty of the housekeeper is to provide a comfortable sitting room in which maids can spend their leisure time.

Duties of Servants.

The Cook is responsible for all cooking, and sometimes for the cleaning of dining room, kitchen and larder.

The Parlourmaid waits at table, is responsible for the drawing room and lounge, answers the door and valets the master.

The Housemaid is responsible for bedrooms, bathroom and dressing rooms.

The House-Parlourmaid combines the duties of housemaid and parlourmaid. (D. D. C. T.)

THE UNITED STATES

The general principles of household management, while the same in all countries, must be modified in the United States to meet the diversified conditions of American life.

The Household Employee.—From colonial times the problem of paid help in the household has been greater than in older countries, since the opportunities for work other than domestic have been more numerous. Families on the same economic level as those employing three or four servants in Europe, employ one "general housework" girl in the United States, with perhaps some part-time assistance for cleaning and laundry. The social position of the household "help" was not affected in colonial times by domestic service, but with the increase of industrial and clerical work open to women the servant's status sank in the social scale. Also the hours of duty were longer and the personal freedom of the servant in her "time off" was often restricted by the demands of the employer. "Living in" meant no home in which to receive friends, and the bedroom of the servant was often unattractive. In consequence, the number of American girls willing to do such work steadily lessened, and even immigrant

girls soon learned that they would have greater freedom and better social advantages in other employments. With the restriction of immigration the servant supply was left far below the demand.

Of recent years there has grown steadily, especially in large cities, a movement to put the work of the household employee on an industrial basis. The aim of this movement is to arrange for the employee an eight-hour day, a six-day week, to live and eat out, and to be called "Miss" or "Mrs." as would be done in a shop or office. By this arrangement the employer receives eight hours of steady work, almost invariably more work than was done in the longer hours of the old type of servant. The day off is chosen by the employer. Where there is only one employee, this leaves the housewife responsible for one meal each day, and three on one day. If two are employed, or even one full-time and one part-time, the hours can all be covered by a proper schedule. The employer saves the cost of an extra bedroom, often high in large cities, and the cost of food, which to-day is no small matter. A higher weekly wage compensates for this. Part-time service on this basis is increasing, and bids fair to solve the household help problem for many housewives who cannot afford full-time service. The social stigma is largely removed by this plan, and it is believed that an increasing number of girls and women now employed as industrial workers or clerks will prefer this less monotonous and equally well-paid occupation.

Labour-saving Devices.—The scarcity of household employees, the cost of employing them and the desire of the homemaker for more time for other interests, have combined to stimulate the production and general use of labour-saving devices. The rapid growth of available electric power has made possible the greater number of these, and widespread advertising has made them known to everyone. The electric iron, toaster, grill, vacuum cleaner and washing machine are widely used; the electric or gas refrigerator, the electric dishwasher, floor polisher and mangle are sold in astounding numbers. From 1924 to 1928 the sale of electric washing machines doubled, and the sale of small electric equipment (including vacuum cleaners) increased 2,000%. In a single year there were sold 790,000 washing machines and 1,028,000 vacuum cleaners. Many of these were sold on the instalment plan, showing that they went to homes of moderate or low income. The use of electric ranges increases less rapidly, since in most urban communities gas is still the cheaper fuel.

Care of the House.—In industrial centres and in many other places the use of soft coal entails more cleaning and therefore more wear and tear. Paint for walls is much more easily cleaned than wall-paper, and is more widely used. The use of the vacuum cleaner and the general substitution of rugs for carpets simplify the problem somewhat. The number of cleansing agents for household use is enormous. As yet no testing bureau supplies the housewife with adequate data regarding these, but the American Home Economics Association and the Bureau of Home Economics of the U.S. Department of Agriculture are stressing the necessity for this. Much attention has been given to planning and arranging the kitchen equipment to make the work as easy and efficient as possible.

Laundry.—Modern equipment simplifies the laundry work, but in cities, lack of space for the work and the cost of hiring a laundress usually make it economical to send at least the household linen to a commercial laundry. It may be returned as "wet wash," to be dried and ironed at home, rough dried, to be ironed at home, or finished. The prevalence of silk underwear and silk stockings or socks makes possible easy laundering of these at home. Dry cleaning of clothing, wool blankets, etc., is generally done in commercial establishments, though much of it is still done in the home.

Aids in Housekeeping.—The Bureau of Home Economics of the U.S. Department of Agriculture does much research work, publishes helpful bulletins for the homemaker and gives personal advice to enquirers. The agents of the extension service of the same department daily teach, advise and help thousands of women in the rural districts and the smaller communities. (See HOME ECONOMICS.) The U.S. Bureau of Standards does testing of value

to the housekeeper, though at present this information does not often reach her. The women's magazines and the farm journals, which are many and whose combined circulation runs into millions, give their readers much valuable matter, and some of them conduct testing bureaux. They also publish pamphlets on various housekeeping subjects. Some large newspapers provide daily or weekly well-ordered and authentic information for the homemaker, and many other papers give more or less desultory information for her. The alert housewife can get authoritative information regarding any part of her task easily and at a low cost. (See also FAMILY BUDGET.)

HOUSEL, the English name, until the time of the Reformation, for the Eucharist. The word in O. Eng. was *húsel*, with the meaning "sacrifice." From this came the verb *housel*, "to give communion to" and from this the noun developed.

HOUSELEEK, *Sempervivum*, a genus of ornamental evergreen plants belonging to the family Crassulaceae. About 50 species are known, some of which are hardy perennial herbs, and grow well in dry or rocky situations; the others are evergreen shrubs or undershrubs, fit only for cultivation in the greenhouse or conservatory. The genus *Sempervivum* is distinguished from the nearly allied *Sedum* by having more than five (about 12) petals, and by the glands at the base of the ovary being lacinated if present. The common houseleek, *S. tectorum*, is often met with in Great Britain on roofs (where it is sometimes planted to keep slates in position), and wall-tops, but is not a native. Originally it was indigenous in the Alps, but it is now widely dispersed in Europe, and has been introduced into America. The leaves are thick, fleshy and succulent, and are arranged in the form of a rosette, lying close to the soil. The plant propagates itself by offsets on all sides, so that it forms after a time a dense cushion or aggregation of rosettes. The flowering stem, which is of rather rare occurrence, is about 1 ft. high, reddish, cylindrical and succulent, and ends in a level-topped cyme, reflexed at the circumference, of reddish flowers, which bloom from June to September. *Sedum acre* (stonecrop) is styled the little houseleek. In Germany it is sometimes called *Donnerkraut*, from being supposed to protect the house on which it grows from thunder. *S. glutinosum* and *S. balsamiferum*, natives respectively of Madeira and the Canary islands, contain a very viscous substance in large quantity, and are used for the preparation of bird-lime; fishermen in Madeira, after dipping their nets in an alkaline solution, rub them with this substance, rendering them as tough as leather. *S. arboreum* is employed in Cyprus, the East, and northern Africa as an external remedy for malignant ulcers, inflammations and burns, and internally for mucous discharges.

HOUSE OF CORRECTION or **BRIDEWELL**, in England and the United States a prison for the confinement of petty offenders. Originating as a workhouse, a place of compulsory employment for vagrants and others out of work, the house of correction in England for a hundred years performed a useful service in the relief of destitution, but by the end of the 17th century it had degenerated into a dumping ground for the riff-raff of the local criminal population. When in 1774-76 John Howard made his famous survey of prison conditions in England and Wales there was little but the name to distinguish the Bridewell from the common gaol. With the centralization of the penal system effected by the Prisons Act of 1877, the houses of correction passed under the control of the Home Office. In the United States they are still administered by local government—city, town or county. (See GAOL; PRISON.) (G. W. K.)

HOUSE OF ISSUE, an investment banking house which underwrites, advertises, and undertakes the sale of an issue of stocks or bonds for a corporation. It is known as the house of issue to distinguish it from other banking houses which may be merely participants in the disposal of the securities.

HOUSE PLANNING. The first quarter of the 20th century has marked a period of great progress in house planning.

The great mechanical advances of the 19th century have been consolidated. The building industry has for the most part recovered from the mistakes made in the first joy over the discovery of power machinery. There was a dreadful period when tradition was thrown to the winds. All past developments of style, mass, detail and even arrangement were forgotten. Men began to study to recover their lost traditions in building and design. With the return of taste and understanding in domestic architecture at the turn of the century, the wealthy man was naturally the first to benefit. Recent years have witnessed further development. People of moderate means have found that they, too, can obtain a modern well planned house.

The layman is apt to think of a house in terms of its appearance and to distinguish houses by various labels, such as "Colonial," "English" or "Spanish." The architect's method is preferable: it is to think first of the use to which the house is to be put; on the one hand what is to go into the house in the way of rooms, space and equipment; and on the other how so to arrange these facilities as to make the best use of the natural advantages of the site, such as sunlight, prevailing breeze, view and trees. When thought of in these terms, with the things wanted balanced against the expected price, the house evolves naturally and the type of design may then be selected.

Land.—The price of land has had a direct effect on the size and variety of houses. High-priced land has produced the apartments and row houses of the more densely populated cities, (see SOCIAL ARCHITECTURE). Low-priced land has made the detached suburban house and the country house with its rambling wings. House planning proper deals with the individual country or suburban home.

The small suburban lot has been a bane on the full enjoyment of natural advantages. It so cramps the plan and the arrangement of both house and grounds that the beauty of the out-of-doors is either spoiled or lost. To combat this difficulty, where the means of the owner are small, there has been developed in England a method of grouping houses so as to concentrate open spaces and make them more useful and enjoyable (see GARDEN CITIES). Perhaps the nearest approach to this in the United States is at Bridgeport, Conn., where a sincere effort to escape from the limitations of the small plot has been made. Had this plan not been adopted, land cost would have compelled either a suburban apartment development, a city row type or the suburban small lot street with each house denied any advantage of outlook and most of the rooms looking directly into neighbours' windows.

One of the great problems remaining to be solved is the question of the efficient utilization of land. There must be a proper balance between the areas utilized for streets and public use and the areas to be put into private lands. In some cases actual discredit has been brought upon the garden city movement by unintelligent and impossible community plans. Mistakes which require disproportionate expenses for streets, pavements, water and sewer and other service features handicap house planning, for these mistakes must be made up for by skimping in design and construction. It is popular to blame the diminishing size of the house upon the high cost of labour. This, however, is only one of the contributing factors. Excessive land costs and wasteful promotion and financing are responsible for innumerable cases which are uneconomic before a single brick is laid or a nail driven.

Modern Conveniences.—The introduction of modern conveniences into homes has played a large part in changing methods of house planning. From one point of view the decreasing size of the house has made necessary more efficient planning and equipment. From another, the demand for conveniences has increased the intricacy of the construction work and added materially to costs, thereby reducing the size of houses. Closets were once a rarity; then they were a space behind a door; to-day even closets are efficiently planned in detail; while they occupy less than one-tenth or one-twelfth of the area of the average room, closets cost from one-quarter to one-fifth as much.

Bath-room.—Bath-rooms occupy perhaps one-fifth of the area of the average room but their cost is nearly double. Not so long ago one bath-room in a house was a luxury. Now those who can

afford it demand a bath for every bedroom and two bath-rooms are common in even the smallest houses. Bath-room costs vary greatly, but an important part of the expense is in bringing the water-pipes to the room and in carrying off the drainage and the gases from the pipes in a sanitary manner. Money is saved when the plan is so arranged that the structural difficulties involved in carrying pipes through walls and ceilings are reduced

to a minimum. The finish of walls, base and bath-room floors in tile or other special material, which brings another trade to the job, is the cause of a very considerable part of the expense of the bath-room, for obviously the tile-work must wait until all pipe-work behind the walls is complete. The many kinds of special tile and other fittings in all grades and combinations of colour that may be had to-day are a temptation to the average owner. Frequently there are long waits for special orders, and delays above all things are expensive in construction. Further details in regard to plumbing and bath-room equipment are given in the section of this article dealing with *Mechanical Equipment*.

Heating.—House heating has become an exact science with a system of ducts, pipes and valves just as complicated as those that serve the bath-room. Economy in heating is gained like all economies by reducing waste. A great step in advance has been made by more thoroughly insulating the shell of the house against exterior cold. Insulating material applied to the sheathing of a frame house or under the furring of a masonry house and in the attic, together with effective window stripping, will greatly increase the efficiency of any heating unit. The principal methods of modern heating are described in the section of this article dealing with *Mechanical Equipment*.

Garage.—The garage has developed from a shed in the back yard into a part of the house, in most cases commodious enough for two cars and with at least the simplest provisions against the spread of fire to the house proper. The floor should be of cement and the walls of masonry; hard cement plaster on a fire-proof backing may be used for both walls and ceilings. The door, at least on the garage side, should be metal clad, though conformity with insurance companies' regulations requires even greater protection. The tendency to make the garage a part of the house has helped to clean up unsightly back yards and, because of the greater privacy possible, to reverse the desirability of front and rear for living or service features. It is certain that in modest cost suburban developments the removal of the clutter and noise from the back yards has been a great step in the direction of better homes.

Kitchen.—The kitchen has developed from a large room containing a huge coal stove, a hot water drum and a tiny sink into a smaller room designed in detail and equipped with labour-saving devices. The modern sink and the small efficient gas or electric stove should be properly related to each other. The dressers, cupboards and counters should be arranged convenient to the sink and service dining table; dry groceries should be convenient to the preparation table. There are various types of dressers. Open shelving is the cheapest. Enamelled metal shelves with glass doors are perhaps more sanitary than those of wood.

There are two types of kitchen efficiency, one for the house designed to be operated with one or no servants and the other for the house designed for several servants. There is the combination sink and the single laundry tray, and the combination sink and dishwasher. There is the electric washing machine and the electric mangle, which of course in the larger houses are placed in a separate laundry. The built-in dining alcove is typical of the modern tendency to save space and labour. Folding ironing boards are also space savers. The electric iron has displaced the old-

fashioned flat-iron. The electric outlet used for the iron should always have special fuse provision and a bull's-eye signal switch. Electric or gas refrigeration is fast displacing the old-fashioned ice

acter largely from that of the plan they follow. The influences that usually fix the type of plan are: (1) the economic factor, (2) climate, (3) habit, (4) site. Some kind of house may be planned to fit almost any kind of site; the lot for which it is most difficult to plan a good house is the long narrow city type; some irregular sites offer very unusual opportunities.

In the great majority of cases the economic limitations of the narrow town lot dictate a narrow house. If that house is to be made detached, and considered only as an individual house, the problem is one to which there is practically no solution aesthetically satisfactory. If there are two storeys and the roof ridge runs the length of the house with a gable at each end the effect will be of an unpleasant high-waisted box. If the gable is placed on the long side of the house it will bring the roof down lower at front and back as desired but it will make it necessary to put on two sets of dormer windows in order to get light at front and rear on the second storey. Of course in the case of houses on narrow lots these will be the most important windows of all, hence will have to be made disproportionately large. As a result, the rafters of the main roof will be cut to pieces and the roof itself then degenerates into little more than a fringe around the house. A single detached house on a lot narrower than 50 ft. is almost certain to be an architectural and economic monstrosity. When the shape of the rectangular plan comes nearer to square, there are limitless possibilities of design. If the house is very small, it will be out of proportion unless the rafters start from below the ceiling height on the second floor.

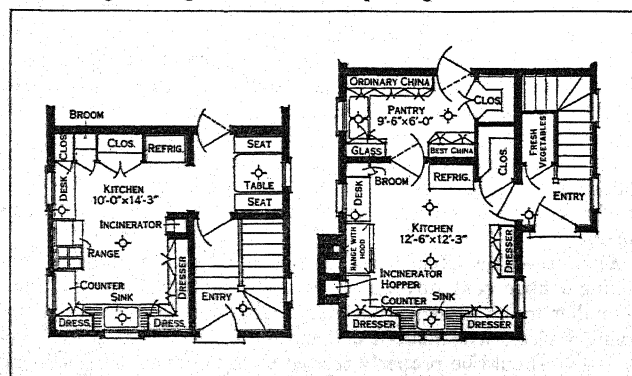

FIG. 3.—LAYOUTS OF TWO WELL-ARRANGED KITCHENS IN A MODERN HOUSE

man and the old annoyances of ice deliveries and overflowing ice drains. For those who can afford its installation, the incinerator is the cleanest and most convenient method of garbage and rubbish disposal. These modern conveniences add to the complexity and expense of construction, but they facilitate housekeeping and increase the productivity of the housewife or her servants.

Plan and Its Relation to Style.—Houses take their char-

Very little variation is possible in storey height, for this dimension is set by the height of a man, whereas length and breadth are dependent only upon the number and size of rooms. As a two storey house is made smaller, it is impossible to reduce the height dimension in the same proportion as the dimensions of length and breadth. It is no wonder, therefore, that the appearance of most small houses is so unattractive. Their design is a far more difficult problem than the design of a larger house.

It must be remembered that there are many different solutions to a problem. What we know as style is nothing more than a method employed for solving the problems of design. In different localities of the Old World different races confronted with different climatic and natural conditions reached different solutions. The flat roof is characteristic where there is little snow or rainfall. The sloping roof increases in steepness where snowfall is heavy. In a hot climate window openings are larger and ceilings are higher. In a damp climate houses are built farther off the ground. Where wood is abundant it is likely to be used as a building material. Where clay abounds it is pressed into brick; elsewhere stone may be the prevailing material.

Habits, manners of life and contacts with other peoples also influence design. In all the great migrations peoples have carried their customs in building with them, though they have frequently developed new characteristics under the influence of their new environment. The Roman influence was carried far and wide over Europe and into eastern Asia and northern Africa. But the Roman influence would have meant little to domestic architecture had not the Italian gentlemen of a later day, wishing to give grandeur to their houses, borrowed the arches, the columns and the decorative elements which they found about them in the ruins of Roman civilization. In imitating Roman models the Italian stone cutter became skilled above all others. He was sent for from France, distant England and even Spain, and he put his stamp upon the architecture of the world, for this was the period of the Spanish conquest of the New World and of the English colonizations. When the carpenters of New England sought to give distinction to their houses they used the classic motives that the Italian stone cutters had introduced into England. These motives, which they had known at home as Georgian, they copied in wood, which, excepting brick, was the only material easily available in the colonies. The style that grew out of it is to-day known as Colonial, though it is often confused with the classic revival of the early American republic and its greater use of the column, a movement in which the research of Thomas Jefferson played an important part.

Through the colonial carpenter builders, the traditional domestic cottage of England took on in the United States some of the outward embellishments of the Italian nobleman. But other influences, both racial and economic, have caused interesting developments in America. In New York and New Jersey the Dutch influence was very active; as a result witness the gambrel roof and the upward curve of the roof at the wide eaves. In Virginia, where large estates predominated and brick was the usual material, great formal houses were built with outlying wings. Further south, in Florida, Mexico and South America, the Spanish influence was dominant; it has taken firm root and it is flourishing to-day in those regions that are exempt from snowfall and where protection is needed against bright summer suns. (See MODERN ARCHITECTURE: 18th and 19th Centuries.)

Style Evolved from Efficient Use.—

Style in architecture is equipment for efficient use and is a natural evolution. It is a product of the factors of economics, climate, tradition and natural environment. To-day the lessons of the entire past experience of mankind can be drawn on. This heritage teaches methods for roofing the narrow house, the square house, the house of irregular or formal plan and the long rambling type of house. It need not be slavishly followed, but a person unfamiliar with it trying to design is like a child. He thinks that the ridge of the roof of a square rectangular house must always

be in the centre. He is ignorant of the "salt box" type, built by the New England farmers, where the roof on the north side ran down almost to the ground; or of the extra space the Dutch type of gambrel roof affords where a small compact plan makes it difficult to keep the mass low.

When considering the irregular form of plan it is most important to consider roof treatments and stair locations. Indeed, there are many irregular treatments of roof plan possible with a first floor plan that is perfectly square or rectangular in outline but unsymmetrical within. The lines of the English domestic way-side cottage have been an inspiring guide to modern architects seeking to obtain irregular roof lines. Plans must never be thought of as flat but always as having volume as well as length and breadth. The second floor cannot be planned out of all relation to the floor below; bearing partitions must run through; its windows must be in reasonable relation to the first floor openings. The special consideration for locating the stair is so to place its point of arrival on the second floor that it may easily serve the greatest possible number of rooms without waste of hall space; on the ground floor it must be convenient to the entrance.

It is desirable to locate the dining room and kitchen with eastern exposure so that they will have the advantage of morning sun and yet be sheltered in the afternoon. If possible the kitchen should have cross ventilation. The living-room and porch should be exposed to the prevailing breeze. In a northern climate the less important rooms should be located on the northern side of the house, unless the outlook happens to be to the north. In any case, great care should be taken never to shut off an important room from the benefit of sunlight and the prevailing breeze.

In making any plan it should always be remembered that rooms must be correctly related with regard not only to interior arrange-

FIG. 7.—DESIGN IN WHICH RIDGE IS ON CENTRE. GABLE INTRODUCED FOR HEAD ROOM WHERE RAFTERS START BELOW SECOND STOREY CEILING

ment but also to their proper relation to the out-of-doors. In an irregular plan this is easier to do than in a rectangular or formal plan. Many unsymmetrical interiors were laid out in outwardly formal houses by the builders of colonial Maryland and Virginia. The best modern planners of domestic architecture have learned from the experience of their forerunners. Avowedly irregular plans were not laid out in the early days. They grew as wing was added to wing. Often the arrangement within was most inconvenient. Modern architects have built up irregular plans having all the charm of the outward aspects of the old rambling houses but carefully developed for internal convenience and the greatest benefit of contact with the out-of-doors.

To secure the fullest benefit of the site is one of the most important considerations. Especially is this true of the hillside or irregular site, where very frequently, if cleverly taken advantage of, differences in level may result in real economies of construction because of the practical utilization of space which otherwise might go into an excessive cellar or attic.

Exterior.—Beauty of exterior comes from the correct combination of the factors of mass, material, window treatment, detail and the relation of mass to site. Mass as an element of plan has already been discussed. No beauty of exterior is possible without correctly proportioned masses. If mass is right the house may be beautiful even with inferior detail, but the best detail can hardly make a house beautiful if the mass is wrong. The arrangement of windows, sometimes known as fenestration, when properly handled adds to the play of light and shadows over the wall surfaces. The shapes of both the windows and the spaces between them are important. In the small house where fenestration is successful, ornamentation and enrichment may be omitted altogether and only the simplest of details used. It must be remembered that one of the principal functions of ornament is to introduce the play of light and shade at the proper points (see ORNAMENT, ARCHITECTURAL). That detail which gives too little or too much shadow, or shadow at the wrong place, is bad. For example, most of the heavily shadowed gable-ends commonly seen are badly designed;

FIG. 6.—TYPE IN WHICH THE RIDGE IS OFF CENTRE. THE REAR RAFTERS START AT SECOND FLOOR

their only excuse is that they are a lazy carpenter's way of keeping rain-water from coming through at the top of the gable.

Perhaps as important as any factor that has to do with exterior appearance is the choice of materials. Materials are chosen not alone for their surface texture but for their endurance; their selection, of course, is controlled by the budget. There are many types of wall from expensive cut stone down through rubble, masonry, brick and brick veneer, to stucco, shingles and clapboards.

If the walls of the house are to be of frame construction, there is no wall finish superior to shingles. Clapboards are cheaper but they are not so warm and it costs more to keep them properly painted. Shingles vary in quality and size. Though even red cedar shingles will eventually wear out when used on a roof, as a wall covering they are practically permanent. For insulation, under either shingles or clapboards, it is well to use a good grade of building paper or insulating quilt. The real base for stucco is a masonry wall, but it sometimes gives good results if well applied on a frame house in a climate not subject to extremes. A good form of outer covering for a frame house is brick veneer, though great care must be taken with the flashing. Stucco when applied over hollow tile or other masonry is a far more enduring material than when used over wood. There has been a tendency in recent years to overdo stucco. Variety of texture is desirable but not to the point that it is sometimes carried. A wall of solid brick or other masonry should be furred out on the inside before applying plaster; otherwise there is likely to be trouble from dampness coming through. A brick wall depends for its beauty upon its bond, its colour and the character of the joints. Even though it is not possible to build a whole house of stone a great deal is added to appearance if some stone can be used. In a house of irregular plan it is often especially happy to vary the materials of outside walls.

An exterior feature that must not be neglected is the chimney. Too many chimneys are wrongly located with respect to the roof ridge and are too small to have character. If it can be done in no other way chimneys may be enlarged at the roof line by corbels inside the attic space. Modern chimneys in well built houses are invariably lined with fire clay flues.

Interior Finish.—The interior is that part of the house with which people come most in contact, so not only its arrangement and convenience but also its finish is most important. The usual materials of interior finish are wood floors, plaster walls and ceilings and wood trim for openings. There is a vast difference in possible methods of treatment.

The best plaster is put on in three coats: the scratch, the brown and the white. The final coat may be a fine eggshell finish, an irregular surface or a sand finish. No finish better than plaster has been found for interior walls but it has many disadvantages: it is a very wet, messy job and it introduces moisture into the building at just the wrong time; it delays the work because it stops all other work and no wood trim or finish can be put in until the plaster is thoroughly dry. Therefore, many types of plaster substitutes have begun to come on the market. These range from plaster boards over which the final white coat is applied to other types of board to which paint or wall paper may be applied direct. There are many excellent grades of wall board now on the market, but with all of them there are two defects that so far have been only partially overcome: if broken the walls are difficult to repair; the cracks between the boards are almost impossible to conceal even when thoroughly plastered over with a fine mesh covering strip.

In the house of modest cost, wood panelling and fine carving are not likely to be used. A single panelled wall, if well worked out, will add charm not easily gained otherwise. It is true that we are likely to stain our oak and pine too yellow, our walnut too brown and our mahogany too red, but we are again learning how to finish woods to make the most of their natural beauty. (See WOOD FINISHES; PAINTS, CHEMISTRY OF; VARNISHES.) The fireplace and the stairs are the two points where beautiful wood-work may usually be used in ways that count. A good cornice in one room counts more than meaningless strips arranged around the walls of all the rooms. Mouldings when applied to walls have value principally for the variations of shade and shadow that they

give, and they must be carefully designed or their effect will be lost. Walls are made beautiful by colour, texture and, where paper is used, by pattern in the proper scale combined with colour. Many people are afraid of colour. All colours are relative. Sometimes what seems to be a strong colour is selected for a background but when furniture and hangings are introduced, it pales into insignificance. (See INTERIOR DECORATION.)

Revolt in Style.—With many new materials becoming available, there is little doubt but that new methods of expression will be developed (see ARCHITECTURE). To be different merely for the sake of being different is infantile. To be wise enough to discover more effective methods of building than those that have been tried, and then to put those methods into practice at the risk of being different, is courageous and worthy of applause. A part of the tendency to modernism is a revolt against the use of classic forms in decoration. It is a movement to be commended in so far as it deals with the elimination of unmeaning and unintelligent forms. A movement confronted with the development of new forms, however, must be led by men who are familiar with the aesthetic subtleties of historic ornament, else the whole movement to revolt will be merely a fumbling in the dark, with accidental achievement its only hope of success. New methods of construction and new forms are certain to evolve from the intelligent effort of an alert and virile race. But progress does not come from shutting the eyes to experience and disregarding tradition.

Mechanical Equipment. Plumbing.—There are three parts to any plumbing installation: (1) the drainage system; (2) the supply system; (3) the fixtures.

The *drainage system* is controlled by traps which should always be filled with water. Their purpose is twofold: to prevent things from going down the drain that should not, and to prevent gases from backing up through the drains and creating unhealthful odours in the house. Drain pipes from water closets (known as soil lines) are larger than sink, tub and basin drains. They should be of extra heavy cast-iron pipe rather than wrought-iron or steel. When a water closet is flushed it creates a suction in the pipe sufficient to syphon the water out of traps on the same line. There are two ways of preventing this: by using anti-syphon traps, and by running fresh air vents from all traps to the outer air, which also permits the back gases from the drains to pass off. The system of vent pipes is very expensive but is required by law in most cities. The drainage is not complete until it is connected to a town sewer or an individual cesspool or septic tank and disposal field.

The *supply system* is controlled by valves. The size and material of the pipes is important. Practically all water contains impurities which, to varying degrees, produce corrosion in certain metals. Hot water corrodes pipes more rapidly than cold. Brass pipe does not corrode. Iron and steel pipes even though galvanized tend to corrode. Genuine wrought-iron pipe is the most superior grade of iron pipe and corrodes very slowly, depending, however, upon the character of the water. Pipes in exposed walls should be protected against freezing. Provision should always be made so that the water-supply system may be drained when the house is unoccupied.

The selection of the fixtures is of the greatest importance. There are many different models. Roughly, the materials are of two classes, vitreous china and porcelain enamelled iron. The plumber generally purchases from what is known as a jobbing house, where popular models are kept in stock. Usually there is a long delay if a less popular model is ordered, even though it is carried in the regular manufacturer's catalogue. The plate number in the catalogue describes the fixture complete with nickel-plated, or chromium-plated, fittings and faucets.

There are many different means for heating water for washing: (1) a hot-water back in a coal range; (2) a gas coil; (3) a small auxiliary coal stove; (4) an automatic gas heater; (5) a coil for winter use inside the steam boiler; (6) a steam coil over which the water passes. In all cases a drum or tank is used. The best location is in the cellar. A ground floor bath-room is a better location for the tank than the kitchen.

The treatment of bath-room walls and floors may vary greatly

from wood floor and plaster walls to the more expensive grades of tile for both walls and floor. Different colours, finishes and shapes of tiles are now obtainable. There are also many varieties of tile substitutes.

Heating.—Modern houses are heated far more efficiently than was dreamed possible by our fathers. There are three typical methods: (1) warm air; (2) steam; (3) hot water.

Warm Air.—The air is warmed by passing through the heating apparatus and then delivered through ducts into the rooms. Where conditions are favourable it will work easily, for it is based on the single principle that warm air rises. Cold air currents check or alter the circulation of warm air currents; thus in a long rambling house, the colder the weather the less heat will be delivered to remote rooms. A cheap variation is the pipeless furnace where all the air passing through the furnace comes through one single large register and circulates directly through the rooms instead of through ducts. This works best in a small square compact house.

Steam.—There are various varieties of steam-heating. Water is boiled in the boiler and steam rises through properly sized pipes passing through radiator coils which give off heat to the rooms. The number of square feet of surface of the coil determines the amount of heat given off in each room. Radiators should be so placed as to combat cold air currents where they enter the rooms but with consideration for economy of the piping runs necessary to reach them. Variations in the system depend upon the way the steam is made to circulate. The simplest form is the one pipe up-feed system. The pipes are large enough to carry the rising steam and at the same time the return water caused by condensation of the steam in the radiators. The pipes must be carefully graded so that the water will flow back to the boiler. Also there must be air valves on the radiators to allow the entering steam to force out the air. Care must be taken in grading pipes so that the returning water may not get trapped and thereby shut off the steam. Where a steam system works easily and quickly it will, because of the vapour given off by the warm water, begin to heat up before steam is actually formed in the boiler. This vapour may be made to do the work of the steam by using special quick-acting valves and a separate pipe to return the water to the boiler, and by inducing the vapour to rise quickly from the boiler by creating a partial vacuum in the radiators. This is known as a vapour system; it is really a refinement of a steam system.

Hot Water.—A hot water system is based on the principle that warm water rises. Circulation commences immediately. By varying the fire the radiators may be kept at any desired temperature up to 180° F. Because they never reach the temperature of steam, greater radiation surface is necessary. In other words, in a water job the radiators must be about half again as large as in a steam job, usually larger pipes are required—installation cost is greater. Where space is precious, hot water heat is objectionable. If the circulation is poor a hot water system will not work. Care should be given to the layout of pipes and to connections and branches.

Oil.—Great progress has recently been made in oil burning devices for residences. Oil, as a substitute for coal, is now in practical use in steam, vapour and hot water systems. Different types of oil burners are required, dependent upon whether electricity or gas is used for ignition.

Lighting.—Electricity is sold by the public service companies at different prices, at a lighting rate and at a power rate. Where there is a low power rate, it is worth while considering having the house wired for modern electrical labour-saving equipment.

Electric current is controlled by a system of switches and fuses. The latter are especially important because they will not allow a

greater than a safe current to pass through a given system of wiring. Fuses burn out when they are overloaded; therefore they should always be installed in metal panel boxes protected against fire.

The cheapest form of wiring is known as knob and tube. Most city codes will not allow this method, because the insulation is unprotected. The use of flexible armoured cable is much safer and worth the difference in price. Rigid iron conduit has further advantages, though it is used principally for large scale work. Connections between runs are made at junction boxes, between runs and fixtures at outlet boxes. All electric work should be securely held in position to prevent straining or breaking which might cause a dangerous fire. The connections between fixtures and wiring should be soldered and then wrapped with tape inside the outlet-box.

All sorts of money can be spent on fixtures. Where economy is necessary the modern tendency is to provide a few essential wall fixtures and a large number of base outlets to which standard and table lamps may be attached. (See LIGHTING.)

Calculation of Costs.—The builders think in terms of quantities, prices of materials and the time and cost of labour necessary to put them together. The home owner thinks in terms of the finished product and he is likely to be frequently misled, because he is apt to confuse construction costs with finished product costs, which include also the cost of land and improvements to land, and the cost of financing, sales and promotion. The architect is likely to think in terms of units of construction. His method is likely to be most helpful to the prospective owner. Cost per cubic foot is often used. A modest sized home may range anywhere from 45 to 85 cents per cubic foot. It is more reliable, however, to attempt to assign a cost to each room taking into consideration size, finish and complexities of construction. Taking each unit of the house, such as cellar, halls and stairs, kitchen and pantry, living-room, bedroom, bath-room, etc., it is relatively simple to grade each of these between fairly reasonable limits and thus arrive at an approximately accurate figure for the house.

Finance.—The increase in prices has made it both difficult and inadvisable for the average family to provide all the capital required for a home. For the money borrowed a mortgage is given in exchange. This document records that the owner has transferred his property to the lender as security for the repayment of the debt. After the debt is paid what remains belongs to the owner. This is known as the owner's equity; thus, if property worth \$10,000 is mortgaged for \$5,000 the owner retains an equity worth \$5,000. Very frequently in buying a home, the owner has not enough cash to purchase an equity worth as much as half the value of the property. He therefore desires a higher mortgage. From the point of view of the person who lends the money, however, the risk increases as the difference between the total value of the mortgage and the total value of the property diminishes. Therefore, the owner of the mortgage demands either a higher interest rate for increasing the value of the mortgage, or he requires the owner to go to someone else to borrow what additional money he may need. If this is done, a second mortgage is generally placed on the property, with the result that the owner transfers part of his equity as a security for that mortgage. The scarcity of homes after the World War combined with the increase in prices and the necessary revision of the family budget brought about a general decrease in the size of the equity in the home that the average family was able to afford. The story of housing finance has been the story of the various methods pursued to close the gap between that portion of the home, which could be paid for by this diminishing equity, and that portion covered by the first mortgage loan. The steadily increasing cost of financing has been due primarily to the inability of the modern family to pay cash.

Attention must be given to the need for lessening risks and stabilizing house financing, especially secondary financing. Present methods have in many cases come to amount merely to exploitation, for the high return has attracted capital, which has been poured into the field indiscriminately, giving support to all sorts

FIG. 8.—LAYOUT OF WIRING SYSTEM FOR ELECTRIC CURRENT

of irresponsible and undesirable building projects. One of the most helpful steps that has been taken has been in Pennsylvania, where building and loan associations have been allowed to enter the second mortgage field and loan up to 80% of the value of the property. Under this system the man who can find cash to the amount of one-fifth of the value of his home is assured of obtaining the balance at reasonable rates. The man who has a steady income and lives within it, and is well protected by life insurance is a good mortgage risk; in time such a man will receive the consideration that he deserves, especially if he agrees to reduce his mortgage if he sells the house. The home that is well planned, well built, conservatively financed and saleable is a good mortgage risk, and in time such homes will receive the consideration that they deserve in more liberal loans and lower rates of interest than the badly planned and uneconomic home. At the present time the public is carrying through ignorance a great and needless burden. It will be able to buy better homes for less money and subject to lower carrying costs when it is intelligently informed in regard to house planning and housing finance. See also BUILDING SOCIETIES.

HOUSE SPARROW (*Passer domesticus*), a bird characterized by its attachment to human habitations; it destroys noxious insects, but in part counterbalances this by its ravages on crops. Its range extends to northern Scandinavia and Russia.

In the years 1860-66 more than 200 house sparrows (called, in America, English sparrows) were brought to New York, where they established themselves and began to spread. By 1928 the house sparrow had found its way to every State and much of Canada. The house sparrow was introduced by Sir W. Buller to New Zealand, to combat a plague of caterpillars. It was also introduced into Australia, and has multiplied immensely in both countries. The house sparrow is rapidly spreading eastward through Siberia, as cities multiply. It was introduced into Greenland, but soon became extinct there. The closely allied tree sparrow (*P. montanus*), distinguished by a brown cap, takes the place of the house sparrow in the cities, in part of Europe and Asia.

HOUSING. The word housing has a general meaning covering conditions and statistics applying to all the dwellings of the community. The word has also acquired more limited and special meanings. It is used to refer to the problem created by deficiency in number, or defects in condition of the dwellings which are available for the poorer members of the community; and in a more technical sense it is employed to signify the housing of the working classes undertaken under the various acts of Parliament which have been passed to deal with the problem.

I. INTRODUCTORY

A housing problem, which differs in character from other problems due to poverty, has arisen so generally in modern civilized countries, that it is worth while to consider what are the various conditions in connection with dwellings which together account for the fact that the housing problem differs in kind as well as in extent from problems arising from lack of food, clothing or other necessities of life.

High Costs: Permanence: Rent.—The three most important of such conditions are:—

1. The high initial cost of even the smallest family dwelling which will satisfy modern standards.
2. The permanent and immovable character of houses when erected.
3. The custom by which the majority of consumers of this particular commodity borrow their house, instead of buying it, paying for it a periodic rent.

The cost of even a small modern dwelling is quite beyond the reach of the vast majority of those who set up a family home. Many will not accumulate during their lifetime a capital sum sufficient to secure the unencumbered ownership of a small dwelling. Many others who might raise the cost have other more tempting uses for their capital, or prefer not to hamper their mobility by the ownership of their house. Owing to the high cost, the majority of occupants must depend on living in dwellings built by those who have command of capital; many prefer to do so.

The permanence of the structure, and the impossibility of moving it from place to place, further differentiate the dwelling from other necessities, and in fairness to the earlier tenants, involve that the repayment of the capital cost be spread over a very long period. The greater part of each rent payment consequently represents interest on the capital invested, or other current outgoings, and only a small portion represents an instalment paying off the capital cost. Periods of twenty to thirty years are commonly adopted for systems of purchase by instalment, while forty to sixty years are usual over which to spread the repayment of loans for housing purposes to public utility societies and local authorities. Even these longer periods do not represent the full life of a well built dwelling house; many last for centuries; and it is commonly accepted that the average useful life of small dwellings built during the last century may be taken at about eighty years. This long period of use or consumption gives opportunity for the play of many factors disturbing to the value, or rent-earning capacity of dwellings; these involve the owner in risks which hardly arise in connection with other classes of products bought and sold across the counter. Considerable changes in the standard of living, of accommodation and of sanitary equipment may take place during the life of the building. The general introduction of internal plumbing and sanitary conveniences, the more recent provision of bathrooms, together with the demand for more sleeping accommodation, and a greater degree of amenity and air space about dwellings, are examples of the changes which have been operative during the last half century. The character of localities also changes; centres of employment may cease to operate, or move to other districts, leaving houses no longer wanted. On the other hand extensive new industrial development may take place in the immediate neighbourhood of good houses bringing dirt and confusion; and the dwellings may become less attractive to good tenants than when they were erected. This may be followed by a general depreciation of the character of the neighbourhood and the value of the houses. Apart from such cases, the influx of a few rowdy or dirty tenants has sometimes proved sufficient to create bad conditions which spread from dwelling to dwelling driving away better tenants and resulting in a general depreciation of the property. The makers of all products and those who deal in them take the risk of changes in value occurring during the course of production or sale; but the long life of a dwelling house involves risks of a quite different order. During the last half of the 19th century, when conditions in Great Britain were fairly stable, there were three tendencies noticeable which affected the rent of dwellings. The standard of accommodation tended to improve; such a tendency might depreciate the value of houses old enough to fall materially below the current standard. The rate of interest on capital tended to fall; thus reducing the rent required to give a remunerative return on a given outlay per house. On the other hand the cost of erecting new dwellings tended to increase, involving an increased rental per dwelling. The financial disturbances caused by the Boer War and other reasons arrested the fall in the rates of interest. Apart from such disturbances it is probable that similar

tendencies would operate during long periods of fairly stable conditions.

The supply of small dwellings has seldom for long exceeded the demand and has frequently been insufficient to meet it, and during the period referred to the value of the older cottages has on the whole risen in sympathy with the rentals of the newer ones to a greater extent than it has been decreased owing to inferior standard or reducing rates of interest; and it is generally true that rent of dwellings gradually rose during that period. This fact among others caused cottage property to be regarded generally as a profitable investment. Various changes in legislation, in the character and equipment expected for dwellings, and in the consequent responsibilities of the owners, were having the effect before the war of diminishing the relative attractiveness of this class of investment. The concurrent increase in alternative openings for the small investor to place his money with reasonable security and return has been an important element in this change. Violent fluctuations in rates of interest, cost of production, and values of money, such as have followed the Napoleonic wars and the recent World War, introduce quite new factors. Periods arise in which the cost of building and the rate of interest which must be paid for capital are so high, and their maintenance at these rates so improbable, that even if adequate rentals could be secured at the moment, there must be considerable risk that such rentals could not be maintained. It must be anticipated that the return to stable conditions in the world will result in a rapid fall in costs and rates. Consequently there will be no prospect of maintaining rents over a sufficient period to repay the capital cost with interest, in competition with dwellings erected at lower cost with cheaper capital.

The permanence of dwellings also brings into play the powerful influence of custom. The regular payment of rents over a long period sets up a customary standard of value. A certain rental, say six shillings a week, becomes habitual; and any higher rent than the customary one is regarded as exorbitant. This influence is one of considerable strength in many places, tending to obstruct the adjustment between rentals and the cost of production or rate of interest. The continuance of low customary rentals for estate or tied cottages in many rural areas has greatly increased the difficulty of securing or maintaining the needed houses for the working classes. The conditions arising from the permanence of the dwelling are intensified owing to the impossibility of moving it from place to place. Many circumstances constitute the ownership of his dwelling by the occupier a considerable tie: the majority of men frequently change their place of employment. Change of ownership is liable to involve capital loss on each occasion: it is difficult to realize on a forced sale of a single house as good a price as that which the purchaser had to pay when he desired to obtain possession of it. The expenses of sale and transfer are also considerable. Ownership, moreover, involves responsibility for upkeep and liability from time to time for comparatively heavy outlays for repair or adjustment to changing conditions. Many of these expenses fall with special weight on the owner of one dwelling, while they are more easily provided for by the property owner who can average the risks, and deal with larger blocks of houses, reducing considerably the incidental expenses per dwelling. These reasons tend to restrict the number of people willing to own their own dwellings. On the other hand, occupying ownership promotes care for the dwelling, tends to reduce maintenance costs, and confers a degree of stability and responsibility on the owner which constitutes an education in citizenship, and from many other points of view is eminently desirable.

Hiring of Houses.—Arising out of the conditions already described there has grown up the general custom of hiring dwelling houses. Peasants have usually hired from the landowner; in the case of agricultural labourers frequently through the farmer; while in urban areas property owners have supplied the need regarding the building and letting of dwellings as a sound investment. As regards those occupiers who rent houses for convenience rather than from necessity, the system presents little difficulty in normal times. If in any place or period conditions temporarily render the provision of dwellings to let not sufficiently attractive,

such persons, if need be, can build for themselves. As regards the majority of people who must depend on renting dwellings the position is, however, different. Property owners will only provide dwellings in numbers and of a character for which they can see a reliable prospect of securing remunerative return. That means rentals adequate to pay the interest on the outlay, to provide a sinking fund to repay the capital cost, and leave something to cover insurance against the many risks involved. Where such prospect does not exist, house shortage is likely to arise.

The increasing standard of accommodation, sanitary equipment, or amenity, is one which is set by the community generally. Unfortunately it does not always represent an effective demand on behalf of poorer tenants. Occupants become accustomed to inferior conditions in dwellings, and easily sink to a low standard of cleanliness and decency. There are, especially in large towns, numbers who will put up with inferior accommodation rather than pay a small additional rent for better dwellings. Considerable numbers of obsolescent houses tend to linger in use by such tenants after the period when they should be destroyed as being below the minimum standard of the day. Public opinion and the sanitary authorities seek to enforce improved standards; on the other hand, among a large section of the population an effective demand, at rents which would render the provision of dwellings up to the improved standard remunerative, does not exist. The individual property owner cannot take the risk of providing up-to-date dwellings in excess of the effective demand. It is these conditions which give rise to the housing problem: how to secure the erection of sufficient dwellings of an up-to-date standard for the poorer sections of the community, so that the demolition of dwellings no longer considered fit for occupation may proceed, and the occupants be removed from the unhealthy and degrading conditions which the tenancy of such dwellings involves. To solve this general housing problem many efforts have been made by legislators and philanthropists; but before referring to them it is desirable to touch on the special housing problem created by the World War which has overshadowed and in a sense absorbed the general problem.

General House Shortage.—In many countries the cessation of house building was almost complete for periods varying from four to six years. Naturally there resulted a shortage of all kinds of houses. Exception should perhaps be made of those at the larger end of the scale; for the general reduction in personal means, owing to war losses, monetary depreciation or taxation, has reduced the effective demand for the larger houses below pre-war level, which has incidentally tended to increase that demand for the middle class of houses. Not only was this shortage of exceptional character, but the difficulties of making it good were unusually great. The mobilization of much skilled building labour for war, or war work, the losses occurring among these craftsmen in the belligerent countries, and the transference of many to other occupations greatly reduced the amount of trained labour available for the work. Recruitment of apprentices to the various crafts also practically ceased, normal wastage was not made good, and at the end of the war the belligerent, and to a less extent some of the neutral countries, were faced with great shortage of dwellings, with large arrears of repair work to existing buildings, while only a much reduced staff of skilled workmen were available to undertake the greatly increased volume of work. Similar conditions existed in other industries. It is not surprising therefore that the cost of building rose; and that the extent of the rise was increased by the general rise in the cost of living and the consequent addition to the rates of pay.

In view of the fact that such high prices were deemed to be temporary, it was impossible to finance the building of houses to let, even if remunerative rents had been for the moment obtainable, and for a large section of the community they were impracticable. The proportion which could be borrowed on mortgage was reduced in the face of such inflated prices; consequently, the fortunate section who had benefited by the war industries and who had ready money accumulated could alone afford to buy or build dwellings. The demand for houses for the middle and working classes was quite abnormal. The middle classes, the clerks

and the skilled well paid artisans, were as much affected by the shortage as the unskilled labourers or the very poor. The returning soldiers found all the existing dwellings occupied and their demand for homes intensified the need. These conditions constituted a quite special housing problem, different not only on account of its magnitude, but also because of the general character of the shortage, from the housing problem existing in pre-war days, which there is reason to fear may still remain to be dealt with after the special shortage due to the war has been made good.

II. EXTENT OF NEED

After the war it was still hardly possible to gauge the extent of the actual shortage of houses in Great Britain, or of the effective demand for them which would arise on demobilization. Many estimates of the need were made, varying from 300,000 up to 1,000,000, depending much on the standard that was adopted in regard to the condemning of old houses. Accurate estimates for the decay and demolition of dwellings are difficult to make at any time. Moreover, it was not easy to estimate the number of post-war families which would need separate dwellings. After the census of 1921, however, figures were available for the number of separate dwellings and families or units of occupancy, which could fairly be compared with those recorded in the 1911 census. Such comparison affords, perhaps, the best foundation available for comparing the need of dwellings at the census periods and indeed at any intermediate date. The relative figures from the two census returns are as follows:—

	No. of separate families	No. of separate dwellings	Dwellings per 100 families	Empty dwellings
1911	8,065,290	7,753,000	97·6	434,048
1921	8,739,197	8,030,000	91·9	215,215

Dwellings and Families.—It will be noticed that the number of separate dwellings available for each hundred families fell from 97·6% to 91·9%. On the same standard of accommodation as shown in the 1911 census there should have been 8,529,456 separate dwellings in 1921 showing a relative shortage of 499,456. In other words 8,529,456 separate dwellings would have been required in the 1921 census to show the same relation between the number of separate census family units and the number of separate dwellings as recorded in 1911. It will be realized that separate families for census purposes has a special meaning; and while its character may vary from census to census it does appear to have some relation to the units of population requiring separate dwellings. The number of empty dwellings recorded in 1921 on the night of the census is less by 215,215 than the number recorded in 1911. This seems to indicate that the intense pressure for housing accommodation known to exist in 1921 had the effect of reducing the number of empty dwellings from 434,048 to 218,833. From one point of view it may be regarded as surprising that the reduction in empties was not greater; on the other hand, it must be remembered that the empties for census purposes include dwellings temporarily closed while the occupants are absent on holiday or for other purposes. The number of empties in the 1911 census was still greater (448,832), and in view of the smaller number of dwellings then in existence the proportion of empties would be somewhat higher than the difference in the figures show. It is not possible to estimate with accuracy what figure for empty dwellings on the basis of the census return can be regarded as adequate in normal times to allow for dwellings from which the occupants are temporarily absent; to provide for empties during changes of tenancy; to allow for the reasonable mobility of the workers; for periods when houses are undergoing drastic repair, or are about to go out of use; as well as those which may be caused locally by definite changes in the distribution of population. Perhaps the figure will lie somewhere between the number shown in the census of 1911 and that shown in the census of 1921. When, moreover, it is realised that the 1911 census recorded 3,129,472 people as living in an overcrowded condition, that is, more than two people to the room, it would seem safer

when comparing the conditions with those existing in 1911 to accept the proportion of empties at that period as forming part of those conditions; and an estimate of the need of dwellings in 1921 based on the number required to restore the condition of housing generally as in 1911 can hardly be regarded as other than a moderate standard to take as a measure of the post-war housing problem.

Taking into consideration the number of unoccupied dwellings that there must be at any time, the number of people who own week-end cottages or in other ways occupy more than one dwelling, and the extent of overcrowding still existing, bearing in mind also that the small size of some of the existing dwellings renders them inadequate to provide for families of average size; many housing reformers would be inclined to set off the number of empties against the limited number of cases where it is desirable for two families to occupy one dwelling, and would like to aim at a condition which would be shown if the census returns gave the number of separate dwellings equal to the number of separate families. It should be realized that neither the standard of the 1911 census, nor the standard of one family one dwelling accurately represents the actual need of new dwellings in order that the people of Great Britain may be properly housed; nor, on the other hand, does it indicate the effective demand for dwellings; that is, the number which if built would be immediately occupied by people who could afford to pay the rents at which the houses could be provided with the present financial assistance, building prices and rate of interest.

Reference has already been made to the number of people living in an overcrowded condition, based on the standard of two persons per room. This number increased from 3,139,472 persons in 1911 to 3,580,274 persons in 1921. The increase of density of room occupation, which shows the pressure on house space in 1921, is not however spread over the whole range of dwellings, but is chiefly found in the one-roomed dwellings. It should be realized that between the census periods the average size of families recorded for census purposes has fallen, the figures being as follows:—

Persons per family in all families	1911	4·36
" " " " " those families occupying dwellings of one to nine rooms	1921	4·14
Persons per family in those families occupying one to nine rooms	1911	4·52
	1921	4·35

Density of Occupation.—The following tables indicate the comparison of density of occupation at the time of the two census periods, both in terms of occupants per room and rooms per occupant, from which it will be seen that the reduction in the size of family is reflected in a reduced density except in the case of one roomed dwellings, where the greatest overcrowding is found.

Further interesting comparison is that between the percentage of families at the two census periods occupying dwellings of various sizes. The general move down in size of dwelling per family as the result of the war, and partly perhaps also as the result of the average reduction in the size of the family unit, is apparent. The total of 11·5% of families occupying dwellings of 1 and 2 rooms and of 25·3% occupying dwellings of 1 to 3 rooms suggests a considerable population living in very inadequate dwellings.

The above figures taken together, indicating to some extent the degree of overcrowding in existing dwellings, show that even if the number of dwellings were brought up to the 1911 standard, or to the standard of one dwelling one family, it might still be found that there were in existence too many dwellings defective in character or providing inadequate accommodation for the size of the families.

A fairly accurate record of all dwellings erected year by year in England and Wales since the census of 1921 is available, the total to the end of March 1928 being 1,020,123. No such accurate figures are, however, available for the wastage of houses due to demolition on account of old age, to removal to make way for the expansion of the business and industrial quarters in the grow-

England and Wales: Average Occupants per Room and Rooms per Occupant in Dwellings of the Following Number of Rooms

Decrease - . . .										

ing towns, or for the making of new roads, railways or other public works. As regards wastage from old age an estimate is sometimes made based on the assumption that the houses built during the 19th century may be given an average effective life of from eighty to one hundred years. Such an estimate must rest solely on general observation and judgment. Taking it however for what it is worth, the number of additional families which would fall to be provided for eighty years ago would be in round figures 40,000 per annum, and assuming on the average that the number of houses built would bear a fairly close relation to the increase of population, if the average age is taken at from eighty to one hundred years, something like that number of houses should be reaching the limit of their useful life each year. To this figure would need to be added those demolished for other reasons, here again only a conjectural estimate can be made. If that be taken at five thousand houses per annum demolished for all other purposes than old age, a figure would be reached of forty-five thousand houses per annum needed fully to maintain the desirable supply of housing, in addition to any needed to provide for a growing population.

Increase of Dwellings.—Records of the number of houses built year by year before the war are not available; but the returns as to inhabited houses duly show the net increase in the number of dwellings yearly from 1900 to 1914 as follows:—

1900	122,578	1908	126,569
1901	117,146	1909	96,251
1902	108,034	1910	29,532
1903	118,681	1911	89,778
1904	115,409	1912	57,039
1905	129,842	1913	59,312
1906	101,674	1914	67,577
1907	59,193		

These figures, which do not include houses built to replace those destroyed but only the net increase in the total number of dwellings assessed, do not suggest that an allowance of rather over 100,000 new dwellings per annum for all purposes is likely to prove an unreasonable one.

Houses and Families.—On the basis of the above estimates, and with a full realization of the numerous factors about which there is considerable uncertainty, it may, nevertheless, be worth while to assess the position in England and Wales at the end of March 1928. An estimate of the probable number of separate families on the census basis for that date gives a figure of 9,208,500; adding to the number of separate dwellings, shown in the 1921 census, the number built and deducting for wastage of houses for six and three quarter years at the rate of 45,000 per annum given above; the following figures would be arrived at as an indication of the number of dwellings needed at the end of March 1928 (a) to restore the position as in the 1911 census, which may perhaps be regarded as the special war problem, or (b) to provide the number of dwellings on the standard of one family one dwelling:—

Estimate of separate Families as at March 31, 1928	9,208,500
Standard of 1911 Census 97.6 dwellings per 100 families: 97.6% of 9,208,500 families=separate dwellings	8,987,496

Separate dwellings recorded in 1921	8,030,000
Built between 1921 and March 31, 1928	1,020,123
Gross total dwellings	9,050,123
Less wastage estimated, 6½ years at 45,000	303,750
No. of dwellings estimated at March 31, 1928	8,746,373
Deficiency on 1911 census basis dwellings	241,123

To give one family one dwelling:—

Family units at March 1928	9,208,500
Dwellings " " "	8,746,373

Required to give one family one dwelling standard dwellings 463,127

If this estimate were correct it would indicate that at the end of March 1928 sufficient houses had been built to meet current needs year by year and to contribute 258,333 dwellings towards the war time arrears. Moreover, if it could be assumed that the 215,215 less dwellings recorded as empties as compared with 1911 represented the condition also at March 31, 1928, and that this reduction in empties did not represent houses occupied which ought to have been empty on account of unfitness or other good reason, there would then be shown a deficiency of occupied dwellings as compared with 1911 of only 25,908. Such assumptions would be very unsafe, however, in face of the general evidence as to the extent of the need still remaining in the spring of 1928.

While these figures may be useful as giving a rough estimate of the position, too much reliance must not be placed upon their accuracy owing to the uncertainty about the wastage of old houses and other factors. Nor should the assumption be made that if the deficiency, on the 1911 basis, whatever it may actually be, could be made good at once, there would be an effective demand for so large a number of dwellings. The extent and duration of unemployment existing in Great Britain must be borne in mind; a large number of people have become accustomed to the inconvenience of two families living in one dwelling. The number of new dwellings which these families would be willing to take up at the rentals at which they can be provided, even with the present financial assistance, can only be approximately gauged by the definite demands for new dwellings of which the various local authorities have records.

The need for housing accommodation and the pressure on existing dwellings are affected not only by the rate of increase in the population, but also by the average numbers in the separate families. The tendency which has for some time prevailed for

the average number of persons per family to diminish, increases the number of dwellings needed to provide for every thousand of the population. On the other hand, the same tendency to smaller families is likely to reduce the extent of overcrowding in existing dwellings or rooms.

Allowing for the diminishing increase in the population, and making due allowance for the increasing number of dwellings which will annually reach the estimated limiting age of 80 years in the future, it seems probable that the annual need for new dwellings will for long lie in the neighbourhood of 100,000 per annum, and may prove somewhat less. To this figure something may need to be added for the clearance or improvement of slum areas if not adequately covered by the allowance made for wastage. During the last few years the building industry has been erecting houses at a rate considerably over 200,000 per annum. A sudden drop from such a figure to an output of 100,000 would be serious for the industry. While it is desirable that the deficiency in dwellings should be made good as rapidly as possible, time should be allowed for a gradual slowing down to the normal figure so that such sudden drop in production may be avoided.

The next census return of 1931 will show how nearly the forecasts are confirmed by the facts and should enable a much closer estimate of the then remaining problems to be made.

III. MEASURES OF RELIEF

While no accurate estimate could be made of the shortage of houses with which Britain would be faced at the end of the World War, the fact that a serious problem would arise had been foreseen; and it was realized that the resources of the country would be severely taxed to make good the deficiency. In the same way, though it was impossible to forecast the extent to which building prices and rates of interest would rise, it was evident that, under the conditions likely to prevail at the close of the war, it would not be possible to build small dwellings to let on an economic basis, and that on every such house erected until conditions again reached a level of pre-war stability, a loss must be faced. Unless that loss could be made good by public funds it was clear that no houses would be built to let.

The working of the Rent and Interest Restriction Act, necessary to prevent a general increase in the rents of existing dwellings, undoubtedly tended in some cases to increase the difficulty of providing new houses. Several committees appointed by the President of the Local Government Board and the Minister of Reconstruction made a study of the problem, and of the alternative methods for dealing with it. Reference may be made to the following published reports dealing with various aspects of the matter:—

Memorandum by the Advisory Housing Panel of the Ministry of Reconstruction. Presented October 1917. C. 8. 9087. Published 1918. Interim and final reports of the Women's Housing Sub. Cd. 9166. Committee Ministry of Reconstruction, 1918-19.

Report of the Housing (Building Construction) Committee C. 9166 (known as the Tudor Walters Committee), 1918.

The method adopted and embodied in the Housing Act of 1919 imposed upon the local authorities the duty of preparing housing schemes for their areas providing for the building, as soon as possible, of the number of houses needed to house the working classes in their districts. Each local authority was required to make a survey of its needs and report the result to the Local Government Board, soon to become the Ministry of Health. To meet the annual loss, *i.e.*, the difference between the net revenue from the rents which could be charged for the houses, and the outgoings for interest, repairs, sinking fund, etc., the Government undertook to bear on behalf of each local authority during the period of the loan, the annual deficiency resulting from approved expenditure in so far as it should exceed the annual proceeds of a local penny rate, which was to represent the contribution of the local authority towards the loss.

Included in the scheme could be improvement or slum clearance schemes made under Parts I. and II. of the Housing Acts, and the loss incurred in these was treated as part of the scheme for the purpose of assessing the Government's contribution.

Financial assistance was given on a comparable scale though in

different form to public utility societies. In a later act, to encourage private enterprise, a subsidy in the form of a lump sum grant per house was offered to private persons building houses within prescribed limits of size and specification of character. As a result of this scheme about 170,000 houses were erected by some 1,274 municipal authorities, 4,500 by public utility societies, and 40,000 by private persons or builders. The progress of the

FIG. 1.—DIAGRAMS OF PROGRESS AND COST IN THE 1919 HOUSING SCHEME, INDICATING THE VARYING LOAD THROWN UPON THE BUILDING INDUSTRY BY THE SCHEME AND THE FLUCTUATIONS IN THE AVERAGE PRICE OF TENDERS APPROVED MONTH BY MONTH

housing scheme is summarized in the following diagrams indicating the fluctuation in production and in cost. (*See fig. 1.*) In regard to the contracts placed by municipal authorities, progress during 1919 was slow. Prices tendered for houses gradually rose, concurrently with the increased demands upon the industry, and with the general rise in the cost of living, rates of wages and prices of building materials. The peak of prices was reached in the summer of 1920 from which time a general decline commenced. This was mainly due to the check which high prices produced in all classes of building other than domestic. Men and materials were liberated for housing work so rapidly that in spite of the increasing numbers put in hand during the autumn of 1920 and in 1921, prices continued to fall. The exercise of greater caution in loading the industry, and stricter control of the prices approved, helped materially to bring about the downward tendency during the autumn of 1920.

In the spring of 1921 conditions of financial stress brought about a change of policy; the expansion of the housing scheme was checked, and in the summer of 1921 the scheme was terminated by a decision to limit the number of houses to be erected under it to a maximum of about 175,000. This curtailment and ultimate stoppage of the scheme intensified the fall in prices which had previously set in, and which already affected many other national products. The fall in building prices ultimately stimulated the production of houses for sale, and other branches of

the building industry; but as regards the smaller dwellings for the working classes, few new houses were put in hand to take the place of the subsidized contracts under the previous housing scheme, which were rapidly being completed during 1922. Towards the end of that year the housing position was again becoming acute; the number of houses to which the first scheme had been limited, did not suffice to keep pace with the annual growth of the housing need since the end of the war, and had done nothing to meet the accumulated arrears of the war period. Even at the comparatively low prices then available for the small number of houses being put in hand, it was evident that without some form of financial assistance dwellings for the working classes could not be erected to let. In the spring of 1923 a new act was promoted by the Minister of Health under which a subsidy was again offered, but on quite different conditions.

Under the 1919 housing scheme, while the local authorities were made responsible for building houses subject to the approval of the Local Government Board, the contribution towards the loss on the dwellings which they had to make was limited to the proceeds, year by year, of a penny rate; and the Government had undertaken to make good the remainder of the loss by an annual subsidy to the local authorities which was thus unlimited. The amount of the penny rate representing in most cases a very small proportion of the loss, the position was soon reached that the whole of the further loss on the schemes being dealt with fell upon the Government, who had only limited means of controlling the expenditure under contracts made between the local authorities and the builders. Such a position was administratively one of great difficulty; on the one hand it gave little encouragement to economy on the part of the local authorities; on the other hand it sometimes promoted the cutting down of the standard of building as a means of reducing the price and so securing the approval of the Government to contracts very advantageous to the local authorities. In the Housing Act of 1923 the position was reversed. The Government undertook to give a definite and limited contribution of £6 per annum per house for a period of twenty years towards the loss which the local authorities might incur in building houses, the latter taking all risk of further loss. Moreover, to encourage private enterprise, the local authorities were authorized, under schemes to be generally approved by the Minister of Health, to give assistance to builders or others wishing to erect houses suitable for the working classes. This assistance could either take the form of passing on to the builder the £6 per year for twenty years, which they would receive from the Government, or the local authorities could, on the security of this payment, raise the equivalent sum, about £75, and give it as a capital grant to the builder. They were further empowered to increase the amount of the grant at the expense of the local rates. Many local authorities did in fact pay lump sum grants of £100 or even more per house.

Provision was also made in this act for subsidizing in a new form slum clearance schemes. In addition to approving loans, the minister was authorized to make grants towards the expenses incurred by local authorities in carrying out improvement schemes, and the consequent re-housing work, under Parts I. and II. of the Housing Acts. The amount of the grant which was to take the form of a fixed annual contribution was to be settled in each case by consultation with the local authority but was not to exceed 50 per cent of the estimated average annual loss likely to be incurred in carrying out the scheme. While contributions have varied, the full 50 per cent has usually been paid in respect of approved schemes.

Additional powers were also given to local authorities to assist private enterprise by way of loans to builders of houses not exceeding £1,500 in value. The Small Dwellings Acquisition Act was amended so as to facilitate loans to owner occupiers for houses not exceeding £1,200 in value. Guarantees to building societies were also authorized so that local authorities could facilitate their operations if they so desired.

The scheme began to produce considerable effect in the autumn of 1923 by which time about 10,000 houses, qualified to

receive assistance under the new scheme, were being constructed; this number rose to about 50,000 in the summer of 1924. The new Labour Government which was then in power considering that the act had not adequately stimulated the building of dwellings to be let to the poorer classes, introduced a further housing act known as the Housing (Financial Provisions) Act 1924. This act left the provisions of the 1923 scheme untouched except as regards one or two minor details of the conditions. Its operation was indeed continued for a period of 15 years, subject to periodic revision as to the amount of the subsidy. In addition to the terms of the former act however it created a new form of financial assistance in the shape of an increased subsidy given for houses built under covenants that they were not to be sold, but to be let under special conditions. The most important was that so long as the annual charge on the rates did not exceed £4 10s. per house, houses should be let at rents not exceeding the rent of similar pre-war houses for the time being prevailing in the district. Since 1924 both these schemes have been running concurrently. The 1923 scheme, with its provision for a lump sum grant and its freedom to sell, has naturally proved the more attractive to private enterprise, while the 1924 scheme which authorized a subsidy of £9 per year for forty years in urban areas

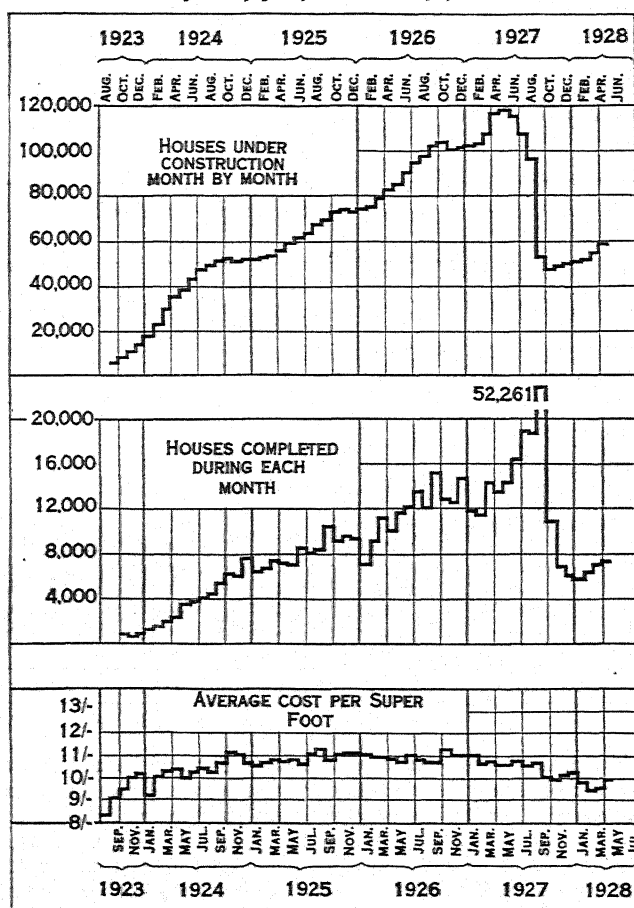

FIG. 2.—PROGRESS AND COST DIAGRAMS IN THE 1923 AND 1924 HOUSING SCHEMES, SHOWING THE TOTAL NUMBERS OF HOUSES UNDER CONSTRUCTION AND COMPLETED MONTHLY AND THE FLUCTUATION OF THE AVERAGE TENDER PRICES FOR MUNICIPAL HOUSES REPORTED

and £12.10s. for agricultural areas for the same period, has proved more attractive to local authorities. They were in a position to comply with the conditions as to letting; and could limit the rents to the required amount by meeting any additional loss out of the local rates. Under the terms of the act they are required to do this up to, but not exceeding, an amount of £4.10s. per annum. After this, if a further loss would be entailed, owing to the relation of local costs to prevalent rents, these rents may be increased sufficiently to keep down the contribution from the local rates to the figure of £4.10s. per annum. The numbers of

houses built under these two schemes grew rapidly until the end of Sept. 1927, when the first revision of the subsidy took effect. All houses completed after that date were eligible only for a reduced subsidy of £4 per house for twenty years under the 1923 Act, and, under the 1924 Act, £7.10s. per house for forty years in urban areas and £11 2s. 6d. in agricultural areas. The general progress of the 1923-24 housing schemes is shown by diagrams which may be compared with those for the 1919 scheme. (See fig. 2.)

Previous to the outbreak of war in 1914 the actual contribution to the number of houses erected year by year made by local authorities was very small. The vast majority of houses were erected by private enterprise without any public assistance. Voluntary agencies, such as building societies, co-operative and co-partnership societies of various types, were contributing an increasing number of dwellings and were particularly influencing the type of houses and the standard of lay out and amenity. But apart from the building societies mainly financed by private enterprise, the volume of building by all these agencies was relatively small. The war conditions had the effect of bringing private enterprise building practically to a standstill, and not until some years had elapsed were conditions such that private enterprise gradually resumed its activities. The following table indicates the relative number of houses built since the war with or without financial assistance from the Government or local authorities, houses built with assistance, and are divided into those built by municipalities and those by private enterprise:—

the Minister to deal with special cases.

In regard to the subsidy for private persons under the 1923 and 1924 Acts, local authorities have been given considerable freedom to adapt schemes to local circumstances; but they have been encouraged to include conditions calculated to check the misuse of the subsidy, such as, the control of the further sale of dwellings within a period of years, or the limiting of the right to alter or extend the building within a like period, and the fixing of maximum selling prices. This latter was subsequently made an absolute condition for earning the grant.

Slum Clearance.—Apart from the provision of additional new dwellings, a commencement has been made with the clearing of unhealthy areas. In spite of the priority given to the erection of new dwellings to increase the total supply, up to the end of January 1928 the following progress had been made.

No. of houses (including shops or other buildings) in schemes confirmed	14,135
No. actually acquired	9,280
No. demolished	5,164
Total number of persons required to be rehoused in connection with schemes confirmed	68,427
No. of dwellings for which loans have been sanctioned	8,377
No. completed	5,887

Some idea of the volume of work undertaken by local authorities in connection with the inspection of dwellings, the repair of those found defective, and their closing or demolition, may be gathered from the following particulars given in the *Annual Report* of the Ministry of Health for the year 1926-27:—

England and Wales

*(Six months to March 31 approximate.)

Maximum and Minimum Sizes.—It should be added that in order to secure the erection of suitable types of dwelling, maximum and minimum limits of size were fixed in the Housing Act of 1923 and were maintained in the 1924 Act. The limits fixed were, for two storey houses, a minimum floor area of 620 square feet with a maximum of 950 square feet; and for one storey houses or flats a minimum of 550 square feet and a maximum of 880 square feet. The areas are measured over all within the main containing walls of the dwelling, and where there is more than one floor the combined areas are taken. Some discretion is allowed to the Minister in special circumstances to permit houses 50 feet smaller than the minimum figures given. In the 1923 Act, houses were required to be provided with a bath, and in the 1924 Act the words were added "in a bathroom." Here again some discretion is allowed to the Minister to dispense with this requirement in special cases, as for example in rural areas where adequate water supply and drainage facilities may not exist. Under all the schemes a requirement that houses shall be built at a density not exceeding twelve to the acre in urban areas and eight to the acre in rural has been generally operative, discretion being left to

During the year under review reports by Medical Officers of Health were received for the year 1925.

In 1,677 districts for which returns were tabulated, 428,625 houses were inspected under the Housing (Inspection of District) Regulations, and the total number of houses inspected, including inspections under the Public Health Acts, was 1,114,504. Defects in 279,407 houses were remedied without the service of formal notices. Notices under section 28 of the Housing, Town Planning, etc. Act, 1919, or section 3 of the Housing Act, 1925, were served in respect of 24,369 houses, and of these houses 18,961 were rendered fit by their owners, and 785 by the Local Authorities, while in 463 cases the owners gave notice of their intention to close the houses. Notices were served under the Public Health Acts in respect of 278,894 houses; in 225,058 of the houses the defects were remedied by the owners, and in 4,285 by the Local Authorities.

The figures as to Closing and Demolition Orders were as follow:—

Representations made with a view to Closing Orders	3,141
Dwelling houses in respect of which Closing Orders were made	2,287
Closing Orders determined after houses were made fit	443
Dwelling houses in respect of which Demolition Orders were made	549
Dwelling houses demolished in pursuance of Demolition Orders	678

THE SLUM ALLEY OF THE OLD TYPE, AND MODERN HOUSING SCHEMES

1. A slum alley. Post-war housing schemes in England and Wales are designed to abolish such conditions, and many slums have been replaced by developments of the type shown in figs. 2-4
2. A new village showing the ample roadway and garden space, features of modern town planning

IV. STANDARDS OF DEVELOPMENT AND ACCOMMODATION

The general limitation of the density of building to 12 houses to the acre in urban and 8 in rural areas has proved perhaps the most valuable as it has been the most characteristic feature of

FIG. 3.—THE DIAGRAM SHOWS THE OLD TYPE OF DEVELOPMENT OF 224 HOUSES ON 10 ACRES OF LAND WITH ROADS OF BYE-LAW WIDTH AND CONSTRUCTION

post-war housing. It has greatly added to the economic ability of the tenants to pay rent by providing each with a valuable plot of garden ground. It has secured ample air space and sunlight for all the dwellings and increased the opportunities for healthy

FIG. 4.—DIAGRAM SHOWING NEW TYPE OF DEVELOPMENT OF 120 HOUSES ON 10 ACRES WITH SOME ROADS OF LESS COSTLY CHARACTER AND BETTER ADAPTATION TO THE CONTOURS OF THE LAND THAN ARE POSSIBLE WITH THE DENSER DEVELOPMENT IN FIGURE 3

living. It has introduced into housing a new standard of amenity, the garden space and open layout of the sites having enhanced the attractiveness of well designed schemes of houses, and given opportunities for screening in the future with foliage those with less pleasing buildings. (See fig. 4.)

This great improvement has moreover been secured at little,

if any, extra cost, the open type of development having allowed economies to be effected in the amount and character of the road works which must have balanced the small extra cost of the additional land.

The gain that can be made by crowding dwellings on land is in any case small; and must be regarded as a very inadequate offset to the great reduction in open space and amenity which results. Where, as in the assisted housing schemes, the average cost of land has been little in excess of £200 per acre, and full opportunity has been afforded to take advantage of less costly types of road appropriate for open development, the possible money gain from over-crowding dwellings practically vanishes, and the advantages of low density become overwhelming.

Economy of Spacious Planning.—The diagrams illustrating the two methods of development and the relative cost per dwelling show how the small saving in original land cost which can be made by adopting high density, is soon expended in the extra

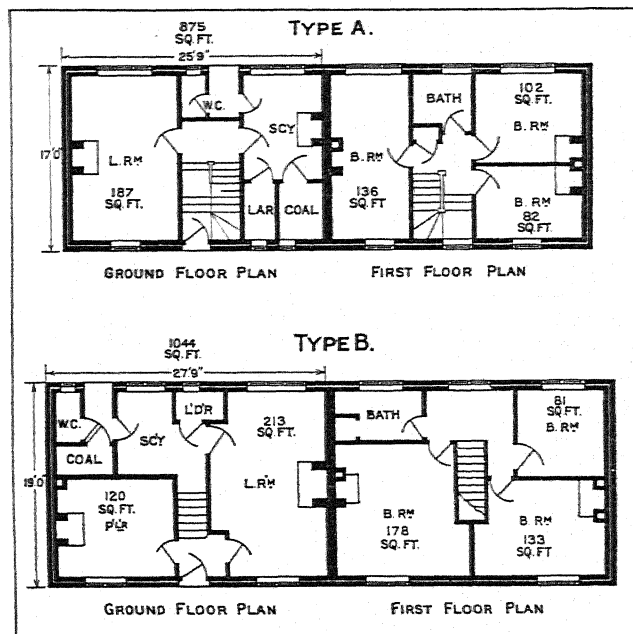

FIG. 5.—HOUSE PLANS OF EARLY TYPES OF COTTAGE USED IN HOUSING SCHEMES

A, non-parlour, and B, parlour, indicate the sizes and accommodation widely used in the 1919 housing schemes

road cost which that increased density of dwellings involves. Much road work cost is expended at every street junction which affords no building frontage, and the greater the density the greater the proportion of such wasted works. Lighter roads may also be used with the type of planning which can be adopted with low density; moreover, with open development the placing of the roads and their exact directions can be chosen to suit the ground, and to reduce excavation and filling, or the deep digging of drains, all of which leads to economy in cost. (See fig. 4.)

The average standard of accommodation and size of dwelling adopted in the 1919 housing scheme was influenced by the fact that during the war the building of houses for the well paid artisans had ceased as completely as the building of smaller houses for the less well paid labourers. Consequently both the Government and the municipalities felt a responsibility to provide houses to meet all sections of the working classes and to interpret that classification in a liberal manner. Owing in the first instance to the rapid rise in building costs, and later to the belief that private enterprise could again take up the supply of the larger types of dwelling, the average accommodation and size was gradually reduced. In the first years the majority of houses built were parlour houses (known as B type), but as time passed the proportions changed and during 1927 the great majority were non-parlour houses (A type). Compare figs. 5 and 6.

An indication of the extent of reduction in actual size of the two types may be gained from the following representing the

average sizes in square feet of municipal houses being approved in the last month of each of the following years:

For	A Type	B Type
Dec. 1919	882 square feet	1,007 square feet
" 1923	802 " "	948 " "
" 1927	786 " "	904 " "

In the A type house part of the reduction in the average size in 1927 is due probably to an increased number of two bedroom

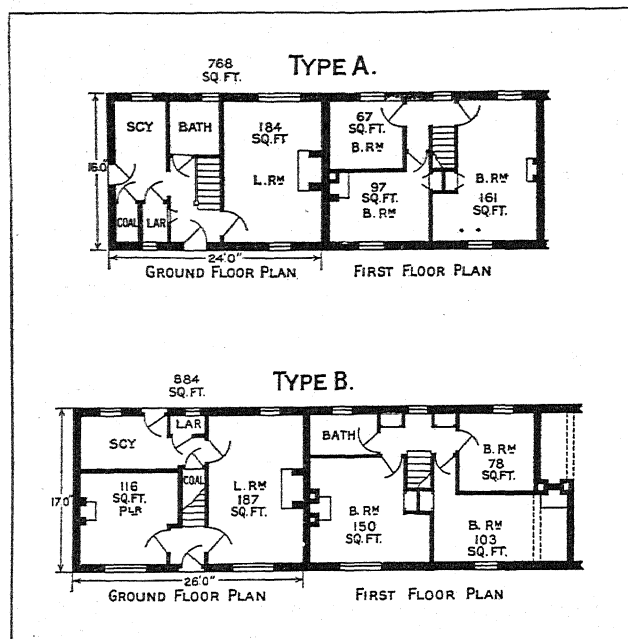

FIG. 6.—PLANS INDICATING THE REDUCED SIZES GENERALLY ADOPTED FOR MUNICIPAL HOUSES IN 1927-1928

houses being included as compared with the earlier periods. In both types moreover the reduction in average area has been in no small degree due to experience and skill in planning to give the required accommodation with the least waste of space, and it does not represent an equal reduction in the size of the rooms.

It is sometimes overlooked that the standard of room area and accommodation adopted in the 1919 housing scheme was not a post war standard due to the enthusiasm for building homes for returning soldiers. It was in fact a pre-war standard, laid down by two committees appointed by the Board of Agriculture and Fisheries, that on Buildings for Small Holdings which reported in 1913 (Cd. 6708) and the Advisory Committee on Rural Cottages which reported in 1914. The standard published in those reports was adopted in the Report of the Tudor Walters Committee, and is as shown below.

V. COST AND RENT

The cost of building houses varies much from place to place as well as from time to time, and it is affected by the design and size of the individual cottages. Comparisons of cost can therefore

usefully be given only in the form of averages, and based on a common type of agreed size. Throughout the various assisted housing schemes since the World War, records of the size and cost of houses, taken from monthly returns sent by the local authorities to the Ministry of Health have been kept, and have been reduced to a common standard of a price per square foot. The general trend of prices for municipal building is therefore accurately represented by the diagrams based on such monthly figures and showing the average of the tender prices approved month by month, or in the limited number of cases where houses were built by cost contracts, or by direct labour, the approved estimates of cost. (See figs. 1 and 2.)

When seeking to compare prices with those prevalent before the war, the difficulty arises that no similar average prices were then available. It is possible for those experienced in building in different parts of the country to fix a range of prices commonly found in pre-war days for cottage building; but no data exist which would enable the average to be accurately placed within that range. Consequently in comparing the cost of providing a dwelling in the years immediately preceding the war with the cost at the commencement of 1928, it may be safer to take two figures in both cases, giving the range of usual high and low limits of cost for each of the important items.

The normal three bedroom non parlour cottage, if compactly planned and providing rooms of the standard of accommodation generally recognized as a desirable minimum, would contain on the two floors measured over all within the containing walls about 800 square feet. In pre-war times usually cubic feet would have been taken; the cubic measure for a certain area varies considerably according to the design of the cottage; but 9,200 cubic feet would be a reasonable figure to take for comparison in this case. For cottages of approximately equivalent character to those erected in post-war housing schemes, though frequently containing no separate bathroom, the range of cost per cubic foot pre-war would be from 4d. to 8d. A figure as low as 4d. was becoming rare, and a figure as high as 8d. was also unusual in carefully managed schemes. It is impossible to say where the average of all working class dwellings erected would be; perhaps 5½d. per cubic foot may be taken as a probable average. 9,200 cubic feet at this figure would equal £210 16s. 8d. or 5s. 3½d. per square foot; and, allowing something for the difference in amenity and equipment, 5s. 6d. per square foot is probably not an unfair average figure to take for pre-war houses for the purpose of comparison with the post-war average figures given above.

As regards land, no average figure can be given, but on the basis of 12 houses to the acre adopted generally for post-war housing schemes and for much of the more progressive work pre-war, the following represents the cost of land at different prices per acre, commonly paid.

£100 per acre equals per house	£ 8 6 8d.
200 " " " " " "	16 13 4d.
300 " " " " " "	25 . . .
400 " " " " " "	35 6 8d.

How Costs Have Risen.—The cost of road making is another item which varies considerably and for which average figures do not exist. A range of from £20 to £35 pre-war, and £35 to £50

I	I. Dimensions to be regarded as the irreducible minimum (from section 157 of Report of Departmental Committee)		II. Dimensions recommended as a desirable minimum (from section 17 of Report of Departmental Committee)		III. No. II. with the addition of a parlour	
	Floor areas in sq. feet 2	Cubic contents in cubic feet* 3	Floor areas in sq. feet 4	Cubic contents in cubic feet* 5	Floor areas in sq. feet 6	Cubic contents in cubic feet* 7
Parlour	165	1,320	180	1,440	120	960
Living room or kitchen	65	520	80	640	180	1,440
Scullery	18	144	24	192	80	640
Larder or pantry	144	1,152	150	1,200	24	192
Bedroom No. 1	(100)	(800)	100	800	160	1,280
Bedroom No. 2	65	520	65	520	120	960
Bedroom No. 3					110	880

*The cubic contents are computed by multiplying the floor areas by 8 feet, the assumed average height of the rooms.

in 1928 would probably cover the majority of cases. On this basis it is possible to set out the probable range of costs for the two periods somewhat as follows:—

	1913-1914		1927-1928	
	From	To	From	To
House of 800 sq.ft. including drains, fences	£ 180	£ 260	£ 360	£ 440
Land	10	30	10	30
Roads & Sewers	20	35	35	50
Total all in cost	210	325	405	520

No doubt figures higher and lower could be found in both periods but the above probably represent the ranges of cost within which the majority of dwellings would fall which were built in the year before the war or were being built in the period 1927-28.

The economic rent of dwellings depends however not only on the total capital cost of providing the buildings, land, roads, drains, etc.; but also on the rate of interest and sinking fund ruling at the period; and on the cost of repairs. To give a general idea of how these different factors affect the weekly rental, it is simpler to take the all-in cost of the cottage and to give examples in round figures of cottages costing £200, £300, £400 and £500, which will cover pre-war and present costs. As the cost of repairs will vary much more nearly with the cost of building than with any factor affecting the rate of interest, it is best to take the repairs as a percentage of the cost. Allowing 1½% as a reasonable amount to cover repairs, insurance and other similar items, the following

Balance of Migration

Area	Increase or decrease of population + or -			Excess of births over deaths			Balance of migration + or -		
	1891-1901	1901-11	1911-21	1891-1901	1901-11	1911-21	1891-1901	1901-11	1911-21
Administrative County of London	+308,313	- 13,306	- 37,162	484,699	538,927	359,861	-176,386	-553,509	-397,023
Outer Ring	+639,283	+684,867	+266,005	247,026	363,026	296,053	+392,257	+321,512	- 30,048
Greater London (i.e., County plus Outer Ring)	+947,596	+671,561	+228,843	731,725	901,953	655,914	+215,871	-231,997	-427,071

table gives the necessary rentals per annum and per week for cottages of the different costs named, which would be required to meet the outgoings with inclusive rates for interest and repayment of loan of 3½%, 4½% and 5½% respectively:

Cost	£ 200	£ 300	£ 400	£ 500
Interest 5½%	11.	16. 10.	22.	27. 10.
Repairs etc. 1½%	3.	4. 10.	6.	7. 10.

" " week	4s. 8d.	6s. 11d.	9s. 3d.	11s. 6d.
Interest 3½%	7.	10. 10.	14.	17. 10.
Repairs 1½%	3.	4. 10.	6.	7. 10.
Rent per year	10.	15.	20.	25.
" " week	3s. 10d.	5s. 9d.	7s. 8d.	9s. 7d.

Price of Money.—It will be noticed that a drop of 1% in interest charged is equivalent in its effect upon rent to a considerable reduction in cost. The range in rates of interest represents approximately that applicable to municipal houses for pre-war and present periods. For dwellings financed by private enterprise, and where it is intended that the rentals shall yield something more than bare interest on costs a higher percentage would have to be allowed, to make the venture profitable. On the other hand, it may be said that private enterprise can build more cheaply than the municipality. Recent evidence based on selling prices does not suggest, however, that they are in fact able to provide similar dwellings at an all-in figure less than the total cost of those built by the municipalities, or to let them at lower rents.

VI. HOUSING IN LONDON

Housing in London presents a problem of special difficulty owing to the magnitude of the urbanized area and the extent of the movements of population which take place from one part to another. It has long been customary to think of London as a city the population of which has been increasing, not only by the natural increase due to excess of births over deaths, but by attracting population from the country or other parts of the world. This has long ceased to be the case. The census of 1911 first revealed the fact that the population in the area administered by the London County Council was actually decreasing, and the census of 1921 showed a still further decrease for that area. The census of 1911 further showed that the excess of emigration over increase and immigration even from Greater London to places more than 30 miles from the centre, could not have been less than 187,000 persons in the period of ten years previous to that census. The census of 1921 has shown that this tendency has increased, and that both the County of London and Greater London have each in the period 1911 to 1921 failed to hold their natural increase of population and have sent out emigrants. It is interesting to note, however, that the inter-census period 1901 and 1911 revealed a very great movement of population into the outer ring, a tendency the checking of which by the want of housing accommodation is revealed by the census of 1921. The annexed table giving these figures in detail, is an interesting record of very great movements of population; numbers equivalent to the total population of large towns having moved from the County of London to the outer ring, or from Greater London to other places, during the inter-census decades:

But for this outward movement of population the need for dwellings in London would have been much greater than has been the case. When the supply of dwellings in London is sufficient to leave freedom for normal movements the tendency to move out from the centre to the suburbs, which was so marked in the period 1901-1911 may again become more active.

The increasing pressure on dwelling accommodation in London even before the war is indicated by the proportion of empty dwellings recorded by the L.C.C. on their many housing estates, as shown by the percentage of rental loss due to empties in each year. During the war there was further increase of pressure and the loss diminished. The following table shows the changes which have taken place. The figures seem to indicate a certain relaxation of pressure, but it is stated that the increase of empties is partly due to the holding of a number of new houses on the various estates for short periods to meet the special needs of certain groups of tenants.

Date	Percentage of rental losses	Date	Percentage of rental losses
1909-10	7.45	1918-19	0.18
1910-11	7.53	1919-20	0.05
1911-12	6.33	1920-21	0.02
1912-13	3.63	1921-22	0.05
1913-14	1.84	1922-23	0.04
1915-16	0.64	1923-24	0.03
1916-17	0.38	1924-25	0.03
1917-18	0.66	1925-26	0.06
		1926-27	0.22

Progress in Greater London.—To meet the needs of Greater London there had been erected since the war up to Sept. 30, 1927:

By the various local authorities	52,199
„ trusts or public utility societies	2,245
„ private enterprise, including houses of all classes	97,691
	152,135

Up to Dec. 31, 1927 the London County Council had built altogether since the Armistice 24,085 dwellings. Of these 1,632 were tenements to meet rehousing obligations under the slum clearance schemes leaving a net addition of 22,453 dwellings. The council had taken steps to deal with 23 unhealthy areas covering 98 acres. This would involve displacing 28,500 persons, of whom rehousing must be provided for 27,000 persons, 20,000 in the cleared sites and 7,000 elsewhere.

VII. HOUSING IN SCOTLAND

While the greater part of what has been written in regard to housing in England and Wales would apply to Scotland also, there are certain distinctions which should be known, and certain aspects of the problem which are special to that country.

The standard of housing north of the Tweed, measured in the number of rooms per dwelling, has been lower than in England; one or two roomed dwellings prevail to a far greater extent; and less complete separation of sleeping rooms from living rooms has taken place. On the other hand, the difference in area occupied per family is not as great as the difference in the number of rooms would suggest, for the rooms are generally larger in pre-war Scottish dwellings than in the English cottages of like period. The prevalence in the larger towns, particularly in Edinburgh and Glasgow, of the tenement block as the method of housing the working classes has also distinguished Scottish practice from English.

The whole problem of housing in Scotland was exhaustively investigated by a Royal Commission which was appointed in Oct. 1912 and published its report in 1918. The commission then estimated that before the housing conditions in Scotland could be regarded as satisfactory 235,990 dwellings would need to be provided, of which number they considered 121,430 were immediately needed to relieve overcrowding and take the place of dwellings clearly unfit for habitation. Their estimates were based on the census of 1911 which showed the population as 4,760,904, the number of occupied houses 1,013,369 and unoccupied 89,060. The commission recommended that no tenements should be built more than three stories high, or exceeding, when three stories high, 32 dwellings to the acre. For double flatted houses 24 to the acre, and for single cottages 16, were recommended as the maximum numbers to be permitted; and these limits they advised should be embodied in an appropriate act of parliament.

The various housing acts giving financial assistance to stimulate the building of houses already described have applied to Scotland, with slight variations chiefly in regard to administration. Building progress there has not been equally rapid, however; probably the much larger volume of work in the neighbouring country had the effect of creating a stronger draw on the inadequate supplies both of labour and materials. The following shows the progress made up to the end of April 1928:

	Completed	Under construction
1919 Act	25,550	..
„ „ private builders	2,324	..
1923 „ local authorities	3,966	119
„ „ private builders	12,298	2,641
1924 „ local authorities	21,396	12,429
„ „ private enterprise	431	419
Slum clearance schemes	7,095	2,854
Demonstration houses	17	..
Steel houses erected on behalf of the Government	2,542	10
Total	75,619	18,472

Persons Per Room.—Bearing in mind the difference in size of rooms and character of dwellings already referred to, the following particulars, taken from the 1911 and 1921 census re-

turns, show the changes during the inter census period; if compared with similar figures given for England and Wales, they also indicate the difference in the standard of housing between the two countries.

	Percentage of persons living	
	More than 3 persons per room	More than 2 persons per room
1911 Census	21.9	45.1
1921 „	21.1	43.3

Population and Houses

	Total population	No. of occupied houses	Per-centage of popu-lation	No. of unoccu-pied houses	Per-centage of houses	No. of houses in course of erection
1911 census	4,760,904	1,013,369	21.3	89,060	8.79	4,718
1921 „	4,882,497	1,057,609	21.7	51,835	4.90	10,628

Percentage of population living in houses containing the following number of rooms

Rooms	1	2	3	4	5	6	7 and over
Percentage of population 1911 census	8.7	40.9	21.9	9.9	5.6	3.8	9.2
1921 census*	8.6	41.7	22.6	10.7	5.9	4.0	7.2
Percentage increase + or decrease —	-0.8	+2.0	+3.0	+8.3	+4.8	+5.2	-22.8

*Calculated from percentage increase or decrease.

It will be noted that the figures indicating a movement towards houses having more rooms, and the reduction of the proportion of those living in the one roomed dwelling, are more favourable than in England and Wales; while the reduction in numbers occupying houses having more than six rooms is relatively greater.

VIII. THE HOUSING ACT, 1925

The various acts passed since 1890 giving powers for dealing with housing problems were consolidated in the Housing Act of 1925. This act is divided into five parts dealing with the various divisions of the subject.

The act is a long one containing 137 sections, and it is only possible here to give a brief summary.

Part I. (Sections 1-34).—In contracts for the letting of houses at rents not exceeding £40 per annum in the county of London, and £26 per annum elsewhere, there is an implied condition that such houses are at the commencement of the tenancy, and shall be maintained in all respects reasonably fit for human habitation.

The local authorities are authorized to require owners to make and keep dwellings in all respects reasonably fit for human habitation, except where the house is in such condition that without reconstruction it is incapable of being made fit. In such cases the owner has an option to close the house, in which case a closing order by the local authority is deemed to have been made. If a notice for repair is not complied with, the local authorities have an option to do the work and recover expenses from the owner. Where a closing order is deemed to be operative the Ministry of Health may authorize a local authority to acquire the house on terms similar to those on which slum property is acquired under Part II. schemes, that is, practically at cleared site value.

In regard to houses occupied by more than one family, that is houses let in tenements, local authorities are authorized to make byelaws to regulate the number of occupants and other matters. A duty is put upon local authorities to inspect their district, and to ascertain whether any dwelling houses are unfit for human habitation, and to keep such records as the Ministry of Health may require. On a representation by the medical officer of health or other officer that a house is unfit for human habitation, the local authority are empowered to make a closing order prohibiting the use of the dwelling for human habitation until rendered fit. If the house is made fit for habitation the closing order is deter-

mined. When a closing order remains operative for three months, it is the duty of the local authority to consider the question of demolition. If there appears to be no prospect of the house being made fit, the local authority may order its demolition. If the order is confirmed the owner must take down and remove the house within three months; failing this, the local authority must do so; and may recoup itself by the sale of materials or recover from the owner the excess cost. Where the owner has executed the required works, the local authority are empowered by an order to charge upon the house an annuity to repay the amount expended in repairs.

This part of the act also forbids back to back houses, and the use of cellars for sleeping rooms, except under certain conditions; and empowers local authorities to make regulations prescribing these conditions. Power is given to secure the removal of obstructive buildings, even if not themselves unfit for habitation, if they render adjacent dwellings unfit or incapable of being made fit. When an order for this purpose is confirmed the local authorities are authorized to purchase the land from the owner. Compensation in this case is paid for the land and building, and is settled if necessary by arbitration.

Should a local authority fail to exercise their powers, and complaint of default is made by the county council, parish council or four electors, the Minister may hold a public local inquiry, and if the default is established the Minister may direct the local authority to act; if they again fail to do so, he may with their consent instruct the county council to carry out the works, and in certain cases the Minister may enforce his order on the local authorities by mandamus. Provision is also made enabling county councils to take action in the areas of the lesser authorities on proper representation. Part I. concludes with various provisions protecting ground landlords and others interested in the property and defining the local authorities upon whom the various duties fall.

Part II. (Sections 35-56) Improvement Schemes.—Where an official representation is made to a local authority, other than a rural district council, respecting any area in the district, either "(a) that any houses, courts or alleys within the area are unfit for human habitation, or (b) that the narrowness, closeness and bad arrangement or the bad condition of the streets and houses or groups of houses within the area, or the want of light, air ventilation or proper conveniences or any other sanitary defects, or one or more of such causes are dangerous or injurious to the health of the inhabitants either of the buildings in the area or neighbouring buildings," and that the most satisfactory method of dealing with the faults is by means of an improvement scheme, if the local authority are satisfied that this is the case, and of the sufficiency of their resources, it is their duty to pass a resolution to the effect that the area is an unhealthy area, and that an improvement scheme ought to be made for it, and they shall forthwith proceed to make a scheme for the purpose. (Several areas may be included in one scheme.) The official representation is made to the local authority by their medical officer of health.

Reconstruction Schemes.—The reconstruction scheme differs from the improvement scheme mainly in being concerned with smaller areas and with the rearrangement of buildings and their sites only, and not with more extensive rearrangements involving streets and alleys. They are to be made in the following cases:

(a) Where a demolition order has been made and the local authority consider it would be beneficial to the health of the inhabitants of the neighbouring houses if the area, of which such buildings forms part, were

1. adopted as a highway or open space, or
2. appropriated, sold, or let for the erection of houses for the working classes, or

3. exchanged with other neighbouring land for such purposes.
- (b) Where it appears to the local authority that the closeness, narrowness and bad arrangement or bad condition of any building, or the want of light or ventilation is prejudicial to the health of the inhabitants either of the said building or of the neighbouring buildings.

and that the most satisfactory method of dealing with the faults is by a reconstruction scheme; in either of the above cases, it is the duty of the local authority to pass a resolution to this effect, and direct such reconstruction scheme to be prepared.

The Act itself should be consulted for the provisions as to appeals, the making, if necessary amending, and confirming of improvement schemes; also as regards compensation; broadly speaking, the principle is that for the unhealthy area proper, the compensation to be paid is the value of the land as a site cleared of buildings and available for development according to the local byelaws. Where, however, the scheme provides for the rehousing of the working classes on the land, or part of it, or requires that the land, or part of it, shall be laid out as an open space, the compensation is reduced to the extent that these limitations on the user of the land diminish its value. As regards the land included only for the purpose of making the scheme efficient, and not on account of its sanitary condition, ordinary compensation for land and buildings under the provisions of the Acquisition of Land Act of 1919 is to be paid.

Part III. (Sections 57-80).—This is concerned with the provision of additional new dwelling houses; and authorizes the various local authorities to provide housing accommodation for the working classes by the erection or acquisition of dwelling houses, or by the conversion of buildings into dwellings; and for this purpose dwellings include lodging houses, tenement houses or cottages; and the latter may have gardens not exceeding in size one acre. The act also includes power to provide and maintain with the consent of the Minister of Health buildings adapted for use as shops, any recreation grounds or other buildings or land, which in the opinion of the Minister will serve a beneficial purpose in connection with the requirements of the persons for whom the housing accommodation is provided (Section 107).

Urban local authorities may go outside the boundaries of their areas for the purpose of building dwellings or exercising the like powers. The duty is put upon the local authority to consider the needs of their area, and as often as the occasion arises, or within three months of notice given by the Minister of Health, to prepare a scheme showing the number and the nature of houses to be provided. When approved with or without modification the scheme becomes binding on the local authority. It is interesting to note that under Section 60 (3) the local authority in preparing a scheme and the Minister in approving it, are directed to take into account and so far as possible, to preserve, existing erections of architectural, historic or artistic interest, and to have regard to the natural amenities of the locality; and under certain circumstances the Minister is empowered to direct that an architect nominated by the Royal Institute of British Architects shall be appointed to secure these ends.

Power is given under which the local authority may acquire land by agreement, and may be authorized by the Minister of Health to purchase compulsorily, for the purpose of carrying out the objects of the Housing Act. Provision is made for empowering the local authority to make byelaws for the management, use and regulating of their houses.

In addition to building themselves, local authorities are authorized to promote or assist public utility societies to provide housing accommodation.

Part IV. (Sections 81-97).—This part contains the financial provisions, defining how the expenses incurred by the local authorities are to be defrayed, expanding their borrowing powers, providing for loans by the public works loans commissioners, and dealing with loans made by local authorities for the purpose of promoting housing development in their area.

Part V. (Sections 98-137).—Part V. contains miscellaneous provisions, e.g., for the varying of restrictive building byelaws, and other matters necessary for the smooth administrative working of the act.

IX. EUROPEAN HOUSING

The shortage of dwellings and their inadequate character have constituted a serious problem in most European countries. The difficulties of solving it have been increased owing to the World War both in the belligerent and the neutral countries; and have been specially aggravated by inflation and consequent instability of currencies. Loans and subsidies to stimulate the erection of dwellings, or remission of taxation upon them when erected, have in one form or another been generally adopted. In many conti-

mental countries a controversy has raged which plays small part in English housing; that between the one-family dwelling, which so overwhelmingly prevails in England, and the multi-family dwellings in the form of blocks of flats, or tenements, which prevail in so many continental cities. In some cases the position as between these two types of dwelling has been influenced by special economic or political considerations. In Vienna, for example, the great scarcity of food for some years after the war caused the garden attached to the one-family dwelling built outside the city to be of quite unusual economic or rent paying value, and for some time attention was mainly directed to building one-family dwellings with good gardens. Later, economic and political considerations produced a reaction from this policy, and a reversion to the general custom in the city of Vienna to building dwellings in large blocks. In England, where flats play so small a part in the general housing, the importance of the controversy abroad is not generally realized. Exact statistics are not available, but an estimate made after enquiry in ten of the larger cities gave a proportion, outside London, of over 97% cottages, and less than 3% flats, of which over one-third would be in buildings of only two storeys. The figures would be different in London; but of the dwellings built by the London county council probably over 80% have been single family cottages. As regards the relative cost of the two types of dwelling, evidence from different countries is conflicting. This is partly accounted for by the fact that building custom, land values and road charges tend to become adapted to the most general form of development in each country. Also climatic conditions or building regulations may require for the single family cottage a thickness of wall construction not required in England. In England, per square foot of accommodation provided, it is seldom that flats cost for the building as little as single family cottages. In some other countries where flats predominate it is reported that the building cost apart from land and roads is somewhat less per square foot than the cost of single family cottages. It is interesting to compare the methods of assistance and results attained in some of the European countries. Particulars can only be given in very general terms however because the methods adopted vary not only in the different countries, but in the different states composing the countries, and from city to city within the same state. In many countries on the continent the cities possess a degree of autonomy in such matters much in excess of that possessed by towns in England.

Austria.—In Austria co-operative societies have had a legal status since the Law of 1873. Subsequent to the World War the position was exceptionally difficult, the single city of Vienna representing about a third of the population of the reduced Austria. Famine conditions for some time existed, and there was a great exodus of population, officers from other parts of the old Austrian empire returning to their various cities and people moving out to the country, where living conditions were easier. The sudden collapse of the value of money coupled with rent restriction which was not at first varied to meet the money situation, resulted for a time in house room being the only cheap commodity. A great expansion of accommodation took place, the one roomed dwelling having been very prevalent in the city before the war; families gladly took advantage of the low rents and the available space to secure a more adequate number of rooms. The urgent necessity of growing food as a means of sustenance produced a strong reaction from the general pre-war tendency to live in small flats within Vienna, and an interesting movement sprang up for the creation of housing settlements with small one-family dwellings having from four to five hundred metres of garden land attached to each. This movement was assisted by the Society of Friends and others interested in the city, and a number of settlements (*Siedlungs*) were built on land largely provided by the city of Vienna from the extensive green belt in their possession. The co-operative building societies grew to an enormous scale, tens of thousands of applicants for houses being enrolled. In spite of the rapidly depreciating currency and other difficulties, great efforts were made to continue the building of dwellings in the settlements. An interesting feature was the

condition that each intending householder must contribute from 1,000 to 2,000 hours of free labour to assist in the erection of the dwellings. This labour, being unskilled, was largely used in digging foundations, making roads, and in the preparation of simple concrete blocks, and in other ways assisting the limited number of skilled workers available. In the summer evenings and at the week-ends when the intending occupants of the dwellings could get free from their ordinary employments, people of all classes could be seen busily engaged in carrying out such operations as they could in connection with the erection of their dwellings. At a latter date after the stabilization of the Austrian currency, owing to the need to press forward more rapidly with the erection of large numbers of dwellings, owing also to certain political considerations, there was a return to the building of the small flat dwellings within the town area. Quite a number of these have been erected in handsome blocks of buildings by the city of Vienna. There is in the city considerable conflict between the advocates of the two policies, those who desire to see the continued erection of *Siedlungs* containing one-family dwellings with ample garden space somewhat on the lines of the English housing schemes, and those who favour the housing of the people in large blocks of small tenements within the central area of the city.

During the nine years up to Dec. 1927 31,542 dwellings were erected in Vienna, and the building programme of the city contemplated erecting a further 30,000 in the following five years.

Belgium.—The construction of dwellings was completely arrested during the World War and after, until it was stimulated by the application of the housing law passed in Oct. 1919. Under this act was founded the *Société Nationale des Logements à Bon Marché*. This central society is the medium through which assistance is given to the regional building societies which are public utility societies and number about 261. Loans have been given to the full value of the lands and buildings under the complete supervision and approval of the *Société Nationale*, in this way differing from most countries where loans have been given only for a proportion of the value. The shareholders of the societies are the State, the provinces, the municipalities and other public institutions or private persons. The first 570,000,000 francs were lent at 2% plus 0.75% sinking fund, plus 0.25% general costs, the period being 65 years. The State bears the difference between the rate at which the money can be raised and this low interest charged for the loans, thus giving in effect a substantial subsidy. After allowing for their own expenses, repairs, etc., it will be seen that the societies would be in a position to let dwellings at a rental of from 4.2% to 4.3% of the cost. For the following 100,000,000 fr. allotted in 1927 interest is raised to 3% and a further 300,000,000 fr. has been proposed with interest at 3½%. With the first 570,000,000 fr. there were built 33,000 dwellings, including apartment dwellings and one-family houses. It is expected that with the next 400,000,000 fr. there will be built about 13,000 dwellings.

In addition to the above arrangements, subsidies have been given to provide for people building for themselves varying from 2,500 fr. to 3,500 fr. per dwelling and 18,000 houses were built under this arrangement up to 1926, when owing to the financial stress and the depreciation of the currency, this form of subsidy was stopped. An addition to this subsidy has been made by some provinces and a very small number of municipalities. It is contemplated that this subsidy may be again renewed. A further subsidy on similar lines is given to the purchasers of houses built by the societies already referred to. In this case the subsidy is not paid in cash, but is given in the form of a reduced price, and some 6,800 of the houses built by the societies have been sold by this method. With the money received for such sales the societies build other houses. It is proposed to give additional assistance by exempting from the land tax for a period of ten years every dwelling erected under a certain value.

As indicating the disturbance in conditions, prices, etc., which has caused and is still causing difficulty in dealing with the housing problem in Belgium, the following figures may

be of interest comparing conditions in 1914 with those in 1926.

	1914	1926
Wages per Hour . .	50 to 60 centimes	4 to 4.25 francs
Average Working Class Rent . .	30 to 50 francs	100 to 160 francs
Average Cost of constructing working class dwelling . .	5,000 to 7,000 francs	18,000 to 26,000 francs

The following measures are recommended for dealing with the slums and the housing problem by *La Ligue Nationale Belge contre les Taudis*, which has been created with the approval of the government and the patronage of the king.

- (1) Inspection of dwellings.
- (2) Construction of cheap dwellings, 20,000 to 25,000 francs.
- (3) Subventions to families needing it to build or buy their houses, up to 6,000 fr.
- (4) Exemption from property tax for 10 years.
- (5) Reconditioning old houses and closing slums, with recourse to the Crown if the municipality fails to act.
- (6) Sanitary inspection of dwellings to be independent of local authorities.
- (7) Education in housekeeping.

France.—The State, the department and the commune each take part in promoting the building of houses for the working classes. The communes can themselves undertake to contract for the building of houses for large families, and owing to the anxiety as to the diminishing population, special facilities are given for houses for larger families; but most of the work is done through co-operative societies known as *Sociétés d'Habitations à bon marché* (d'H.B.M.). The State assists these societies by granting loans at less than the market rate of interest; frequently at 3½%, up to 60% of the cost of the building or the selling price, whichever is the least, but where repayment is guaranteed to the State by a department or commune the proportion may be increased to 75%. The State has also given subsidies up to ¼ of the cost of the building to communes, organizations (d'H.B.M.), and certain other public or semi-public bodies willing to construct houses that are to be let at ⅔ the ordinary market rent and are to be available for the use of large families having more than three children under sixteen years of age. The communes are empowered to make donations to societies (d'H.B.M.) of land area for purposes of construction and may also make loans to them. They may subscribe to the shares of such societies or may guarantee the interest on those shares up to 3% for 20 years. They may also guarantee interest and sinking fund of loans which are approved by the public offices. All such new buildings have been given exemption from certain taxes for a period of fifteen years. There are about 340 co-operative housing societies that were actively working before the World War. In addition to the co-operative societies there are public offices for cheap houses of which the boards consist of 18 members, six appointed by the prefect, six by the department and municipalities jointly, and six by various institutions such as trade unions, savings banks, mutual benefit societies, housing associations, etc. Societies (d'H.B.M.), public offices, etc., in 1928 received subventions equal to 33% of the building cost and loans up to 52% of the cost at 3% interest, repayment spread over 40 years. The advantages are granted where two-thirds of the houses are let to families with at least four children under 16 years of age. The estimates of the number of new dwellings required in France have varied very much. In 1921 an estimate of 500,000 for the whole of the country was made by Bonnevez and Loucher, while the bureau of municipal statistics estimated the urgent need for Paris at 47,794, and that in the remainder of the department of the Seine as 13,924. There were those, however, who consider that these figures underestimate the needs.

Germany.—In Germany the maximum difficulties have been experienced. The housing problem was a serious one before the World War; rents had risen until they represented about 20% of the incomes of the mass of the people. The greatest fluctuations in currency and instability of conditions generally, have

had to be faced. Excessive speculation in land owing partly to comparative simplicity of transfer had seriously hampered developments in many places. Co-operative housing societies for building dwellings had been fostered by the Government and by municipalities to counteract the evils of speculation and speculative building. Of these societies something like a thousand were formed between 1870 and the commencement of the war. A public audit of their accounts was required, and their capital was obtained partly by shares taken up by investors, partly from Governmental and other public bodies. The war brought about an acute shortage. The emergency was met by varying methods in different States and cities, but general control of rents was introduced, and in many States a rationing of house room in existing dwellings was put in force, each family being allowed so many rooms. In some cases a maximum was fixed of three rooms for the ordinary family, and the householder was required to take in tenants or lodgers to fill the remaining rooms in the dwelling. Subsidies of various kinds were given to stimulate building, and owing to the instability of financial conditions, it may perhaps be said generally that up to 1924 the subsidies were given in forms which represented the amount of capital which would be lost permanently as a result of building operations. The inflation which so seriously increased the difficulties of building new houses had the effect on all existing buildings of practically cancelling the mortgages, which could be, and were, extensively paid off in the debased and almost valueless currency. Subsequently the position was stabilized, so that all mortgages paid off before June 15, 1922, were regarded as completely cancelled, but those paid after that date, or left standing, were to be commuted in the revised currency at 25% of their original value. In view of the great relief thus conferred on the owners of pre-war buildings, a tax, known as the house interest tax, was imposed on all such buildings. This amounts approximately to 50% of the pre-war rents; and about half of this tax has been earmarked to provide cheap mortgages for new dwellings. Taking the conditions prevailing in year 1927-8 and comparing them with pre-war conditions, the problem still to be faced in Germany may be set down as follows:

	Cost	Yearly charges per cent	Yearly charges marks	Per week
Pre-war	5,000 mks.	7%	350 mks.	6s. 8d.
1927-28	10,000 mks.	15%	1,500 mks.	28s. 10d.

Since 1924 there has no longer been a cash subsidy, but cheap second or third mortgages have been arranged by the States or municipalities coming behind the first ordinary and very expensive mortgage, the latter costing from six to twelve per cent. Interest on the cheap mortgages has generally been fixed at about 3%, plus 1% for repayment of the capital, but during the first three years in many cases a nominal charge of one per cent without any repayment has been fixed. The money to provide for this reduced interest comes largely from the house tax referred to above.

In spite of all the difficulties 1,337,714 new dwellings had been built in Germany since the war up to the end of 1927. They include flats and houses, flats probably predominating largely. Of these dwellings 288,635 were built during the year 1927, of which number 282,968 were subsidized. In the case of houses costing 15,000 marks the financing would be somewhat as follows:—

6,000 marks, on first mortgage borrowed at market rate.

5,700 marks, on second mortgage.

3,300 marks, the building owner's money, or third mortgage, the second and third mortgages being provided by the State or local authority through the agency of the central building society.

Holland.—Holland, a non-belligerent country in some ways able to profit by the World War, nevertheless was faced with a serious housing problem, and has undoubtedly handled it with great ability and zeal. Both in regard to the development of new areas for cottage dwellings, and of those for blocks of flats, a degree of skill, architectural taste and originality has been devoted to the laying out of the sites and the designing of the buildings, which has won the admiration, and in some respects the

wonder, of all housing experts. For occasionally it must be admitted that the originality has been such that those not initiated find some difficulty in appreciating the results. This, however, applies to a small proportion of the work only, most of it being quite successful and much very beautiful.

In spite of its good fortune in keeping out of the war and being able to preserve a sound currency, Holland in common with other countries was faced with the difficulty of high prices rendering the erection of dwellings to be let at possible rentals over long periods unremunerative. Moreover in many of her most important towns no buildings could be erected except on an expensive foundation set on deeply driven piles and with a raising of the surface ground from ten to fifteen feet. Under the Housing Act of 1901 facilities were in operation for the granting of loans for housing purposes both from the State and municipality, very largely operated through building societies, such as are known as public utility societies in England, and from 1916 to 1927 subsidies were granted in addition to loans. The State and the municipality undertook to bear jointly the loss due to the difference between actual rents obtained for the dwellings and what would have been an economic rent, the State paying 75% of the deficit and the municipality 25%. In 1920 a scale of minimum rents was fixed according to the space provided, the percentage of the expenses to be covered by the rent rising with the increase of cubic space, and varying from 50 to 70 per cent of the economic rent; and by 1924 it was required that new dwellings should bring in at least 90 per cent of the economic rent. For each of the years 1927 and 1928 the State provided for loans 12,000,000 guilders, and gave 80,000 guilders to cover 50% of the deficit on new houses which were let at rents less than required to give a return on the cost. One peculiarity of the loans in Holland has been that when made to approved public utility societies loans have been given up to 100% of the costs of the building. Such loans, however, were not granted direct, but through the local authority who had to take responsibility to the State. The following table indicates that in spite of great variation in the activities of the different agencies building houses, the provision of loans and subsidies has been so managed as to maintain a wonderful uniformity of annual building, and to avoid the violent fluctuations in the demand made on the building industry, which have occurred in England and some other countries.

property or for hire. These represent usually a rather better quality of dwelling and the limit in this case is fixed at ten rooms. Under this act facilities are given for financing the building of the "case popolari" and "economic" houses by means of loans and by way of subsidy, the State may contribute to the extent of 2½% towards the amortization and payment of interest on such loans. Also power is given to grant special fiscal facilities in respect of dwelling houses, and the communes are empowered to co-operate for the direct construction of houses themselves, or through special institutes and for the taking over of the necessary land, and for the provision of public services. In this act no assistance was given to private enterprise working for speculative profit.

For this reason, among others, from 1923 a change of policy took place. The contributions for amortization purposes were discontinued, but the fiscal facilities were extended by a decree of March 8, 1923, which provided exemption for 25 years from the building tax for all new buildings and extensions to existing buildings for use as dwellings, hotels, offices and shops, whether carried out by private enterprise or otherwise provided the extensions were completed by Dec. 31, 1926. The exemption is extended to thirty years in respect of "case popolari" and "economic" houses constructed by the communes direct, or by institutes under their direct control. The provisions proved effective in reviving private building enterprise, and from the second half of 1923 onwards, building was actively resumed. The commune increased the assistance by reducing the duties payable on the necessary building materials; by placing municipal land at the disposal of the builders on favourable terms; and by directly subsidizing in the form of capital and contributions or amortization. The approach of the date, Dec. 31, 1926, at which these provisions were to expire, gave rise to frantic building activities resulting in scarcity of labour and an upward trend in prices. To check this movement, on Aug. 30, 1925, the period for the completion of the dwellings was extended to Dec. 31, 1928, provided, however, that they were commenced within two months from the date of the official publication of the decree. This had the effect of limiting the concession on the one hand, but, on the other hand, extended the period for carrying out the work, and thus greatly eased the strain on the building industry. In regard to dwellings commenced subsequent to Oct. 31, 1925, the remission of the building tax will be graduated in regard to houses completed before Dec. 31, 1940.

Holland: Statistics for Period 1921-27

	Number of new houses built by				Converted or renovated	Total	Number of houses which have been built with premium or with subsidy under the Housing Act	Decrease of the total supply of houses by demolition, change of use, etc.	Net increase of the housing supply	Increase per 1,000 inhabitants

							(Note, 18,000 also in 1920)			

Italy.—Italy before the World War had given legal status to public utility societies under the Housing Act of 1908. After the war by the Act of Nov. 30, 1919, special provision was made for encouraging building. This act made a distinction between "economic" houses, and houses for the people (*case popolari*), which are defined as those constructed by corporate bodies, such as communes, communal institutes, co-operative societies or industrial or agricultural concerns for letting, but not for sale. They remain permanently the property of the society. Such dwellings may not consist of more than six rooms. In addition to these there are houses built by loans ("economic") constructed by co-operative societies for their members, either to become their individual

After the first two years $\frac{1}{15}$ of the total tax in force will be paid, and this proportion will be gradually increased by degrees so that the entire tax becomes payable in the 17th year. In addition, exemption from the building tax is still granted to the "*case popolari*" for 25 years from the date when they first become habitable, but only on condition that the dwelling does not consist of more than three rooms plus domestic offices, and that they are built by controlled institutes and remain their unalienable property. An exception is made to this point in regard to dwellings constructed for individual ownership by farm labourers, artisans, etc., in communes outside the large cities; these being treated as "*case popolari*." This is done in order to encourage building in rural or semi-

rural areas. The State assists the corporate authorities by paying up to twenty per cent of the cost of construction, by granting facilities and exemptions from taxes and reductions up to 50% on the railway rates for carriage of building materials. In Italy, also, by a decree of June 30, 1927, luxury type of building was forbidden for twelve months in order to relieve the strain on the building industry. These and other experiences of Italy in connection with the assistance of housing, are of special interest owing to the parallel they afford with aims and conditions in England.

HOUSING IN THE UNITED STATES

The term "housing" in a general sense may mean any form of building enterprise providing dwellings for the people, but in the United States it generally signifies some special way of providing dwellings for unskilled labourers and the very poor. This means primarily the "tenement house," defined as a house where three or more families live independently of one another and do their own cooking on the premises. Although it is commonly felt that tenement laws were passed for the poor, living in low rental houses, the early tenement house laws made no such economic or social distinction. But such distinction has been frequently made. The proposed laws in New York (1928), covering all kinds of houses, seem to avoid class distinction with the term "dwellings law." The housing problem has been created, in part, because a large portion of an American city's population is forced into unused, dilapidated dwellings which go to make up the slums. Thus, housing, in the strictest sense, deals with slum-relief; i.e., elimination of poor housing and prevention of its recurrence. In New York a survey of the problems indicates that one-third of the people live in old type tenements on expensive land with miserable accommodation; one-third live in modern tenements, far safer, more sanitary and improved as to light and air; and the remaining third live in one- and two-family houses and illegally converted tenements.

The Slums are a natural product of modern industrial conditions. Their beginning dates from the industrial revolution of 150 years ago, when workers left humble cottages, fields, shops and manual labour to assemble in factories operated on principles of mechanized, socialized labour. Their quarters were miserable; built to save space, they deprived the worker of light and air. A city slum, the direct result of changed modes of living and labour, is no longer a necessary adjunct to the production of wealth. The application of the principle of efficiency to the housing problem shows itself in the community's concern about death rates and the prevalence of disease. (See **SLUMS**.)

The term slums refers to any section of a community quarter, where unskilled workers and the poor dwell in houses made over for many families or in unhealthy tenements. Such houses and tenements are often found in what were once good neighbourhoods. Several families usually occupy a home meant for one, which makes a prosperous enterprise for the owner. The owner of the multiple dwelling often erects a six-storey tenement on the 25 ft. lot of the former two or three-storey house. This is soon followed by others in the vicinity, and the whole block, once filled with desirable private homes, becomes a mass of crowded tenements with light and air at a premium.

Social and Moral Effects.—Degeneration of areas into unsuitable tenements and dwellings cause general property deterioration, as well as seeming to create acute social problems. Darkness, dirt and disease breed discontent, disorder, crime and resentment against society. Disease and crime may be found in the more refined regions, but the source of the social evil is the slum, where poor dwelling conditions foster incurable ills.

Attempting to cope with evil conditions incident to the slums, many American communities have worked on effects rather than on causes. Slums bred disease, communities built hospitals; crime came from congested areas, society met it with prisons. It is now realized that it were better for the community, which has long cared for disease and crime, to look to the causes of these social ills. The simplicity of providing adequate facilities for a community are sometimes forgotten in dealing with complex legal provisions and structural plans. Both legislation and subsequent construction refer to but four natural benefits expected by man on earth, namely, light, air, health and safety. It is only in crowded cities that such natural advantages become complicated problems.

The History of Housing.—The housing problems in the United States are epitomized in New York because its size and social character, as an immigrant port, ever tend toward insanitary conditions. Better housing activities have generally developed through popular agitation, political legislation, private philanthropy, the creating of special dwelling centres by employers or by a combination of these factors. Housing reform goes back to 1647 when New York, or New Amsterdam, passed an ordinance aimed essentially at chimney fires, which authorized "surveyors of buildings" to regulate building in and near the city. For 200 of the 300 years during which New York has had some sort of housing ordinances, public interest has concentrated on fire hazards.

After the War of 1812, when New York's population grew rapidly, health authorities became interested in its housing problem. In 1834, Gerrit Forbes, health official, traced high death rates to bad housing. General concern for public health, deepened by yellow fever epidemics, cholera and the prevalence of small-pox and typhus, was shown in a report by Dr. John H. Griscom in 1842 which pointed out over-crowding and insanitary tenement conditions.

Added to these official recognitions of slum problems, humanitarian agitation was strongly voiced in 1847 and in 1853 by the Association for Improving the Conditions of the Poor. In 1857 the New York State legislature appointed the first special committee to investigate New York and Brooklyn tenement conditions. Because of overcrowding, dilapidation, dirt, dark rooms, high rents and other attendant evils the committee recommended certain acts as to cellar apartments; halls and stairways as safe exits; prevention of prostitution, incest and drunkenness; providing separate apartments or enough rooms for decency. The Council of Hygiene and Public Health investigated and reported on sanitary conditions, 1865; the department of health was formed, 1866; the first tenement house law passed, 1867; a tenement house commission founded with Joseph W. Drexel as chairman, 1884. In 1894 Richard Watson Gilder headed the tenement house committee. The 1900 tenement house commission brought about the 1901 tenement house law and the tenement house department.

Tenement House Legislation.—The 1867 tenement house act required city water in each house or yard, no cellar dwellings unless ceilings were at least 1 ft. above ground, general repairs and cleanliness. The 1879 act dealt chiefly with ventilation, demanding windows to the outer air, and standardized each adult's air-space at 600 cubic feet. The governor appointed commissions, in 1884 and 1894 which were responsible for the 1887 and 1895 acts. The 1901 law is the standard, but is hardly the ideal. After operating over 25 years it is to have fairly radical changes. It has been a model for most of the 11 States with tenement laws, although California, Indiana and Iowa have changed while Kentucky has repealed it. Its provisions govern consideration of sanitation and safety. Other States with tenement laws for cities, are: Pennsylvania, which had a housing law in 1895, New Jersey, Connecticut, Wisconsin, Indiana, California, Kentucky, Massachusetts, Michigan and Minnesota. The 1901 law in 1928 had 102 sections and 150 amendments and over 40,000 tenements were built under its regulations. In 1927 New York State law created a temporary commission to revise the 1901 law. It drew up a bill for the legislature's action.

Constructive Legislation.—There are two types of housing

laws: "restrictive," to prevent, correct or abolish bad housing in tenement design and building; and "constructive," to promote good housing. The latter is still tentative and promissory. National legislation has not covered good housing; such constructive work is left to philanthropy, semi-philanthropy and private business initiative. But there have been experiments at public expense like Mulberry bend, N.Y.; Willow Tree alley, Wash.; and Morton street, Boston. Even these were the elimination of bad, rather than the creation of good houses. Such cases indicate that the tax-paying public will assume almost no responsibility for housing poorer classes. The city of Cohoes, N.Y., built and sold 20 houses at prices within the means of wage-earners receiving \$30 a week. Under the State police power Cohoes passed a law in 1924 directing the city to buy land and build houses to control congestion and epidemics. The authorities met no impediment from the State Constitution or city charter. So overwhelming is the amount and force of purely restrictive legislation that constructive attempts are overlooked or minimized, although the World War taught the United States that Federal, State and municipal Governments may find it expedient or necessary to engage in some degree and form of housing enterprise. The Government undertook housing in the emergency of war; and while it did not bring permanent results it stimulated public sentiment. With such a background, a municipal housing system may sometime become a settled policy of the United States.

The Housing Situation in War Time.—The housing shortage in the United States prior to, during and after the war was due to general and economic conditions and specifically war activities. Before the war, building declined because private initiative withheld capital from an enterprise growing less profitable. Later dwelling construction through private capital was directly checked by war preparations. Federal Government influence was both negative and positive. Restrictively, through the U.S. Housing Corporation, it asked the public to stop unnecessary building, impeded credit and by prohibitive building permits brought construction to a standstill. Constructively, it tried to secure housing for war-workers, provide transport, prevent congestion, encourage capital to build and itself tried to supply dwellings. During 109 days of its own housing activity, July 25 to Nov. 11, 1918, the U.S. Housing Corporation investigated over 100 cities, planned 128 sites, granted 60 contracts, was ready or preparing for 30 more, started on over 40 projects and provided 20,000 workers' homes. In 1919 the corporation began to liquidate its business.

The Housing Shortage.—Housing conditions became worse after the war. In New York, 1921, with 982,000 tenements, only 1,510 were vacant. Housing facilities were so inadequate that dwellings abandoned nearly 100 years and almost uninhabitable, were used with almost no repair. So great was the housing demand that obviously serious violations of law often occurred. Then came a period of intensive building, through the 1920 Tax Exemption Act, which was partly maintained to satisfy the city's housing needs. This started a number of legislative bills tending to relax restrictions on the plea that restrictions increased necessary construction costs.

Governmental Responsibility.—Since 1920 a temporary commission has been formed to examine and revise the tenement house law, and this has made New York housing legislation again restrictive. Outside of the City of New York, there have been various enterprises assuming the form of government responsibility for citizens' dwellings. Typical of this is the National Homestead Act, 1862, whereby the Government gave 87,000,000 ac. of public land to settlers at \$1.25 per acre.

James H. Mellon of the Massachusetts State legislature fostered in 1909 the Massachusetts Homestead Commission. The State was to acquire and distribute abandoned farms, on a homestead basis to such city dwellers as might possess agricultural knowledge, thus decreasing city congestion and increasing food production. Later an act providing homesteads in suburbs of cities and towns was passed, with the commonwealth assisting. It was held contrary to the State Constitution and amended (1915) so that the general court could authorize the commonwealth to take and hold

land to relieve congestion and provide homes; but not to sell land or buildings at less than cost. Upon the basis of this amendment, Massachusetts passed the first American law for direct housing enterprise. Lowell, Mass., has applied the law to a small building project.

The California Immigration and Housing Commission in 1913 investigated San Francisco, Sacramento and smaller cities, and recommended legislation. It also studied English town planning and public loans to individuals but was strongly influenced by the Massachusetts Homestead Commission's work. An act resulted creating city-planning commissions and a State-wide housing act. To promote home ownership, Oklahoma, in 1915, passed a law authorizing and instructing the land office to invest in loans to home builders by selling State educational institution lands.

Federal efforts at helpful legislation through the Borland-Pomerene Bill which authorized loans to building associations formed to erect workers' homes in the District of Columbia, has had little practical effect. The Buchanan Bill, subsequently enacted, allowed postal savings to be used for housing loans to working men. The Federal attitude toward community housing is seen in a U.S. Supreme Court decision regarding North Dakota's purely economic enterprises. It held that laws engaging the State in manufacturing, marketing farm products, homes, appropriating money, creating a State banking system and authorizing bonds and taxation to carry out the schemes were not unconstitutional as far as tax payers were concerned.

Model Tenements.—The New York Association for Improving the Condition of the Poor started the Workmen's Home Association, 1854. The Boston Co-operative Building Company, 1871, opened its first model tenement in 1872, and developed "estates." The Alfred T. White Brooklyn tenements of three groups, 1877-78, were examples of good housing in that they were only two rooms deep, covering but 50% of the land. The City and Suburban Homes Company, with standards like those of the White tenements, formed through the Association for Improving the Condition of the Poor, followed the example of the Workmen's Home Association. In New York city there are 26 model tenement properties. Washington, D.C., has its Sanitary Improvement Company, 1897, and Sanitary Housing Company, 1904; Cincinnati, its Schmidlapp houses, 1911. The Octavia Hill Association of Philadelphia, through some management features, *i.e.*, substituting women social workers for male rent collectors, has had wide influence. More recent model housing examples in New York city are the apartments built by the Metropolitan Life Insurance Co., John D. Rockefeller, Jr., and the City Housing Corporation.

National Housing Agencies.—The National Housing Association (1910) headed by Robert W. DeForest, partly financed by the Russell Sage Foundation; Better Homes in America (1923) controlled by James Ford, supported by the Laura Spellman Rockefeller Estate; and the National Housing Committee for Congested Areas (1927), August Heckscher, chairman and supporter, represent the development in organization during the present century. The National Housing Association is limited to discussions and publications, Better Homes in America seeks practical demonstration from general discussion, while the National Housing Committee for Congested Areas aims at general constructive laws, particularly the excess condemnation law.

State and City Organizations.—There were State Housing Associations established in Indiana, 1911, New Jersey, 1913 and Pennsylvania, 1913, carrying on propaganda, securing and preserving restrictive laws. There are many city associations throughout the country. In New York the tenement house committee of the Charity Organization Society, founded in 1898 under Robert W. DeForest and Lawrence Veiller, aided the passage of the Tenement House Act, 1901, the institution of the tenement housing department and has supervised the tenement house law. The Philadelphia Housing Association (1909) aims at investigation of housing conditions, the enforcement of the housing law, the enactment of additional legislation and the education of the public in housing matters. The San Francisco Housing Association (1910) played an important part in securing State-wide tenement housing

BY COURTESY OF HENRY ATTERBURY SMITH

TWO PLANS OF MODERN APARTMENT HOUSE ARRANGEMENT

1. Apartment house buildings at Jackson Heights. Diagonal, 45°, "Saw-tooth," or $\frac{3}{4}$ Open Units. Observe the "Open Stair" heads with incinerator chimneys adjacent. Two elevators furnish express service to the roof, distributing tenants to all stair heads by means of connecting bridges. Note absence of dark yards or courts
2. Vanderbilt East River Homes, fireproof throughout, with balcony floors on level with apartment floors. The window sash is open from floor to ceiling, permitting open air sleeping. These buildings house 376 families, having 900 rooms and 376 baths. 632 rooms are less than 7'0" wide, and some are 6'0" wide, but all are light and airy
3. Drawing showing layout of the buildings at Jackson Heights. Diagonal placement permits of maximum light and air for occupants. In such buildings, running north and south in single rows, each room would actually receive sunlight during some portion of every day
4. Open Stairs of the Vanderbilt Apartments. These eliminate all halls and inter-communication between suites. Entrances to all apartments open into fresh air. Contagion, infection, odours and neighbour annoyances are reduced to a minimum. Entrance to apartments is under control and observation at all times
5. Plan submitted to W. K. Vanderbilt in 1908. Observe all primary rooms in zone of primary value. Vestibules, baths and staircases are in zone of secondary value. Apartments only two rooms deep are assured of complete cross-ventilation
6. Plan of one building at Jackson Heights. All of the six buildings vary in arrangements. Observe the absence of halls and interior rooms. Complete cross-ventilation is secured
7. View across courts of a roof of the Vanderbilt Apartments. Observe two "Open Stair" heads. Tiled roofs of all "Open Stair" multiple dwellings are used for many open air purposes, e. g., for sun rooms and drying decks as illustrated
8. Entrance to "Open patios" of the Vanderbilt apartments. There are no doors or gates between street and individual apartment entrances. Dead air pockets are thus eliminated and complete circulation of fresh air is permitted

legislation but since the establishment of the State Commission of Housing and Immigration (1913) has ceased to exist. Cincinnati has a Better Housing League, which is functioning effectively, Chicago has had a housing council and there were housing committees in Minneapolis and Cleveland, which latter drew up in 1914 the local tenement house law known as the Sunlight Code. There were similar committees in Baltimore, St. Louis, Detroit, Columbus, O., and Louisville.

Private Housing Enterprises.—In addition to general housing agencies, endeavouring to stimulate building and actually

NEW YORK CITY TENEMENT BLOCK SHOWING: 1. RAILROAD FLATS WITHOUT WINDOWS; 2. DOUBLE FLATS BUILT AFTER 1879; 3. CONVERTED DWELLINGS WITH INTERIOR ALCOVE ROOMS; 4. REAR TENEMENTS; 5. NEW LAW TENEMENTS BUILT AFTER 1901

construct model tenements, many employers in the United States have constructed dwellings for their employees. More than 200 industrial companies have themselves provided dwellings for over 160,000 workers. This activity is believed by many persons to be somewhat feudal in character and is at variance with modern social and economic tendencies so that such industrial housing is not expected to increase.

The New York State Board of Housing.—The State board of housing was appointed in 1926. The essentials of the State housing plan are: control of dividends on capital invested in housing projects to avoid speculative profit; exemption of the housing corporation, its stocks, bonds and interest thereon from State taxation to reduce annual charges on the project; exemption of buildings and improvements from local taxation further to reduce annual charges; exercise of the power of condemnation to insure acquisition, at fair prices, of suitable sites for large scale production; statutory limitation of rents so that economies thus gained shall be conserved for tenants; creation of a State board of housing to administer the law. The State housing plan required special legislation, to provide for tax exemptions. This law as enacted is not ideal but it recognizes that the housing of the poor in the slums, or the eradication of the slums, requires public action, since private enterprise or commercial building cannot supply the demand for low-priced dwellings.

Housing on a broad scale involves considerable condemnation. The New York act authorizes a "Public Limited Dividend Housing Company," and grants it the power of condemnation, but prohibits selling or otherwise disposing of land so acquired except to another limited company after the State housing board has approved the transfer. A private limited dividend housing company has not the right of eminent domain in acquiring property.

Condemnation by the Public Limited Dividend Housing Company occurs under the State condemnation law. If the property is in New York city, the housing company may ask the city to start proceedings for acquisition of title. The city then acquires the property as for a public use and conveys it to the company. Rents of apartments built under the State housing law are limited in New York city to \$12.50 a room monthly in Manhattan, \$11 in Brooklyn and the Bronx, \$10 in Queens and Richmond, and \$9 elsewhere. Rents may increase only if the State housing board deems it an economic necessity. A bill was before the Massachusetts senate in 1928 to form Limited Dividend Companies and a State board in order to build and supervise houses and

apartments to rent reasonably.

New York City's Plan.—The National Housing Committee has centred its efforts upon the slums in New York city's most congested area. In 1928 a scheme known as the Walker-Heckscher plan, suggested by August Heckscher, indicated the possibility of New York city leasing lands to those who would erect thereon fireproof, elevator apartments to rent for not more than \$8 a room monthly. The principle of operating such housing is incorporated in the law of excess condemnation, which has existed for 300 years in various European countries. The United States applied the law practically and extensively for the first time when, in 1812, the State of New York passed a law enabling New York city to condemn remnants left over after street and park openings. The law was employed until 1834, when it was declared unconstitutional but it was revived in 1913 with an amendment.

Excess Condemnation bears directly upon slum clearance and municipal housing. Slum clearance concerns New York city more than any other municipality, and in this respect it is interesting to note that the State Constitution says: "The legislature may authorize cities to take more land and property than is needed for actual construction in the laying out, widening, extending or re-locating parks, public places, highways or streets; provided, however, that the additional land and property so authorized to be taken shall be no more than sufficient to form suitable building sites abutting on such park, public place, highway or street. After so much land has been appropriated for such park, public place, highway or street as is needed therefor, the remainder may be sold or leased." (Amendment adopted 1914, Art. 1, Sec. 7.)

The New York city charter embodied the spirit of the State amendment and the housing plan, referred to above, was adopted by the city of New York in 1927 by the board of aldermen. It was submitted to the voters, who empowered the city, through the sinking fund commission, to extend the lease period of land thus taken from a 20-year maximum to a longer term to be decided by the commission in granting the lease. Thus a feasible plan, or at least a promising experiment, was formed for eradicating slum centres. Subsidized housing does not appeal to the United States in the manner it does in Europe. The government provides public schools, highways, bridges, courts, fire and police departments, etc., and although it is believed by some that the Government should create a housing subsidy, no action has been taken. Thus far, indirect subsidy amounts to tax exemption and the remote aid of publicly owned transit facilities, which make profitable real estate developments in interest of cities.

The housing situation in the United States is now included in the more general problem of city planning, including zoning, transit and traffic. Nearly 400 cities with about one-fourth of the country's total population have city planning commissions, and nearly one-half of these have adopted practical plans which are helping those cities develop.

HOUSMAN, ALFRED EDWARD (1859–), scholar and poet, was born on March 26, 1859. He was educated at Bromsgrove school (1870–77) and held a scholarship at St. John's college, Oxford (1877–81), of which college he has since been made an honorary fellow. After leaving Oxford he held a post in H.M. patent office till he was appointed professor of Latin at University college, London, in 1892. In 1911 he was made a fellow of Trinity college, Cambridge, and professor of Latin in that university. His chief publications, besides many papers in classical journals (for which see *A List of Adversaria* printed at Cambridge in 1926) are editions of Juvenal (1905), Manilius (I., 1903, II., 1912, III., 1916, IV., 1920), and Lucan (1926), and two volumes of lyrics, *A Shropshire Lad* (1896) and *Last Poems* (1922).

As a scholar Housman invites comparison with Bentley for learning, ingenuity and controversial vigour. He has led the attack on superstitious fidelity to the "best ms." and "palaeographical probability," and brought to the defence of common-sense in scholarship an armoury of sarcastic wit which has helped to make him the most widely feared of contemporary scholars. It is not these powers, however, nor the range, depth, and unflinching accuracy of his learning, but the strength and keenness of his intellect, which give to his work its quality of greatness and to him his claim to pre-eminence in the world of scholarship.

As a poet Housman appeals to a larger public. The popularity of *A Shropshire Lad* grew slowly, but so surely that *Last Poems* had an immediate success greater than that of any other book of poetry published in England during the century. The poems are enjoyed by those readers whose interests are not literary because the language is simple and the verse melodious, the subjects are attractive, and the thought is easily understood; they are admired by the best judges because they are flawless in taste and execution and possess a quality both in their form and in their feeling which it is equally vain to imitate and to seek elsewhere in literature: they are as romantic as ballads, as classical as the Greek Anthology. The poems number little more than a hundred; about a third are written in the character of a country boy who is exiled in London; they deal with the vicissitudes of friendship, the passing of youth, the beauty and the cruelty of nature, and the vanity of human wishes, as experienced by one whom nothing can cheat either of his courage or of his despair.

Probably no well-known writer has been so averse from publicity as Professor Housman, and of those who know him few know him well. In the preface, as in the title, to *Last Poems* he indicated without any appearance of regret that no more poetry from him was to be expected. (J. Sp.)

HOUSMAN, LAURENCE (1867–), English writer and artist, was born on June 18, 1867. Having studied at South Kensington, he first made a reputation as a book illustrator. Some of his best pictorial work may be seen in the editions of Meredith's *Jump to Glory Jane* (1892), the *Weird Tales* of Jonas Lie (1892), Jane Barlow's *Land of Elfintown* (1894), Christina Rossetti's *Goblin Market* (1893), *Werewolf* (1896), by his sister, Miss Clemence Housman, Shelley's *Sensitive Plant* (1898), and his own *Farm in Fairyland* (1894). His designs were engraved on wood by Miss Housman. His volumes of verse include *Green Arras* (1896), *Rue* (1899), *Spikenard* (1898) and *Mendicant Rhymes* (1906); and the mysticism which characterizes the devotional poems in *Spikenard* recurs in his half-allegorical tales, *All Fellows* (1896), *The Blue Moon* (1904) and *The Cloak of Friendship* (1906). His nativity play, *Bethlehem*, was presented in the Great Hall of London University at South Kensington for a week in Dec. 1902. In 1900 he published anonymously *An Englishwoman's Love Letters*, and followed this essay in popular fiction by the novels *A Modern Antaeus* (1901) and *Sabrina Warham* (1904). On Dec. 23, 1904, his fantastic and moving play *Prunella*, written in collaboration with Mr. Granville Barker, was produced at the Court Theatre. His later works include *Angels and Ministers* (1921) and *Little Plays of St. Francis* (1922).

HOUSSAYE (HOUSSET), ARSÈNE (1815–1896), French novelist, poet and man of letters, was born at Bruyères (Aisne). He wrote *Histoire du quarante et unième fauteuil de l'académie française* (1855). In 1849, through the influence of Rachel, he became administrator of the Comédie Française, a position he filled with unflinching tact and success until 1859, when he was made inspector-general of works of art. He died on Feb. 26, 1896.

His *Confessions, souvenirs d'un demi-siècle* appeared in 1885–91. See also J. Lemaître, *Arsène Houssaye* (1897, bibl.).

HOUSSAYE, HENRY (1848–1911), French historian, son of the preceding, was born in Paris. His early writings were devoted to classical antiquity, and to Greek history. He is best known, however, for his works on the Napoleonic period. These include: 1814 (1888), which went through no fewer than 46 editions; 1815, the first part of which comprises the first Restoration, the return from Elba and the Hundred Days (1893); the second

part, Waterloo (1899); and the third part, the second abdication and the White Terror (1905); and *Iéna et la campagne de 1806* (1912). He was elected a member of the French Academy in 1895, and died in Paris on Sept. 23, 1911.

See L. Sonolet, *Henri Houssaye* (1905).

HOUSTON, SAM or SAMUEL (1793–1863), American general and statesman, of Scotch-Irish descent, was born near Lexington, Va., on March 2, 1793. His father, who had fought in the Revolutionary War, died in 1806, and soon afterward Samuel removed with his mother to the frontier in Blount county, Tenn. When he was about 15 his elder brothers obtained for him a place as clerk in a trader's store, but he ran away and lived with the Cherokee Indians of East Tennessee for nearly three years. On his return he opened a country school, and later attended a session or two of the Academy at Maryville. During the War of 1812 he served under Andrew Jackson against the Creek Indians. In 1817 he was appointed sub-agent in managing the removal of the Cherokees from East Tennessee to a reservation in what is now Arkansas, but he was offended at a rebuke from John C. Calhoun, then secretary of war, for appearing before him in Indian garments, as well as at an inquiry into charges affecting his official integrity, and he resigned in 1818. He entered a law office in Nashville, and was admitted to the bar. From 1823 to 1827 Houston represented the ninth district of Tennessee in Congress, and in 1827 was elected governor of the State by the Jackson Democrats. He married Eliza Allen in Jan. 1829; his wife left him three months later, and he resigned his office of governor, again took up his residence among the Cherokees, who were at this time about to remove to Indian Territory, and was formally adopted a member of their nation.

In 1830 and again in 1832 he visited Washington to expose the frauds practised upon the Cherokees by Government agents. Commissioned by President Jackson, Houston went to Texas in Dec. 1832 to negotiate treaties with the Indian tribes there for the protection of American traders on the border. He decided to remain in Texas, and was elected a delegate to the constitutional convention which met at San Felipe on April 1, 1833 to draw up a memorial to the Mexican Congress asking for the separation of Texas from Coahuila, in which the anti-American Party was in control, as well as to frame a constitution for the commonwealth as a new member of the Mexican Republic. In Nov., 1835, soon after the outbreak of the War for Texan Independence, he was chosen commander-in-chief of the Texan army. On April 21, 1836, while in command of 743 raw troops, he met on the bank of the San Jacinto about 1,600 Mexican veterans led by Santa Anna and completely routed them; on the next day Santa Anna was taken prisoner.

Texan independence was won by this victory and Houston was elected president of Texas, Sept. 1, 1836. His term expired in Dec. 1838; he was elected again in 1841 and served until 1844. During his first term a newly founded city was named in his honour and this was the seat of Government in 1837–39 and in 1842–45. Texas having been admitted as a State of the American Union in 1845, Houston was elected one of its first two U.S. senators. He served as a stalwart Union Democrat from 1846 until 1859; he opposed the Kansas-Nebraska bill in an able speech and spoke frequently in defence of the rights of the Indians. In 1859 he was elected governor of Texas and tried to prevent the secession of his State: upon his refusal, in March 1861, to swear allegiance to the Confederacy he was declared deposed. He died at Huntsville, Tex., on July 26, 1863. Houston was an able soldier, wary, intrepid and resolute; and was a legislator of rare foresight, cool discrimination and fearless candour.

Creel, *Sam Houston, Colossus in Buckskin* (1928); M. James, *The Raven: The Life of Sam Houston* (1929).

HOUSTON, a city of south-eastern Texas, U.S.A., on the Houston ship channel (formerly Buffalo bayou), 50m. from the Gulf of Mexico, surrounded by producing oil-fields; a port of

entry in the Galveston customs district, the county seat of Harris county, the principal industrial centre of southern Texas and one of the leading Gulf ports. It is on Federal highways 75 and 90, has two commercial airports, and is served by the Galveston, Houston and Henderson, the Houston, Belt and Terminal, the Missouri-Kansas-Texas, the Missouri Pacific, the Santa Fe and the Southern Pacific railways, and by 35 steamship lines, operating to the principal ports of the world. The population in 1920 was 138,278, of whom 33,960 were negroes and 12,012 were foreign-born white; and was estimated locally (with allowance for new territory annexed since 1920) at 265,000 in 1928. The estimate for the entire metropolitan area in 1928 was 300,000.

The city has a fine site, covering 40 sq.m., on both sides of the channel, and a climate which permits home-grown strawberries in February and roses all the year round. Its rapid commercial and industrial development since the World War has been accompanied by tremendous improvements in paving and widening streets, constructing sewers and bridges, building driveways along the bayous, adding parks and beautiful buildings (including a new library, an art museum, an auditorium and an outdoor theatre), and transforming the business section with modern office buildings and hotels. The parks have an area of 2,500 acres. The 19 first-class hotels can accommodate over 5,000 guests. The assessed valuation of property in 1927 was \$279,504,510. The Rice institute, founded by William Marsh Rice in 1891, and endowed by him with \$10,000,000 (which did not become available until 1908), bids fair to be one of the most beautiful universities of America. Its campus of 300 ac. is 3 m. from the centre of the city. The general architectural plan contemplates eventually 30 main buildings, in a prevailing Mediterranean style. The initial group was ready for the opening of the first session in Sept. 1912. By 1928 the endowment had grown to \$14,000,000 and the enrolment was about 2,000. Tuition is free.

The city has a commission form of government, adopted in 1905, the second of its kind to be organized in the United States. Since 1924 the public schools have been in the hands of an elected board, distinct from the city government. The port (4 m. E. of the city) is administered by the Harris county navigation and canal commission. The municipality owns the port facilities, the Harbor Belt railway, the waterworks (artesian wells), the public market and an auditorium seating 4,500.

The navigable waterway to the gulf has been the basis of Houston's economic life ever since sailing boats and flat-bottom barges made their way up and down the shallow, meandering tide-water stream in the early days of the village. By 1928 about \$24,000,000 had been spent by the Federal Government and the citizens of the Harris county navigation district in improving the channel and providing harbour facilities. A 25 ft. channel from the turning basin at Houston to Galveston bay was completed in 1914, and in 1919-25 it was widened and deepened to 30 feet. The port is a terminal of the intra-coastal canal, which will give it direct access to 7,000 m. of inland waterways. By 1925 Houston had become a world port, with 359 steamers clearing for foreign ports and 729 for American ports, and a total commerce valued at \$522,429,205, 4.5 times as much as the previous high record (1918) and 43 times as much as it was 20 years earlier. The first shipment of cotton to Liverpool was made in 1919, and in 1927 2,167,420 bales were exported. Petroleum products rank next to cotton (in value) among the exports and first in tonnage. Others of importance are rice, refined sugar and cotton-seed meal from local plants.

On the banks of the ship channel are 13 oil refineries, with their own wharves, tank farms and tanker lines; cotton compresses and storage warehouses; fertilizer, cement and chemical works; flour mills and grain elevators, and other industries, representing a capital investment of over \$140,000,000. Additional plants, valued at \$12,000,000, are on the light-draft channel which connects the port with the city. Houston was an important manufacturing centre even before the development of the coastal oil-fields and the recent commercial expansion, and in 1925 the output of the factories within the city limits was valued at \$87,445,460. Among the most important industries (after the oil refineries) are railroad repair and construction shops, foundries

and machine shops, rice mills and printing and publishing plants.

Houston is office headquarters for the Southern Pacific and several other railways, for the intra-coastal canal commission, and for many of the oil companies operating in the gulf coast fields, all of which are within a short journey, two of them (the Sinclair and the Galena Signal) lying just outside the city's bounds. It is an important financial centre. Bank debits to individual accounts in 1927 amounted to \$2,103,652,612. In recent years it has been the meeting-place for many large gatherings, including the National Democratic convention of 1928.

The permanent settlement of Houston began soon after the decisive battle of San Jacinto (April 21, 1836), and it was named after Gen. Sam Houston. It was the first capital of the Republic of Texas (1837-39) and was again the seat of government from 1842 to 1845. The city was incorporated in 1840. The population of 2,396 in 1850 grew to 16,513 in 1880; 44,633 in 1900; and 78,800 in 1910. Between 1910 and 1920 the area was more than doubled and the population increased 75.5%. Further annexations of territory have been made since 1920. The battle-field of San Jacinto, 22 m. below Houston on the banks of the ship channel, has been a State park since 1906.

HOUWALD, CHRISTOPH ERNST, FREIHERR VON (1778-1845), German dramatist and author, was born at Straupitz, Lower Lusatia, on Nov. 28, 1778. In 1821 Houwald was unanimously elected syndic for Lower Lusatia. He died at Neuhaus, near Lübben, on Jan. 28, 1845. Houwald wrote several "Fate tragedies," of which the best known as *Das Bild, Der Leuchtturm, Die Heimkehr, Fluch und Segen* (all published in 1821) and some excellent books for young people.

See his *Sämtliche Werke* (Leipzig, 5 vols., 1851; 2nd ed., 1858-59); and O. Schmidtborn, *C. E. von Houwald als Dramatiker* (1909).

HÖVA, the name originally applied to the middle-class Malayo-Indonesian natives of Madagascar (*q.v.*), as distinct from the noble class *Andriana* and the slave class *Andevo*. Höva now means the most numerous and powerful of the tribes of the native population of Madagascar. The Höva occupy the province of Imérina, the central plateau of the island, are of Malayo-Indonesian origin. They seem to have arrived four centuries ago but there may have been earlier migrations from Indonesia. The Höva are short and slim, with a complexion of a yellowish olive, many being fairer than the average of southern Europeans. Their hair is long, black and smooth but coarse. Their heads are round, with flat straight foreheads, flat faces, prominent cheekbones, small straight noses, fairly wide nostrils, and small black and slightly oblique eyes. Among the lower classes, there is a tendency to thick lips, kinky hair and dark skin. In many of their customs, such as taboo, infanticide, marriage and funeral rites, they show their Indonesian origin. Most of them now profess Christianity.

See Van Genep, *Tabou et Totemisme en Malgache*.

HOVE, a municipal borough of Sussex, England, adjoining Brighton on the west, on the Southern Railway. Pop. (1921) 46,505. Here is the Sussex county cricket ground. The municipal borough, incorporated in 1898, includes the parishes of Hove and Aldrington, and is within the parliamentary borough of Brighton.

HOVENDEN, THOMAS (1840-1895), American artist was born in Dunmanway, Co. Cork, Ireland, on Dec. 28, 1840. He was a pupil of the South Kensington Art Schools and those of the National Academy of Design, New York, whither he had removed in 1863. Subsequently he studied under Cabanel in Paris and spent much time in Brittany, where he painted many pictures of the peasantry. Returning to America in 1880, he became an academician in 1882, and attracted attention by an important canvas of "The Last Moments of John Brown" (now in the Metropolitan Museum of Art). His "Breaking Home Ties," a picture of American farm life, was engraved with considerable popular success. Hovenden was mortally injured in a heroic effort to save a child from a railroad train between his home at Plymouth Meeting and Norristown, Pa., and died at Norristown on Aug. 14, 1895. Among his works are:—"News from the Conscript" (1877), "Loyalist Peasant Soldier of La Vendée" (1879), "A Breton Interior," "Image Seller" and "Jerusalem

the Golden" (in the Metropolitan Museum of Art).

HOWARD (ENGLISH FAMILY). The head of this family, the duke of Norfolk, is the premier duke and the hereditary earl marshal of England, while the earls of Suffolk, Carlisle and Effingham and the Lord Howard of Glossop represent in the peerage its younger lines.

Its founder was a Norfolk lawyer, William Howard or Haward, who was summoned to parliament as a justice in 1295, being appointed a justice of the common pleas in 1297. The genealogists trace back the Howard pedigree to a Howard or Hereward in the tenth century, grandfather of a Hereward who was banished by William the Conqueror.

William Howard's eldest son, Sir John Howard, served in Edward II.'s wars in Scotland and Gascony, was sheriff of Norfolk and Suffolk and governor of Norwich Castle. When he died in 1331 he was seised of many Norfolk manors. His son and heir, another Sir John, admiral of the king's navy in the north, was a banneret who displayed his banner in the army that laid siege to Calais. By the admiral's wife Alice, sister and heir of Sir Robert de Boys, the Howards had the Boys manor of Fersfield, near Diss, which is still among the possessions of the dukes of Norfolk. His son Sir Robert Howard, who had married a daughter of Sir Robert Scales (Lord Scales), died in 1388. From Sir John Howard, the only son of Sir Robert, two branches of the house of Howard spring. The elder line was soon extinct. By his first wife, Margaret, daughter and heir of Sir John Plays, Sir John Howard had a son who died before him, leaving a daughter through whom descended to her issue, the Veres, earls of Oxford, the ancient Norfolk estates of the Howards at East Winch and elsewhere with the lands of the houses of Scales, Plays and Walton, brought in by the brides of her forefathers. By his second wife, the heir of the Tendrings of Tendring, he had a second son, Sir Robert Howard, a knight who fought under Henry V. in France, and died, like his half-brother, before the old knight's career ended in 1436.

Robert Howard married Margaret Mowbray, daughter of the banished duke of Norfolk. Their only son, Sir John Howard, took service with his cousin the third duke of Norfolk, who had him returned as knight of the shire for Norfolk. The last of the Mowbray dukes of Norfolk had left a child heir, Anne Mowbray, married to the infant duke of York, the younger of the princes doomed by Richard in the Tower. By the death of this little girl, John Howard became one of the coheirs of her house, which was now represented by the issue of Margaret Mowbray, his mother, and of her sister Isabel, who had married James, Lord Berkeley. A lion's share of the Mowbray estates, swollen by the great alliances of the house, heir of Breouse and Segrave, and, through Segrave, of Thomas of Brotherton, son of Edward I., fell to Howard, who, by a patent of June 28, 1483, was created duke of Norfolk and earl marshal of England with a remainder to the heirs male of his body. On the same day the Lord Berkeley, the other coheir, was made earl of Nottingham. "Jack of Norfolk" led the archer vanguard at Bosworth and died in the fight, from which his son Thomas, earl of Surrey, was carried away a wounded prisoner. An attainder by the first parliament of Henry VII. extinguished the honours of the father with those of the son, who had been created an earl when the Lord Howard was raised to the dukedom. Their estates were forfeit.

Thomas Howard was released from the Tower of London in 1489, his earldom of Surrey and his Garter restored. In his 70th year, as lieutenant-general of the North, he led the English army at Flodden, earning a patent of the dukedom of Norfolk, dated Feb. 1, 1513-14. The victor of Flodden is the common ancestor of all living Howards that can show a descent from the main stock. For the history of the Howard dukes of Norfolk see **NORFOLK, EARLS AND DUKES OF**.

The eldest of the cadet branches of the ducal house has its origin in William (c. 1510-1573), eldest son of the victor of Flodden by his second marriage. He survived the reign of Henry VIII., that perilous age for the Howards, with no worse misadventure than the conviction of himself and his wife of misprision of treason in concealing the offences of his niece, Queen Catherine. But both were pardoned. In 1553 he had the office of lord ad-

miral of England, and in the next year the Garter. For his services against Sir Thomas Wyatt he was created (March 11, 1553) Lord Howard of Effingham, the title being taken from a Surrey manor granted him by Edward VI. Queen Elizabeth continued his employment in diplomacy, and had he been richer he might have had an earldom. His eldest son Charles, earl of Nottingham (q.v.) (1536-1624), was lord admiral of England in 1585 and commander in chief against the Spanish Armada. Two of his sons succeeded in turn to the earldom of Nottingham, extinct on the death of Charles, the third earl in 1681. Sir William Howard of Lingfield, younger brother of the great admiral, carried on the Effingham line, his great-grandson succeeding to the barony on the extinction of the earldom. Francis, seventh Lord Howard of Effingham, was created earl of Effingham in 1731, a title extinct in 1816 with the fourth earl, but revived again in 1837 for the eleventh baron, who had served as a general officer in the Peninsular campaign, the great-grandfather of the present peer.

A patent of 1604 created Henry Howard (1540-1614), younger son of Surrey the poet, earl of Northampton, a peerage which ended with his death.

Thomas, son of the fourth duke of Norfolk's marriage with the daughter and heir of Thomas, Lord Audley of Walden, founded the line of the present earls of Suffolk and Berkshire and of the extinct Lords Howard of Escrick. His barony of Howard of Walden has descended to his heirs general. Another son, Lord William Howard (q.v.) married in 1577 one of the three coheirs of the Lord Dacre of Gilsland. His great-grandson Charles Howard, was created, in 1661, earl of Carlisle (q.v.), Viscount Morpeth and Lord Dacre of Gilsland, titles which are still held by his descendants. From Sir Francis Howard, a cavalier colonel and a younger son of "bould Willie," come the Howards of Corby Castle in Cumberland, a branch without a hereditary title.

William Howard, Viscount Stafford, was the fifth son of Thomas, earl of Arundel, and grandson of Philip the prisoner. Marrying the sister and heir of the fifth Lord Stafford, who died in 1637, he and his wife were created Baron and Baroness Stafford by a patent of 1640, with remainder, in default of heirs male, to heirs female. A grant of the precedence enjoyed by the bride's father being held illegal, her husband was in 1640 created Viscount Stafford. Roger Stafford, heir of the ancient Staffords, had been forced to surrender his barony in 1639. The Viscount, accused by Titus Oates, was sent to the Tower in 1678 and beheaded in 1680. He was beatified in 1929. In 1688 his widow was created countess of Stafford for life, and his eldest son, Henry, had the earldom of Stafford, with special remainder to his brothers. This earldom ended in 1762, but the attainder was reversed by an act of 1824 and in the following year Sir George Jerningham, the heir general, established his claim to the Stafford barony of 1640.

Howard, 10th duke of Norfolk, *Historical Anecdotes of the Howard Family* (1769); H. Howard of Corby, *Memorials of the Howard Family* (1834-36); M. A. Tierney, *History of Arundel* (1834); G. E. C. *Complete Peerage* (1887-1893); J. H. Round, *Studies in Peerage and Family History* (1901); G. Brenan and E. P. Statham, *House of Howard* (2 vols., 1907).

HOWARD, CATHERINE (d. 1542), the fifth queen of Henry VIII., was a daughter of Lord Edmund Howard and a granddaughter of Thomas Howard, 2nd duke of Norfolk (d. 1524). Her father was very poor, and Catherine lived mainly with Agnes, widow of the 2nd duke of Norfolk, meeting the king at the house of Stephen Gardiner, bishop of Winchester. After the divorce of Anne of Cleves Henry was privately married to Catherine at Oatlands in July 1540. Soon afterwards she was publicly acknowledged as queen. Before her marriage Catherine had had several lovers, among them being a musician, Henry Mannock, or Manox; her cousin, Thomas Culpepper; and Francis Dereham, to whom she had certainly been betrothed. After becoming queen she occasionally met Dereham and Culpepper, and in November 1541 Archbishop Cranmer informed Henry that his queen's past life had not been stainless. Cranmer had obtained his knowledge indirectly from an old servant of the duchess of Norfolk. Dereham confessed to his relations with Catherine, and after some

denials the queen herself admitted that this was true; but denied betrothal to Dereham, or misconduct since her marriage. Dereham and Culpepper were executed in December 1541 and their accomplices were punished, but Catherine was released from prison. On fresh evidence of alleged infidelity after marriage a bill of attainder was passed through parliament, and on Feb. 13, 1542, the queen was beheaded.

See A. Strickland, *Lives of the Queens of England* (vol. iii. 1877).

HOWARD, JOHN (1726-1790), English philanthropist and prison reformer, was born at Hackney, probably on Sept. 2, 1726. His father was a retired merchant who lived at Cardington, near Bedford. After serving as an apprentice to a firm of grocers, John Howard inherited considerable property on his father's death and decided to travel. He was on his way to Portugal in 1754 when the ship was taken by a French privateer, the crew and passengers being carried to Brest, where they were treated with great severity. Howard was permitted to return to England on parole to negotiate an exchange. He settled at Cardington, interesting himself in meteorological observations, and was admitted a member of the Royal Society in 1756. In 1766, after the death of his second wife, Howard went for a prolonged foreign tour, from which he returned in 1770.

In 1773 he became high sheriff of Bedford and paid visits to the gaol. Howard found it, like all the prisons of the time, wretchedly defective in its arrangements; neither the gaoler nor his subordinates were salaried officers, but were dependent on fees from prisoners. He found that some whom the juries had declared not guilty, others in whom the grand jury had not found even such appearance of guilt as would warrant a trial, others whose prosecutors had failed to appear, were detained in prison for months, until they paid the fees of gaol delivery. His prompt application to the justices for a salary to the gaoler in lieu of his fees was met by a demand for a precedent in charging the county with an expense. He went accordingly from county to county, and though he could find no precedent he discovered many abuses in prison management and determined to devote himself to prison reform.

In 1774 he gave evidence before a committee of the House of Commons, and received the thanks of the house. Almost immediately an act was passed which provided for the liberation, free of all charges, of every prisoner against whom the grand jury failed to find a true bill, giving the gaoler a sum from the county rate in lieu of the abolished fees. This was followed by another requiring justices of the peace to see that the walls and ceilings of prisons were scraped and whitewashed once a year at least; that the rooms were regularly cleaned and ventilated; that infirmaries were provided for the sick, and proper care taken to get them medical advice; that the naked should be clothed; that underground dungeons should be used as little as could be; and generally that such courses should be taken as would tend to restore and preserve the health of the prisoners. Howard had the provisions of the new legislation printed at his own cost, and sent to every gaoler and warder in the kingdom. In 1774 he stood as an anti-ministerial candidate for Bedford, was returned, but was unseated after a scrutiny.

After a tour in Scotland and Ireland, he travelled in 1775 through France, the Low Countries and Germany. At Paris he was at first denied access to the prisons; but, on the pretext of giving alms he succeeded in inspecting the Bicêtre, the Force l'Évêque and other prisons, the only important exception being the Bastille. At Ghent he examined the great Maison de Force. At Amsterdam, as in Holland generally, he was much struck with the comparative absence of crime, a phenomenon which he attributed to the industrial and reformatory treatment there adopted. In Germany he found little that was useful and much that was repulsive; in Hanover and Osnabrück, under the rule of a British sovereign, he even found traces of torture. After a short tour in England (1775-76), he again went abroad, extending his tour to several of the Swiss cantons.

In 1777 appeared *The State of the Prisons in England and Wales, with Preliminary Observations, and an Account of some Foreign Prisons*. One result was the drafting a bill for the estab-

lishment of penitentiary houses, where by means of solitary imprisonment, accompanied by well-regulated labour and religious instruction, the object of reforming the criminal and inuring him to habits of industry might be pursued. New buildings were manifestly necessary; and Howard volunteered to go abroad again and collect plans. He first went to Amsterdam (1778), and carefully examined the "spin-houses" and "rasp-houses" where prisoners were set to useful work; next he traversed Prussia, Saxony, Bohemia, Austria and Italy, everywhere inspecting prisons, hospitals and workhouses, and carefully recording the merits and defects of each. The information he thus obtained was presented to parliament, and a bill was passed for building two penitentiary houses; Howard was appointed first supervisor, but he resigned the post before anything practical had been achieved. In 1780 he had published his *State of Prisons*. Howard made other and more extended continental tours to Denmark, Sweden and Russia in 1781, and to Spain and Portugal in 1783. The results of these journeys were embodied in 1784, in a second appendix to his great work.

The five remaining years of his life were chiefly devoted to researches on the means for prevention of the plague, and for guarding against the propagation of contagious distempers in general. After an extended tour of the continent, he was preparing to return when it occurred to him that he still lacked personal experience of quarantine discipline. He returned to Smyrna, and, deliberately choosing a foul ship, took a passage to Venice. A protracted voyage of 60 days, during which the ship was attacked by pirates, was followed by a weary term of quarantine in the Venetian lazaretto. He reached England in 1787. He then inspected prisons of the United Kingdom, and prepared his *Account of the Principal Lazarettos in Europe* (1789).

In 1789 he made his last journey. Travelling overland to St. Petersburg and Moscow, and visiting the principal military hospitals that lay on his route, he reached Kherson where he inspected the hospitals. In attending a case of camp fever he contracted the disease, which terminated fatally on Jan. 20, 1790. He was buried near the village of Dauphigny on the road to St. Nicholas. There is a statue to his memory in St. Paul's, London, and one at Bedford.

Gardner, *The Place of John Howard in Penal Reform* (1926) and other Publications of the Howard League for Penal Reform.

HOWARD, LELAND OSSIAN (1857-), American entomologist, was born at Rockford (Ill.) on June 11, 1857. He graduated from Cornell university, becoming B.S. in 1877 and M.S. in 1883. After serving as assistant entomologist at the United States Department of Agriculture, Washington (D.C.), in 1878, he was made chief of the Bureau of Entomology in 1894. He retired from the chiefship of the Bureau in Oct. 1927, to devote his time wholly to research. From 1904 he was consulting entomologist in the United States Public Health Service, and from 1895 honorary curator of the United States National Museum. He was in 1917 a member of the committee on agriculture and chairman of the sub-committee on medical entomology of the National Council of Defence. He was chairman of the Pan-Pacific Food Conservation Congress at Honolulu (1924).

Howard wrote *Mosquitoes—How they Live* (1901); *The Insect Book* (1902); *The House Fly—Disease Carrier* (1911); a monograph on mosquitoes for the Carnegie Institution (1912); and many government bulletins.

HOWARD, OLIVER OTIS (1830-1909), American soldier, was born in Leeds, Me., on Nov. 8, 1830. He graduated at Bowdoin college in 1850, and at the U.S. Military Academy in 1854. At the beginning of the Civil War he resigned to become colonel of a Maine volunteer regiment, and at the first battle of Bull Run was in command of a brigade. He served in the Peninsular Campaign, and at the battle of Seven Pines (Fair Oaks) he was twice wounded, losing his right arm. On his return to

active service in Aug. 1862, he took part in the Virginian campaigns of 1862-63; at Antietam he succeeded Sedgwick in command of a division, and he became major-general of volunteers in March 1863. In the campaign of Chancellorsville (see WILDERNESS) he commanded a corps which was routed by "Stonewall" Jackson, and in the first day's battle at Gettysburg he was for some hours in command of the Union troops. Howard's corps was transferred to Tennessee after Rosecrans's defeat at Chickamauga, and formed part of Hooker's command in the victory of Chattanooga. When Sherman prepared to invade Georgia in the spring of 1864 Howard was placed in command of a new corps, and took part in the actions of the Atlanta campaign, receiving another wound at Pickett's mills. On the death in action of Gen. M'Pherson, Howard, in July 1864, was selected to command the army of the Tennessee. In this position he took part in the "March to the Sea" and the Carolinas campaign.

Howard served as commissioner of the Bureau of Refugees, Freedmen and Abandoned Lands from 1865 until 1874; in 1872 he was special commissioner to the hostile Apaches of New Mexico and Arizona; in 1874-81 was in command of the department of the Columbia and conducted the campaign against Chief Joseph in 1877 and that against the Bannocks and Piutes in 1878. In 1886 he was promoted major-general and in 1894 he retired. Howard was deeply interested in the welfare of the negroes; and the establishment by the U.S. Government in 1867 of Howard university, at Washington, especially for their education, was largely due to him; it was named, in his honour, and from 1869 to 1873 he presided over it. In 1895 he founded for the education of the "mountain whites" the Lincoln Memorial university at Cumberland Gap, Tenn. He died at Burlington, Vt., on Oct. 26, 1909. He wrote, amongst other works, *Donald's Schooldays* (1877); *Chief Joseph* (1881); a life of General Zachary Taylor (1892) in the "Great Commanders" series; *Isabella of Castile* (1894); *Fighting for Humanity* (1898); *Henry in the War* (1898); papers in the "Battles and Leaders" collection on the Atlanta campaign; *My Life and Experience among our Hostile Indians* (1907); and *Autobiography of O. O. Howard* (1907).

HOWARD, SIR ROBERT (1626-1698), English dramatist, sixth son of Thomas Howard, 1st earl of Berkshire, was born in 1626. He was knighted at the second battle of Newbury (1644) for his signal courage on the Royalist side. Imprisoned in Windsor Castle under the Commonwealth, his loyalty was rewarded at the Restoration, and he eventually became auditor of the exchequer. His best play is a comedy, *The Committee, or the Faithful Irishman* (1663; printed 1665), which kept the stage, long after its interest as a political satire was exhausted, for the character of Teague, said to have been drawn from one of his own servants. He was an early patron of Dryden, who married his sister, Lady Elizabeth Howard, and in the *Indian Queen*, a tragedy in heroic verse (1664; pr. 1665) Howard had assistance from Dryden, although the fact was not made public until the production of Dryden's *Indian Emperor*. The magnificence of the spectacle made a great sensation. In 1665 Howard published *Four New Plays*, in the preface to which he opposed the view maintained by Dryden in the dedicatory epistle to *The Rival Ladies*, that rhyme was better suited to the heroic tragedy than blank verse. Howard made an exception in favour of the rhyme of Lord Orrery, but by his silence concerning Dryden implicated him in the general censure. Dryden answered by placing Howard's sentiments in the mouth of Crites in his own *Essay on Dramatic Poesy* (1668). The controversy continued, but Dryden completely worsted his adversary in the 1668 edition of *The Indian Emperor*. Howard died on Sept. 3, 1698.

His brother, James Howard, wrote two comedies, *All Mistaken, or the Mad Couple* (1667; pr. 1672) and *The English Mounseieur* (1666; pr. 1674), the success of which seems to have been partly due to the acting of Nell Gwynn.

HOWARD, SIDNEY COE (1891-), American playwright and author, was born in Oakland, Calif., on June 26, 1891. He graduated at the University of California in 1915 and during the next year worked under George Pierce Baker in Harvard uni-

versity. During the World War he served with the American ambulance corps and was later a captain in the U.S. aviation service. He served on the editorial staff of *Life* 1919-22, and in 1923 was a feature story writer for Hearst's *International Magazine*. In 1922 he was married to Clare Eames, the actress. He is the author of the following plays: *Swords* (1921), *Casanova* (1923), *They Knew What They Wanted* (1925), which won the Pulitzer prize for the best American drama of that year; *Lucky Sam McCarver* (1925) and *The Silver Cord* (1926), included in Burns Mantle's *The Best Plays of 1926-27* (1927), and of many translations and adaptations of European drama. He has also published one volume of short stories, *Three Flights Up* (1924).

HOWARD, LORD WILLIAM (1563-1640), known as "Belted or Bauld (bold) Will," 3rd son of Thomas Howard, 4th duke of Norfolk (executed in 1572), and of his second wife Margaret Audley, was born at Audley End in Essex on Dec. 19, 1563. In 1577 he married Elizabeth, daughter of Thomas, Lord Dacre. Being suspected of treasonable intentions together with his elder brother, Philip, earl of Arundel, he was imprisoned in 1583, 1585 and 1589. He joined the church of Rome in 1584, both brothers being dispossessed by the queen of a portion of their Dacre estates, which were, however, restored in 1601 for a payment of £10,000. Lord William was a learned and accomplished scholar. He died in Oct. 1640 at Greystock. See also HOWARD (FAMILY).

HOWARD OF EFFINGHAM, LORD: see NOTTINGHAM, CHARLES HOWARD, 1ST EARL OF.

HOWARD OF EFFINGHAM, WILLIAM HOWARD, 1ST BARON (c. 1510-1573), English lord high admiral, was the son of the 2nd duke of Norfolk (d. 1524). At Anne Boleyn's coronation he was deputy earl marshal. In 1541 he was charged with abetting his relative Queen Catherine Howard, and was convicted of misprision of treason, but pardoned. In 1552 he was made governor of Calais, and in 1553 lord high admiral, being created Baron Howard of Effingham in 1554 for his defence of London in Sir Thomas Wyatt's rebellion against Queen Mary. He befriended the princess Elizabeth, but his popularity with the navy saved him from Mary's resentment; and when Elizabeth became queen he filled various important posts. His son, the second baron, the victor over the Armada, was created earl of Nottingham (q.v.); and from a younger son the later earls of Effingham were descended.

HOWE, ELIAS (1819-1867), American sewing-machine inventor, was born in Spencer, Mass., on July 9, 1819. In 1835 he entered the factory of a manufacturer of cotton machinery at Lowell, Mass., where he learned the machinist's trade. While employed in a machine shop at Cambridge, Mass., he conceived the idea of a sewing-machine, and for five years spent all his spare time in its development. In Sept. 1846 a patent for a practical sewing-machine was granted to him; and Howe spent the following two years (1847-49) in London, employed by William Thomas, a corset manufacturer, to whom he had sold the English rights for £250. Years of disappointment and discouragement followed before he was successful in introducing his invention, and several imitations which infringed his patent, particularly that of Isaac Merritt Singer (1811-75), had already been introduced and were widely used. His rights were established after much litigation in 1854. He died in Brooklyn, N.Y., on Oct. 3, 1867.

See *History of the Sewing Machine and of Elias Howe, Jr., the Inventor* (Detroit, 1867); P. G. Hubert, Jr., *Inventors*, in "Men of Achievement" series (1893).

HOWE, JOHN (1630-1706), English Puritan divine, was born on May 17, 1630 at Loughborough, Leicestershire, where his father was vicar. He studied at Christ's college, Cambridge, became fellow and chaplain of Magdalen college, Oxford, and held a Devonshire curacy. In 1657 Howe became domestic chap-

BY COURTESY OF SMITHSONIAN INSTITUTION
THE FIRST PRACTICAL SEWING MACHINE INVENTED BY ELIAS HOWE, SEPTEMBER 1846

lain to Cromwell. In this position his conduct was such as to win the praise of even the bitterest enemies of his party. Without overlooking his fellow-Puritans, he was always ready to help pious and learned men of other schools. Seth War (afterwards bishop of Exeter) and Thomas Fuller were among those who profited by Howe's kindness, and were not ashamed subsequently to express their gratitude for it. On the resignation of Richard Cromwell, Howe returned to Great Torrington, to leave it again in 1662 on the passing of the act of Uniformity. For several years he led a wandering and uncertain life, until he found a home with Lord Massereene, of Antrim castle, Ireland, with whom he lived for five or six years as domestic chaplain. Here he produced the most eloquent of his shorter treatises, *The Vanity of Man as Mortal*, and *On Delighting in God*, and planned his best work, *The Living Temple*. In 1676 he became joint-pastor of a non-conformist congregation at Haberdashers' hall, London; and in the same year he published the first part of *The Living Temple*, entitled *Concerning God's Existence and his Conversableness with Man: Against Atheism or the Epicurean Deism*.

For five years after his settlement in London Howe enjoyed comparative freedom, and was on not unfriendly terms with many eminent Anglicans, such as Stillingfleet, Tillotson, John Sharp and Richard Kidder; but in 1685 he left England with Philip, Lord Wharton. In 1686 he determined to settle for a time at Utrecht, where he officiated in the English chapel. Among his friends there was Gilbert Burnet, who introduced him to William of Orange. In 1687 Howe returned to England. He died in London on April 2, 1706. Richard Cromwell visited him in his last illness.

The works published in his lifetime, including a number of sermons, were collected into 2 vols. fol. in 1724, and again reprinted in 3 vols. 8vo. in 1848. A complete edition of the *Whole Works*, including much posthumous and additional matter, appeared with a memoir in 8 vols. in 1822; this was reprinted in 1 vol. in 1838 and in 6 vols. in 1862-63. E. Calamy's *Life* (1724) forms the basis of *The Life and Character of Howe, with an Analysis of his Writings*, by Henry Rogers (1836, new ed. 1863). See also a sketch by R. F. Horton (1896).

HOWE, JOSEPH (1804-1873), Canadian statesman, was born at Halifax, Nova Scotia, on Dec. 13, 1804, the son of John Howe (1752-1835), a United Empire Loyalist who was for many years king's printer and postmaster-general for the Maritime Provinces and the Bermudas. In 1827 he started the *Acadian*, a weekly non-political journal, but soon sold it, and in 1828 purchased the *Nova Scotian*, which later became amalgamated with the *Morning Chronicle*. In 1836 he was elected member for Halifax in the provincial assembly, and during the next twelve years agitated for responsible government for Nova Scotia. This brought him into conflict with the lieutenant-governor, Lord Falkland (1803-1884), whom he forced to resign. Responsible government was finally conceded in 1848 by the imperial authorities. In 1850 he was sent to England on behalf of the Intercolonial railway, for which he obtained an imperial guarantee. In 1854 he resigned from the cabinet, and was appointed chief commissioner of railways.

From 1860 to 1863 he was premier of Nova Scotia. Though his eloquence had done more than anything else to make practicable a union of the British North American provinces, he opposed confederation, but finally entered (on Jan. 30, 1869) the cabinet of Sir John Macdonald as president of the council. In May 1873 he was appointed lieutenant-governor of Nova Scotia, but died suddenly on June 1 of the same year.

His *Letters and Speeches* were published in 1858 in Boston, Mass., in 2 vols., edited nominally by William Annand, really by himself. See also *Public Letters and Speeches of Joseph Howe* (Halifax, 1909). *The Life and Times* by G. E. Fenety (1896) is poor. *The Life* by the Hon. James W. Longley (Toronto, 1904) is dispassionate, but otherwise mediocre. *Joseph Howe*, by George Monro Grant (reprinted Halifax, 1904), is a brilliant sketch.

HOWE, JULIA WARD (1819-1910), American author and reformer, was born in New York City May 27, 1819, and died at her summer home, Oak Glen, in Rhode Island, Oct. 17, 1910. The only woman to be honoured by election to the American Academy of Arts and Letters, Mrs. Howe probably owed this distinction to her stirring Civil War poem, *The Battle Hymn of the Republic* (published first in the *Atlantic Monthly*, Feb. 1862). Although this is the piece with which her name will ever be asso-

ciated, Mrs. Howe was one of the most active and versatile personalities of her day. She wrote poetry from her childhood, the most complete collection of it being *From Sunset Ridge: Poems Old and New* (1898). She studied, wrote, lectured on German philosophy, did some editorial work, advocated abolition, preached occasionally from Unitarian pulpits, was one of the organizers of the American Woman-Suffrage Association, and was a zealous worker for the advancement of women, for prison reform, for world peace and for other humanitarian movements. Her father, Samuel Ward, was a banker; her mother, Julia Rush Cutler Ward, a poet of some ability; her husband, Dr. Samuel Gridley Howe, a distinguished philanthropist and pioneer in the education of the blind and the feeble-minded. Her five children in turn made names for themselves in the educational and literary world.

Mrs. Howe's dramatic experiments were failures, and the most of her books of travel and essays have been forgotten. Her biographical works, like her poetry, remain of interest: *A Memoir of Dr. Samuel G. Howe* (1876), *Margaret Fuller* (1883), *Sketches of Representative Women of New England* (1905), and her own *Reminiscences* (1899).

A selection from her speeches and essays has been made by her daughter, Florence Howe Hall, under the title *Julia Ward Howe and the Woman Suffrage Movement* (1913); and a selection from Mrs. Howe's journals has been made by her daughter, Laura E. Richards, under the title *The Walk with God* (1919). Laura E. Richards and Maud Howe Elliott published *Julia Ward Howe, 1819-1910* (2 vols., 1915; and one vol., 1925).

HOWE, RICHARD HOWE, EARL (1726-1799), British admiral, was born in London on March 8, 1726. He was the second son of the 2nd Viscount Howe. He entered the navy in 1740, saw much active service, and was rapidly promoted. In 1755 he went with Boscawen to North America as captain of the "Dunkirk" (60), and his seizure of the French "Alcide" (64) was the first shot fired in the war. From this date till the peace of 1763 he served in the Channel in various more or less futile expeditions against the coast of France, with a steady increase of reputation as a firm and skilful officer. On Nov. 20, 1759, he led Hawke's fleet as captain of the "Magnanime" (64) in the victory of Quiberon.

By the death of his elder brother, killed near Ticonderoga on July 6, 1758, he became Viscount Howe—an Irish peerage. In 1762 he was elected M.P. for Dartmouth. During 1763 and 1765 he was a member of the Admiralty board, and from 1765 to 1770 was treasurer of the navy. In that year he was promoted rear-admiral, and in 1775 vice-admiral. In 1776 he was appointed to the command of the North American station. The rebellion of the colonies was making rapid progress, and Howe was known to be in sympathy with the colonists. He had sought the acquaintance of Benjamin Franklin, and it was perhaps because of his known sentiments that he was joined in commission with his brother, General Sir William Howe, to make a conciliatory arrangement. A committee appointed by the Continental Congress conferred with the Howes in September 1776 but nothing was accomplished. The appointment of a new peace commission in 1778 offended the admiral deeply, and he sent in his resignation. Before it could take effect France declared war, and a powerful French squadron was sent to America under the Count d'Estaing. Being greatly outnumbered, Howe had to stand on the defensive, but he baffled the French admiral at Sandy Hook, and defeated his attempt to take Newport in Rhode Island by a fine combination of caution and calculated daring. On the arrival of Admiral John Byron from England with reinforcements, Howe left the station in September. Until the fall of Lord North's ministry in 1782 he refused to serve, assigning as his reason that he could not trust Lord Sandwich. He considered that he had not been properly supported in America, and was embittered both by the supersession of himself and his brother as peace commissioners, and by attacks made on him by ministerial writers in the press.

On the change of ministry in March 1782 he was selected to command in the Channel, and in the autumn of that year he carried out the difficult operation of the final relief of Gibraltar. The French and Spaniards had in all 46 line-of-battle ships to his 33, and his ships were ill-equipped and manned. He was, moreover, hampered by a great convoy carrying stores. But Howe handled his ships well, the enemy was awkward and unenterprising,

and the operation was brilliantly successful. From Jan. 28 to April 16, 1783, he was First Lord of the Admiralty, and again from Dec. 1783 till Aug. 1788, in Pitt's first ministry. On the outbreak of the Revolutionary war in 1793 he was again named to the command of the Channel fleet. In 1794 he won the epoch-making victory of the First of June (see FIRST OF JUNE, BATTLE OF). Though Howe was now nearly seventy, and had been trained in the old school, he displayed an originality not usual with veterans, and not excelled by any of his successors in the war, not even by Nelson, since they had his example to follow and were served by more highly trained squadrons than his. In 1797 he was called on to pacify the mutineers at Spithead, and his great influence with the seamen, who trusted him, was conspicuously shown. He died on Aug. 5, 1799, and was buried in his family vault at Langar. His monument by Flaxman is in St. Paul's Cathedral. In 1782 he was created Viscount Howe of Langar, and in 1788 Baron and Earl Howe. In June 1797 he was made a knight of the Garter. His nickname of "Black Dick" was given on account of his swarthy complexion, and the well-known portrait by Gainsborough shows that it was apt.

The standard *Life* is by Sir John Barrow (1838). Interesting reminiscences will be found in the *Life of Codrington*, by Lady Bourchier. Accounts of his professional services are in Charnock's *Biographia Navalis*, v. 457, and in Ralf's *Naval Biographies*, i. 83. See also Beatson's *Naval and Military Annals*, James's *Naval History*, and Chevalier's *Histoire de la Marine française*, vols. i. and ii.

HOWE, SAMUEL GRIDLEY (1801-1876), American philanthropist, was born at Boston, Mass., on Nov. 10, 1801. He attended Brown university, Providence, R.I., and the Harvard Medical school. He was admitted to practice, but abandoned the medical field to take part in the Greek revolution. After six years with the Greek army he returned to America to raise funds for the cause. He collected \$60,000 and established a relief depot near Aegina, where he started works for the refugees. The existing quay, or American Mole, was built through his efforts. He formed another colony of exiles in the Isthmus of Corinth. He wrote a *Historical Sketch of the Greek Revolution*, which was published in 1828, and in 1831 he returned to America. Through the influence of his friend, Dr. John D. Fisher, Howe received a proposal to direct the establishment of a New England asylum for the blind at Boston. Howe set out at once for Europe to investigate the problem. There he was temporarily diverted from his task by becoming involved in the Polish revolt. He was arrested and imprisoned at Berlin, but was at last released through the intervention of the American minister in Paris. Returning to Boston in July 1832, he began receiving a few blind children at his father's house in Pleasant street. In Jan. 1833, the project received help from the legislature, which voted \$6,000 a year (later increased to \$30,000) to the institution on condition that it educate gratuitously 20 poor blind from the State. In addition, Col. Thomas H. Perkins, a prominent Bostonian, presented his mansion and grounds in Pearl street for the school to be held there in perpetuity. This building being later found unsuitable, Col. Perkins consented to its sale, and in 1839 the institution was moved to a large building in South Boston, which had previously been a fashionable hotel. It was henceforth known as the Perkins institution and Massachusetts asylum (or, since 1877, school) for the blind. Howe was the director and the life and soul of the school. He opened a printing-office and organized a fund for printing for the blind.

In 1843 he married Julia Ward, and with her made a prolonged European trip. Upon their return to America he became interested in the condition and treatment of idiots. He became chairman of a State commission of enquiry into the number and condition of idiots in Massachusetts. The report of this commission published in 1848 caused a profound sensation. An appropriation of \$2,500 per annum was made for training ten idiot children, and by degrees the value of the school for idiotic and feeble-minded youths, which, starting in South Boston, and in 1850 removed to Waltham, was generally appreciated. Dr. Howe was an ardent abolitionist and a member of the Free Soil Party. He played a leading part in Boston in the movements which culminated in the Civil War. In 1871 he was sent to Santo Domingo as a member of the commis-

sion appointed by President Grant to examine the condition of the island. The Santo Dominican Government desired annexation but the scheme fell through. Within two years Dr. Howe's health broke and on Jan. 19, 1876, he died at Boston.

A *Memoir* of Dr. Howe by his wife appeared in 1876. See also the *Letters and Journals of S. G. Howe*, edited by Laura E. Richards (1910); John Thomson Faris, *Men Who Conquered* (Chicago, 1922); and "Samuel Gridley Howe, 1801-76," *Social Service Review*, vol. i, p. 291-309 (Chicago, 1927).

HOWE, WILLIAM HOWE, 5TH VISCOUNT (1729-1814), British general, was the younger brother of George Augustus, 3rd viscount, killed in the Ticonderoga expedition of 1758, and of Richard, 4th viscount and afterwards Earl Howe, the admiral. He entered the army in 1746. In Wolfe's expedition to Quebec he distinguished himself greatly at the head of a composite light battalion. He led the advanced party in the landing at Wolfe's Cove and took part in the battle of the Plains of Abraham which followed. He commanded his own regiment in the defence of Quebec in 1759-1760, led a brigade in the advance on Montreal and took part on his return to Europe in the siege of Belleisle (1761). He was adjutant-general of the force which besieged and took Havana in 1762, and at the close of the war had acquired the reputation of being one of the most brilliant of the junior officers of the army. He was made colonel of the 46th Foot in 1764 and lieutenant-governor of the Isle of Wight four years later. From 1758 to 1780 he was M.P. for Nottingham. In 1772 he became major-general, and in 1774 he was entrusted with the training of light infantry companies on a new system, the training-ground being Salisbury Plain.

Shortly after this he was sent out to North America. He did not agree with the policy of the government towards the colonists, and regretted in particular that he was sent to Boston, where the memory of his eldest brother was still cherished, and General Gage, in whom he had no confidence, commanded in chief. He was the senior officer after Gage, and led the troops actively engaged in the storming of Bunker Hill, he himself being in the thickest of the fighting. In the same year Howe was made a K.B. and a lieutenant-general, and appointed, with the local rank of general, to the chief command in the seat of war. For the events during his command see AMERICAN REVOLUTION. He retained it until May 1778—on the whole with success. He resigned because he thought the home government had not afforded the proper support, and after his return to England, he and his brother engaged in a heated but fruitless controversy with the ministers. Howe's own defence is embodied in *Narrative of Sir William Howe before a Committee of the House of Commons* (London, 1780). In 1782 Howe was made lieutenant-general of the ordnance; in 1790 he was placed in command of the forces organized for action against Spain, and in 1793 he was made a full general. He held various home commands in the early part of the French revolutionary war, in particular that of the eastern district at the critical moment when the French established their forces on the Dutch coast. When Earl Howe died in 1799, Sir William succeeded to the Irish viscounty. He had been made governor of Berwick-on-Tweed in 1795, and in 1805 he became governor of Plymouth, where he died on July 12, 1814. With his death the Irish peerage became extinct.

HOWEL DDA ("the Good") (d. 950), prince of Deheubarth (south central Wales) before 915, and king of Wales from 943 to 950, was the grandson of Rhodri Mawr (the Great), who had united practically the whole of Wales under his supremacy. As Idwal Voel succeeded his father Anarawd, the elder son of Rhodri, as lord of Gwynedd in 915, so Howel at some time before that date succeeded Rhodri's younger son Cadell as prince of Deheubarth. Howel married Elen, daughter of the last king of Dyfed, and also added Kidweli and Gwyr to his dominions, while on the death of Idwal, who was slain by the English in 943, he took possession of Gwynedd. Both these princes had done homage to the English kings, Edward the Elder and Aethelstan, in 922 and 926, and we find that Howel attended the wittans of the English kingdom and witnessed about ten charters between the years 931 and 949. He was secure, therefore, from attack on the eastern side of his kingdom, and it is not certain whether he

was engaged in any of the battles recorded during these years in Wales, either in Môn 914, at Dinas Newydd 919 or at Brun 935. To the peaceful character of his reign is probably due the high place which he holds among the Welsh princes. From 943 to 950 Howel Dda was probably ruler of all Wales except Powys (apparently dependent on Mercia), Brecheiniog, Buallt, Gwent and Morgannwg. With Morgan Hen, king of Morgannwg, Howel had a dispute which was eventually settled in favour of the former at the court of the English king. Howel died in 950, and such unity as he had preserved at once disappeared in a war between his sons and those of Idwal Voel. The code of laws attributed to this prince is perhaps his chief claim to fame. He is said to have summoned four men from each cantref in his dominions to the Ty Gwyn (perhaps Whitland in Carmarthenshire) to codify existing custom. Three codes, accordingly called Venedotian, Demetian and Gwentian, are said to have been written down by Bleggwyrd, archdeacon of Llandaff (see WELSH LAWS).

See Sir John Rhys and Brynmor-Jones, *The Welsh People* (1900); and Aneurin Owen, *Ancient Laws and Institutions of Wales* (1841).

HOWELL, JAMES (c. 1594–1666), author of the *Epistolae Ho-eliae*, who came of an old Welsh family, was born probably at Abernant, in Carmarthenshire, where his father was rector. From the free grammar school at Hereford he went to Jesus college, Oxford, and took his degree of B.A. in 1613. He occupied numerous posts, served for a time in parliament and at various periods maintained himself almost entirely by writing pamphlets, dictionaries and translations. In 1660 the post of historiographer royal was created for him. Howell was buried in the Temple Church on Nov. 3, 1666.

All Howell's writings are imbued with a certain simplicity and quaintness. But he lives by his entertaining *Letters*, the *Epistolae Ho-eliae* (4 vols., 1645–55). Their dates are often fictitious, and they are, in nearly every case, evidently written for publication. Thackeray said that the *Letters* was one of his bedside books. He classes it with Montaigne and says he scarcely ever tired of "the artless prattle" of the "priggish little clerk of King Charles's council."

The *Epistolae* have been frequently edited, notably by J. Jacobs in 1890, with a commentary (1891), and Agnes Repplier (1907).

HOWELLS, WILLIAM DEAN (1837–1920), American novelist, was born at Martin's Ferry (O.), March 1, 1837. His father, William Cooper Howells, a printer-journalist, moved in 1840 to Hamilton (O.), and here the boy's early life was spent as type-setter, reporter, and editor in the offices of various newspapers. In the midst of routine work he contrived to familiarize himself with a wide range of authors in several modern tongues, and to drill himself thoroughly in the use of good English. In 1860, as assistant editor of the leading Republican newspaper in Ohio, he wrote—in connection with the Presidential contest—*The Campaign Life of Lincoln*. In the same year he was appointed consul at Venice, where he remained till 1865. On his return to America he joined the staff of the *Atlantic Monthly*, and from 1872 to 1881 was its editor-in-chief. From 1885 until his death on May 11, 1920, he lived in New York. For a time he conducted for *Harper's Magazine* the department called "The Editor's Study," and in Dec. 1900 he revived for the same periodical the department of "The Easy Chair," which had lapsed with the death of George William Curtis. In 1915 he received the gold medal of the National Institute of Arts and Letters for his work in fiction. Of Mr. Howells's many novels, the following may be mentioned as especially noteworthy: *Their Wedding Journey* (1872); *The Lady of the Aroostook* (1879); *A Modern Instance* (1882); *The Rise of Silas Lapham* (1885); *The Minister's Charge* (1886); *A Hazard of New Fortunes* (1889); *The Quality of Mercy* (1892); *The Landlord at Lion's Head* (1897). He also published *Poems* (1873 and 1886); *Stops of Various Quills* (1895), a book of verse; books of travel; several amusing farces, and volumes of essays and literary criticism, among others, *Literary Friends and Acquaintance* (1901), which contains much autobiographical matter; *Literature and Life* (1902); and *English Films* (1905). His later works included *My Mark Twain* (1910); *Imaginary Interviews* (1910); *Parting Friends*; a *Farce* (1911);

Familiar Spanish Travels (1913); *New Leaf Mills*; a *Chronicle* (1913); *The Seen and Unseen of Stratford-on-Avon*; a *Fantasy* (1914); *The Daughter of the Storage and Other Things in Prose and Verse* (1916); *The Leatherwood God* (1916) and *Years of My Youth* (1916). In 1920 he edited with an introduction *The Great Modern American Stories*. He left unfinished *Years of My Middle Life*.

Howells was long considered the foremost representative of the realistic school of indigenous American fiction. Though in his earliest novels his method was not consistently realistic—he was at times almost as personal and whimsical as Thackeray—yet his vivid impressionism and his choice of subjects, as well as an occasional explicit protest that "dulness is dear to him," already revealed unmistakably his realistic bias. In *A Modern Instance* (1882) he gained complete command of his method, and began a series of studies of American life remarkable for their loyalty to fact, and their power to reveal both the springs of American character and the sociological forces shaping American civilization. He refused to over-sophisticate or to over-intellectualize his characters, and he was very sparing in his use of psychological analysis. He insisted on seeing and portraying American life under its own skies and with its own atmosphere; he did not scrutinize it with foreign comparisons in mind, and thus try to find and to throw into relief unsuspected configurations of surface. He kept his dialogue toned down almost to the pitch of everyday conversation, although he has shown in his comedy sketches how easy a master he was of adroit and witty talk.

Finkins, *William Dean Howells* (1924); H. T. and W. Follet, *Some Modern Novelists* (1919); and *William Dean Howells; Life in Letters*, edited by his daughter Mildred Howells (1928).

HOWITT, WILLIAM (1792–1879), English author, born at Heanor, Derbyshire. He married, in 1821, Mary Botham (1799–1888), like himself a Quaker and a poet. The Howitts collaborated throughout a long literary career, the first of their joint productions being *The Forest Minstrels and other Poems* (1821). In 1831 William Howitt produced *The Book of the Seasons, or the Calendar of Nature*. Mary Howitt devoted herself to Scandinavian literature, and between 1842 and 1863 she translated the novels of Frederika Bremer and many of the stories of Hans Andersen. With her husband she wrote in 1852 *The Literature and Romance of Northern Europe*. In June of that year William Howitt, with two of his sons, set sail for Australia, where he spent two years in the goldfields and collected the material for *A Boy's Adventures in the Wilds of Australia* (1854). He died in Rome on March 3, 1879, and his wife, Mary Howitt, also died there on Jan. 30, 1888. Their son, Alfred William Howitt, made himself a name by his explorations in Australia.

Mary Howitt's autobiography was edited by her daughter, Margaret Howitt, in 1889. William Howitt wrote some 50 books, and his wife's publications, inclusive of translations, number over 100.

HOWLER, a name applied to the members of the genus *Alouatta* of tropical American monkeys. These monkeys, which are of large size, with thick fur, red or black in colour, are characterized by the inflation of the hyoid bone (which supports the tongue) into a large shell-like organ communicating with the windpipe, and giving peculiar resonance to the voice. The muzzle is projecting, and the profile of the face slopes regularly backwards. The long tail is prehensile, thickly furred, with the under surface of the extremity naked, to secure a better grip. Howlers dwell in companies, and in the early morning and evening make the woods resound with their cries, which are often continued throughout the night. They feed on leaves, and are in the habit of sitting on the topmost branches of trees. When on the move they progress in order, led by an old male.

"Howler" is also a slang term for conspicuously absurd blunders made by schoolboys or students in examinations, etc.

HOWRAH, a city and district of British India, in the Burdwan division of Bengal. The city is situated opposite Calcutta, with which it is connected by a floating bridge. The municipal area is about 11 sq.m.; pop. (1921), 195,301. Since 1881 the

had broken up is of great interest, as many of them are identical in name and topography with the high valley states and districts on the Upper Oxus.

Passing by Bamian, where he speaks of the great idols, he crossed Hindu-Kush, and descended the valley of the Kabul river to Nagarahara (Nagara, adjoining Jalalabad). Travelling thence to Peshawar (*Purushapura*), the capital of Gandhara, he made a detour, through the valley of Swat and the Dard states, to the Upper Indus, returning to Peshawar, and then crossing the Indus (*Sintu*) into the decayed kingdom of *Taxila* (Ta-cha-si-lo, Takshasila), then subject to Kashmir. In the latter valley he spent two whole years (631-633) studying in the convents, and visiting the many monuments of his faith. In his further travels he visited Mathura (*Mot'ulo*, Muttra), whence he turned north to Thanesar and the upper Jumna and Ganges, returning south down the valley of the latter to Kanyakubja or Kanauj, then one of the great capitals of India. The pilgrim next entered on a circuit of the most famous sites of Buddhist and of ancient Indian history, such as Ajodhya, Prayag (Allahabad), Kausambhi, Sravasti, Kapilavastu, the birth-place of Sakya, Kusinagara, his death-place, Pataliputra (Patna, the *Palibothra* of the Greeks), Gaya, Rajagriha and Nalanda, the most famous and learned monastery and college in India, adorned by the gifts of successive kings, of the splendour of which he gives a vivid description. There he spent nearly two years in mastering Sanskrit and the Buddhist philosophy. Again, proceeding down the banks of the Ganges, he diverged eastward to Kamarupa (Assam), and then passed by the great ports of Tamralipti (Tamluk, the misplaced *Tamalitis* of Ptolemy), and through Orissa to Kanchipara (Conjeeveram), about 640. Thence he went northward across the Carnatic and Maharashtra to Barakacheva (Broach of our day, *Barygasa* of the Greeks). After this he visited Malwa, Cutch, Surashtra (peninsular Gujarat, *Syastrene* of the Greeks), Sind, Multan and Ghazni, whence he rejoined his former course in the basin of the Kabul river.

This time, however, he crossed Pamir, of which he gives a remarkable account, and passed by Kashgar, Khotan (*Kustana*), and the vicinity of Lop-nor across the desert to Kwa-chow, whence he had made his venturesome and lonely plunge into the waste fifteen years before. He carried with him great collections of books, precious images and reliques, and was received (April 645) with public and imperial enthusiasm. The emperor T'ai-Tsung desired him to commit his journey to writing, and also that he should abandon the eremitic rule and serve the state. This last he declined, and devoted himself to the compilation of his narrative and the translation of the books he had brought with him from India. The former was completed A.D. 648. In 664 Hsüan Tsang died in a convent at Chang-gan. On the approach of death the saint caused one of his disciples to frame a catalogue of his good works, of the books that he had translated or caused to be transcribed, of the sacred pictures executed at his cost, of the alms that he had given, of the living creatures that he had ransomed from death.

(H. Y.; R. K. D.)

HSUAN T'UNG (1906-), emperor of China, or, more correctly, the Ch'ing emperor. At a meeting of the Grand Council held on Nov. 13, 1908, under the presidency of the Empress Dowager Tzu-Hsi, in anticipation of the death of the Emperor

Kuang Hsu, Pu Yi, the infant son of Prince Ch'un, was selected to succeed his uncle, under the style of Hsuan T'ung. The emperor died on Nov. 14, and the empress dowager on Nov. 15, whereupon Prince Ch'un became regent for his son. The reign lasted for three disturbed years during which the demand for reforms grew in intensity to a point when on Feb. 12, 1912, a decree of abdication was issued. The boy was permitted to retain his title of emperor and to reside in the imperial palace, a subsidy being voted for the maintenance of the imperial family. In July 1917, during the presidency of Li Yuan-hung, an attempt by General Chang Hsun, to restore the emperor was frustrated by Tuan Chi-jui after a few days' nominal "reign." The emperor's education has been upon modern lines and included the services of an English tutor. In 1922 he married a daughter of Jung Yuan, a Manchu noble. The ceremony took place with every symbol of imperial magnificence, costly wedding gifts being sent by the highest republican officials including the president, who conveyed the congratulations of the republican government. He then took the significant step of cutting off his queue, and adopting the personal name, Henry Pu-yi. In Nov. 1924, during the occupation of the capital by the Kuominchun, or National Army, he left the palace under duress and has since resided in the Japanese Concession at Tientsin.

HUAMBO: see ANGOLA.

HUANCVELICA, a department of central Peru, bounded by the departments of Junín, north, Ayacucho, east and south, Ica and Lima, west. Area, 8,300 sq.m.; pop. (estimated 1920), 223,796. It is a region of lofty peaks, dark lakes, high valleys and the headwaters of great streams, chief of which is the Mantaro. The only finished roads are a section of the *sierra* trunkline in the valley of the Mantaro and part of the Huancavelica-Lircay highway. Communication is still largely by mule. The chief resources are silver, copper, lead, coal, tungsten and mercury; chief products, wheat and other cereals (Acobamba), potatoes and livestock, especially alpacas. The capital, Huancavelica, about 80 m. south of Huancayo, with which it has been connected by rail since Dec. 1926 (altitude 12,464 ft.; pop., about 6,000), is in a cold and remote valley, surrounded by mountains. There are no modern improvements, but substantial stone houses and several fine churches of the colonial period. It is 160 m. from the port of Pisco. The history of Huancavelica is interwoven with that of the Santa Barbara mercury mine, 2,000 feet above the town—in a seam of cinnabar of varying breadth, 40 m. in length—from its acquisition by the Spanish crown in 1570 to its purchase by the Fernandini interests in 1915. Other towns are Castrovirreina, noted for its silver mines, Pampas and Lircay.

HUÁNUCO, a mountainous department of central Peru, bounded on the north by Libertad and San Martín, east by Loreto, south by Junín, west by Lima and Ancachs. Area, 15,430 sq.m.; pop. (estimated, 1920), 145,309, largely Indian. It includes *sierra* and wooded eastern slopes of the Cordillera and is traversed from south to north by the valley of the Huallaga river and the upper Marañon. Cotton, sugar-cane, coffee, rice, cacao, coca and other tropical crops are grown in the valleys. Posuso, a German colony, is on a tributary of the Pachitea. The enormous mineral resources are little exploited. The only finished road connects Cerro de Pasco with the city of Huánuco, a distance of 62 m. The road to Puerto Leguía on the Pachitea, is finished (1928) only as far as the Puente de Rancho across the upper Huallaga, 18 m. below the capital. Huánuco, capital of the department, in a beautiful valley on the left bank of the Huallaga river, is about 8,000 ft. above sea-level. Pop. (estimated) 6,000. The town was founded in 1539 by Gomez Alvarado and was an important colonial centre. Huánuco is celebrated for its fruits, the *chirimoya* (*Anona cherimolia*) of this region being the largest and most delicious of its kind.

HUARÁS, capital of the department of Ancachs, Peru, on the left bank of Huarás river, about 190 m. N.N.W. of Lima and 84 m. by mule from the port of Casma. Pop. (estimate, 1920) 14,000; altitude 9,800 ft. It is a picturesque Indian town in a fertile valley with magnificent views of snow-capped peaks. The climate is cool and bracing. The chief agricultural products are

wheat, barley, maize, potatoes and fruit. Cattle are superior in quality. Silver, lead and copper mines in the vicinity are worked on a small scale; mineral springs are locally famous. A railway up the Santa valley from the port of Chimbote is finished only as far as Huallanca (86 m.) but will eventually connect Huarás with the coast, a distance of 149 m. (see ANCACHES).

HUARTE DE SAN JUAN or **HUARTE Y NAVARRO, JUAN** (c. 1530–1592), Spanish physician and psychologist, was born at Saint-Jean-Pied-de-Port (Lower Navarre) and studied medicine at the university of Huesca, during the plague which devastated Baeza in 1566. His *Examen de ingenios para las ciencias* (1575), one of the first attempts to show the connection between psychology and physiology, won him a European reputation, and was translated by Lessing.

HUASTEC. A native people of the Atlantic coast of Mexico, south of Tampico and the lower Panuco river. They form an isolated offshoot of the great Maya family of Yucatan and Guatemala, but decisive evidence is lacking as to whether Huastec speech represents an archaic form of the Mayan language and the people a remnant left behind in an ancient southward migration of the stock, or the reverse. Culturally the Huastec belong rather in the Toltec-Aztec than in the Maya province, although their lowland habitat brought with it many differentiations. They formed the north-eastern frontier of the higher civilization of ancient Mexico. About 20,000 Huastec-speaking Indians survive.

See B. Sahagun, book X., ch. 29; Seler, *Gesamm. Abh.*, II. (1904); W. Staub, *El Mexico Antiguo*, I. (1919); R. Schuller, *ibid.*, II. (1924).

HUBAY, EUGENE DE (1858–), Hungarian composer and violinist, sometimes known as Eugen Huber, was born at Budapest Sept. 15, 1858. His first teacher was his father, who was a professor of the violin, and conductor of the Hungarian national opera. From 1871–5 he studied in Berlin under Joachim, and later, on the recommendation of Liszt, gave successful violin recitals in different countries including England. While in Paris he was associated with Vieuxtemps and Massenet. In 1882 he succeeded Wieniawski as professor of the violin at the Brussels Conservatoire, and in 1886 was appointed to a similar post at the Budapest Academy, of which he has been the director since 1919. His pupils include many eminent violinists, among them Vecsey, Jelly d'Aranyi and Szigeti. Hubay has written a number of operas (*The Violin Maker of Cremona*; *Anna Karenina*; *Alienor*; *Die Maske*; *Moosröschen*; *Lavottas Liebe*, etc.) as well as symphonies, violin concertos, smaller instrumental works and songs.

HUBBARD, ELBERT (1856–1915), American author and founder of the Roycroft Corporation, was born in Bloomington, Ill., in 1856, and perished in the sinking of the "Lusitania," on May 9, 1915. In 1891, after having sold his interest in a manufacturing company in Buffalo, N.Y., he started tramping through Europe. Meeting William Morris and visiting his Kelmscott Press in England, he was inspired to found a similar press, the Roycroft Press, at East Aurora, N.Y. Here he wrote in 1894 *A Little Journey to the Home of George Eliot*, the first of the famous *Little Journey* booklets, one of which was issued each month from his press for 15 years thereafter. These were pleasant biographical essays, in which the facts and information were interwoven with shrewd comment, wisdom and satire. In the same year Hubbard began printing *The Philistine*, an original magazine of pocket size, which was continued until his death, Hubbard's facile pen supplying most of the contents. In an 1899 number was printed "A Message to Garcia" the most famous single piece that Hubbard wrote. In 1908 he began to edit and publish *The Fra*, his second monthly magazine, which was continued to 1917. By this time his printing establishment had grown to large proportions. Besides his writings it was publishing many artistic books, hand-illuminated and hand-bound. To the printing shop Hubbard added furniture and leather shops and a smithy, in all of which the aim was to produce articles with something of the excellence of workmanship possessed by the old time craftsman. Painting, clay-moulding and terra-cotta work were included and an art school was established. Much of the work was done by neighbouring boys and girls although many

persons were attracted to the community by its leader and the spirit of his enterprise. The Roycrofters were formed into a legal corporation in which only the workers held shares. The community and the Roycroft enterprises were continued by Hubbard's son, Elbert.

Hubbard preached a gospel that was both individualistic and communal, and his writings contain a strong mixture of radicalism and conservatism. He apotheosized work, and his constant theme was efficiency. In style his writings were clear, vigorous and epigrammatic. Besides those mentioned his more important books were: *Time and Chance* (1899); *Life of Ali Baba* (1899); *The Man of Sorrows* (1906); *So Here Cometh White Hyacinths* (1907); and *The Roycroft Dictionary* (1914). *Elbert Hubbard's Scrap Book* (1923) and *The Note Book of Elbert Hubbard* (1927) were published posthumously. See also A. Lane, *Elbert Hubbard and His Work* (1901); and F. Shay, *Elbert Hubbard of East Aurora* (1926).

HUBER, JOHANN NEPOMUK (1830–1879), German philosophical and theological writer, a leader of the Old Catholics, was born on Aug. 18, 1830, at Munich, where he was professor of theology from 1864 until his death on March 20, 1879. He joined Döllinger and others in the challenge to the supporters of the Vatican council in the treatise *Der Papst und das Concil*, which appeared under the pseudonym of "Janus," and also in 1870 by a series of letters (*Römische Briefe*, a redaction of secret reports sent from Rome during the sitting of the council), which were published over the pseudonym Quirinus in the *Allgemeine Zeitung* (see DÖLLINGER).

His *Über die Willensfreiheit* (1858) was followed in 1859 by *Die Philosophie der Kirchenväter*, which was promptly placed upon the Index. He also published adverse criticisms of Darwin, Strauss, Hartmann and Haeckel.

See E. Zirngiebl, *Johannes Huber* (1881).

HUBER, LUDWIG FERDINAND (1764–1804), German publicist, was born in Paris on Sept. 14, 1764, and was brought up in Leipzig, where he became closely associated with Körner, to whose sister-in-law, Dora Stock, he became betrothed. From 1787 to 1792 he was secretary to the Saxon legation at Mainz, but abandoned the post on account of his passion for Thérèse Forster, whose husband had deserted her. On Georg Forster's death in Paris Huber married Thérèse in Switzerland. In 1798 he became editor of the *Allgemeine Zeitung* in Stuttgart, and, when the paper was prohibited in Württemberg, removed with it to Ulm, where he died on Dec. 24, 1804.

Huber wrote many plays, the best of which was *Das heimliche Gericht*. His *Sämtliche Werke* (4 vols., 1807–19) contain a biography by Thérèse Huber.

HUBER, MAX (1874–), Swiss lawyer, was born on Dec. 28, 1874, at Zürich. From 1902 to 1921 he held a law professorship—first extraordinary and subsequently ordinary—at the University of Zürich. In 1921 he resigned his chair and became honorary professor. The Swiss Federal Council on many occasions consulted him as an expert in international questions and he was a Swiss representative at The Hague Conference in 1907. During the World War he was legal adviser to the Swiss Political Department; he was entrusted with several missions to the Peace Conference, to the League of Nations and to various Governments. He was a member of the Jurists' Committee of the Council of the League of Nations dealing with the Aaland islands question and of the International Blockade Commission. He became both a judge of the Permanent Court of International Justice in 1922 and a member of the Permanent Court of Arbitration.

His publications include: *Die Staatensuccession* (1898) and *Völkerbundsprobleme in der Botschaft des schweizerischen Bundesrats vom 4 Aug. 1919* (1919).

HUBERT, ST. (d. 727) bishop of Liège, of whose life nothing is known except that in 708 he succeeded Lambert in the see of Maestricht (Tongres), and that he erected a basilica to his memory. In 825 Hubert's remains were removed to a Benedictine cloister in the Ardennes, which thenceforth bore his name. A late legend represents his conversion as having been brought about while he was hunting on Good Friday by a miraculous appearance of a stag bearing between his horns a cross or crucifix

surrounded with rays of light. He is the patron of hunters, and is also invoked in cases of hydrophobia. His feast is celebrated on Nov. 3.

See *Acta Sanctorum*, Nov. i. G. Kurth, *Charles de l'abbaye de St. Hubert en Ardenne* (Brussels, 1903).

HUBLI, a town of British India, in the Dharwar district of Bombay, 15 m. S.E. of Dharwar town. Pop. (1921) 69,206. It is a railway junction on the Madras and Southern Mahratta system, where the lines to Bangalore and Bezwada branch off south and west. It is an important centre of trade in cotton, grain and salt, and has spinning and weaving mills, factories for ginning and pressing cotton, railway workshops, soap and manure works. Hubli was an early English factory; it is a military station.

HÜBNER, EMIL (1834–1901), German classical scholar, son of the historical painter Julius Hübner (1806–82), was born at Düsseldorf on July 7, 1834. After studying at Berlin and Bonn, he travelled widely on antiquarian and epigraphical researches. The results of these travels were embodied in several important works: *Inscriptiones Hispaniae Latinae* (1869, supplement 1892), *I. H. Christianae* (1871, supplement 1900); *Inscriptiones Britanniae Latinae* (1873), *I. B. Christianae* (1876); *La Arqueologia de España* (1888); *Monumenta linguae Ibericae* (1893). Hübner wrote several other classical books of great ability in their day. He died on Feb. 21, 1901.

HÜBNER, JOSEPH ALEXANDER, COUNT (1811–1892), Austrian diplomatist, was born in Vienna on Nov. 26, 1811, of middle-class origin, his real name, afterwards changed to Hübner, being Hafenbreidl. He began his public career in 1833 under Metternich, who employed him successively in Paris (1837), Lisbon (1841), Leipzig (1844) and Milan (1848). After being held some months as hostage by the Italians in 1848, he returned to the Austrian Court; his journal of this period (*Ein Jahr aus meinem Leben*) is a very valuable record of contemporary events. In March 1849 he became Austrian ambassador in Paris, leaving his post only on the outbreak of the war of 1859, which took him unprepared. After a short period as Minister of Police he lived in retirement till 1865, when he became ambassador at Rome till 1867. In 1879 he was made a life-member of the Austrian *Herrenhaus*; in 1854 baron; in 1888 count. He died in Vienna on July 30, 1892. Besides his journal Hübner wrote two racy travel books and a *Life of Sixtus the Fifth* (English trans. 1872). A strong conservative and admirer of Metternich, of whose era he was the last survivor, he was yet an able and broad-minded man.

See Sir Ernest Satow, *An Austrian Diplomatist in the Fifties* (1908).

HUC, ÉVARISTE RÉGIS (1813–1860), French missionary-traveller, was born at Toulouse, on Aug. 1, 1813. He entered the congregation of the Lazarists at Paris, and shortly after receiving holy orders in 1839 went out to China. At Macao he spent some 18 months in the Lazarist seminary, preparing himself for the regular work of a missionary. He at first superintended a Christian mission in the southern provinces, and then perfected his knowledge of the language at Peking, eventually settling in the Valley of Black Waters or He Shuy, just within the borders of Mongolia. There, beyond the Great Wall, a large, scattered population of native Christians had found refuge from the persecutions of Kia-King, to be united half a century later in an apostolic vicariate. Huc studied the dialects and customs of the Tatars, translated various religious works, and in 1844, at the instigation of the vicar apostolic of Mongolia, undertook an expedition to Tibet.

Accompanied by his fellow-Lazarist, Joseph Gabet, and a young Tibetan priest who had embraced Christianity, he set out from Dolon Nor. To escape attention the little party assumed the dress of lamas or priests. Crossing the Hwang-ho, they advanced into the sandy tract known as the Ordos desert. After terrible sufferings they entered Kansu, having recrossed the flooded Hwang-ho, and in Jan. 1845 reached Tang-Kiul on the boundary. There they waited for eight months, and studied the Tibetan language and Buddhist literature, residing for part of the time in the Kunbum Lamasery, which was reported to accommodate 4,000 persons. Towards the end of September they joined a returning Tibetan embassy from Peking, which comprised 2,000

men and 3,700 animals. Crossing the deserts of Koko Nor, they passed the lake of that name, with its island of contemplative lamas, and, following a difficult and tortuous track across snow-covered mountains, they at last entered Lhasa on Jan. 29, 1846. Favourably received by the regent, they opened a little chapel, but the Chinese ambassador interfered and had the two missionaries conveyed back to Canton, where they arrived in October of the same year. For nearly three years Huc remained at Canton, but Gabet, returning to Europe, proceeded thence to Rio de Janeiro, and died there shortly afterwards. Huc returned to Europe in shattered health in 1852. He died in Paris on March 31, 1860.

His writings comprise, besides numerous letters and memoirs in the *Annales de la propagation de la foi*, the famous *Souvenirs d'un voyage dans la Tartarie, le Thibet, et la Chine pendant les années 1844–1846* (2 vols., 1850; Eng. trans. by W. Hazlitt, 1851, abbreviated by M. Jones, 1867); its supplement, crowned by the Academy, entitled *L'Empire chinois* (2 vols., 1854; Eng. trans., 1859); and an elaborate historical work, *Le Christianisme en Chine, etc.* (4 vols., 1857–58; Eng. trans., 1857–58).

See, for information specially relating to the whole subject, the Abbé Desgodin, *Mission du Thibet de 1855 à 1870* (Verdun, 1872); and "Account of the Pundit's Journey in Great Tibet," in the *Royal Geographical Society's Journal* for 1877. See also Prince Henry of Orleans, *Le père Huc et ses critiques* (1893).

HUCBALD (HUGBALDUS, HUBALDUS) (c. 840–930), Benedictine monk, and writer on music, was born at the monastery of Saint Amand near Tournai. He studied at the monastery, where his uncle Milo was head of the school. Hucbald's success in music is said to have excited his uncle's jealousy and to have made it necessary for him to leave St. Amand. In 860 he was at St. Germain d'Auxerre, bent upon completing his studies, and in 872 he was back again at St. Amand as successor to his uncle, to whom he had been reconciled in the meantime. Between 883 and 900 Hucbald went on several missions of reforming various schools of music, including that of Reims, but in 900 he returned to St. Amand, where he died on June 25, 930, or, according to other chroniclers, on June 20, 932. The only work which can positively be ascribed to him is his *Harmonica Institutio*. The *Musica Enchiriadis*, published with other writings of minor importance in Gerbert's *Scriptores de Musica*, and containing a complete system of musical science as well as instructions regarding notation, dates from the close of the 10th century. This work is celebrated chiefly for an essay on a new form of notation described in the present day as *Dasia Notation*. The author of the *Harmonica Institutio* wrote numerous lives of the saints and a curious poem on bald men, dedicated to Charles the Bald.

Riemann, *Geschichte der Musiktheorie* (2nd ed., 1920).

HUCH, RICARDA (1864–), German poet and historical novelist, was born at Brunswick on July 18, 1864, and educated in Brunswick and Zürich. She was appointed secretary of the library in Zürich and married first Dr. Ceconi, and later Dr. Richard Huch, a lawyer. After leaving Zürich she lived in Bremen, Vienna, Trieste and Florence, then settling in Munich. She wrote a number of romantic and imaginative novels, among which may be mentioned *Aus der Triumphgasse* (1902); *Vita Somnium Breve, Erinnerungen, von Ludolf Ursleu dem Jüngeren* (1893); *Der grosse Krieg in Deutschland* (1912–14); and *Der wiederkehrende Christus* (1925). Her most important historical works are *Blüthezeit der Romantik* (1899); *Ausbreitung und Verfall der Romantik* (1902); *Das Risorgimento* (1908); *Michael Bakunin* (1923). In 1919 appeared a volume of reflections, *Der Sinn der heiligen Schrift*, which reveal a profound knowledge of psychology. One of the leaders of the revolt against naturalism, Ricarda Huch attained at her best a high degree of musical rhythm and romantic beauty.

HUCHOW, a Chinese town of 100,000 inhabitants in north-east Chekiang, lying to the south of the Tai-Nu Lake about 50 m

N. of Hangchow and 120 m. W.S.W. of Shanghai. Huchow is the centre of the great silk area of the Yang-tze delta which is shaped like an inverted funnel with its stem along the Grand Canal, splaying out beyond Wusih to include all northern Chekiang where the mulberry has little competition from cotton. Huchow is famous for silk products but in recent years its output has decreased owing to the competition of Shanghai, Wusih and Hangchow with their more modern methods. It retains its importance, however, for the cultivation of the Huchow mulberry. It has a large export trade in saplings and its raw cocoons and hand-reeled silk are in great demand at Shanghai, Wusih and Hangchow. Trade is carried on by junks.

HUCHOWN, "of the Awle Ryale" (fl. 14th century), Scottish poet, is referred to by Wyntoun in his *Chronicle* in these words:—

Hucheon,
pat cunnande was in littatur.
He made a gret Gest of Arthure,
And þe Awntyr of Gawane,
þe Pistil als of Suet Susane.
He was curyousse in his stille,
Fayr of facunde and subtile,
And ay to pleyssance hade delyte,
Mad in metyr meit his dyte
Lilil or noucht neuir þe lesse
Wauerande fra þe suythfastnes.

(Cott. ms. bk. v. 11, 4308-18.)

Much critical ingenuity has been spent in endeavouring to identify (a) the poet and (b) the works named in the foregoing passage. It has been assumed that "Huchown," or "Hucheon," represents the "gude Sir Hew of Eglyntoun" named by Dunbar (q.v.) in his *Lament for the Makaris* (l. 53). The only known Sir Hugh of Eglintoun of the century is frequently mentioned in the public records from the middle of the century onwards, as an auditor of accounts and witness to several charters. By 1360 he had married Dame Egidia, widow of Sir James Lindsay and half-sister of Robert the Steward. His public office and association with the Steward sorts well with the designation "of the Awle Ryale," if that be interpreted as "Aula Regalis" or "Royal Palace." He appears to have died late in 1376 or early in 1377.

The first of the poems named above, the *Gest of Arthure* or *Gest Historyalle* (ib. i. 4288), has been identified by Dr. Trautmann, "Anglia," *Der Dichter Huchown* (1877), with the alliterative *Morte Arthure* in the Thornton ms. at Lincoln, printed by the E.E.T.S. (1865). The problem of the second (*The Awntyr of Gawane*) is still in dispute. There are difficulties in the way of accepting the conjecture that the poem is the "Awntyres of Arthure at the Tern Wathelyne" (see S.T.S., *Scottish Alliterative Poems*, 1897, and Introduction, pp. 11 *et seq.*), and little direct evidence in favour of the view that the reference is to the greatest of middle English romances, *Sir Gawain and the Grene Knight*. The third may be safely accepted as the well-known *Pistil* [Epistle] of *Swete Susan*, printed by Laing (*Select Remains*, 1822) and by the S.T.S. (*Scottish Alliterative Poems*, u.s.).

See, in addition to the above works, G. Neilson, *Sir Hew of Eglintoun and Huchown of the Awle Ryale* (Glasgow, 1901) and *Huchown of the Awle Ryale, the Alliterative Poet* (Glasgow, 1902); J. T. T. Brown, *Huchown of the Awle Ryale and his Poems* (Glasgow, 1902), in answer to the foregoing. See also the correspondence in the *Athenæum*, 1900-01, and the review of Neilson's pamphlets, *ib.* (Nov. 22, 1902); and J. H. Millar, *Literary History of Scotland* (1903).

HUCHTENBURG, JOHN VAN (1647-1733), Dutch painter, a native of Haarlem, was first taught by Thomas Wyk, and afterward visited Italy, where he lived in Rome with his brother Jacob, who spent all his life in Italy and painted landscapes, very few of which are extant. After Jacob's death, John wandered homewards, taking Paris on his way, and served under Van der Meulen, then employed in illustrating for Louis XIV. the campaign of 1667-68 in the Low Countries. In 1670 he settled at Haarlem, where he married, and kept a dealer's shop. He produced pictures of hunts and robber camps, and, later, ventured on cavalry skirmishes and engagements or regular troops. These were admired by Prince Eugène, who made him court painter and employed him to paint the chief incidents of his battles. A series of ten of these pictures is in the Turin gallery. He died in

Amsterdam in 1733.

The earliest date on his pictures is 1674, when he painted the "Stag-Hunt" (museum of Berlin), and the "Fight with Robbers," (Lichtenstein collection at Vienna). A "Skirmish at Fleurus" (1690), in the Brussels gallery, was the precursor of more powerful works, such as the "Siege of Namur" (1695), in the Vienna museum. The National Gallery, London and the Louvre have each a picture by him. Munich has the well-known "Tallart taken Prisoner at Blenheim in 1704," and Amsterdam the "Battle of the Boyne."

HUCKABACK, the name given to a type of cloth used for towels. For this purpose it has perhaps been more extensively used in the linen trade than any other weave. One of the chief merits of a towel is its capacity for absorbing moisture; plain and other flat-surfaced cloths do not perform this function satisfactorily, but cloths made with huckaback, as well as those made with the honeycomb (q.v.), and similar weaves, are particularly

(A) ORDINARY AND MOST USED HUCK OR HUCKABACK. (B) DEVON OR MEDICAL HUCK

well adapted for this purpose. The body or foundation of the cloth is plain and therefore sound in structure (see designs A and B in figure), but at fixed intervals some of the warp threads float on the surface of the cloth, while at the same time a number of weft threads float on the back. Thus the cloth has a somewhat similar appearance on both sides. Weave A is the ordinary and most used huck or huckaback, while weave B, which is usually woven with double weft, is termed the Devon or medical huck. The cloths made by the use of these weaves were originally all linen; for cheapness and ease of weaving, cotton threads were gradually introduced, wholly or in part, for the warp. Such cloths have also been made solely from cotton yarns and occasionally by mixed yarns made from inferior fibres.

See T. Woodhouse and T. Milne, *Textile Design: Pure and Applied*, pp. 56-67 (1912). (T. W.)

HUCKLEBERRY, the popular name in the north-eastern United States of the genus *Gaylussacia* (family Ericaceae), small branching shrubs resembling in habit the English bilberry (*Vaccinium*), to which it is closely allied, and bearing a similar fruit. The common huckleberry of the northern states is *G. resinosa*; while *G. brachycera* and *G. dumosa* are known respectively as box and dwarf huckleberry. The name *Gaylussacia* commemorates the famous French chemist Gay-Lussac.

HUCKNALL TORKARD, a town in Nottinghamshire, England; 132 m. N.N.W. from London by rail. Pop. (1921) 16,834. The church of St. Mary Magdalene contains the tomb of Lord Byron. There are collieries in the vicinity, and the town has tobacco and hosiery works. Small traces are found of Beauvale abbey, a Carthusian foundation of the 14th century, to the west; and 3 m. N. is Newstead abbey, founded by Henry II., and associated with Byron. There remain the Early English west front of the church, a Perpendicular cloister and the chapter-house. To the south of Hucknall are traces of Gresley castle, of the 14th century.

HUDAIDA, chief sea-port of Yaman, on the Arabian coast of the Red sea, 14° 48' N. and 42° 57' E., on sandy beach exposed to S. and W. winds. Steamers anchor more than 1 m. from shore, and all goods are lightered by *Sanbūks* (Arab sailing boats). Its population of 30,000 in Turkish times, when there were a garrison and many officials, contained Indian, African and Greek traders, but since the World War prosperity has declined, though more recently Italian commercial and political activity bids fair to improve matters. Regular steamer communication is maintained with Massawa in Eritrea, while Hudaida is also served from Suez and Aden. After the war Hudaida, which was occupied by British troops, was handed over by the British Government to the Idrisi ruler of 'Asir, but in 1921 Imām Yahya of Yaman had no difficulty in wresting the town and district from him. And by the Italian treaty with the Imām, Hudaida is formally recognized as forming part of Yaman, though the Wahhabi king of Hijāz and Najd still regards it as *de jure* part of 'Asir within his dominions. Hudaida has long since displaced Mocha as the chief emporium

of the Yaman coffee trade, and also handles by far the greater part of the import trade of the country.

HUDDERSFIELD, a municipal, county and parliamentary borough in the West Riding of Yorkshire, England, 16½ m. S.W. of Leeds and 190 m. N.N.W. of London. Pop. (1921), 110,102. The town is situated on fairly steep slopes on the left bank of the river Colne, a tributary of the Calder. It is served by the L.M.S. railway and has connection by rail with all the important towns of industrial northern England. The Sir John Ramsden's canal links it, by water, with the Calder Navigation, giving water communication with the extensive canal system of Lancashire and Yorkshire.

Huddersfield (*Odersfelte*) rose to importance only after the introduction of the woollen trade in the 17th century. After the Conquest, William I. granted the manor to Ilbert de Lacy, of whom the Saxon tenant Godwin was holding as underlord at the time of the Domesday Survey. From the Lacys it passed to Thomas Plantagenet, duke of Lancaster, through his marriage with Alice de Lacy, and so to the crown, on the accession of Henry IV. In 1599 Queen Elizabeth sold it to William Ramsden, whose descendants still own it. To John Ramsden, in 1670, Charles II. granted a market in Huddersfield to be held every Wednesday. By the beginning of the 18th century Huddersfield had become a "considerable town," chiefly owing to the manufacture of woollen kersies, and towards the end of the same century, trade was increased by two events—the opening of navigation on the Calder in 1780 and the completion of the cloth-hall or piece-hall, built and given to the town by Sir John Ramsden in 1784.

The town is almost entirely modern, the chief buildings being great warehouses and business premises, built principally of grey stone. The parish church of St. Peter was rebuilt in 1837 and is believed to occupy a site which has carried a church since the 11th century. The cloth-hall dates from 1784, when it was erected as a clothiers' emporium, but it now serves as an exchange news-room. Huddersfield college was opened in 1838, the Longwood school was founded in 1731. There is a sulphurous spa in the district of Lockwood. Huddersfield is the chief seat of the fancy woollen trade in England, but plain and fancy woollen goods of every description, including worsteds, are manufactured there. Fancy goods in silk and cotton are produced in great variety. Coal is abundant in the vicinity and there are iron foundries, engineering works and silk and cotton spinning mills in the town. Since 1832 Huddersfield has had representation in parliament and returns one member. The town possesses no charter before 1868, when it was created a municipal borough. The county borough was created in 1888.

HUDSON, GEORGE (1800–1871), English railway financier, known as the "railway king," was born in York in March 1800. He helped to secure the passing of the York and North Midland bill, and was elected chairman of the new company—the line being opened in 1839. From this time he turned his undivided attention to the projection of railways. In 1841 he initiated the Newcastle and Darlington line. With George Stephenson he planned and carried out the extension of the Midland to Newcastle, and by 1844 had over a thousand miles of railway under his control. In this year the mania for railway speculation was at its height, and no man was more courted than the "railway king." Deputy-lieutenant for Durham, and thrice lord mayor of York, he was returned in the Conservative interest for Sunderland in 1845. He was suddenly ruined by the disclosure of the Eastern Railway frauds. Sunderland clung to her generous representative till 1859, but on the bursting of the bubble he had lost influence and fortune at a single stroke. He died in London, on Dec. 14, 1871.

HUDSON, HENRY, English navigator and explorer. The first of his voyages in quest of new trade and a short route to China by way of the North Pole, in accordance with the suggestion of Robert Thorne (d. 1527), was made for the Muscovy company with ten men and a boy in 1607. Hudson first coasted the east side of Greenland, and sailed along the great ice barrier until he reached "Newland," as Spitsbergen was then called, and followed its northern coast to beyond 80° N. lat. On the home-

ward voyage he accidentally discovered an island in lat. 71° which he named Hudson's Touches, and which has since been identified with Jan Mayen island. Molineux's chart, published by Hakluyt about 1600, was Hudson's blind guide in this voyage, and the polar map of 1611 by Pontanus illustrates well what he attempted. He investigated the trade prospects at Bear island, and recommended his patrons to seek higher game in Newland; hence he may be called the father of the English whale-fisheries at Spitsbergen.

Next year Hudson was again sent by the Muscovy company to open a passage to China, this time by the north-east route between Spitsbergen and Novaya Zemlya. In this voyage (April 22–Aug. 26) he raked the Barents sea in vain between 75° 30' N.W. and 71° 15' S.E. for an opening through the ice, and on July 6, "voide of hope of a north-east passage (except by the Waygats, for which I was not fitted to trie or prove)," he resolved to sail to the north-west, and if time and means permitted to run 100 leagues up Lumley's Inlet (Frobisher strait) or Davis's "overfall" (Hudson strait). But he was compelled to return without accomplishing his wish. The Muscovy company thenceforward directed all its energies to the profitable Spitsbergen trade.

Towards the end of 1608 Hudson "had a call" to Amsterdam, where he saw the cosmographer Plancius and the cartographer Hondius, and, after some delay, undertook for the Dutch East India company his third voyage to find a passage to China either by the north-east or north-west route. With a mixed crew of 18 or 20 men he left the Texel in the "Half-Moon" on April 6, and by May 5 was in the Barents sea, and soon afterwards among the ice near Novaya Zemlya. Some of his men becoming disheartened and mutinous, he submitted to them, as alternative proposals, either to go to Lumley's Inlet and follow up Waymouth's light, or to make for North Virginia and seek the passage in about 40° lat., according to the letter and map sent him by his friend Captain John Smith. The latter plan was adopted, and on May 14 Hudson set his face towards the Chesapeake and China. He touched at Stromo in the Faroe islands for water; an accident (June 5) off Newfoundland compelled him to put into the Kennebec river. Sailing again on July 26, he began on Aug. 28 the survey where Smith left off, at 37° 36' according to his map, and coasted northwards. On Sept. 3, in 40° 30', he entered the bay of New York, and after having gone 150 m. up the river which now bears his name to near the position of the present Albany, treating with the Indians, surveying the country, and trying the stream above tide-water, he became satisfied that this course did not lead to the South seas or China. On Oct. 4 the "Half-Moon" left for the Texel, and on Nov. 7 arrived at Dartmouth, where she was seized and detained by the English Government, Hudson and the other Englishmen of the ship being commanded not to leave England, but rather to serve their own country. The voyage exploded Hakluyt's myth, which from the publication of Lok's map in 1582 to the 2nd charter of Virginia in May 1609 he had lost no opportunity of promulgating, that near 40° lat. there was a narrow isthmus, formed by the sea of Verrazano, like that of Tehuantepec or Panama.

A new company was formed to support Hudson in a fourth attempt on the North-West passage, the principal promoters being Sir Thomas Smith (or Smythe), Sir Dudley Digges and John Wolstenholme. He determined this time to carry out his old plan of searching for a passage up Davis's strait. Hudson sailed from London in the little ship "Discovery" of 55 tons, on April 17, 1610, and entered the strait which now bears his name about the middle of June. Sailing steadily westward he entered Hudson bay on Aug. 3, and spent three months examining the eastern shore of the bay. On Nov. 1 the "Discovery" went into winter quarters in the S.W. corner of James bay, being frozen in a few days later. On the ship breaking out of the ice in the spring Hudson had a violent quarrel with a young fellow named Henry Greene, who now retaliated by inciting the discontented part of the crew to put Hudson and eight others (including the sick men) out of the ship (June 22, 1611). Robert Bylot was elected master and brought the ship back to England. During the voyage home Greene and several others were killed in a fight with the Eskimo,

while others again died of starvation, and the remnant which reached England in September were thrown into prison. Nothing was ever heard of the deserted men.

The four great geographical landmarks which to-day serve to keep Hudson's memory alive, namely the Hudson bay, strait, territory and river, had repeatedly been visited and even drawn on maps and charts before he set out on his voyages; but he carried his discoveries beyond the limits of his predecessors. The fisheries of Spitsbergen and the fur industry of the Hudson Bay Territory were the immediate fruit of his labours.

See *Henry Hudson, the Navigator* (Hakluyt Society, 1860); T. A. Janvier, *Henry Hudson* (1909); L. Powys, *Henry Hudson* (1928).

HUDSON, SIR JEFFERY or GEOFFREY (1619–1682), English dwarf, was born at Oakham, Rutlandshire, in 1619. For the first 30 years of his life he measured only 18–20 in., though perfectly proportioned, but he then grew to 3 ft. 9 in. After the marriage of Charles I. and Henrietta Maria, Hudson was taken to court where he became a favourite of the queen. He led an adventurous life and is reputed to have held a commission as captain of horse during the Civil War. He accompanied the queen to Paris, left after killing Crofts in a duel, was captured at sea and sold as a slave in Barbary. He escaped, and after the Restoration lived in retirement on a pension, to which the duke of Buckingham contributed. He was arrested in 1679 on suspicion of complicity in the Popish Plot, and confined in the Gatehouse prison. He died in 1682, after his release. Several portraits of him exist, of which that by Sir Ralph Mytens is at Hampton Court.

HUDSON, JOHN (1662–1719), English classical scholar, was born at Wythop in Cumberland. He was educated at Oxford, where the remainder of his life was spent. In 1701 he was appointed Bodley's librarian, and in 1711 principal of St. Mary's hall. He died on Nov. 26, 1719. His works were chiefly editions of classical authors.

See Wood, *Athenae Oxonienses*, iv.; introduction to the edition of Josephus; W. Hutchinson, *History of Cumberland* (1794).

HUDSON, WILLIAM HENRY (1841–1922), British naturalist and writer, was born at Quilmes, near Buenos Aires, on Aug. 4, 1841, and remained on the pampas until 1874, when he came to England. From then the greater part of his life was spent in poverty, and marked by frequent ill-health. His wife, Emily, long kept a boarding-house in London, where Hudson too lived, known to only a small circle of appreciative friends. A civil list pension granted in 1901 aided him somewhat, but he relinquished this when belated success reached him. He died in London on Aug. 18, 1922, and was buried at Broadwater, Sussex. Hudson called himself a field naturalist, and though the charms of wild life made a pre-eminent appeal to his sincere observing mind, he was not without an understanding of simple human joys and sorrows. This versatility of his sensitive nature is well instanced in his last work, *A Hind in Richmond Park*, published posthumously in 1922. His other writings include the memorable pictures of the South America of his youth, such as *The Purple Land* (1885); *A Crystal Age* (1887); *El Ombú* (1902); *Green Mansions* (1904); *Far Away and Long Ago* (1918); of the English countryside, such as *A foot in England* (1909); *A Shepherd's Life* (1910); *Dead Man's Plack* (1920); ornithological works, as his collaboration with P. L. Sclater in *Argentine Ornithology* (1888); and his own *British Birds* (1895); and *Birds of La Plata* (1920); and many pamphlets for the Society for Protection of Birds. A bird sanctuary with a decoration by Jacob Epstein was erected to his memory in Hyde Park, London, in 1925.

BIBLIOGRAPHY.—Hudson's collected works were published in London (24 vols., 1922–23). See G. F. Wilson, *A Bibliography of the Writings of W. H. Hudson* (1922); H. J. Massingham, *Untrodden Ways: Adventures among the Works of Hudson*, etc. (1923); Morley Roberts, *W. H. Hudson* (1924); and *Letters from W. H. Hudson to Edward Garnett* (1925).

HUDSON, a town of Middlesex county, Massachusetts, 28 m. W. of Boston; on the Assabet river and served by the Boston and Maine railroad. The population in 1925 was 8,130. It has important manufactures of boots and shoes, rubber footwear, lasts, shoemaking machinery and accessories, worsted, webbing and knitted

goods. The settlement here, dating from about 1699, was at first called Howe's Mills, and after 1800 Feltonville. The shoe industry was established in 1816, and by 1860 the place was known throughout the east as a shoemaking centre.

HUDSON, a city of New York, on the E. bank of the Hudson river, 114 m. above New York city, at the head of natural deep-water navigation; the county seat of Columbia county. It is served by the Boston and Albany and the New York Central railways, and by river steamers. The population was 11,755 in 1925 (81% native white). The city lies on sloping ground, commanding fine views of the Hudson and the Catskills beyond, with the Berkshires a few miles to the east. It is the seat of the State Training school for girls. Its diversified manufactures, including cement, ice tools and conveying machinery, ginger ale, power presses, marine equipment and knitted goods, in 1925 were valued at \$4,924,802. Hudson was named after Hendrik Hudson, who (tradition says) landed here from the "Half Moon," proceeding on up the river by a smaller boat. For many years it was merely a landing, with two crude wharves and storehouses, called Claverack Landing. Some Dutch settlers came in the middle of the 18th century, and in 1783 the place was colonized by an association of merchants and fishermen from Rhode Island, Nantucket, and Martha's Vineyard. The present name was adopted in 1784 and the city was chartered in 1785. It was made a port of entry in 1790, and until the War of 1812 had a considerable foreign commerce and was the base of a large whaling fleet.

HUDSON BAY, an inland sea in the N.E. of Canada, extending from 78° to 95° W. and from 51° to 70° N. On the east it is connected with the Atlantic Ocean by Hudson Strait, and on the north with the Arctic Ocean by Fox Channel and Fury and Hecla Strait. Its southern extremity between 55° and 51° N. is known as James Bay. It is 590 m. in width, and 1,300 from south to north, including James Bay (350 m.) and Fox Channel (350 m.). The customary use of the term includes James Bay, but not Fox Channel. The average depth of water is about 70 fathoms, deepening at the entrance of Hudson Strait to 100 fathoms. James Bay is much shallower, and unfit for shipping save for a central channel leading to the mouth of the Moose river. The centre and west of the main bay are absolutely free from shoals, rocks or islands, but down its east coast extend two lines of small islands, one close to shore, the other at 70 to 100 m. distance, and comprising a number of scattered groups (the Ottawa Islands, the Sleepers, the Belchers, etc.).

Into Hudson and James Bays flow numerous important rivers, so much so that the water of the latter is rather brackish than salt. Beginning at the north-west, the chief of these are Churchill, Nelson (draining Lake Winnipeg, and the numerous inland rivers of which it is the basin), Hayes (the old boat route of the voyageurs to Winnipeg), Severn, Albany, Moose, Nottaway, Rupert river (draining Lake Mistassini), East Main, Great Whale and Little Whale.

Save for some high bluffs on the east and north-east, the shores of the bay are low. Around much of James Bay extend marshes and swampy ground. Geologically the greater part of the Hudson Bay district belongs to the Laurentian system, though there are numerous outcrops of later formation; from Ordovician to Devonian on the south and west, and on the east coast a narrow belt of Animikie rocks, of which the islands are composed. Iron ores occur in the latter rocks. Spruce, balsam and poplar grow to a fair size as far as the northern limit of James Bay. Caribou, musk ox and other animals are still found in large numbers, and there is an abundance of feathered game—ducks, geese, loons and ptarmigan; hunting and fishing form the chief occupations of the Indians and Eskimo who live in scattered bands near the shore. The bay abounds with fish, of which the chief are cod and salmon. There are also porpoise and whales. The last have long been pursued by American whalers, whose destructive methods have so greatly depleted the supply that the government of Canada is anxious to declare the bay a *mare clausum*.

Hudson Strait is about 450 m. long with an average breadth of 100 m., narrowing at one point to 45. Its shores are high and bold, rarely less in height than 1,000 ft., save on the coast

of Ungava Bay, a deep indentation on the south-east. No islands or rocks impede navigation. Its depth is from 100 to 200 fathoms. Owing to the violence of the tides, which rise to a height of 35 ft., it never absolutely freezes over.

After three centuries of exploration, the navigability of Hudson Bay and Strait remains a vexed question. To Canada it is one of great commercial interest, and numerous expeditions have been made and reports issued by the Geological Survey. From Winnipeg to Liverpool via Churchill is over 500 m. less than via Montreal, and from Edmonton to Liverpool almost 1,000 m. less. Were navigation open for a sufficient time, such a route for the grain of the Canadian and American west would be of enormous advantage. But heavy ice often drifts about in the strait. Past the mouth flows a stream often over 100 m. wide, of berg and floe ice, carried by the Arctic current. Owing to the proximity of the Magnetic Pole (in Boothia) the compass often refuses to work. For sailing ships, such as the Hudson's Bay Company has long employed, the season for safe navigation is from July 15 to Oct. 1. In over 200 years very few serious accidents have occurred to the company's ships within these limits. It is claimed that specially built and protected steamers would be safe from June 15 till Nov. 1, and the problem may be solved by ice-breaking vessels of great power. The only good harbour available is Fort Churchill, at the mouth of the Churchill river, which is large and easy of access. Moose Factory (at the foot of James Bay) and York Factory (at the mouth of the Nelson) are mere roadsteads. Marble Island, south of Chesterfield Inlet, where the whalers winter, is too far north for regular shipping.

The Cabots entered the strait in 1498, and during the next century a series of Elizabethan mariners; but the bay was not explored until 1610, when Henry Hudson pushed through the ice and explored to the southern limit of James Bay.

See Lieutenant Gordon, R.N., *Reports on the Hudson's Bay Expeditions* (1884, 5, 6); William Ogilvie, *Exploratory Survey to Hudson's Bay in 1890* (Ottawa, 1891); R. F. Stupart, *The Navigation of Hudson's Bay and Straits* (Toronto, 1904).

HUDSON FALLS, a village of Washington county, New York, on the Hudson river, 58 m. above Albany, adjoining Ft. Edward on the south and Glens Falls on the north. It is on federal highways 4 and 9, and is served by the Delaware and Hudson railway. The population in 1925 was 6,266. It has ample water-power and important manufactures, producing annually some 20,000,000 rolls of wall-paper, thousands of tons of paper bags and pulp and other commodities. The village was incorporated as Sandy Hill in 1810. The present name was adopted in 1910.

HUDSON RIVER, situated entirely within the State of New York, U.S.A., has its source in the Adirondack mountains near Newcomb, Essex county, in 14 small lakes, 2,000 ft. above tide-water, and having an area of about 6,000 acres. The river flows generally south and empties into New York bay, distant about 250 m. in a straight line and about 315 m. measured along the course of the river. The principal tributary is the Mohawk river, which rises in Lewis county, N.Y., flows southward to Rome, and thence east to the Hudson at Cohoes. Above Troy, N.Y., the drainage basin is about 9,900 sq.m., of which the drainage basin of the Mohawk constitutes about 40%. The fall in the upper portion of the river is very rapid. The discharge at Troy varies within wide limits; the low water discharge is generally assumed at about 2,000 cu.ft. per second, but discharges as low as 1,500 cu.ft. per second have been observed. The maximum observed flow was 240,000 cu.ft. per second. The Hudson is tidal from its mouth to the U.S. dam at Troy. The mean range of tide is 4.4 ft. at the Battery (New York city), 3.3 ft. at Albany, and slightly less at Troy. In its natural state the 21 m. section of the river below Troy was exceedingly tortuous and unstable with a minimum depth of 4 ft. at mean low water above Albany and $7\frac{1}{2}$ ft. below. Improvement for navigation was commenced by the State of New York in 1797. Between 1834 and 1890 the Federal Government and the State of New York simultaneously improved the river, but since 1890 the Federal Government alone has continued the improvement. The controlling depth between Troy and Hudson is about $11\frac{1}{2}$ feet. Below Hudson, a natural depth of 27 ft.

or more exists except for a few shoals near New Germantown, on which there is a depth of 25 feet. The lower portion of the Hudson, called the North river, forms a part of New York harbour and has been improved to a depth of 40 ft. Fast river steamers with a maximum draught of 11 ft. carry passengers and package freight between New York and Albany, stopping at intermediate ports. Bulk freight is largely carried in barges and canal boats, the greatest number of which draw 10 ft. or less. The New York State barge canal, entering the Hudson river via the Mohawk, provides a waterway for barge traffic between New York city and the Great Lakes with terminals at Oswego on Lake Ontario, and Tonawanda and Buffalo on Lake Erie. This canal carries a large and important commerce. There is also a waterway for small boats and barges from the Hudson to the lower St. Lawrence by way of the Champlain canal, Lake Champlain, and the Richelieu river and Chambly canal. This waterway is now little used. Poughkeepsie, N.Y., which is the farthest port upstream on the Hudson river to which ocean-going vessels now go, is a very important distributing centre for Pacific coast lumber brought through the Panama canal. The commerce at Poughkeepsie was about 165,000 tons in 1926. The U.S. Congress has authorized the improvement of the river to provide a depth of 27 ft. from the upper limits of New York harbour to Albany, N.Y., and work on this project was being prosecuted vigorously in 1928. Albany, already a very important railroad centre, is expected to become one of the great inland ports and trans-shipment points in the country. The principal ports and cities on the river above New York city are Yonkers, Tarrytown, Nyack, Ossining, Haverstraw, Peekskill, West Point, Newburgh, Poughkeepsie, Kingston, Catskill, Hudson, Albany, Troy, Cohoes and Glens Falls. Above Troy there are numerous falls and rapids which are used as a source of the power which serves many busy manufacturing centres. The New York Central and Hudson River railroad parallels the river on the east bank between New York and Albany, and the West Shore railroad on the west bank. Excursion boats and passenger steamers make regular trips between New York and Albany or Troy, stopping at intermediate points.

History.—Verrazano proceeded a short distance up the Hudson by boat in 1524; but the first European to demonstrate its extent and importance was Henry Hudson (*q.v.*), from whom the river derives its name. The Dutch later settled the valley. During the early days of colonization and settlement by the Dutch and later by the English, the valley of the Hudson provided a natural highway to Canada via the Lake George, Lake Champlain route, and to western New York via the Mohawk valley. During all of the early wars on the North American continent, the valley was a region of great strategic importance. It has been used in exploration, in war and in commerce. Water transportation on the river itself and later on via the Erie canal to the Great Lakes played a most important part in determining the location and building up of the great commercial, industrial and trans-shipment centres at the mouth in the New York city area.

The valley of the Hudson has been the scene of many important historical events. During the Revolutionary War, an enormous chain was stretched across the river between Gee's Point and Constitution island to prevent the passage of British ships. Benedict Arnold, while military commander of the forts in this locality, planned to surrender them to the British. He made his escape from his quarters on the east bank near the site of the village of Garrison to a British ship anchored in the river below. Fulton made his first successful experiments with steam navigation on the Hudson river. Washington Irving, who is buried in Sleepy Hollow cemetery, has memorialized the valley in his stories. A highway bridge crosses the river at Bear Mountain park located on the river just below the naval station at Iona island. This park is the summer playground of the people of New York city.

Above Cornwall the valley slopes gently away from the river and the scenery, though not tame, cannot compare with the grandeur of the lower river. The Catskill mountains are visible to the west. At Cornwall the river enters the northern portals of the highlands between a series of hills, whose precipitous sides often rise abruptly from the water's edge. For about 16 m. the river

BY COURTESY OF (1, 2) THE GOVERNOR AND COMMITTEE OF THE HUDSON'S BAY COMPANY, (4) THE CANADIAN AIR FORCE, (5) THE HUDSON'S BAY COMPANY OVERSEAS SETTLEMENT, LTD.

POSTS OF THE HUDSON'S BAY COMPANY

1. Facsimile of part of the first sheet of charter granted May 2, 1670, by King Charles II. to "The Governor and Company of Adventurers of England Trading into Hudson's Bay." Now in Hudson's Bay House, London. The original covered five sheets of parchment; it gave power to the Company to rule within its territory according to English law.
2. Interior of Fort Garry. This post formed the nucleus of present-day Winnipeg; it was sold to that city in 1882, and now only the front gate of the old fort remains standing.
3. Prince of Wales Fort, built on Churchill River in 1718. It was subsequently rebuilt according to the plans of engineers who had served under Marlborough, and was at length destroyed by the French.
4. Fort York or York Factory, on the bank of the Hayes River along the western shore of Hudson Bay. One of the early important gateways into the fur country.
5. The Winnipeg store of the Hudson's Bay Company. The Company now has similar stores in cities throughout western Canada.

scenery is magnificent. Below Peekskill the view from the river continues beautiful, but the banks are less precipitous. Beginning at Piermont on the west bank are the famous Palisades which extend some 13 m. along the river to the south. These rock cliffs rise precipitously to a height of over 500 ft. above the water. New York city, with its teeming millions and its enormous sky-scrapers is situated at the mouth of the river. A suspension bridge connecting New York city and Fort Lee on the New Jersey side was begun in 1928. Tunnels or tubes for the trains of the Pennsylvania railroad, inter-urban electric lines, and vehicles have been constructed under the North river connecting New York city with the New Jersey side. (E. JA.)

HUDSON'S BAY COMPANY, or "the Governor and Company of Adventurers of England trading into Hudson's Bay," a corporation formed for the purpose of importing into Great Britain the furs and skins which it obtains, chiefly by barter, from the Indians of British North America.

In 1670 Charles II. granted a charter to Prince Rupert and 17 other noblemen and gentlemen, incorporating them as the "Governor and Company of Adventurers of England trading into Hudson's Bay," and securing to them a monopoly of the trade of all lands watered by streams flowing into Hudson bay. Besides the complete lordship and entire legislative, judicial, and executive power, the corporation received also the right to "the whole and entire trade and traffic to and from all havens, bays, creeks, rivers, lakes, and seas into which they shall find entrance or passage by water or land out of the territories, limits, or places aforesaid." The first settlements in the country thus granted, which was to be known as Rupert's Land, were made on James bay and at Churchill and Hayes rivers; but it was long before there was any advance into the interior, for in 1749, when an unsuccessful attempt was made in parliament to deprive the company of its charter on the plea of "non-user," it had only some four or five forts on the coast, with about 120 regular employees. Although the commercial success of the enterprise was from the first immense, great losses were inflicted on the company by the French. After the cession of Canada to Great Britain in 1763, numbers of fur-traders spread over that country and began even to encroach on the Hudson's Bay Company's territories. These individual speculators finally combined into the North-West Fur Company of Montreal.

In the competition which arose between the companies the Indians were demoralized, body and soul, by the abundance of ardent spirits with which the rival traders sought to attract them to themselves; the supply of furs threatened soon to be exhausted by the indiscriminate slaughter, even during the breeding season, of both male and female animals; and the worst passions of both whites and Indians were inflamed to their fiercest (see RED RIVER SETTLEMENT). At last, in 1821, the companies amalgamated, obtaining a licence to hold for 21 years the monopoly of trade in the vast regions lying to the west and north-west of the older company's grant. In 1838 the Hudson's Bay Company acquired the sole rights for itself, and obtained a new licence, also for 21 years. On the expiry of this it was not renewed, and since 1859 the district has been open to all.

The licences to trade did not of course affect the original possessions of the company. Under the terms of the deed of surrender, dated Nov. 19, 1869, the Hudson's Bay Company surrendered all its rights of government, subject to certain terms and conditions, including the payment to the company by the Canadian Government of a sum of £300,000 sterling on the transfer of Rupert's Land to the Dominion of Canada, the retention by the company of its posts and stations, with a right of selection of a block of land adjoining each post in conformity with a schedule annexed to the deed of surrender; and the right to claim in any township or district within the fertile belt in which land is set out for settlement, grants of land not exceeding one-twentieth part of the land so set out. The boundaries of the fertile belt were fixed as follows: "On the south by the United States' boundary; on the west by the Rocky Mountains; on the north by the northern branch of the Saskatchewan; on the east by Lake Winnipeg, the Lake of the Woods, and the waters connecting

them." In 1872 it was agreed that the one-twentieth of the lands in the fertile belt reserved to the company under the terms of the deed of surrender should be taken by "allotting in every fifth township two whole sections of 640 acres each, and in all other townships one section and three-quarters of a section each."

From this time little was done to develop the Company until just before the outbreak of the World War. During the period 1914-18 one part of the company with 300 steamers was engaged in food and munition transport for the French and Belgian Governments. From the end of the war the company began to develop rapidly; the annual reports show a steady increase in business done, and the company is opening new offices in territories hitherto untouched. Large stores are now complete in Winnipeg, Saskatoon, Calgary, Edmonton, Vancouver, and Victoria, and agreements have been made with the United States for the importation of furs to special centres. An experiment in reindeer farming in Baffin's Land failed; but efforts are being made elsewhere, with promises of success. For the past few years (to 1927) the company has ceased trading in Kamchatka and Siberia owing to the rapidly changing authority there.

See G. Bryce, *Remarkable History of the Hudson's Bay Company* (1900); and A. C. Laut, *Conquest of the great Northwest; being the story of the adventurers of England known as Hudson's Bay Co.* (1909); *Canadian Progress* (an annual publication), and the annual reports of the Hudson's Bay Company. (X.; A. N. J. W.)

HUÉ, a town of French Indo-China, capital of Annam, on the Hué river (Song-Huong-Giang) inaccessible to large ships, about 8 m. from its mouth in the China Sea. Pop. about 60,000, of whom only some hundreds are Europeans. The country immediately surrounding it is flat, alluvial land, traversed by streams and canals and largely occupied by rice fields. Beyond the plain rises a circle of hills formed by spurs of the mountains of Annam. Hué consists of a native market town and a European quarter in which the palace of the French resident general is situated, separated by the official Annamite part of the town. The latter contains the royal palace, the houses of the native ministers and officials, the arsenals, etc. The palace stands inside a separate enclosure. Glass- and ivory-working are carried on, but otherwise industry is of only local importance. Rice is imported by way of the river. A frequent service of steam launches connects the town with the ports of Thuan-an, at the mouth of the river, and Tour-

ROYAL PALACE AT HUÉ, CAPITAL OF ANNAM, INDO-CHINA, SHOWING, IN FRONT OF THE BUILDING, THE URNS OF THE ANNAMITE DYNASTIES

ane, on the bay of that name. Tourane is also united to Hué by a railway opened in 1906. In the vicinity the chief objects of interest are the tombs of the dead kings of Annam.

HUE AND CRY, a phrase employed in English law to signify the old common law process of pursuing a criminal with horn and voice. It was the duty of any person aggrieved, or discovering a felony, to raise the hue and cry, and his neighbours were bound to turn out with him and assist in the discovery of the offender. In the case of a hue and cry, all those joining in the pursuit were justified in arresting the person pursued, even though it turned

out that he was innocent. A swift fate awaited any one overtaken by hue and cry, if he still had about him the signs of his guilt. If he resisted he could be cut down, while, if he submitted to capture, his fate was decided. Although brought before a court, he was not allowed to say anything in self-defence, nor was there any need for accusation, indictment or appeal. Although regulated from time to time by writs and statutes, the process of hue and cry continued to retain its summary method of procedure, and proof was not required of a culprit's guilt, but merely that he had been taken red-handed by hue and cry. The various statutes relating to hue and cry were repealed in 1827 (7 and 8 Geo. IV. c. 27). The Sheriffs Act, 1887, re-enacting 3 Edw. I. c. 9, provides that every person in a county must be ready and apparelled at the command of the sheriff and at the cry of the county to arrest a felon, and in default shall on conviction be liable to a fine. (See also HARO.)

For the early history, see Pollock and Maitland, *History of English Law*, vol. ii.; W. Stubbs, *Select Charters*.

HUEHUETENANGO, a town in north-western Guatemala, capital of the province of the same name, 106 m. W.N.W. of Guatemala city. It is overwhelmingly Indian in population and is an important centre of the Guatemalan area known as "los altos" (the highlands). Pop. (1920) 9,513. Huehuetenango is on the river Salega, and lies at an altitude of 7,050 feet. It enjoys a semi-tropical climate and is surrounded by a fertile agricultural country raising wheat, maize, potatoes, beans, melons, fruits, etc. Sheep graze on the hills, and there is a considerable production of hand-woven woollens in ancient patterns used by the local villagers for their typical costumes and also in conventional tweed patterns which are sold in Guatemala city. Coffee, cacao, sugar cane and tropical fruits are grown in neighbouring valleys. Huehuetenango is reached by automobile from San Felipe, the nearest railway station, and from Quezaltenango (*q.v.*) and, via the latter city, from Guatemala city.

The name, Huehuetenango means "Place of the Ancients" and the town is located close to the ruins of an ancient Indian centre called Zaculeu. In Spanish times, the Dominican missionaries penetrated to Huehuetenango, and near by, at Chiantla, had a monastery richly equipped from the returns of a silver mine owned by the Dominicans and worked by the Indians; it was at one time one of the wealthiest religious communities in Central America. It was taken over by the government in 1873, and the mines were abandoned.

HUELVA, a maritime province of south-western Spain, formed in 1833 of districts taken from Andalusia, and bounded on the north by Badajoz, east by Seville, south by the Gulf of Cadiz and west by Portugal. Pop. estimated (1925) 360,101; area 3,913 sq.m. The northern district is highland traversed in a south-westerly direction by the Sierra Morena, here known, in its main ridge, as the Sierra de Aracena. The south is a lowland maritime strip with flat waste lands (Las Marismas) in the south-east around the mouth of the Guadalquivir. The lower reaches of the Guadalquivir and Guadiana are navigable and form respectively for some distance the south-eastern and south-western boundaries. The Odiel and the Tinto both fall into the Atlantic by navigable *rias* or estuaries. Huelva has a mild and equable climate, with abundant moisture and a fertile soil. In the northern highlands there are many oaks, pines, beeches, cork-trees and chestnut, while the lowlands afford excellent pasturage. But agriculture and stock-breeding are here less important than in most Spanish provinces, although the exports comprise large quantities of fruit, oil and wine, besides cork and esparto grass. The headquarters of the fishing trades, which include the drying and salting of fish, are at Huelva, the capital, and Ayamonte on the Guadiana. There are numerous brandy distilleries, but the great local industry is the mining of copper manganese and iron. The well known Rio Tinto copper mines, near the sources of the Tinto, like those of Tharsis, 30 m. N.N.W. of Huelva, were exploited from very early times and later by the Carthaginians, and Romans. Saline and other mineral springs are common throughout the province. Huelva is the principal seaport, with railway connections with Seville and Mérida, while a network of narrow-gauge railways gives access to the chief mining centres. See also

ANDALUSIA.

HUELVA (the ancient Onuba, Onoba or Onuba Aestuaria), the capital of the Spanish province of Huelva, about 10 m. from the Atlantic ocean, on the left bank of the river Odiel, and on the Seville-Huelva, Mérida-Huelva and Rio Tinto-Huelva railways, the last-named being a narrow-gauge line. Pop. (1920) 34,437. Huelva is built on the western shore of a triangular peninsula formed by the estuaries of the Odiel and Tinto, which meet below the town. Huelva was originally a Carthaginian trading-station, and afterwards a Roman colony. The colossal statue of Columbus was erected in 1892 to commemorate the fourth centenary of his voyage which began and ended in the village of Palos de la Frontera on the Tinto. Columbus resided in the neighbouring Franciscan monastery of Santa María la Rábida after his original plans for the voyage had been rejected by King John II. of Portugal in 1484. The present town is modern in appearance, and owes its prosperity to a transit trade in copper and other ores, for which it is the port of shipment. After 1872, when the famous Rio Tinto copper mines were for the first time properly exploited, it progressed rapidly in size and wealth. Besides exporting copper, manganese and other minerals, Huelva is the headquarters of the sardine, tunny and bonito fisheries, and of a trade in grain, grapes, olives and cork. The copper and cork industries are mainly in British hands, and the bulk of the imports, which consist chiefly of coal, iron and steel and machinery, comes from Great Britain. Foodstuffs and Australian hardwood are also imported.

HUÉRCAL OVERA, a town of south-eastern Spain, in the province of Almería, on the Lorca-Baza railway, and between two branches of the River Almanzora. Pop. (1920), 15,982. Huércal Overa is the chief town of a thriving agricultural district, largely dependent on the lead mining carried on among the surrounding highlands.

HUESCA, a frontier province of northern Spain, formed in 1833 of districts previously belonging to Aragon; and bounded on the north by France, east and south-east by Lérida, south-west and west by Saragossa, and north-west by Navarre. Pop. estimated (1925) 252,237; area 5,848 sq.m. The entire northern half of Huesca belongs to the mountain system of the Pyrenees, which here attain their greatest altitudes in Aneto, the highest point of the Maladetta ridge (11,168 ft.), and in Monte Perdido (10,998 ft.). The southern half forms part of the rugged and high-lying plateau of Aragon, with the Sierra de Alcubierre on the south-western border. The whole province is included in the basin of the Ebro, and is drained by four of its principal tributaries—the Aragon in the north-west, the Gallego in the west, the Cinca in the centre, and the Noguera Ribagorzana along part of the eastern border. These rivers rise among the Pyrenees, and take a southerly course; the two last-named unite with the Segre before joining the Ebro. The Cinca receives the combined waters of the Alcanadre and Isuela on the right and the Esera on the left.

The climate is influenced locally by the cold winds of the snow-capped Pyrenees and the continental conditions of the interior plateau.

Agriculture is facilitated by a fairly complete system of irrigation, by means of which much waste land has been reclaimed, although large tracts remain useless. There is good summer pasturage on the mountains, where cattle, sheep and swine are reared. The mountains are richly clothed with forests of pine, beech, oak and fir; and the southern regions, wherever cultivation is possible, produce abundant crops of wheat and other cereals, vines, mulberries and numerous other fruits and vegetables. The mineral resources include small quantities of argentiferous lead, copper, iron and cobalt, with salt, lignite, limestone, millstone, gypsum, granite and slate. The minerals are of little commercial value and there are many transport difficulties. Mineral springs are numerous. Timber, millstones, cattle, leather, and some brandy and wine are exported to France. The manufactures of Huesca are of little importance.

The Saragossa-Lérida-Barcelona railway traverses the province, and gives access, by two branch lines, to Jaca, by way of

Huesca, the provincial capital, and to Barbastro. Jaca is connected with Pau (France) by rail. Huesca and Jaca are episcopal cities. Fraga was an ancient residence of the kings of Aragon; there is a fine 12th century parish church and a ruined Moorish citadel. Monzon, the meeting-place of the Aragonese and Catalan parliaments, is a town on the lower Cinca, with the ruins of a Roman fortification, and of a 12th century castle, which was owned by the Knights Templar. (See also ARAGON.)

HUESCA (anc. *Osca*), the capital of the Spanish province of Huesca, 35 m. N.N.E. of Saragossa, on the Tardienta-Huesca-Jaca railway. Pop. (1920), 13,921. Huesca occupies a height near the right bank of the river Isuela, overlooking a broad and fertile plain. Strabo (iii. 161, where some editors read *Ileosca*) describes *Osca* as a town of the *Ilergetes*, and the scene of Sertorius's death in 72 B.C.; while Pliny places the *Oscenses* in *regio Vescitania*. Plutarch (*loc. cit.*) calls it a large city. Julius Caesar names it *Vencedora*; and the name by which Augustus knew it, *Urbs victrix Osca*, was stamped on its coins, and is still preserved on its arms. In 1096 Pedro I. of Aragon regained it from the Moors, after winning the decisive battle of Alcoraz. Huesca is an episcopal see and has an imposing Gothic cathedral, begun in 1400, finished in 1515, and enriched with fine carving. In the same plaza is the old palace of the kings of Aragon, formerly given up for the use of the now closed Sertoria (the university), so named in memory of a school for the sons of native chiefs, founded at Huesca by Sertorius in 77 B.C. (Plut. *Sert.* 15). Huesca manufactures cloth, pottery, bricks and leather; but its chief trade is in the cereals, wine, fruit and vegetables produced in the *Hoja*.

HUET, PAUL (1804–1869), French landscape painter, was born in Paris on Oct. 3, 1804. He forms a link between Georges Michel and Théodore Rousseau as one of the initiators of the "paysage intime" movement in France. His fiery, romantic temperament led him to endow trees and natural objects with the emotions which he himself experienced, and his paintings of Nature in her stormy aspects though admirably composed are apt to be over-dramatic in treatment. He died on Jan. 29, 1869.

See Muther, *Hist. of Modern Painting*, II. xxiv.; Ernest Chesneau, *Peintres et statuaires romantiques* (1880); Léon Mancino, *Un précurseur (L'Art, 1883, i. 49)*; Paul Huet d'après ses écrits, sa correspondance, ses contemporains, documents recueillis par son fils, M. René Paul Huet (1911).

HUET (HUETIUS), PIERRE DANIEL (1630–1721), bishop of Avranches, French scholar, was born at Caen. He was educated at the Jesuit school of Caen, and also received lessons from the Protestant pastor, Samuel Bochart. In 1652 Samuel Bochart took Huet with him to Stockholm. This journey, in which he saw Leyden, Amsterdam and Copenhagen, as well as Stockholm, resulted in the discovery, in the Swedish royal library, of some fragments of Origen's *Commentary on St. Matthew*, which gave Huet the idea of editing Origen, a task he completed in 1668. He eventually quarrelled with Bochart, who accused him of having suppressed a line in Origen in the Eucharistic controversy. In Paris he entered into close relations with Chapelain. During the famous dispute of Ancients and Moderns Huet took the side of the Ancients against Charles Perrault and Desmarests. Among his friends at this period were Conrart and Pellisson. His taste for mathematics led him to the study of astronomy. He next turned his attention to anatomy, and, being himself short-sighted, devoted his inquiries mainly to the question of vision and the formation of the eye. In this pursuit he made more than 800 dissections. He then learned all that was then to be learned in chemistry, and wrote a Latin poem on salt. All this time he was no mere book-worm or recluse, but was haunting the salons of Mlle. de Scudéry and the studios of painters; nor did his scientific researches interfere with his classical studies, for during this time he was discussing with Bochart the origin of certain medals, and was learning Syriac and Arabic under the Jesuit Parvilliers. He also translated the pastorals of Longus, wrote a tale called *Diane de Castro*, and defended, in a treatise on the origin of romance, the reading of fiction.

On being appointed assistant tutor to the Dauphin in 1670, he

edited with the assistance of Anne Lefèvre, afterwards Madame Dacier, the well-known edition of the Delphin Classics. This series was an edition of the Latin classics in about 60 volumes, and each work was accompanied by a Latin commentary and verbal index. Huet was admitted to the Academy in 1674. He issued one of his greatest works, the *Demonstratio evangelica*, in 1679. He took holy orders in 1676, and two years later the king gave him the abbey of Aulnay, where he wrote his *Questiones Aletuanae* (Caen, 1690), his *Censura philosophiae Cartesianae* (1689), his *Nouveau mémoire pour servir à l'histoire du Cartésianisme* (1692), and his discussion with Boileau on the Sublime. In 1685 he was made bishop of Soissons, but after waiting for installation for four years he took the bishopric of Avranches instead. He exchanged the cares of his bishopric for what he thought would be the easier chair of the Abbey of Fontenay, but there he was vexed with continual law-suits. At length he retired to the Jesuits' House in the Rue Saint Antoine at Paris, where he died in 1721. His great library and manuscripts, after being bequeathed to the Jesuits, were bought for the royal library.

In the *Huetiana* (1722) of the abbé d'Olivet will be found material for arriving at an idea of his prodigious labours, exact memory and wide scholarship. Another posthumous work was his *Traité philosophique de la faiblesse de l'esprit humain* (Amsterdam, 1723). His autobiography, found in his *Commentarius de rebus ad eum pertinentibus* (1718), has been translated into French and into English.

See de Gournay, *Huet, évêque d'Avranches* (1854).

HUFELAND, GOTTLIEB (1760–1817), German economist and jurist, was born at Danzig on Oct. 19, 1760. He studied at Leipzig, Göttingen and Jena, and in 1788 was appointed to an extraordinary professorship at Jena. Five years later he was made ordinary professor. He lectured on natural law, developing with great acuteness and skill the formal principles of the Kantian theory of legislation. In 1803 Hufeland removed to Würzburg, and then to Landshut. From 1808 to 1812 he acted as burgomaster in his native town of Danzig. He died at Halle on Feb. 25, 1817.

Hufeland's works on the theory of legislation are marked by precision of statement and clearness of deduction. They form on the whole the best commentary upon Kant's *Rechtslehre*, the principles of which they carry out in detail, and apply to the discussion of positive laws. In political economy Hufeland's chief work is the *Neue Grundlegung der Staatswirthschaftskunst* (2 vols., 1807–13), the second volume of which has the special title, *Lehre vom Gelde und Geldumlaufe*. Hufeland was the first among German economists to point out the profit of the *entrepreneur* as a distinct species of revenue with laws peculiar to itself.

See Roscher, *Geschichte der National Ökonomik in Deutschland*.

HUGEL, FRIEDRICH VON, BARON (1852–1925), Catholic theologian, son of Karl Von Hugel (1775–1870), baron of the Holy Roman Empire, was born on May 5, 1852 at Florence. In 1867 the family moved to England, and settled at Torquay. Von Hugel later became one of the most sympathetic, resourceful and persuasive religious teachers of his age. But while he possessed a generous sympathy for all seekers after truth, he held the Catholic Church to possess the fullest, richest and deepest realization of religion. He accepted the papacy, but thought that Church government was overcentralized, believing that this tendency could be counteracted by the healthy interaction of energy between the head and the members of the whole body of believers. His relations with the Higher Criticism resulting from his Biblical scholarship led him to be classed with the Modernists, but when the crisis of Modernism was over he made it clear that he could not follow the Modernists who revolted from Rome, and that he rejected their theory of belief.

In 1873 Von Hugel married Lady Mary Herbert, a daughter of Sydney Herbert (Lord Herbert of Lea). He died in London on Jan. 27, 1925, leaving his library to St. Andrews university.

His works include: *The Mystical Element of Religion as studied in St. Catherine of Genoa and her Friends* (1908, new and rev. ed. 1923); *Eternal Life, a Study of its Implications and Applications* (1912, 2nd ed. repr. 1913); *The German Soul in its Attitude towards Ethics and Christianity*; *The State and War* (1916); *Essays and Addresses on the Philosophy of Religion* (1921).

HUGGENBERGER, ALFRED (1867–), Swiss poet and novelist, was born at Bewangen (Canton Zürich) on Dec. 26, 1867. Himself of peasant stock, he is one of the most masterly delineators of Swiss village life of to-day, both in prose and verse. Among his novels mention may be made of *Die Bauern von Steig* (1913), *Die Geschichte des Heinrich Lenz* (1915), *Der Kampf mit dem Leben* (1926), and *Die Frauen von Siebenacker* (1925). *Dorfgenossen* (1914) and *Von den Kleinen Leuten* (1910) are characteristic specimens of his shorter tales. His poetical power (at its best in the lyric) is well seen in *Lieder und Balladen* (1895), *Hinterm Pflug* (1908), *Die Stille der Felder* (1913), and *Lebenstreue* (1923). He has also written in dialect (Thurgovian), stories for children, and *Der Brunnen der Heimat* (1927), a volume of reminiscences.

See R. Hagni, *Alfred Huggenberger: Persönlichkeit und Werk* (1927). (J. F. M.)

HUGGINS, SIR WILLIAM (1824–1910), English astronomer, was born in London on Feb. 7, 1824, and was educated at the City of London school and then under private tuition. Having determined to apply himself to the study of astronomy, he built in 1856 a private observatory at Tulse Hill, in the south of London. At first he occupied himself with ordinary routine work, but soon seized eagerly upon the opportunity for novel research offered by Kirchhoff's discoveries in spectrum analysis. The chemical constitution of the stars was the problem to which he turned his attention, and his first results, obtained in conjunction with Prof. W. A. Miller, were presented to the Royal Society in 1863, in a preliminary note on the "Lines of some of the fixed stars." His experiments, in the same year, on the photographic registration of stellar spectra, marked an innovation of a momentous character. But the wet collodion process was then the only one available, and its inconveniences were such as to preclude its extensive employment; the real triumphs of photographic astronomy began in 1875 with Huggins's adoption and adaptation of the gelatine dry plate which enabled the observer to make exposures of any desired length.

In the last quarter of the 19th century spectroscopy and photography together worked a revolution in observational astronomy, and in both branches Huggins acted as pioneer. Many results of great importance are associated with his name. Thus in 1864 the spectroscope yielded him evidence that planetary and irregular nebulae consist of luminous gas. On May 18, 1866, he made the first spectroscopic examination of a temporary star (Nova Coronae), and found it to be enveloped in blazing hydrogen. In 1868 he proved incandescent carbon-vapours to be the main source of cometary light; and in the same year applied Doppler's principle to the detection and measurement of stellar velocities in the line of sight. In solar physics Huggins showed that the form of the prominences could be observed spectroscopically. With Lady Huggins (*née* Margaret Lindsay Murray, who, after their marriage in 1875, actively assisted her husband) he produced calcium in the laboratory under such conditions that it gave a pair of lines identical with a pair in the solar spectrum whose origin before this had been uncertain. Huggins was made K.C.B. in 1897 and was an original member of the Order of Merit (1902). He was president of the British Association in 1891, and during the years 1900–05, president of the Royal Society, from which he at different times received a Royal, a Copley and a Rumford medal. Four of his presidential addresses were republished in 1906, in an illustrated volume entitled *The Royal Society*. A list of his scientific papers is contained in chapter ii. of the magnificent *Atlas of Representative Stellar Spectra*, published in 1899, by Sir William and Lady Huggins conjointly, for which they were adjudged the Actonian prize of the Royal Institution. His memoirs in the *Philosophical Transactions* and other journals were collected in his *Scientific Papers*, published in 1909. Sir William Huggins died on May 12, 1910. Lady Huggins died on March 24, 1915.

HUGH, called THE GREAT (d. 956), duke of the Franks and count of Paris, son of King Robert I. of France (d. 923) and nephew of King Odo or Eudes (d. 898), was one of the founders of the power of the Capetian house in France. Hugh's first wife

was Eadchild, a sister of the English king, Aethelstan. At the death of Raoul, duke of Burgundy, in 936, Hugh was in possession of nearly all the region between the Loire and the Seine, corresponding to the ancient Neustria, with the exception of the territory ceded to the Normans in 911. He took a very active part in bringing Louis IV. (d'Outremer) from England in 936, but in the same year Hugh married Hadwig, sister of the emperor Otto the Great, and soon quarrelled with Louis. Hugh even paid homage to Otto, and supported him in his struggle against Louis. When Louis fell into the hands of the Normans in 945, he was handed over to Hugh, who released him in 946 only on condition that he should surrender the fortress of Laon. At the council of Ingelheim (948) Hugh was condemned, under pain of excommunication, to make reparation to Louis who had made an alliance with Otto. It was not, however, until 950 that the powerful vassal became reconciled with his suzerain and restored Laon. But new difficulties arose, and peace was not finally concluded until 953. On the death of Louis IV. Hugh was one of the first to recognize Lothair as his successor, and, at the intervention of Queen Gerberga, was instrumental in having him crowned (Nov. 12, 956). In recognition of this service Hugh was invested by the new king with the duchies of Burgundy (his suzerainty over which had already been nominally recognized by Louis IV.) and Aquitaine. But his expedition in 955 to take possession of Aquitaine was unsuccessful. In the same year, however, Giselbert, duke of Burgundy, acknowledged himself his vassal and betrothed his daughter to Hugh's son Otto. At Giselbert's death (April 8, 956) Hugh became effective master of the duchy, but died soon afterwards, on June 17, 956.

HUGH CAPET (c. 938–996), king of France and founder of the Capetian dynasty, was the eldest son of Hugh the Great by his wife Hadwig. When his father died in 956 he succeeded to his numerous fiefs around Paris and Orleans, and his cousin, the Frankish king Lothair, recognized him somewhat reluctantly as duke of the Franks. Many of the counts of northern France did homage to him as their overlord, and Richard I., duke of Normandy, was both his vassal and his brother-in-law. His authority extended over certain districts, south of the Loire, and, owing to his interference, Lothair was obliged to recognize his brother Henry as duke of Burgundy. Hugh supported his royal suzerain when Lothair and the emperor Otto II. fought for the possession of Lorraine; but chagrined at the king's conduct in making peace in 980, he went to Rome to conclude an alliance with Otto. Laying more stress upon independence than upon loyalty, Hugh appears to have acted in a haughty manner toward Lothair, and also towards his son and successor Louis V.; but neither king was strong enough to punish this powerful vassal. When Louis V. died without children in May 987, Hugh and the late king's uncle Charles, duke of Lower Lorraine, were candidates for the vacant throne, and in this contest the energy of Hugh's champions, Adalberon, archbishop of Reims, and Gerbert, afterwards Pope Sylvester II., prevailed. Declaring that the Frankish crown was an elective and not an hereditary dignity, Adalberon secured the election of his friend, and crowned him, probably at Noyon, in July, 987.

The authority of the new king was quickly recognized in his kingdom, which covered the greater part of France north of the Loire with the exception of Brittany, and in a shadowy fashion he was acknowledged in Aquitaine; but he was compelled to purchase the allegiance of the great nobles by large grants of royal lands, and he was hardly more powerful as king than he had been as duke. Moreover, Charles of Lorraine was not prepared to bow before his successful rival, and before Hugh had secured the coronation of his son Robert as his colleague and successor in December 987, he had found allies and attacked the king. Hugh was worsted during the earlier part of this struggle, and was in serious straits, until he was saved by the wiles of his partisan Adalberon (*q.v.*) bishop of Laon, known as Asselin, who in 991 treacherously seized Charles and handed him over to the king. This capture virtually ended the war, but one of its side issues was a quarrel between Hugh and Pope John XV., who was supported by the empire, then under the rule of the empresses Adelaide and Theophano as regents for the young emperor Otto III.

In 987 the king had appointed to the vacant archbishopric of Reims a certain Arnulf, who at once proved himself a traitor to Hugh and a friend to Charles of Lorraine. In June 991, at the instance of the king, the French bishops deposed Arnulf and elected Gerbert in his stead, a proceeding which was displeasing to the pope, who excommunicated the new archbishop and his partisans. Hugh and his bishops remained firm, and the dispute was still in progress when the king died at Paris on Oct. 24, 996.

Hugh was a devoted son of the church, to which, it is not too much to say, he owed his throne. As lay abbot of the abbeys of St. Martin at Tours and of St. Denis he was interested in clerical reform, was fond of participating in religious ceremonies, and had many friends among the clergy. His wife was Adelaide, daughter of William III., duke of Aquitaine, by whom he left a son, Robert, who succeeded him as king of France. The origin of Hugh's surname of *Capet*, which was also applied to his father, has been the subject of some discussion. It is derived undoubtedly from the Lat. *capa*, *cappa*, a cape, but whether Hugh received it from the cape which he wore as abbot of St. Martin's, or from his youthful and playful habit of seizing caps, or from some other cause, is uncertain.

See Richerus, *Historiarum libri IV.*, edited by G. Waitz (Leipzig, 1877); F. Lot, *Les Derniers Carolingiens* (1891), and *Études sur le règne de Hugues Capet* (1903); G. Monod, "Les Sources du règne de Hugues Capet," in the *Revue historique*, tome xxviii. (Paris, 1891); P. Viollet, *La Question de la légitimité à l'avènement à Hugues Capet* (1892); and E. Lavisse, *Histoire de France*, tome ii. (1903-05).

HUGH DE PUISET (c. 1125-1195), bishop of Durham, was the nephew of Stephen and Henry of Blois; the latter brought him to England and made him an archdeacon of the see of Winchester. Hugh afterwards became archdeacon and treasurer of York. In 1153 he was chosen bishop of Durham, in spite of the opposition of the archbishop of York; but he only obtained consecration by making a personal visit to Rome. Hugh remained neutral, as far as he could, in the quarrel between Henry and Becket, but he at least connived at the rebellion of 1173 and William the Lion's invasion of England in that year. After the failure of the rebellion the bishop was compelled to surrender Durham, Norham and Northallerton to the king. In 1179 he attended the Lateran Council at Rome, and in 1181 by the pope's order he laid Scotland under an interdict. In 1184 he took the cross. At the general sale of offices with which Richard began his reign (1189) Hugh bought the earldom of Northumberland. The archbishopric of York had been vacant since 1181. This vacancy increased Hugh's power vastly, and when the vacancy was filled by the appointment of Geoffrey he naturally raised objections. This quarrel with Geoffrey lasted till the end of his life. Hugh was nominated justiciar jointly with William Longchamp when Richard left the kingdom. But Longchamp soon deprived the bishop of his place (1191), imprisoned him, and forced the surrender of his castle, his earldom and hostages. Hugh was compelled to acknowledge Geoffrey of York as his ecclesiastical superior in 1195. Combining in his own hands the palatinate of Durham and the earldom of Northumberland, Hugh held a position not much dissimilar to that of the great German princes, a local sovereign in all but name.

See Kate Norgate's *England under the Angevin Kings* (1887); Stubbs's preface to *Hoveden*, iii.

HUGHES, ARTHUR (1832-1915), English painter, was born in London on Jan. 27, 1832. In 1846 he studied at the art school at Somerset House, under Alfred Stevens, and later entered the Royal Academy schools. He met Millais and Holman Hunt, and became one of the pre-Raphaelite group of painters. He also became widely known as an illustrator. He died at Kew Green on Dec. 22, 1915.

HUGHES, CHARLES EVANS (1862-), American lawyer and statesman, was born at Glens Falls, New York, on April 11, 1862. He attended Madison (now Colgate) university (1876-78), whence he proceeded to Brown university where he was awarded the Dunn Premiums for excellence in English literature and general excellence (B.A., 1881; M.A. 1884). He then taught at Delhi, N.Y., studying law in his leisure. In 1882 he entered the Columbia Law school, taking his LL.B. degree in

1884 and obtaining a prize fellowship of three years' duration. In the same year he was admitted to the New York bar and engaged in practice until his appointment in 1891 as professor of law at Cornell university, a position which he resigned in 1893 in order to resume practice. He continued, however, to maintain his connection with Cornell in the capacity of special lecturer, and was a special lecturer at the New York Law school from 1893 to 1900. In 1905 he was counsel for the Stevens Gas and Electric Lighting Commission appointed by the State legislature to investigate the cost of gas. In the same and following year he acted as counsel for the Armstrong Life Insurance Commission which investigated the affairs of the life insurance companies operating under State charters. In 1906 he was retained by the Federal Government to investigate alleged violation of the Sherman law by the coal-carrying roads. In the same year, as nominee of the Republican Party for governor of the State of New York, he was elected by 57,897 votes over William Randolph Hearst, being the only successful candidate on the Republican ticket, and was re-elected in 1908. His régime as governor was distinguished by the initiation of far-reaching reforms both legal and administrative, including the formation of a Public Service commission, legislation protecting women and children in factories and stricter election laws. By his efforts also pool-selling and book-making on race tracks were placed in the same category as other forms of gambling. He resigned on Oct. 6, 1910, being appointed associate justice of the U.S. Supreme Court by President Taft.

He remained on the Supreme Court bench for six years. His contributions on constitutional questions were always masterly, particularly those which he rendered in the "State Rate Cases," which involved the line of division of State and Federal sovereignty in the field of railway regulation. (See *Minnesota Rate Cases*, 230 U.S.R. 352.)

In 1912 he had refused to be a candidate for the presidency, but on his nomination, June 10, 1916, by the Republican national convention in Chicago, he accepted and resigned from the Supreme Court. President Woodrow Wilson was renominated by the Democrats. The electoral vote was 277 for Wilson against 254 for Hughes. The popular vote was 9,129,606 for Wilson against 8,538,221 for Hughes. The following year he again entered upon the practice of law in New York city. In 1917 he was appointed chairman of the Draft Appeals board of New York city, and in 1918 he acted as special assistant to the U.S. attorney general in charge of the investigation of alleged waste and delay in the construction of aircraft.

On the inauguration of President Harding, on March 4, 1921, he became the secretary of State. The Soviet Government approached him in his first month of office asking that the United States should resume trade relations with Russia, but he promptly rejected the Soviet proposals. Later on M. Chicherin communicated with him with a view to recognition by the United States of the Soviet republic, but this also was refused on Dec. 19, 1923. In 1921 Hughes, under authorization by President Harding, sent out invitations suggesting a conference on the limitation of armaments. The conference was held—Hughes being chief U.S. delegate and chairman—with the result that seven treaties were negotiated relating to limitation of naval armaments, the fortification of islands in the Pacific and relations between China and other Powers. (See WASHINGTON CONFERENCE.)

In a speech at New Haven in Dec. 1922 Hughes dealt with the matter of German reparations, and unofficially suggested a committee of experts to investigate. This was the genesis of the committee which ultimately prepared what is known as the Dawes Plan. (See REPARATIONS.) The Tacna-Arica dispute afforded another instance of his intervention on behalf of peace. (See TACNA-ARICA QUESTION.)

Hughes's attitude in respect of foreign affairs was well set forth in an address entitled "The Pathway of Peace," delivered by him before the Canadian Bar Association on Sept. 4, 1923. "The League of Nations," he said, "by its constitution presupposed that peace could be maintained by economic pressure and military force." He dissented from this, since he believed that there was no path to peace except as the will of peoples might open it. The

way to peace was through agreement, not force. He was in favour of the adherence of the United States to the World Court of International Arbitration. The judicial impartiality of Hughes's character fitted him admirably to succeed in handling the international problems confronting him as secretary of State, but his personality was not magnetic, and he was incapable of arousing enthusiasm even in the ranks of his own party.

He resigned office on March 4, 1924, retired from active politics, and resumed practice at the bar. In 1925 he acted as chairman of the New York State Reorganization Commission, appointed to investigate the structure of the State Government. The commission reported on March 1, 1926, urging that the 180 State bureaux and departments be merged into 18 and that an executive budget system be introduced, and these recommendations were subsequently carried into effect by the State legislature. He was appointed by President Coolidge on Oct. 1, 1926, U.S. member of The Hague Court of Arbitration. Early in that year steps were taken to bring his name forward again for the Presidency, which he discouraged, saying that he was too old. Later on he announced definitely that he would not be a candidate. Having been appointed special master of the U.S. Supreme Court to enquire into the diversion of the water from Lake Michigan by the Chicago sanitary district he brought in a report on Nov. 24, 1927, upholding the rights of Chicago and advising the interested States to withdraw from their litigation. He was appointed chief of the U.S. delegation to the sixth Pan-American conference, which was held at Havana on Jan. 16 to Feb. 20, 1928. Declining the chairmanship, he was elected vice-president, and became a powerful factor in assuaging the jealousies and compromising the conflicting claims of the various countries represented, at the same time impressing upon the conference that the policy of the U.S. in Latin-American affairs was in no sense aggressive. In Sept. 1928 he was appointed a judge of the Permanent Court of International Justice, and on Feb. 3, 1930, was appointed Chief Justice of the United States by President Hoover.

C. E. Hughes has delivered numerous addresses subsequently reproduced in pamphlet form. In addition, he has published *Addresses and Papers* (1908); *Conditions of Progress in Democratic Government* (Yale Lectures, 1910); *Addresses 1906-16* (1916); *Foreign Relations* (1924); *The Pathway of Peace* (1925); and *The Supreme Court of the United States: Its Foundation, Methods and Achievements* (1928); *Our Relations to the Nations of the Western Hemisphere* (1928). See also *Public Papers of C. E. Hughes, Governor, 1907-1910* (1910); *Pan American Peace Plans* (1929). (H.W.H.K.)

HUGHES, DAVID EDWARD (1831-1900), Anglo-American electrician, was born on May 16, 1831, in London, but the earlier part of his life was spent in America, whither his parents emigrated when he was about seven years old. In 1850 he became professor of music at the college of Bardstown, Kentucky, and soon afterwards teacher of natural philosophy at the same place, but resigned in 1854. In 1855 he took out a patent in the United States for his type-printing telegraph instrument. Its success was immediate and in 1867 Hughes brought it over to Europe. In the succeeding ten years it came into extensive use all over Europe, gaining for its inventor numerous honours and prizes. Hughes played an important part in the development of telephony; his microphone was the forerunner of the various forms of carbon transmitter in general use. Continuing his experiments with his microphonic joints, Hughes discovered the phenomena on which depends the action of the so-called "coherers" used in wireless telegraphy. Hughes, who is also known for his invention of the induction balance and for his contributions to the theory of magnetism, died in London on Jan. 22, 1900.

HUGHES, SIR EDWARD (c. 1720-1794), British admiral, entered the Royal Navy in 1735, and four years later was present at Porto Bello. In 1740 he became lieutenant, and in that rank served in the Cartagena expedition of 1741, and at the indecisive battle of Toulon (1744). From that time he was almost continuously employed on active service. He was with Boscawen at Louisburg and with Saunders at Quebec. As Commodore he commanded in the East Indies from 1773 to 1777. It was not long before he returned to the East as a rear-admiral, with an overwhelming naval force. On his outward voyage he retook Goree from the French. In 1782 he stormed Trincomalee a few days

before the squadron of Suffren arrived in the neighbourhood. In 1783 Suffren (*q.v.*) was perhaps the ablest sea-commander that France ever produced, but his subordinates were factious and unskilful; Hughes, on the other hand, whose ability was that born of long experience rather than genius, was well supported. Five fiercely contested general actions were fought by the two fleets, neither of them gaining a decisive advantage. In the end Hughes held his ground. After the peace he returned to England. He died at Luxborough, Essex, in 1794.

HUGHES, HUGH PRICE (1847-1902), British Nonconformist divine, was born at Carmarthen on Feb. 8, 1847, the son of a surgeon. He established in 1887 the West London mission, holding popular services on Sunday in St. James's hall, Piccadilly, when he preached from time to time on the housing of the poor, sweating, gambling and other subjects of social interest. In connection with this mission he founded a sisterhood to forward the social side of the work, which was presided over by Mrs. Hughes. He had started in 1885 the *Methodist Times*, and rapidly made it a leading organ of Nonconformist opinion. He was a born fighter, and carried the fire and eloquence he showed on the platform and in the pulpit into journalism. He supported W. T. Stead in 1885, as he had earlier supported Mrs. Josephine Butler in a similar cause; he attacked the trade in alcohol; was an anti-vivisectionist; he advocated arbitration; and his vehement attacks on Sir Charles Dilke and Charles Stewart Parnell originated the phrase the "Nonconformist conscience." He differed strongly from a large section of Nonconformist opinion in his defence of the South African War. In 1898 he was president of the Wesleyan Conference. His energies were largely devoted to co-operation among the various Nonconformist bodies, and he was one of the founders and most energetic members of the National Council of the Evangelical Free Churches. He died in London on Nov. 17, 1902.

See his *Life* (1904) by his daughter, Dorothea Price Hughes.

HUGHES, JOHN (1677-1720), English poet and miscellaneous writer, was born at Marlborough, Wiltshire. He died on the night of the production of his most celebrated work, *The Siege of Damascus*, Feb. 17, 1720. Hughes wrote some of the libretti of the cantatas (2 vols., 1712) set to music by Dr. John Christopher Pepusch. Others of his pieces were set to music by Ernest Galiard and by Handel. In the masque of *Apollo and Daphne* (1716) he was associated with Pepusch, and in his opera of *Calypso and Telemachus* (1712) with John E. Galiard. Hughes's version of the *Letters of Abelaud and Heloise* . . . (1714) is notable as the basis of Pope's "Eloisa to Abelaud" (1717).

His *Poems on Several Occasions, with some Select Essays in Prose* . . . were edited with a memoir in 1735, by William Duncombe, who had married his sister Elizabeth. See also *Letters by several eminent persons* (2 vols., 1772) and *The Correspondence of John Hughes, Esq. . . and Several of his Friends* . . . (2 vols., 1773), with some additional poems.

HUGHES, JOHN (1797-1864), American Roman Catholic divine, was born in Annalaghan, county Tyrone, Ireland, on June 24, 1797. He followed his father to Chambersburg, Pa., and was ordained deacon in 1825 and priest in 1826. He opposed the lay trustee system in Philadelphia where he served in several churches. In the New York diocese he was consecrated coadjutor to Bishop Dubois in 1838, bishop in 1842, and first archbishop in 1850, and worked against the lay trustee system and for State support for parochial schools. At all times he constituted himself a defender of his faith against miscellaneous attacks of Protestant clergy and the "Native American" and "Know-Nothing" agitations of 1844 and 1854. He was equally ready, however, to denounce sources of weakness within the Church as is shown by his attack in 1856 on three classes of Roman Catholic papers which he considered injurious. During the Civil War his ardent attachment to the Union resulted in his going to France to counteract the influence of the Slidell mission and was productive of good feeling towards the North both in Rome and Ireland. The establishment of St. John's college (now Fordham university) in 1841 largely with funds collected by him in Europe is one of his most constructive achievements. He died in New York city on Jan. 3, 1864. His reputation as a member of the Church militant he himself explained on the

ground that "the circumstances by which I have been surrounded, and the character of the country and people with whom I had to deal, did not allow me to use, at all times, that meek and apostolic spirit which is so appropriate and beautiful."

His works were edited by Laurence Kehoe (1864-65). Good biographies were prepared by J. G. Hassard (1865) and H. A. Brann (1892).

HUGHES, SIR SAM (1853-1921), Canadian soldier and politician, was born at Darlington, Ont. on Jan. 8, 1853. In the Fenian raids of 1870 he served with the Canadian volunteer militia, and in 1873 was gazetted to the 45th Regiment. Educated at Toronto University, he lectured at a Toronto collegiate institute until 1885, when he took up journalism, being editor and proprietor of the *Lindsay Warder*, 1885-97. In 1892 Hughes was elected to the Dominion parliament, but service in the South African War interrupted his political career. Returning to Canada after the coronation of King George V. in 1911, he became minister of militia and defence, and was chiefly responsible for the creation of the overseas force which sailed for Europe in 1914. In 1915 Hughes was created K.C.B. and promoted major-general; but in the following year disagreements with Sir Robert Borden resulted in his resignation. Hughes criticized severely the strategy and leadership of Sir Arthur Currie. In July 1921 he announced his intention of retiring from parliament, and he died at Lindsay, Ont., on Aug. 24, 1921.

HUGHES, THOMAS, English dramatist, a native of Cheshire, entered Queens' college, Cambridge, in 1571, and became a member of Gray's Inn. He wrote *The Misfortunes of Arthur*, *Uther Pendragon's son reduced into tragical notes by Thomas Hughes*, performed at Greenwich in the queen's presence on Feb. 28, 1588. Nicholas Trotte provided the introduction, Francis Flower the choruses of Acts I. and II., William Fulbeck two speeches, while three other gentlemen of Gray's Inn, one of whom was Francis Bacon, undertook the care of the dumb show. The argument of the play, based on a story of incest and crime, was borrowed, in accordance with Senecan tradition, from mythical history, in this case Geoffrey of Monmouth's *Historia Britonum*. Dr. W. J. Cunliffe has proved that Hughes's memory was saturated with Seneca, and that the play may be resolved into a patchwork of translations, with occasional original lines.

The Misfortunes of Arthur was reprinted in J. P. Collier's supplement to Dodsley's *Old Plays*; and by Harvey Carson Grumline (Berlin, 1900) who points out that Hughes's source was Geoffrey of Monmouth's *Historia Britonum*, not the *Morte D'Arthur*.

HUGHES, THOMAS (1822-1896), English lawyer and author, second son of John Hughes of Donnington Priory, editor of *The Boscobel Tracts* (1830), was born at Uffington, Berks. He was educated at Rugby school under Dr. Arnold, and at Oriel college, Oxford. He was called to the bar in 1848, became Q.C. in 1869, a bencher in 1870, and was appointed to a county court judgeship in the Chester district in July 1882. While at Lincoln's Inn he came under the dominating influence of his life, that of Frederick Denison Maurice. In 1848 he joined the Christian Socialists, under Maurice's banner, among his closest allies being Charles Kingsley. In Jan. 1854 he was one of the original promoters of the Working Men's College in Great Ormond Street, of which he became principal after Maurice's death. Hughes sat in parliament from 1865 to 1874, and introduced a trades union bill which, however, only reached its second reading. On one of his visits to America in 1879 he planned a co-operative settlement, "Rugby," in Tennessee, which involved him in money losses. In 1848 Hughes had married Frances, niece of Richard Ford, of Spanish *Handbook* fame. They settled in 1853 at Wimbleton, and there was written his famous story, *Tom Brown's School Days* (1857) "by an Old Boy." *Tom Brown* did a great deal to fix the English concept of what a public school should be. Hughes also wrote *The Scouring of the White Horse* (1859), *Tom Brown at Oxford* (1861), *Religio Laici* (1868) and *Life of Alfred the Great* (1869). He died at Brighton on March 22, 1896.

HUGHES, WILLIAM MORRIS (1864-), Australian statesman, was born on Sept. 25, 1864, at Llansantffraid, Montgomeryshire, Wales. At the age of 20 he went to Australia. Here he drove sheep and cattle across New South Wales and Queensland,

worked on farms and cooked for harvesting gangs, became a sailor on coasting steamers, prospected for gold, tramped from station to station doing odd jobs, taught children in remote settlements, walked hundreds of miles organizing for the Australian Workers' Union, and in the end drifted back to Sydney and gravitated to politics. He formed the Sydney waterside workers into a militant organization, and entered the New South Wales parliament in 1894 as member for the Lang division of Sydney.

As a member of the Opposition Hughes was an effective debater, and devised the Labour party's caucus system of settling all internal dissensions outside the House and presenting a united front in parliament. Then in 1901 came federation, and as member for West Sydney in the first House of Representatives Hughes found wider scope for his political genius. In 1904 J. C. Watson formed the first Labour ministry, and Hughes, who in the midst of his industrial and political work had found time to qualify as a barrister, became minister for external affairs. The ministry was short-lived, but thenceforth it was clear to friends and foes alike that a new force had entered Australian politics. During the years that followed Hughes became a powerful orator, and his courage, energy, intellectual gifts and dominating personality made his succession to Mr. Fisher almost inevitable.

Hughes was attorney-general in the Fisher ministry of 1908, and revealed a breadth of view and a warm Imperialism hardly to be looked for in a party which, not so many years before, had toyed with the idea of "cutting the painter." He promoted the scheme of compulsory military service, and he was heart and soul with his leader when Fisher, who had returned to office after the Liberal defeat of 1913, made his historic offer in 1914 of Australia's last man and last shilling. In 1915 Fisher went to London as high commissioner, and Hughes succeeded him as prime minister. Hughes, by his driving force and faculty of kindling enthusiasm, gave an immense stimulus to the raising and maintenance of the Australian Expeditionary Forces; and with equal energy he set to work to eradicate German commercial influence from Australia. He secured legislation annulling German contracts, transferred control of output to the newly established Australian Metal Exchange, prevented trading with the enemy, and disinherited enemy shareholders in commercial enterprises of every kind.

In 1916 he visited England and preached a renaissance of the British race based upon a greater development of the empire's resources and a closer-knit economic system. Returning to Australia he attempted to introduce conscription. On this issue the Labour party split, and Hughes formed a Coalition Government composed of the Liberals and that section of the Labour party which followed him on the conscription issue. The conscription referendum, on which the Government was defeated, was marked by great bitterness, and there followed a period of industrial and political strife without parallel in Australia's history. Hughes was hotly attacked for his autocratic methods, for his excursions into State shipowning and shipbuilding, and for his policy of concentrating power in his own hands by means of the War Precautions Act, the establishment of boards to control industry, and the appointment of special tribunals to settle industrial disputes over the head of the Arbitration Courts. But so long as the War lasted there was no acceptable alternative leader, and the prime minister left to attend the Peace Conference with his prestige higher than ever. His assertion of Australia's right to proclaim something rather like a Monroe Doctrine for the Pacific awakened Americans and the world to the importance of Australasia; and at Versailles his dogged advocacy of the Commonwealth's right to a mandate over the former German colony of Papua, helped to make history. His quarrel with President Wilson, embittered by mutual dislike, gave rise to some of the most piquant passages in the annals of the conference.

In Australia, on his return, Hughes found grave industrial troubles disturbing a country already weighed down by an immense load of debt and the problem of reabsorbing 400,000 men into civil life. But he could not prevent discontent revealing itself in the secession of certain Liberal-Nationalists and the formation of a new Country party. As the conditions which had brought it

into existence disappeared, the war party which he led began to crumble, and in Feb. 1923, after holding office as prime minister for eight years, he was forced by a Liberal-Country party coalition to resign in favour of the treasurer, S. M. Bruce.

(G. C. Dr.; X.)

HUGH OF LINCOLN, ST. (c. 1140–1200), bishop of Lincoln, was born of a noble family at Avalon, in Burgundy. He entered the canons regular at Villard-Benoît and about 1160 was appointed prior of a dependent cell. Later, however, he joined the monks of the Grande Chartreuse, and rising to the important office of procurator, he acquired a reputation for energy and tact which led Henry II. of England to request his assistance in establishing at Witham in Somersetshire the first English Carthusian monastery. Hugh became the first prior, and under him the Charterhouse, a copy of the Grande Chartreuse, was completed. In 1186 Henry procured his election to the see of Lincoln. There he let neither royal nor ecclesiastical influence interfere with his conduct, but fearlessly resisted any infringement of the rights of his church or diocese. Though himself an ascetic, he was noted for his kindness to the poor, to lepers and to Jews. In 1200 Hugh revisited his native country and on the return journey was seized with an illness, of which he died at London on Nov. 16, 1200. He was canonized by Honorius III. and his feast is celebrated on Nov. 17.

The *Magna vita S. Hugonis* was edited (1864) by J. F. Dimock, who also edited a *Metrical Life of St. Hugh of Avalon* (1860) and a *Vita* by Giraldus Cambrensis (1877). See the *Vie de St. Hugues, évêque de Lincoln* (1140–1200) *par un religieux de la Grande Chartreuse* (Montreuil, 1890, Eng. trans. by H. Thurston, S.J., with valuable notes 1898); C. L. Marson, *Hugh, bishop of Lincoln* (1901); R. M. Woolley, *St. Hugh of Lincoln* (1927). A complete bibliography is given in U. Chevalier, *Bio-bibliographie* (1905); see also A. Potthast, *Bibliotheca med. aev.*, 1380.

Another ST. HUGH OF LINCOLN was a child about ten years old when he was found dead on premises belonging to a Jew. It was said that the boy had been scourged and crucified in imitation of the death of Christ, and many Jews were punished. The incident is referred to by Chaucer in the *Prioresses Tale* and by Marlowe in the *Jew of Malta*.

See J. Jacobs, *Little St. Hugh of Lincoln* (1884).

HUGH OF ST. CHER (c. 1200–1263), French cardinal and Biblical commentator, was born at St. Cher, near Vienne, and, while a student in Paris, became a Dominican in 1225. Later, as provincial of his order, he won the confidence of the popes Gregory IX., Innocent IV. and Alexander IV., who charged him with several important missions. Created cardinal-priest in 1244, he played an important part in the council of Lyons in 1245, contributed to the reform of the Carmelites (1247), and the condemnations of the *Introductorius in evangelium aeternum* of Gherardino del Borgo San Donnino (1255), and of William of St. Amour's *De periculis novissimorum temporum*. He died at Orvieto on March 19, 1263. He directed the first revision of the text of the Vulgate begun in 1236 by the Dominicans; this first "correctorium," vigorously criticized by Roger Bacon, was revised in 1248 and in 1256, and forms the base of the celebrated *Correctorium Bibliae Sorbonicum*. With others of his order he edited the first concordance of the Bible, *Concordantie Sacrorum Bibliorum* or *Concordantie S. Jacobi*. His *Postillae in sacram scripturam juxta quadruplicem sensum, litteralem, allegoricum, anagogicum et morale* was published frequently in the 15th and 16th centuries, and his exegetical works appeared at Venice in 1754 in 8 vols.

See Quetif-Echard, *Scriptores ordinis praedicatorum*; Denifle, in *Archiv für Literatur und Kirchengeschichte des Mittelalters*, iv. *L'Année dominicaine*, iii. (1886); *Chartularium universitatis Parisiensis*, i.

HUGH OF ST. VICTOR (1096–1141), mystic philosopher and theologian, was born at Hartingam, Saxony. After spending some time in a house of canons regular at Hamersleben, in Saxony, where he took the habit, he went to the Abbey of St. Victor in Paris. There he rose to be canon, in 1125 *scholasticus*, and perhaps even prior, and it was there that he died on March 11, 1141. Hugh initiated that mysticism of the school of St. Victor which filled the whole of the second part of the 12th century; but

in reaction to the theories of Roscelin and Abelard, his mysticism was the orthodox system of a subtle and prudent rhetorician. In theology, he paved the way for the great *Summae* of the 13th century by his excellent dogmatic synthesis, entitled *De sacramentis*: Creation and restoration are the critical events in the history of the world. By the former the world was constituted, by the latter it regains its lost glory. The work of creation can be known by a study of the profane sciences; that of restoration is revealed in Holy Scriptures. His sacramental teaching clarified many points later adopted by his successors. Hugh did not profess the contempt for the profane sciences which his followers the Victorines expressed. His division of these sciences into theoretical, practical, mechanical and logical, and his moderate realism occupy a subordinate position to his interest in psychology. Like Augustine, he starts from consciousness of the self, which he believes bears witness to the existence, the substantiality, and the spirituality of the soul. Knowledge of the self is the fruit of introspection, knowledge of the external world is the fruit of the zealous exercising of natural talent, and knowledge of God the fruit of contemplation. For Hugh the existence of God is provable both from internal and from external experience, especially that of the changeability of creatures.

Besides the *De Sacramentis*, Hugh's chief works are the encyclopaedic *Didascalion*, the *De Unione corporis et spiritus*, the mystical treatises *De arca Noë morali*, *De arca Noë mystica*, *De vanitate mundi*, *De artha animae*, *De amore sponsi ad sponsam*, etc., the commentaries on Scriptural books and on the *Celestial Hierarchy* of the Pseudo-Dionysius.

The 1648 Rouen edition of his *opera* was reprinted in Migne's *Patrol. Lat.*, vols. 175–177. See B. Haureau, *Les Oeuvres de Hugues de St. Victor* (1859; 2nd ed., 1886); article by H. Denifle in *Archiv für Literatur und Kirchengeschichte des Mittelalters*, iii. (1887); A. Mignon, *Les Origines de la Scholastique et Hugues de St. Victor* (1895); J. Kilgenstein, *Die Gotteslehre des Hugo von St. Victor* (1898); Ostler, *Die Psychologie des Hugo von St. Viktor* (1906); Pourrat, *La Théologie sacramentaire* (1907); M. Grabmann, *Die Gesch. der Scholast. Methods* (1909–11), and complete bibliography in Überweg, *Gesch. der Philosophie* (Bd. ii. 1928).

HUGO, GUSTAV VON (1764–1844), German jurist, was born at Lörrach in Baden, on Nov. 23, 1764. He became extraordinary professor of law at Göttingen in 1788, ordinary professor in 1792. In the preface to his *Beiträge zur zivilistischen Bücherkenntnis der letzten vierzig Jahre* (1828–29) he gives a sketch of the condition of the civil law teaching at Göttingen at that time. He was the founder of that historical school of jurisprudence which was continued and further developed by Savigny. His *magna opera* are the *Lehrbuch eines zivilistischen Kursus* (7 vols., 1792–1821), in which his method is thoroughly worked out, and the *Zivilistisches Magazin* (6 vols., 1790–1837). He died at Göttingen on Sept. 15, 1844.

See Eyssenhardt, *Zur Erinnerung an Gustav Hugo* (1845).

HUGO, VICTOR MARIE (1802–1885), French poet and novelist, was the third son of Captain (subsequently General) Joseph Léopold Sigisbert Hugo by his wife Sophie, daughter of M. Trébuchet of Nantes. In the autobiographical notes which the poet dictated to his wife and which were published in 1863 under the title *Victor Hugo raconté par un témoin de sa vie*, a wholly apocryphal account of the origins of the Hugo family is given. History discloses only that the poet's grandfather, Joseph Hugo, was a carpenter at Nancy, that his great grandfather was a peasant-farmer in the Vosges. His mother's family were of Breton, and indeed Celtic origin, and the fact that Victor Hugo was thus "d'un sang bréton et lorrain à la fois," may account for the curious blending in his character of imagination and insensitiveness, of recklessness and caution, of extravagance and parsimony. At the time of the poet's birth his father, who was suspected by Bonaparte of being a supporter of Moreau, had been relegated to the command of a battalion at Besançon. It was here, in the Maison Barette on the Place St. Quentin, that Victor Hugo was born on Feb. 26, 1802.

Victor Hugo's life divides itself into seven distinct though

unequal periods. There is his exciting Napoleonic childhood (1802-15); his infant-prodigy period in Paris (1815-22); his royalist period (1822-27); the three turbulent years of the romantic crusade (1827-30); the 15 successful years under Louis Philippe (1830-45); his political period, and his 18 years of exile (1852-70); and the final apotheosis when he lived on as the bard and prophet of the Third Republic (1870-85).

Childhood (1802-1815).—The events of Hugo's childhood are important and must be recorded in some detail. It was an exaggeration on his part to say that:—

Parmi les chars poudreux, les armes éclatantes
Une muse des camps m'emporta sous les tentes . . .

but it is a fact that his early years were inflamed by many journeys and excitements, and that his whole subsequent attitude towards life was much affected by the contrasts and vicissitudes, by the actual flash and jingle, of the Napoleonic era. His father had attached himself to Joseph Bonaparte and accompanied that monarch first to Naples and then to Madrid. Of the Italian journey, undertaken at the age of five, little remained for Hugo beyond some faint memories of Rome and Naples, of the snow and sledges upon the Mont Cenis, of the nut-trees among the rocks at Avellino. The Spanish journey of 1811 left an infinitely deeper impress. General Hugo was by then a count of the Empire. He was governor of Madrid, and King Joseph's confidential adviser: he was count of Cifuentes and marquis of Siguenza: he possessed on paper large properties in Castile and a fortune of one million réals. There was no limit to the honours or prosperity which such a father could obtain, and the Spanish journey was thus undertaken in a blaze of anticipation and with all the conveniences and attentions accorded to highly important personages. Such glories left an indelible impression, but they were not of long duration. Victor and his brother Eugène were sent to the College of Nobles in Madrid, where they were supposed to consort with the Spanish aristocracy. The latter, however, regarded them as foreigners and invaders, whereas the Jesuits who were in charge of the college imagined that they were Protestants and eyed them askance. It was not a happy period; and it produced in Hugo an aristocracy-complex, a love-hatred of aristocracy, which, working on his persistent egoism, became one of the many constituents of his later demagogues. For the moment, however, his vanity reacted to these humiliations only in the form of national arrogance:—

Chez dix peuples vaincus, je passais sans défense
Et leur respect craintif étonnait mon enfance . . .
Quand je balbutiais le nom chéri de la France
Je faisais pâlir l'étranger.

By the spring of 1812 the French position in Madrid, in spite of the pallor of the inhabitants, became insecure: General Hugo felt it safer to send his wife and children back to Paris.

In the intervals of these Italian and Spanish expeditions, Mme. Hugo educated her children in Paris. She was a hard and stingy woman,—imperious, independent and cold. Her politics were anti-Bonapartist, she was royalist and Vendéenne. Her religion was Voltairean, inclining to deism. Her influence upon her children was immense and she succeeded for many years in imposing upon them her dislike of Napoleon, her very acute dislike of their own father. They were happy there, in the large garden of No. 12 Impasse des Feuillantines, where they climbed the trees, and played with little Adèle Foucher, and had pleasant discursive lessons from Père de la Rivière, and listened to the long stories of General Lahorie, an aged conspirator whom their mother was hiding from the police. With the fall of Napoleon the fortunes of the Hugo family declined suddenly: their many castles in Spain melted into the air: General Hugo was interned on an allowance of £40 a year at Blois, where he established an alternative Mme. Hugo, and became thereafter for his sons "le brigand de la Loire." Mme., no longer countess, Hugo found herself in reduced circumstances: she left the Feuillantines and took a small flat in the rue Bonaparte. And Victor Hugo, for his part, was sent to the Pension Cordier, rue Marguerite, to prepare for the Ecole Polytechnique. These circumstances of his early years have been recorded in some detail since their grandeur and their instability

help to explain many outstanding faults in Hugo's genius and character. His intermittent education, the constant disagreements between his father and mother, the contrast between the splendours of his father's prospects and the meagre squalor of the result, the violent tawdriness of the whole Napoleonic system, account in their several ways for the superficiality of his knowledge and convictions, for his flashy exaggerations, for his passion for contrast, for the actual vulgarity of his character and mind. For the first 13 years of his life he was continually in a dramatic, and therefore in a false, position: a twist was thereby given to his egoism which developed into a foolish, and subsequently an embittered, form of conceit.

The Infant Prodigy (1815-1822).—His three years at the Pension Cordier, the lectures which he attended simultaneously at Louis-le-Grand, were important to Hugo as constituting the only systematic or thorough education that he ever obtained. He was excellent at mathematics, superficial in his classical studies, and a voracious reader. The tragedies of Voltaire which had hitherto been his main source of reading, were now supplemented by Ossian, by Calderon, by Chateaubriand. On July 10, 1816 we find him writing "I wish to be Chateaubriand or nothing." His literary ambition was thus aroused at the age of 14 and during his school-boy years he composed all manner of verses, odes, satires, acrostics, riddles, epics and madrigals. There was a tragedy, *Irtamère*, in the manner of Voltaire: a long poem on the flood: a melodrama entitled *Inez de Castro*: a comic opera: and a series of translations from Ossian and the classics. In 1817 he obtained an honourable mention from the Académie Française for a poem on the theme of "Happiness procured by study and application," and, thus encouraged, he embarked upon his first novel *Bug-Jargal*, which dealt with a blood curdling episode in the negro revolt at San Domingo. In 1819 he was accorded by the Academy of the Jeux Floraux at Toulouse the first prize for a poem on the restoration of the statue of Henry IV., and it was on this occasion that Chateaubriand is said to have called him "l'enfant sublime." His eldest brother Abel Hugo had by then begun to edit a short-lived journal entitled *Le Conservateur Littéraire*. To this journal Victor Hugo contributed not only the text of his novel *Bug-Jargal*, but a great mass of valueless prose and verse which poured precociously from his teeming brain. He was already secretly engaged to his early playmate Adèle Foucher; the death of his mother in June 1821, and his refusal to accept any money from his father, brought him face to face with actual penury: for a whole year he existed on 700 francs in an attic in the rue du Dragon, an experience which he subsequently exploited in the person of Marius in *Les Misérables*: and during these months he wrote with dogged perseverance, with that self-confidence which throughout his life never failed him.

The Royalist Period (1822-1827).—In June 1822, at the age of twenty, Victor Hugo published his first volume of poetry under the title *Odes et Poésies diverses*. Apart from some sentimental verses addressed to Adèle Foucher (*le Vallon de Chérisy*, *À toi, le Regret*) the pieces collected in this volume were designed to catch the ear of the court. This design succeeded. Fifteen hundred copies were sold in four months. The little volume reached the hands even of Louis XVIII. who with tears in his eyes read the stilted odes on the death of the Duc de Berry or on the birth of the Duc de Bordeaux. Victor Hugo was accorded a pension of £40 from the privy purse, a salary which in the following year was doubled. He felt justified in pressing his suit on Adèle Foucher: the parents consented: the marriage took place at St. Sulpice on Oct. 14, 1822: Victor Hugo was reconciled with his father who thereupon ceased to be the "brigand de la Loire" and became "ce héros au sourire si doux": and Eugène Hugo, who was also in love with Adèle, went mad during the wedding and had to be confined in an asylum, where he died in 1837. Money was required to support Hugo's wife and impending family. Early in 1823 he published a second "tale of horror" under the title *Han d'Islande* and in 1824 he founded the *Muse française*. The contributors to this journal formed the *Cénacle*, a literary club which met in the rooms of Charles Nodier, librarian of the Arsenal, and of which the leading members were Hugo, Alfred de Vigny,

Nodier, Soumet, Emile Deschamps and Delphine Gay. Of these young writers it was Nodier only who was frankly revolutionary and romantic. The others hedged: Victor Hugo himself, who had just been made a Chevalier of the Légion d'Honneur and who had personally been invited to attend the coronation of Charles X. at Rheims, was again in a false position. The year 1825, however, marks the first definite break on his part with the classic traditions of the restoration court. He came more and more under the influence of Nodier; he visited Switzerland in the company of that romantic; he visited Lamartine at St. Pont: he read German ballads. In 1826 he published *Bug-Jargal*, and to a new edition of the *Odes* which appeared the same year he added the *Ballades* in which the transition from classicism to romanticism is clearly adumbrated. His early admiration of Chateaubriand bore a comparatively tardy fruit.

The Romantic Crusade (1827-1830).—It must be remembered that Hugo was a cautious man, and one who would have hesitated to put himself at the head of the new romantic movement had he not been assured not only of leadership but also of success. By the end of 1826 the originators of the French romantic movement, Chateaubriand and Lamartine, had retired into political life; a second and more vigorous wave of romanticism was about to overwhelm French literature; Hugo was quick to realise the tidal force of this new movement and quick to determine that he himself should ride upon its crest. The great decisions of Hugo's life were always taken under the impulse of an inspired opportunism. His convictions were adjusted rapidly to the new formula, and into the expression of this formula he flung the irresistible force of his imagination and his rhetoric. The influence of the *Cénacle*, the influence of Nodier, the far more forceful and encouraging influence of Sainte-Beuve, all contributed to this new orientation: the affectionate relations which he now established with his father revived the excited Bonapartism of his early years: and, no less importantly, the success of Weber's *Freischütz* in 1826, and the still greater success of Miss Smithson's Shakespearean season in 1827, convinced him that the Parisian public were ready for something exciting, for something explosive, for something which had nothing whatever to do with complimentary odes to Charles X. His break with the court was signaled by the publication in the *Débats* of his *Ode à la Colonne*, a fine diatribe in which he championed Napoleon's marshals against the insults which had been offered them by the Austrian ambassador. By Feb. 1827 he had already written the first draft of *Cromwell*, and during the months that followed he was engaged on writing the preface to that play which constituted the "declaration of rights" of the romantic movement. The essence of this manifesto is its wholly justified attack upon the stagnation which had come over French literature owing to the tyranny of the classical formula and the rigid rules of Boileau. With impassioned rhetoric Hugo argued that art was evolutionary and dynamic, that the old formula stood only for rigidity and decay. "The object," he wrote, "of modern art is not beauty but life." This famous preface, which was published in Oct. 1827, at once rendered Hugo the prophet and protagonist of the new school. It was less difficult, however, to formulate these new conceptions than to put them into practice. *Cromwell* itself was not suited for the stage, and an adaptation of Scott's *Kenilworth* which he produced under a pseudonym early in 1828 with the title of *Amy Robsart* was a ghastly failure. With his quick sensitiveness to public opinion Hugo abandoned drama for the moment, and adopting the then popular theme of the Greek War of Independence he composed and published *Les Orientales*, a series of poems on the Levant which, while they reflected no personal experiences, were yet so beautifully cadenced and designed that they at once achieved an immediate popularity. This volume in which he had the insight, thanks to Sainte-Beuve, to revive the forgotten metres of Ronsard and his imitators, was issued in Jan. 1829, one of the most active, and certainly one of the most important years of Hugo's life. In this year he produced *Les Orientales*, *Le Dernier jour d'un Condamné*, and *Marion de Lorme*: and he wrote the whole of *Hernani*, a great portion of *Nôtre Dame de Paris* and most of the lyrics which were subsequently included in the *Feuilles d'Automne*. *Marion de*

Lorme was banned for political reasons by the censor, but on Feb. 25, 1830 *Hernani* was produced at the *Théâtre Français* with Mlle. Mars in the part of Doña Sol. The 45 representations of this eloquent melodrama are known in French literary history as "Les batailles d'Hernani." It may be questioned whether the opposition of the classics was as determined as has been represented: but there can be no question regarding the violence of the *claque* which Hugo, Mme. Hugo and Théophile Gautier had organized. Sainte-Beuve, who was already in love with Mme. Hugo, disapproved of all this self-advertisement. "Je suis blasé," he wrote, "sur Hernani." But Hugo for his part had achieved not fame only, but fortune: the play brought him 15,000 francs: he was acclaimed by Chateaubriand as "the rising sun": he had opened the flood-gates of romanticism to Alexandre Dumas, to Alfred de Vigny, and to George Sand: and he moved with his wife and children to a larger house near the Champs Elysées. Unfortunately, however, the Revolution of July momentarily distracted public attention from Victor Hugo.

Success (1830-1845).—With the advent of the monarchy of July, under the sly complacency of Louis-Philippe, we leave the *Sturm und Drang* period of Hugo's life and pass into a phase of 15 years' success. He published *Nôtre Dame de Paris* in April of 1831 and acquired thereby great popularity in circles where poetry was unread and where controversial drama was not appreciated. In December of that year he again, and rightly, aroused the admiration of the intellectuals by his *Feuilles d'Automne*. Fortune smiled upon him: his four children, Léopoldine, Charles, François-Victor and Adèle were living depositaries of sentimentality: he was surrounded by friends and disciples, by de Musset, de Nerval, Alexandre Dumas and Petrus Borel: he was sufficiently in opposition to Louis Philippe to be regarded as a martyr while not actually becoming one: and he moved into another and more romantic apartment, now the Musée Victor Hugo, in the Place des Vosges. In Nov. 1832, he produced *le Roi s'amuse*, which would have been a failure had it not been banned by the censor on the second night. On Feb. 2, 1833 he gave *Lucrezia Borgia* at the Porte St. Martin, and was accorded a public ovation: the part of Princess Negroni was taken by Juliette Gauvain, known, under the name of Juliette Drouet, as a leading courtesan. Hugo decided to redeem this woman, and for several years he confined her in a little flat which he alone was allowed to visit; she is the heroine of his most lovely lyrics and she remained his mistress for more than 50 years. Mme. Hugo, who was not allowed any similar indulgence in regard to Sainte-Beuve, acquiesced unhappily in this arrangement. *Lucrezia Borgia* was the last but one of Hugo's successes on the stage; *Marie Tudor* and *Angelo* both failed in 1833; for a moment the triumph of *Ruy Blas* in 1838 recalled the days of *Hernani*, but a final end was put to the romantic drama by the complete collapse of *Les Burgraves* in 1843.

During these years, however, his reputation as one of the greatest of French lyric poets was firmly established. The *Feuilles d'Automne* of 1831 was succeeded by the *Chants du Crépuscule* of 1835, by *Les Voix intérieures* of 1837, and *Les Rayons et les Ombres* of 1840. In 1839 Hugo presented himself for election to the French Academy: M. Dupaty was selected in his place. In 1839 he again stood as a candidate, but it was M. Molé who was chosen. A third time, in 1840, it was M. Flourens, and not Victor Hugo, who was elected. It was only at his fourth attempt, in 1841, that he secured admission. These years of popular, if not official, success and adulation were not good for Victor Hugo: his temperamental egoism increased, and his former austerity was succeeded by a period of indulgence which provoked frequent scandals. The year 1843 was marked by a double tragedy: the failure of *Les Burgraves* was complete and crushing: and in the autumn of the same year his daughter Léopoldine, who had just married, was drowned in the Seine. In later years, this tragedy echoed for Victor Hugo in what are perhaps the finest of all his lyrics (*Trois Ans Après* and the Villequier series in the second volume of *Les Contemplations*), but for the moment he was stunned. He abandoned poetry for politics, and in 1845 he was created a peer of France.

Politics and Exile (1845-1870).—Victor Hugo, unlike Cha-

teaubriand or Lamartine or Byron, was not good at politics. In the tribune of the House of Peers he ranted and raved and indulged in phrases of such bombastic rhetoric that even his brother peers failed to take him seriously. After the revolution of 1848 he stood for the presidency of the Republic but obtained only a very few votes. During the *coup d'état* of December 1851, he made a scene in an omnibus, and he addressed the troops in the Place de la Bastille from a four-wheeler. He was a member of the committee of Insurrection and behaved during the two days of December with courage but without good sense. He was rescued by Juliette Drouet, and finally on Dec. 14, 1851 he escaped to Brussels in the disguise of a workman. In Aug. 1852 he proceeded to Jersey, where he lived at Marine Parade ("la roche où j'ai ployé mon aile") and from where he published *Napoléon le Petit* (1852) and *Les Châtiments* (1853) which, whatever its weakness and exaggeration as a satire, contains some of the most marvellous of his metrical triumphs. In 1855 he moved to Guernsey where, the next year, he bought Hauteville House. Here he resided, revelling in his martyrdom, for 17 years. In 1856, at the age that is of 54, he published *Les Contemplations* which contain what is perhaps the most durable section of his lyric verse, and two years later he composed the first section of the *Légende des Siècles*. In 1862 he published *Les Misérables*, and in 1866 *Les Travailleurs de la Mer* and in 1869 *L'homme qui rit*. The last years of his exile had been saddened by the desertion of his family: his wife went to live in Brussels where she died in 1868: his daughter Adèle ran away with an English officer; only Mme. Drouet, in her cottage next to Hauteville House, remained faithful to the veteran egoist. The establishment of the Republic released Victor Hugo from exile. He returned in triumph to Paris in Sept. 1870.

Last Years (1870-1885).—His re-entry into the political life of his country was not of long duration. He was elected to the National Assembly but resigned on being unable to obtain a hearing. During the Commune he moved to Brussels where his offer to house the communist exiles led to a riot and his expulsion by the Belgian Government. On his return to Paris he was elected to the Senate, but took no part in the debates. It was easier and safer for him to remain in his house in the Avenue d'Eylau and to watch while one by one the beacons of his apotheosis were lit around him. His fame was universal: his faculties undimmed by age. In his 80th year he published those still fresh and lovely verses of the *Quatre Vents de l'Esprit*: he attended the triumphant jubilee of *Hernani*; and on his 80th birthday he was acclaimed by six hundred thousand of his fellow citizens. Juliette Drouet, faithful to the end, died in 1883; and on May 31, 1885 Victor Hugo himself was buried in the Panthéon. His body, in accordance with his last behest, had been placed in a pauper's coffin; for a night it lay in state under the Arc de Triomphe; the pomp and drama of his funeral was symbolic of his strangely histrionic mind.

The output of his last years was, in quantity if not in quality, amazing. It can be catalogued as follows:—*Actes et Paroles* (1872); *L'Année Terrible* (1872); *Quatre-vingt-treize* (1874); *Légende des Siècles* (second series 1877); *L'Art d'être grand-père* (1877); *L'Histoire d'un crime* (1877); *Discours pour Voltaire* (1878); *Le Pape* (1878); *La Pitié suprême* (1879); *L'Ane* (1880); *Religions et Religion* (1880); *Les Quatre Vents de l'Esprit* (1881); *Torquemada* (1882); *Légende des Siècles* (3rd series 1883). Of the many posthumous works published by his friends Paul Meurice and Auguste Vacquerie the most interesting is the volume of autobiographical notes entitled *Choses vues*, and the collection of poetry published under the name of *Toute la Lyre*. The other posthumous collections served only to harm the poet's reputation.

The idolatry with which Victor Hugo was acclaimed by his worshippers has produced an inevitable reaction. Under the influence of this reaction his bad qualities—his vulgarity, his bombast, the tenuity of his thought and feeling, his sheer blatant egoism—have obscured his remarkable gifts. It is possible perhaps to make a juster estimate. From the historical point of view Victor Hugo is unquestionably one of the greatest figures in French literature. His influence was not only very deep but also extremely wide: it is possible to find in Hugo's work the germ of practically

every subsequent movement, whether Parnassian, Symbolist or Decadent; such diverse figures as Baudelaire, Verlaine and even Rimbaud owe him heavy debts; he was without doubt the greatest literary influence in 19th century France. It is true that this influence bore almost wholly on technique, but technique in French poetry is of primary importance. Victor Hugo was not quite the revolutionary ("le démagogue horrible et débordé") that he pretended: but he *did* re-introduce the lovely metres and cadences of the 16th century, he *did* break the tyranny of Boileau, and he *did* render the French ear sensitive to the delicate vowel changes and balances in which their language is so rich. Thus although his drama is dead, and his novels can scarcely be compared with those of Balzac, Sand or even Dumas, yet the great mass of his verse, whether lyric, satiric or narrative, will always retain, not only its beauty but its strength. Most of Hugo's boasts about himself, about that "ego Hugo" who was the centre of all his thoughts, are not only insufferable, but inaccurate: he was right, however, and absolutely right, when he described himself as placed "au centre de tout comme un écho sonore." His receptive faculty was unlimited: his interpretive faculty was of a high standard: it was his selective faculty which was at fault. The fact that he could, with dangerous facility, cast into beautiful and convincing form what the average person of 1840-80 felt inarticulately, accounts not only for his unequalled popularity, but for his own unfortunate conviction that he was the prophet of his country and his age.

"Moi," he exclaims in a characteristic passage:—

"Moi, qui me crus apôtre . . .

"La France, dans sa nuit profonde

"Verra ma torche flamber."

Interpretation and melody, however, are not enough. Victor Hugo possessed a trivial character and an uninteresting mind. A high quality of either mind or character are not perhaps essential to the finest poetry, but the absence of both must always reduce a poet to the second category. Hugo was a master of language: he was a great literary figure: he might perhaps have been a great mystic had he been less worldly: but as it is, when asked who was the greatest French poet of the 19th century we must reply, in the words of a recent French cynic, "Unfortunately, Victor Hugo." (H. Nr.)

Duclaux, *Victor Hugo* (1921; an excellent and truthful book); Mary Robinson, *Victor Hugo* (1925).

HUGO, a city of south-eastern Oklahoma, U.S.A., 8 m. from the Red river, on Federal highway 70 and two lines of the Frisco railway; the county seat of Choctaw county. The population in 1920 was 6,368 (86% native white). It is the shipping and trading centre for a fruit-growing, farming and lumbering region; and it has railroad shops, planing mills, creosote works, cotton gins and compresses, cottonseed-oil mills and grain elevators.

HUGUENOTS, the name given from about the middle of the 16th century to the Protestants of France. According to Henri Étienne (*Apologie d'Herodote*, 1566), the word is a nickname. The Protestants at Tours, he says, used to assemble by night near the gate of King Hugo, whom the people regarded as a spirit. A monk, therefore, in a sermon declared that the Lutherans ought to be called *Huguénots*, as kinsmen of King Hugo, inasmuch as they would only go out at night as he did. This name became popular from 1560 onwards.

The French reform movement has often been regarded as an offshoot of Lutheranism, and up to the middle of the century its adherents were known as Lutherans. But it should not be forgotten that so early as 1512 Jacobus Faber (q.v.) of Étaples published his *Santi Pauli Epistolae xiv . . . cum commentariis*, which enunciates the cardinal doctrine of reform, justification by faith, and that in 1523 appeared his French translation of the New

Testament. As early as 1525 Jacques Pavannes, the hermit of Livry, and shortly afterwards Louis de Berquin, the first martyrs, were burned at the stake. But no persecution could stop the Reform movement, and on the walls of Paris and even at Amboise, on the very door of Francis I.'s bedroom, there were found placards condemning the mass (1534). On Jan. 29, 1535, an edict was published ordering the extermination of the heretics and resulting in a general emigration. Three years later the first French Protestant church, composed of 1,500 refugees, was founded at Strasbourg.

Of all these exiles the most famous was John Calvin (*q.v.*), the future leader of the movement, who fled to Basle, where he is said to have written the famous *Institutio christianae religionis*, preceded by a letter to Francis I. in which he pleaded the cause of the reformers. The first Protestant community in France was that of Meaux (1546) organized on the lines of the church at Strasbourg of which Calvin was pastor. The Catholic Florimond de Raemond paid it the beautiful tribute of saying that it seemed as though "la chrétienté fut revenue en elle à sa primitive innocence."

Persecution, however, became more rigorous. The Vaudois of Cabrières and Mérindol had been massacred in 1545 by the orders of Jean de Maynier, Baron d'Oppède, lieutenant-general of Provence; and at Paris was created a special court in the parlement for the suppression of heretics, a court which became famous in history as the *Chambre ardente* (1549). The church at Paris was founded in 1556, and in spite of persecution the reformers increased in numbers. In 1558 at Poitiers it was decided that all the Protestant churches in France should formulate by common accord a confession of faith and an ecclesiastical discipline. The church at Paris was commissioned to summon the first synod, which, in spite of the danger, was convened on May 25, 1559. The Synod of Paris derived its inspiration from the constitution introduced by Calvin at Geneva, which has since become the model for all the Presbyterian churches. Ecclesiastical authority resides ultimately in the people, for the faithful select the elders who are charged with the general supervision of the church and the choice of pastors. The churches are independent units, and there can be no question of superiority among them; at the same time they have common interests and their unity must be maintained by an authority which is capable of protecting them. The association of several neighbouring churches forms a local council (*colloque*). Over these stands the provincial synod, on which each church is equally represented by lay delegates and pastors. Supreme authority resides in the national synod, composed of representatives, lay and ecclesiastic, elected by the provincial synods. The democratic character of this constitution of elders and synods is particularly remarkable in view of the early date at which it began to flourish.

The synod of 1559 was the beginning of a remarkable increase in the Reform movement; at that synod 15 churches were represented; two years later, in 1561, the number was 2,150—an increase which carried the struggle into the arena of national politics.

The conspiracy of Amboise, formed with the object of kidnapping the king (March 1560) resulted in the death of the plotters and was followed by the proclamation of the Edict of Romorantin, which laid an interdict upon the Protestant religion. But the reformers had become so powerful that Coligny, who was to become their most famous leader, protested in their name against this violation of liberty of conscience. For a moment, at the colloquy of Poissy (Oct. 1561), at which Roman Catholic and Protestant divines were assembled together, it seemed as though a *modus vivendi* would be established. The attempt failed, but by the edict of Jan. 1562 religious liberty was assured to the Huguenots. This, however, was merely the prelude to civil war, the signal for which was given by the Guises, who slaughtered a number of Huguenots assembled for worship in a barn at Vassy (March 1, 1562); and the duke of Guise, entering Paris in triumph, transferred the court to Fontainebleau by a daring *coup d'état* in defiance of Catherine de' Medici, the queen regent. It was then that Condé declared there was no hope but in God and his arms, and, with the Huguenot leaders, signed at Orleans (April 11, 1562) the mani-

festos in which, having declared their loyalty to the Crown, they stated that as good and loyal subjects they were driven to take up arms for liberty of conscience on behalf of the persecuted saints. Until the end of the century the history of France is that of the struggle between the Huguenots upholding "The Cause" (*La Cause*) and the Roman Catholics fighting for the Holy League (*La Sainte Ligue*). The leading events only are related here (*see also* FRANCE: *History*). The war lasted, with intermissions in 1563 and 1568, until 1569, when, after the defeat of the Huguenots at Jarnac, Condé was assassinated. But Jeanne d'Albret renewed the courage of the vanquished by presenting to them her son, Henri de Bourbon, the future Henry IV.; and Coligny, whose heroic courage rose with adversity, collected the remnants of the Protestant army and by a march as able as it was audacious, moved on Paris. The Peace of St. Germain followed, on Aug. 8, 1570.

For a moment it seemed reasonable to hope that the war was over. Coligny had said that he would prefer to be dragged through the streets of Paris than to recommence the fighting: Henri de Bourbon was to marry Marguerite of France. Peace seemed to be assured when on the night of Aug. 24, 1572, after a council at which Catherine de' Medici, Charles IX., the duke of Anjou, and other leaders of the league assisted, there occurred the Massacre of St. Bartholomew (*q.v.*), in which Coligny and all the leading Huguenots were slain. The Paris massacre was repeated throughout France, and the Protestants were slain in thousands. The survivors resolved upon a desperate resistance. A Huguenot political party was formed at Milhau in 1573, definitely constituted at La Rochelle in 1588, and lasted until the peace of Alais in 1629. The delegates selected by the churches bound themselves to offer a united opposition to the violence of the enemies of God, the king and the state. It is a mistake to suppose that they desired to overthrow the monarchy. But it is true that among themselves they formed a kind of republic which, according to the historian J. A. de Thou, had its own laws dealing with civil government, justice, war, commerce, finance. They had a president called the protector of the churches, an office held first by Condé and afterwards by the King of Navarre up to the day on which he became king of France as Henry IV. (1589). The fourth religious war, which had broken out immediately after the Massacre of St. Bartholomew, was brought to an end by the pacification of Boulogne (July 16, 1573), which granted a general amnesty. The recollections of the horrors of St. Bartholomew's night had hastened the death of Charles IX., the last of the Valois. Under Henry III. the most debauched and effeminate of monarchs, the war broke out anew. It lasted, with one brief intermission in 1576, until March 22, 1594, when Henry of Navarre entered Paris as Henry IV., successor of Henry III., who had been assassinated by a monk in 1589. The league was utterly defeated. Thus the Huguenots after forty years of strife obtained by their constancy the promulgation of the Edict of Nantes (April 13, 1598), the charter of religious and political freedom. (*See* NANTES, *EDICT OF*.)

Twelve years afterwards, on May 14, 1610, Henry was assassinated by Ravallac, leaving his great work incomplete. During the minority of Louis XIII. power resided in the hands of counselors who favoured the Catholic party. The Huguenots once more took up arms under the leadership of Henri de Rohan (*q.v.*). Richelieu had entered the king's council on May 4, 1624; the destruction of the Huguenots was his policy, and he pursued it to a triumphant conclusion. On Oct. 28, 1628, La Rochelle, the last stronghold of the Huguenots, was obliged to surrender, after a siege rendered famous for all time by the heroism of its defenders and of its mayor. The peace of Alais, which was signed on June 28, 1629, marks the end of the civil wars.

Louis XIV.—The Huguenots had ceased to exist as a political party and, assured that liberty of conscience would be granted them, showed themselves loyal subjects. On the death of Louis XIII., the declaration of July 8, 1643, had guaranteed to the Protestants "free and unrestricted exercise of their religion," thus confirming the Edict of Nantes. The Roman Catholic clergy, however, had never accepted the Edict of Nantes, and all their efforts

were directed to obtaining its revocation. As long as Mazarin was alive the complaints of the clergy were in vain, but when Louis XIV. attained his majority there commenced a legal persecution which was bound in time to bring about the ruin of the reformed churches. The Edict of Nantes, which was part of the law of the land, might seem to defy all attacks, but the clergy found means to evade the law by demanding that it should be observed with literal accuracy, disregarding the changes which had been produced in France during more than half a century. The clergy in 1661 successfully demanded that commissioners should be sent to the provinces to report infractions of the edict, and thus began a judicial war which was to last for more than 20 years. All the churches which had been built since the Edict of Nantes were condemned to be demolished. All the privileges which were not explicitly stated in the actual text of the edict were suppressed. More than 400 proclamations, edicts, or declarations attacking the Huguenots in their households and their civil freedom, their property and their liberty of conscience, were promulgated during the years which preceded the revocation of the Edict of Nantes. In spite of all sufferings which this rigorous legislation inflicted upon them they did not cease to resist, and in order to compel them to accept the "king's religion," the *dragonnades* (1683-86) were organized, which effected the forcible conversion of thousands of Protestants who gave way under the tortures which were inflicted upon them. It was then that Louis XIV. declared that "the best of the larger part of our subjects, who formerly held the so-called reformed religion, have embraced the Catholic religion, and therefore the Edict of Nantes has become unnecessary." On Oct. 18, 1685, he pronounced its revocation. Thus under the influence of the clergy was committed one of the most flagrant political and religious blunders in the history of France, which in the course of a few years lost more than 400,000 of its inhabitants. Many emigrated to England or Prussia and became very useful citizens of their adopted countries.

Persecution had succeeded in silencing, but it could not convert the people. Despair armed the Cévennes, and in 1702 the war of the Camisards broke out, only to end in the defeat of the insurgents (see CAMISARDS and CAVALIER, JEAN). The Huguenots seemed to be finally conquered. On March 8, 1715, Louis XIV. announced that he had put an end to all exercise of the Protestant religion; but in this very year, on Aug. 21, while the king was dying at Versailles, there assembled together at Monoblet, in Languedoc, under the presidency of Antoine Court, the "Restorer of Protestantism," then only 20 years of age, a conference devoted to the re-establishment of the church. This was the first "synod of the Desert." (See COURT, ANTOINE.)

Year by year the churches became more numerous. In 1756 there were already 40 pastors; several years later, in 1763, the date of the last "synod of the Desert," their number had increased to 65. As the 18th century advanced public opinion began to revolt from the persecution of the Huguenots. The torture of Jean Calas, who was condemned on a false charge of having killed his son because he desired to become a Catholic, caused general indignation, of which Voltaire became the eloquent mouthpiece, and the edict of Nov. 1787, in spite of the fierce opposition of the clergy, renewed the civil rights of the Huguenots by recognizing the validity of their marriages. Two years later the Declaration of the Rights of Man affirmed the liberty of religion. By the law of the 18th of Germinal, year X., the legal standing of the Protestant church was recognized, but it was denied the character of free church, which it had hitherto claimed.

The Protestants, on the day on which liberty of conscience was restored, could measure the full extent of the misery which they had endured. Of this people, which in the 16th century formed more than one-tenth of the population of France, there survived only a few hundred thousand. In 1626 there were 809 pastors in the service of 751 churches; in 1802 there were only 121 pastors and 171 churches; in Paris there was only a single church with a single pastor. The church had no faculty of theology, no schools, no Bible societies, no asylums, no orphanages, no religious literature. Everything had to be created afresh, and this work was pursued during the 19th century with energy and faith.

LATER HISTORY

At the fall of the Empire (1815) the reaction of the White Terror once more exposed the Protestants to outrage, and again a number fled from persecution and sought safety in foreign countries. Peace having been established, attention was then focused on religious questions, and the period was marked in Protestantism by a remarkable awakening. On all sides churches were built and schools opened. During that period were founded the great religious societies:—Société biblique (1819), Société de l'instruction primaire (1829), Société des traités (1821), Société des missions (1822). On the other hand, the old union of the reformed churches had ceased to exist since the revolution of July. Ecclesiastical strife broke out and never entirely ceased. A schism occurred first in 1848, owing to the refusal of the synod to draw up a profession of faith. The comte de Gasparin and the pastor, Frédéric Monod, seceded and founded the Union des Églises Évangéliques de France, separated from the State, of which E. de Pressensé was to become the most famous pastor. Under the Second Empire (1852-70) the divisions between the orthodox and the liberal thinkers were accentuated and resulted in a separation, which followed on the reassembly of the national synod, authorized in 1872 by the government of the Third Republic. The old Huguenot Church was thus separated into two parts, having no other link than that of the Concordat of 1802, and each possessing its own peculiar organization.

The law of Dec. 9, 1905, which separated the Church from the State, was accepted by the great majority of Protestants as a legitimate consequence of the reform principles, and its application caused no difficulty with the State. In 1907 the National Union of the Reformed Churches of France, consisting of ten regional unions, was founded in Paris; these unions are combined with others in the Protestant Federation of France, which convenes a General Assembly of all affiliated churches every five years. The restoration of Alsace and Lorraine to France involved the inclusion of the Lutheran and Reformed Churches of those provinces in the main body of French Protestants, increasing the membership to nearly one million. These churches are established and supported by the French state, in accordance with the régime existing before the Franco-German War of 1870-71.

HUGUES, CLOVIS (1851–1907), French poet and socialist, was born at Menerbes in Vaucluse. For a revolutionary article in *Fraternité* he was condemned in 1871 to three years' imprisonment and a fine of 6,000 francs. From 1875 onwards he edited *La Jeune République*. In 1877 he fought a duel in which he killed his adversary, a rival journalist. Elected deputy by Marseilles in the general elections of 1881, he was at that time the sole representative of the Socialist Party in the chambers. He was re-elected in 1885, and in 1893 became one of the deputies for Paris, retaining his seat until 1906. He died on June 11, 1907. His principal works are: *Poèmes de prison* (1875), written during his detention; *Soirs de bataille* (1883), *Jours de combat* (1883), and *Le Travail* (1889); the novels, *Madame Phaéton* (1885) and *Monsieur le gendarme* (1891); and the dramas, *Une étoile* (1888) and *Le sommeil de Danton* (1888).

HUICHOL. This tribe in the mountains of northern Jalisco is one of the few in Mexico that has preserved not only its speech and race but its native religions and culture relatively uncontaminated by conquest and contact. They practise the *peyote* cult; their decorative and ritual symbolism is rich. They are, with the neighbouring Cora, members of the so-called Piman or Sonoran division of the Uto-Aztecan family. They number somewhat over, and the Cora somewhat under, 3,000.

See C. Lumholtz, *Unknown Mexico* (1902); *Symbolism of the Huichol Indians* (1900).

HUILA: see ANGOLA.

HUITZILOPOCHTLI (wē-tsē-lō-pocht'lē), the supreme being in the religions of ancient Mexico, and also the god of war. He was the mythic leader and chief divinity of the Aztecs, dominant tribe of the Nahua nation. As a humming-bird Huitzilopochtli was alleged to have led the Aztecs to a new home. His idol was a huge block of basalt (still thought to be preserved in Mexico), on one side of which he is sculptured in hideous form, adorned with the feathers of the humming-bird. The ceremonies of his worship were of the most bloodthirsty character, and hundreds of human beings were sacrificed annually before his shrine, their limbs being eaten by his worshippers. When his temple was dedicated in 1486 it is traditionally reported that 70,000 people were killed. (See MEXICO.)

HULDA, in Teutonic mythology, goddess of marriage, a beneficent deity, patroness and guardian of maidens (see BERCHTA).

HULKE, JOHN WHITAKER (1830–1895), British surgeon and geologist, was born on Nov. 6, 1830. He was educated at the Moravian College at Newwied, at King's College school, and at the hospital, becoming M.R.C.S. in 1852. In the Crimean War he was appointed (1855) assistant-surgeon at Smyrna and subsequently at Sebastopol. On returning home he was successively medical tutor at his old hospital, assistant-surgeon to the Royal Ophthalmic Hospital, Moorfields (1857–68), and surgeon (1868–90), and after 1870 surgeon at Middlesex hospital. His skill as an operator was widely known, but he made his special mark as an ophthalmologist. He was elected F.R.S. in 1867 for his researches on the anatomy and physiology of the retina in man and the lower animals, particu-

larly the reptiles. He subsequently devoted his spare time to geology and especially to the fossil reptilia, describing many remains of Dinosaurs. He died in London on Feb. 19, 1895.

HULL, ISAAC (1773–1843), commodore in the U.S. Navy, was born at Derby (Conn.), on March 9, 1773. When only 14 he went to sea as a cabin boy. At 19 he commanded his first ship, and in 1798 received a commission in the U.S. navy as lieutenant. He served two years on the "Constitution," the ship which he later commanded, chased Barbary pirates as commander of the "Argus," and when the War of 1812 broke out he had already commanded the "Constitution" for six years, carrying the U.S. minister to France in 1811, and specie to Holland in payment of interest on a debt due from the United States. His ship was shadowed by British men-of-war. On July 19, 1812, five days out, the "Constitution" met a British blockading squadron. There followed one of the most remarkable sea chases ever recorded. For three days and nights Hull kept his ship ahead, using every device known to seamanship, outwitting his pursuers by brilliant manoeuvres, towing, and kedging. The British gave up the pursuit. On Aug. 2 he set sail without orders and encountered the British frigate "Guerrière," which he captured. For this Hull received a gold medal, and the "Constitution" the nickname of "Old Ironsides." Resigning his command, Hull became a member of the navy board; later he commanded the navy yards at Boston and Washington, and squadrons in the Mediterranean and the Pacific. After 37 years of active service he retired and made his home in Philadelphia (Pa.), where he died Feb. 13, 1843.

See A. T. Mahan, *Sea Power in its Relations to the War of 1812* (1905); and T. R. Roosevelt, *The Naval War of 1812* (1882).

HULL, a city (1875) and railway junction of the province of Quebec, Canada, and the capital of Wright county, opposite the city of Ottawa. Pop. (1921) 24,117. The magnificent water-power of the Chaudière Falls of the Ottawa is utilized for the lighting of the city, the operation of a system of electric railways connecting Hull with Ottawa and Aylmer, and a number of large saw-mills, pulp, paper and match manufactories. Three bridges unite Ottawa and Hull. Champlain was the first white man to set foot on the site of Hull, but long before he came it was a favourite meeting-place for the Indians. Philemon Wright, of Woburn, Massachusetts, was the first man to settle here in 1800. The report he sent back was so favourable that a number of other families followed from the same place and laid the foundations of the future city.

HULL (officially KINGSTON-UPON-HULL), a city and county of a city, municipal, county and parliamentary borough and seaport in the East Riding of Yorkshire, England, at the junction of the river Hull with the Humber, 22 m. from the open sea, and 181 m. N. of London by the L.N.E. railway. Pop. (1921) 287,150. The city area is 9,042 acres. The town stands on a level plain so low as to render embankments necessary to prevent inundations. The older portion is completely enclosed by the Hull on the east, the Humber on the south, and by docks on the north and west. Here are a few old houses and also narrow streets typical of the mediaeval mercantile town, though modern improvements have destroyed some of them.

The first mention of Hull occurs under the name of Wyke-upon-Hull in a charter of 1160, by which Maud, daughter of Hugh Camin, granted it to the monks of Meaux, who in 1278 received licence to hold a market here every Thursday, and a fair on the eve, day and morrow of Holy Trinity and 12 following days. Shortly afterwards, Edward I., seeing its value as a port, obtained the town from the monks in exchange for other lands in Lincolnshire, and changed its name to Kingston-upon-Hull. To induce people to settle here, he gave the town a charter in 1299. This made the town a free borough, and provided that the king would send his justices to deliver the prison when necessary; and it granted two weekly markets on Tuesday and Friday, and a fair on the eve of St. Augustine, lasting 30 days. Commissioners were sent by the king in 1303 to enquire how and where the roads to the new town could best be made, and in 1321, Edward II. granted a licence to enclose the town with a ditch and "a wall of stone and lime."

While inspecting former charters, Edward III., in 1381,

BY COURTESY OF THE AMERICAN INDIAN MUSEUM FOUNDATION

HUITZILOPOCHTLI, AZTEC GOD OF WAR. FROM A TIZOC STONE IN THE NATIONAL MUSEUM AT MEXICO CITY

granted the burgesses the right to hold the borough with fairs, markets and free customs at a fee-farm of £70, and power to choose a mayor and four bailiffs each year. So that they might obtain a supply of fresh water, Hessle, North Ferriby and other places were granted to the burgesses of Hull in 1440, and the county of the town of Kingston-upon-Hull was created, and included these places. In 1541 the town was visited by Henry VIII., who ordered a castle and other places of defence to be built. Edward VI. granted the manor to the burgesses in 1552, but the town was not incorporated until 1576. A new charter was granted by James II. in 1688. During the Civil Wars, although the majority of the inhabitants were Royalists, Hull was garrisoned by the Parliamentarians, and Charles I. was refused admission by the governor, Sir John Hotham. In 1643 it was besieged for six weeks, and the new governor, Ferdinando Fairfax, 2nd Baron Fairfax, obliged the Royalist army to retreat by opening the sluices and flooding the surrounding country.

Holy Trinity church is one of the largest English parish churches, with the transepts and choir in Decorated style. The choir is largely of brick, and thus affords an unusually early example of the use of this material in English ecclesiastical architecture. The nave is a fine example of Perpendicular style. The church of St. Mary, Lowgate, was founded in the 14th century, but is almost wholly a reconstruction. A Friends' meeting-house was built in 1919, a synagogue in 1914 and a large Wesleyan Methodist hall in 1910. The principal public buildings are the town hall in Lowgate, and the Royal Institution, containing a library and museum, and accommodating the Literary and Philosophical Society. The Grammar school was founded in 1486. One of its masters was Joseph Milner (1744-97), author of a history of the church, and among its students were Andrew Marvell, the poet (1621-78) and William Wilberforce (1759-1833). The latter is commemorated by a column and statue near the dock offices, and by the preservation of the house of his birth in High street. This house belongs to the corporation, and was opened in 1906 as the Wilberforce and Historical museum. The city hall and municipal art galleries were opened in 1910, and the Guildhall enlarged in 1915.

With its Grammar school, the Hull and East Riding college, Hymer's college, the Trinity House Marine school (established in 1716), the Humber Industrial school ship, "Southampton," and technical and art schools, Hull is the educational centre for the whole of East Riding. The need for a centre for higher education was recognized by the Rt. Hon. T. R. Ferens, in 1925, when he gave £250,000 towards the establishment of a university college. He had previously given land on the Cottingham road, on the outskirts of the city, as a site for a new technical college, but this has been used for the new University college buildings which were opened in 1928. Charities and benevolent foundations are numerous. Trinity House, a charity for seamen of the merchant service, was founded by the Trinity House Guild (instituted in 1369) and the present building was erected in 1753. It contains a noteworthy collection of paintings and a museum, much of which was destroyed by fire in 1924. The Charterhouse belongs to a foundation for the support of the old and feeble, established in 1384 by Sir Michael de la Pole, afterwards earl of Suffolk. The infirmary was founded in 1782. In 1912 a home for incurables was built and in 1914 a new poor law hospital.

The original harbour occupied that part of the river Hull which faced the old town, but in 1774 an Act was passed for forming a dock on the site of the old fortifications on the right bank of the Hull. This afterwards became known as Queen's dock, and with Prince's and Humber docks, it completes the circle round the old town. The small railway dock opens from Humber dock. East of the Hull lie the Victoria dock and extensive timber ponds, and west of the Humber dock basin and parallel to the Humber, lies Albert dock. Others are the Alexandra, St. Andrew's and fish docks. The port was enlarged in 1914 by the opening of the King George's dock, with a large grain silo and fine equipment, covering an area of 53 ac., and with provision for future extension to 85 acres. The docks are owned by the L.N.E. railway and cover a water area of 236 ac., with 10 m. of quays. The ports of Hull and Goole have been administratively combined

since 1888 under the Humber Conservancy Board. Hull has become one of the largest ports of Great Britain, having shipping commerce with all parts of the world. It is one of the principal ports for the manufactures of Lancashire and Yorkshire, and has direct communication by canal and rail with the coalfields of the West Riding. Large quantities of grain are imported from Russia and America, and timber is imported from Norway and Sweden. Iron, fish, butter and fruit are other important imports.

Hull was an early seat of the whale "fisheries," and sea fishing is still extensively prosecuted. There are some 300 steam trawlers in the fishing fleet, which did valuable service during the World War. The extensive and varied traffic of Hull was much affected by the war, as the city was in the area of the North sea operations, but the volume of trade had almost recovered in 1928. The numerous industries include iron-founding, shipbuilding and engineering, and the manufacture of chemicals, vegetable oil, colours, cement, paper, starch, soap and cotton goods; there are also tanneries and breweries. Passenger steamship services run from Hull to the principal Norwegian and Swedish ports. A ferry serves New Holland on the Lincolnshire shore.

Hull was represented in the parliament of 1295, and has sent members ever since, save that in 1384 the burgesses were exempted from returning any member on account of the expenses which they were incurring through fortifying their town. The parliamentary borough returned two members in 1885, three in 1913, and now the borough is divided into four divisions—east, central, north-west and south-west, each of which returns one member. Hull became the seat of a suffragan bishop in the diocese of York in 1891. This was a revival, as the office was in existence from 1534 till the death of Edward VI. The county borough was created in 1888.

HULLAH, JOHN PYKE (1812-1884), English composer and teacher of music, was born at Worcester on June 27. He was a pupil of William Horsley from 1829, and entered the Royal Academy of Music in 1833. He wrote an opera to words by Dickens, *The Village Coquettes*, produced in 1836; *The Barbers of Bassora* in 1837, and *The Outpost* in 1838, the last two at Covent Garden. From 1839, when he went to Paris to investigate various systems of class-teaching in music, he identified himself with Wilhem's system of the "fixed Do," and his adaptation of that system was taught with enormous success from 1840 to 1860. His highly popular compositions consisted mainly of ballads; but his greatest service to the art was the hard work he did to improve musical education, to secure the performance of good music and maintain high artistic standards. Among his writings may be mentioned his admirable report for the Council of Education on musical education abroad (1878) and his *Grammar of Vocal Music* (1843); and among his other publications, the two great collections of choral music which he made and edited.—*Part Music and Vocal Scores*.

HULL HOUSE: see SOCIAL SETTLEMENTS.

HULME, WILLIAM (1631-1691), English philanthropist, was born near Manchester, and died on Oct. 29, 1691. He founded the Hulme Trust in memory of his son, to maintain "four exhibitioners of the poorest sort of bachelors for the space of four years," at Brasenose college, Oxford. The value of the property greatly increased, and the income from it now maintains the Hulme Grammar school in Manchester, supports a residential college, Hulme Hall, attached to the university of Manchester, and provides a number of scholarships at Brasenose college.

See J. Croston, *Hulme's Charity* (1877).

HÜLS, a town of Germany, in the Prussian Rhine province, 4 m. N. of Crefeld and 17 m. N.W. of Düsseldorf by rail. Pop. (1925) 6,786. It has manufactures of machinery, leather and silk.

HULSE, JOHN (1708-1790), English divine, was born at Middlewich, Cheshire. He succeeded to estates in Cheshire which he in turn bequeathed to Cambridge University mainly for the establishment of a Hulsean lectureship.

HUMACAO, a prosperous and important town in the eastern part of Porto Rico. The population in 1920 was 6,183, and in 1928, 6,885. The population of the municipal district was 20,229

in 1920. The town is beautifully situated in a valley, surrounded on three sides by mountains, with the ocean six miles to the east, from which the ocean breezes make climatic conditions nearly perfect. The lowlands of the district are very fertile and are principally devoted to growing sugar-cane and tobacco, while on the mountain slopes coffee is produced. The town is connected with the other parts of the island by excellent highways, with superior motor bus service. Good schools are provided, and the town has water service, electric lights, hospitals and a library.

HUMANE SOCIETY, ROYAL. This society was founded in England in 1774 for the purpose of rendering "first aid" in cases of drowning and for restoring life by artificial means to those apparently drowned. The society, the chief offices of which are at 4, Trafalgar square, London, has 300 depôts throughout the kingdom, supplied with life-saving apparatus. The chief and earliest of these depôts is the Receiving House in Hyde Park, on the north bank of the Serpentine, which was built in 1794 on a site granted by George III. Boats and boatmen are kept to render aid to bathers, and in the winter ice-men are sent round to the different skating grounds in and around London. The society distributes money-rewards, medals, clasps and testimonials to those who save or attempt to save drowning people. It further recognizes "all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blasting furnaces, or in sewers where foul gas may endanger life." It further awards prizes for swimming to public schools and training ships. Since 1873 the Stanhope gold medal has been awarded "to the case exhibiting the greatest gallantry during the year." During the year 1927, 506 persons were rewarded for saving or attempting to save 524 lives from drowning. The society is maintained by private subscriptions and bequests. (See also DROWNING AND LIFE-SAVING.)

HUMANISM, in general any system of thought or action which assigns a predominant interest to the affairs of men as compared with the supernatural or the abstract (from Lat. *humanus*, human, connected with *homo*, mankind). The term is specially applied to that movement of thought which in western Europe in the 15th century broke through the mediaeval traditions of scholastic theology and philosophy, and devoted itself to the rediscovery and direct study of the ancient classics. This movement was essentially a revolt against intellectual, and especially ecclesiastical authority, and is the parent of all modern developments whether intellectual, scientific or social (see RENAISSANCE).

The name has also been applied in recent years to a form of Pragmatism (*q.v.*) which is usually known on the European continent as Hominism (*q.v.*).

HUMANITARIANS, in the theological sense, is a term applied chiefly to a school of theologians who repudiated the doctrine of the Trinity and held an extreme view of the person of Christ as simply human although miraculously endowed. The adoption of this position by men like Nathaniel Lardner, Joseph Priestley and Theophilus Lindsey in the middle of the 18th century led to the establishment of the first definitely organized Unitarian churches in England (see UNITARIANISM).

HUMAYUN (1508-1556), Mogul emperor of Delhi, succeeded his father Baber in India in 1530, while his brother Kamran obtained the sovereignty of Kabul and Lahore. Humayun was thus left in possession of his father's recent conquests, which were in dispute with the Indian Afghans under Sher Shah, governor of Bengal. After ten years of fighting, Humayun was driven out of India and compelled to flee to Persia through the desert of Sind, where his famous son, Akbar the Great, was born in the petty fort of Umarkot (1542). Sher Shah was killed at the storming of Kalinjar (1545), and Humayun, returning to India with Akbar, then only 13 years of age, defeated the Indo-Afghan army and reoccupied Delhi (1555). India thus passed again from the Afghans to the Moguls, but six months afterwards Humayun was killed by a fall from the parapet of his palace (1556), and left his kingdom to Akbar. The tomb of Humayun is one of the finest Mogul monuments in the neighbourhood of Delhi, and it was here that the last of the Moguls, Bahadur Shah, was captured by Major Hodson in 1857.

HUMBER, an estuary on the east coast of England, formed by the rivers Trent and Ouse, the northern shore belonging to Yorkshire and the southern to Lincolnshire. These rivers join near Faxfleet and flow east for 18 m., then south-east for 19 m. to the North sea. The width of the estuary is 1 m. at the head, widening to 3½ m. at 8 m. above the mouth, where it increases to 8 m. in width. On the north side at the mouth is a large shallow bay enclosed by Spurn Head (*q.v.*). Except where the Humber cuts through a low chalk ridge, between north and south Ferriby, the shores and adjacent lands are nearly flat. The water is muddy; and the course for shipping has to wind about to avoid numerous shoals. The course is carefully buoyed and lighted, for the Humber is an important highway of commerce, having on the Yorkshire bank the great port of Hull, and on the Lincolnshire bank those of Immingham and Grimsby, while Goole, to which there is a channel 22 ft. deep at spring tides, lies on the Ouse a little above the junction with the Trent. Canals connect with south Yorkshire, the Trent and the Midlands. A tidal bore is sometimes seen on the Humber. On the Yorkshire side the action of the river towards the mouth alters the shore-line constantly. Many villages have disappeared, notably Ravenspur, which was once a port and the scene of the landing of Bolingbroke (1399).

HUMBERT, RANIERI CARLO EMANUELE GIOVANNI MARIA FERDINANDO EUGENIO (1844-1900), King of Italy, son of Victor Emmanuel II. and of Adelaide, archduchess of Austria, was born at Turin, capital of the kingdom of Sardinia, on March 14, 1844. His education was entrusted to Massimo d'Azeglio, Pasquale Stanislao Mancini and others. Entering the army on March 14, 1858 as a captain, he was present at Solferino in 1859, and in 1866 commanded a division at Custozza. Attacked by the Austrian cavalry near Villafranca, he formed his troops into squares and drove the assailants towards Sommacampagna, remaining himself throughout the action in the square most exposed to attack. With Bixio he covered the retreat of the Italian army, receiving the gold medal for valour. On April 21, 1868 he married his cousin, Margherita Teresa Giovanna, princess of Savoy. On Nov. 11, 1869 Margherita gave birth to Victor Emmanuel, prince of Naples, afterwards Victor Emmanuel III. of Italy.

Ascending the throne on the death of his father (Jan. 9, 1878), Humbert adopted the style "Humbert I. of Italy" instead of Humbert IV., and consented to the burial of his father at Rome in the Pantheon, and not in the royal mausoleum of Superga. He began a tour of the kingdom. On entering Naples (Nov. 17, 1878) he was attacked by a fanatic named Passanante. The king ward off the blow with his sabre, but Cairoli, the prime minister, in attempting to defend him, was severely wounded. The would-be assassin was condemned to death, but the king commuted the sentence to penal servitude for life. In 1881 King Humbert, again accompanied by Cairoli, resumed his interrupted tour, and visited Sicily and the southern Italian provinces. In 1882 he took part in the national mourning for Garibaldi, whose tomb at Caprera he repeatedly visited. When, in the autumn of 1882, Verona and Venetia were inundated, he hastened to the spot, directed salvage operations, and provided large sums of money for the destitute. He showed similar devotion at the Ischia earthquake of 1883, and the cholera epidemic at Naples in 1884.

Compared with those of his grandfather, Charles Albert, and of his father, Victor Emmanuel, the reign of Humbert was tranquil. Scrupulously observant of constitutional principles, he followed, as far as practicable, parliamentary indications in his choice of premiers, only one of whom—Rudini—was drawn from the Conservative ranks. He approved the conclusion of the Triple Alliance, and in repeated visits to Vienna and Berlin, established and consolidated the pact. Towards Great Britain his attitude was invariably cordial, and he considered that the Triple Alliance should be supplemented by an Anglo-Italian naval *entente*. His support of the policy of colonial expansion tended to diminish his popularity after the disaster of Adowa on March 1, 1896. His popularity was, however, enhanced by the firmness of his

attitude towards the Vatican, as exemplified in his telegram declaring Rome "intangible" (Sept. 20, 1886), and affirming the permanence of the Italian possession of the Eternal City. Above all King Humbert was a soldier, jealous of the honour and prestige of the army to such a degree that he promoted a duel between his nephew, the count of Turin, and Prince Henry of Orleans (Aug. 15, 1897) on account of the aspersions cast by the latter upon Italian arms. Humbert's claims to popular affection were enhanced by his munificence in the relief of innumerable private wants into which he had made personal inquiry. The regard in which he was universally held was abundantly demonstrated on the occasion of the unsuccessful attempt upon his life made by the anarchist Acciarito near Rome on April 22, 1897, and still more after his assassination at Monza by the anarchist Bresci on July 29, 1900. Good-humoured, active, tender-hearted, somewhat fatalistic, but, above all, generous, he was spontaneously called "Humbert the Good." He was buried in the Pantheon in Rome, by the side of Victor Emmanuel II., on Aug. 9, 1900.

See Stillman, *The Union of Italy, 1815-1895* (1898); Pedrotti, *Vita e regno di Umberto I re d'Italia* (1901).

HUMBERT, GEORGES LOUIS (1862-), French general, was born at Gazeran (Seine et Oise) on April 8, 1862, and entered the military academy of St. Cyr in Oct. 1881. In March 1912 he was made a general of brigade, and in 1913 was sent to Morocco. On the outbreak of the World War he was given command of the 1st Moroccan division, which he held during the battle of the Marne. On Oct. 27, 1914 he was confirmed in the rank of general of division and given command of the XXXII. Army Corps. On July 22, 1915 he took over the III. Army. In Oct. 1919 he was appointed governor of Strasbourg and commandant of the Alsace territory, and in the January following was made a member of the superior war council.

HUMBLE-BEE: see BUMBLE-BEE.

HUMBLE PETITION AND ADVICE, a memorial presented to Oliver Cromwell by the English parliament called in 1656. In its original version the parliament petitioned the Protector to assume the title of king. This Cromwell was unwilling to do: the petition was therefore amended, and after being passed on May 25, 1657, received the Protector's assent. On June 26 an Additional Petition modified the previous document.

The most important clause was that in which the parliament vindicated its right to control its own elections—a privilege flagrantly violated by Cromwell's exclusion of some 100 members from this very parliament:—

That the ancient and undoubted liberties and privileges of Parliament (which are the birthright and inheritance of the people, and wherein every man is interested) be preserved and maintained; and that you will not break nor interrupt the same, nor suffer them to be broken or interrupted; and particularly that those persons who are legally chosen by a free election of the people to serve in Parliament, may not be excluded from sitting in Parliament to do their duties, but by judgement and consent of that House whereof they are members.

By Article 5 the Protector was accorded the right to name the members of the other House; but all future members were to be nominated in accordance with the consent of the House itself—a clause which in effect entrenched the Puritan Party in the other House against all attack. In the disputes which arose over this fundamental difficulty Cromwell dissolved parliament in 1658.

HUMBOLDT, ALEXANDER (FRIEDRICH HEINRICH ALEXANDER) Baron von (1769-1859), German naturalist and traveller, was born at Berlin, on Sept. 14, 1769, son of a major in the Prussian army. His education devolved upon his mother, who was left a widow in 1779. His researches into the vegetation of the mines of Freiberg led to the publication in 1793 of his *Florae Fribergensis Specimen*; and the results of prolonged experiments on the phenomena of muscular irritability, then recently discovered by L. Galvani, were contained in his *Versuche über die gereizte Muskel- und Nervenfasern* (Berlin, 1797), enriched in the French translation with notes by Blumenbach.

In 1794 he was admitted to the intimacy of the famous Weimar coterie, and contributed (June 1795) to Schiller's new periodical,

Die Horen, a philosophical allegory entitled *Die Lebenskraft, oder der rhodische Genius*. In 1790 he visited England with George Forster, the companion of Cook on his second voyage. In 1792 and 1797 he was in Vienna; in 1795 he made a geological and botanical tour through Switzerland and Italy. Meanwhile he had been appointed assessor of mines at Berlin, in 1792. He rapidly rose to the highest post in his department, and was entrusted with important diplomatic missions. After the death of his mother in 1796 he severed his official connections, to fulfil his desire to travel. He left for Marseilles with Aimé Bonpland, the botanist, hoping to join Bonaparte in Egypt, but the two travellers eventually went to Madrid, where the unexpected patronage of the minister d'Urquijo determined them to make Spanish America the scene of their explorations.

They sailed in the "Pizarro" from Corunna, in 1799, stopped six days at Tenerife for the ascent of the Peak, and landed at Cumana. There Humboldt observed, on the night of the 12-13th of November, that meteor-shower which forms the starting-point of our knowledge of the periodicity of the phenomenon; thence he proceeded with Bonpland to Caracas; and in 1800 he left to explore the course of the Orinoco. He covered in four months 1,725 m. of wild and uninhabited country, established the existence of a communication between the water-systems of the Orinoco and Amazon, and the exact position of the bifurcation. On Nov. 24 the two friends set sail for Cuba, and after a stay of some months regained the mainland at Cartagena. Ascending the Magdalena, and crossing the Cordilleras, they reached Quito on Jan. 6, 1802. They made the ascent of Pichincha and Chimborazo, and an expedition to the sources of the Amazon en route for Lima. At Callao Humboldt observed (c. Nov. 9) the transit of Mercury, and studied the fertilizing properties of guano, the introduction of which into Europe was mainly due to his writings. After a year in that province, and a short visit to the United States, they returned (1804) to Europe.

In this expedition Humboldt laid the foundation in their larger bearings of the sciences of physical geography and meteorology. By his delineation (in 1817) of "isothermal lines," he suggested the idea and devised the means of comparing the climatic conditions of various countries. He first investigated the rate of decrease in mean temperature with increase of elevation above the sea-level, and afforded, by his enquiries into the origin of tropical storms, the earliest clue to the detection of the more complicated law governing atmospheric disturbances in higher latitudes; while his essay on the geography of plants was based on the then novel idea of studying the distribution of organic life as affected by varying physical conditions. His discovery of the decrease in intensity of the earth's magnetic force from the poles to the equator was communicated (Dec. 7, 1804) to the Paris Institute. His services to geology were mainly based on his study of the volcanoes of the New World. He showed that they fell naturally into linear groups, presumably corresponding with vast subterranean fissures; and by his demonstration of the igneous origin of rocks previously held to be of aqueous formation, he contributed largely to the elimination of erroneous views.

After a short trip to Italy with Gay-Lussac to investigate the law of magnetic declination, and a sojourn of two years and a half in Berlin, he settled (1808) in Paris for the purpose of securing the scientific co-operation required for the arrangement of the material he had collected on his travels. This colossal task occupied him for 21 years, and even then remained incomplete. With the exception of Napoleon Bonaparte, he was the most famous man in Europe. Academies, both native and foreign, were eager to enroll him among their members. Frederick William III. of Prussia gave him a court sinecure. He refused the appointment of Prussian minister of public instruction in 1810. In 1814 he accompanied the allied sovereigns to London. Three years later he was summoned by the king of Prussia to attend him at the congress of Aix-la-Chapelle. Again in the autumn of 1822 he accompanied the king to the Congress of Verona, proceeded to Rome and Naples, and returned to Paris in the spring of 1823.

In Paris Humboldt found scientific sympathy, and the social stimulus which his mind craved. When at last he received a sum-

mons to join the court at Berlin he obeyed regretfully. He never ceased to rail against the bigotry without religion, aestheticism without culture, and philosophy without common sense, which he found dominant in Berlin. At first he sought relief from the "nebulous atmosphere" of his new abode by frequent visits to Paris; but as years advanced his excursions were reduced to accompanying the monotonous "oscillations" of the court between Potsdam and Berlin. On May 12, 1827, he settled permanently in the Prussian capital, where his first efforts were directed towards the investigation of the nature and law of "magnetic storms"—a term invented by him to designate abnormal disturbances of the earth's magnetism. His appeal to the Russian government in 1829 led to the establishment of a line of magnetic and meteorological stations across northern Asia; while his letter to the duke of Sussex, then (April 1836) president of the Royal Society, secured for the undertaking the wide basis of the British dominions. Thus that scientific conspiracy of nations which is one of the noblest fruits of modern civilization was by his exertions first successfully organized.

In 1811, and again in 1818, projects of Asiatic exploration were proposed to Humboldt, first by the Russian, and afterwards by the Prussian government; but it was not until he had entered upon his 60th year that he resumed his early rôle of a traveller. Between May and Nov. 1829 he with Gustav Rose and C. G. Ehrenberg, traversed the Russian empire from the Neva to the Yenesei, travelling 9,614 m. in 25 weeks. The journey was too rapid to be profitable. Its most important fruits were the correction of the prevalent exaggerated estimate of the height of the Central-Asian plateau, and the discovery of diamonds in the gold-washings of the Ural.

Between 1830 and 1848 Humboldt was frequently sent on diplomatic missions to the court of Louis Philippe, with whom he always maintained cordial personal relations. The death of his brother, Wilhelm von Humboldt (*q.v.*), saddened the later years of his life. After the accession (1840) of Frederick William IV., Humboldt was more and more in demand at court, and was much hindered in his own work.

The first two volumes of the *Kosmos*, the great work of his life, were published, and in the main composed, between 1845 and 1847, the third and fourth between 1850 and 1858; a fifth appeared posthumously in 1862. The idea of a work which should convey, not only a graphic description, but an imaginative conception of the physical world—which should support generalization by details, and dignify details by generalization—had first taken shape in lectures in 1827–28. These formed, as his biographer expresses it, "the cartoon for the great fresco of the *Kosmos*," and cover the whole scientific knowledge of the time. The supreme and abiding value of his work consists in its faithful reflection of the mind of a great man.

In 1857 Humboldt had a slight apoplectic stroke. He died on May 6, 1859, and received a state funeral. Humboldt never married. To his brother's family he was much attached. In his later years the sway of an old and faithful servant held him in more than matrimonial bondage, and four years before his death he executed a deed of gift transferring to this man Seifert the absolute possession of his entire property. Humboldt's early zeal for the improvement of the condition of the miners in Galicia and Franconia, his consistent detestation of slavery, his earnest patronage of rising men of science, bear witness to the large humanity which formed the ground-work of his character. The faults of his old age are shown in his letters to Varnhagen von Ense. The chief of these was his habit of smooth speaking, almost amounting to flattery, which contrasted with the caustic sarcasm of his confidential utterances. After every deduction has been made Humboldt was a great representative of the scientific side of the culture of his country.

The *Voyage aux régions équinoxiales du Nouveau Continent, fait en 1799–1804, par Alexandre de Humboldt et Aimé Bonpland* (Paris, 1807, etc.), consisted of 30 vols., and comprised subordinate but important works. Among these may be enumerated *Vue des Cordillères et monuments des peuples indigènes de l'Amérique* (2 vols. folio, 1810); *Examen critique de l'histoire de la géographie du Nouveau Continent* (1814–34); *Atlas géographique et physique du royaume de la Nouvelle*

Espagne (1811); *Essai politique sur le royaume de la Nouvelle Espagne* (1811); *Essai sur la géographie des plantes* (1805, now very rare); and *Relation historique* (1814–25), an unfinished narrative of his travels, including the *Essai politique sur l'île de Cuba*. The *Nova genera et species plantarum* (7 vols. folio, 1815–25), containing descriptions of above 4,500 species of plants collected by Humboldt and Bonpland, was mainly compiled by C. S. Kunth; J. Oltmanns assisted in preparing the *Recueil d'observations astronomiques* (1808); Cuvier, Latreille, Valenciennes and Gay-Lussac co-operated in the *Recueil d'observations de zoologie et d'anatomie comparée* (1805–33). Humboldt's *Ansichten der Natur* (Stuttgart and Tübingen, 1808) went through three editions in his lifetime, and was translated into nearly every European language. The results of his Asiatic journey were published in *Fragments de géologie et de climatologie asiatiques* (2 vols. 1831), and in *Asie centrale* (3 vols. 1843)—an enlargement of the earlier work.

The publication of his *Briefe an Varnhagen von Ense* (Leipzig, 1860) was followed by *Briefwechsel mit einem jungen Freunde* (Berlin, 1861); *Briefwechsel mit Heinrich Berghaus* (3 vols., Jena, 1863); *Correspondance scientifique et littéraire* (2 vols., Paris, 1865–69); "Lettres à Marc-Aug. Pictet," published in *Le Globe*, tome vii. (Geneva, 1868); *Briefe an Bunsen* (Leipzig, 1869); *Briefe zwischen Humboldt und Gauss* (1877); *Briefe an seinen Bruder Wilhelm* (Stuttgart, 1880); *Jugendbriefe an W. G. Wegener* (Leipzig, 1896); besides some other collections of less note. An edition of Humboldt's principal works was published in Paris by Th. Morgand (1864–66). See also Karl Bruhns (and others), *Alexander von Humboldt, eine wissenschaftliche Biographie* (3 vols., 1872, with bibliography; Eng. trans. by Lassell, 1873); Karl von Baer, *Bulletin de l'acad. des sciences de St.-Petersbourg*, xvii. 529 (1859); R. Murchison, *Proceedings, Geog. Society of London*, vi. (1859); L. Agassiz, *American Jour. of Science*, xxviii. 96 (1859); *Proc. Roy. Society*, X. xxxix.; A. Quetelet, *Annuaire de l'acad. des sciences* (Brussels, 1860), p. 97; J. Mädler, *Geschichte der Himmelskunde*, ii. 113; J. C. Houzeau, *Bibl. astronomique*, ii. 168. (A. M. C.; X.)

HUMBOLDT, KARL WILHELM VON (1767–1835), German philologist and man of letters, the elder brother of Alexander von Humboldt, was born at Potsdam, on June 22, 1767. After studying at Berlin, Göttingen and Jena, in the last of which places he formed a close and lifelong friendship with Schiller, he married Fräulein von Dacherode, and in 1802 was appointed by the Prussian Government first resident and then minister plenipotentiary at Rome. While there he published a poem entitled *Rom*. His critical essay on Goethe's *Hermann und Dorothea*, published in 1800, had already placed him in the first rank of authorities on aesthetics, and, together with his family connections, had much to do with his appointment at Rome; while in the years 1795 and 1797 he had brought out translations of several of the odes of Pindar, which were held in high esteem. On quitting his post at Rome he was made councillor of State and minister of public instruction. He soon, however, retired to his estate at Tegel, near Berlin, but was recalled and sent as ambassador to Vienna in 1812. In 1813, as Prussian plenipotentiary at the congress of Prague, he was mainly instrumental in inducing Austria to unite with Prussia and Russia against France; in 1815 he was one of the signatories of the capitulation of Paris, and drafted the treaty between Prussia and Saxony, by which Prussian territory was largely increased. In 1816 he was at Frankfort, but was summoned to London in the midst of his work, and in 1818 had to attend the congress at Aix-la-Chapelle. The reactionary policy of the Prussian Government made him resign his office of privy councillor and give up political life in 1819; and from that time forward he devoted himself solely to literature and study.

In 1816 he had published a translation of the *Agamemnon* of Aeschylus, and in 1817 corrections and additions to Adelung's *Mithridates*, that famous collection of specimens of the various languages and dialects of the world. Among these additions that on the Basque language is the longest and most important, Basque having for some time specially attracted his attention. Wilhelm von Humboldt introduced Basque to the notice of European philologists, and made a scientific study of it possible. He visited the Basque country itself, the result of his visit being the valuable "Researches into the Early Inhabitants of Spain by the help of the Basque language" (*Prüfung der Untersuchungen über die Urbewohner Hispaniens mittelst der vaskischen Sprache*, 1821). Another work on what has sometimes been termed the metaphysics of language appeared from his pen in 1828, under the title of *Über den Dualis*; but the great work of his life, on the ancient Kawi language of Java, was interrupted by his death on April 8, 1835. The imperfect fragment was edited by his brother and

Dr. Buschmann in 1836, and contains the introduction on "The Heterogeneity of Language and its Influence on the Intellectual Development of Mankind," which was afterwards edited and defended against Steinthal's criticisms by Pott (2 vols., 1876). This essay, which has been called the textbook of the philosophy of speech, first clearly laid down that the character and structure of a language expresses the inner life and knowledge of its speakers, and that languages must differ from one another in the same way and to the same degree as those who use them. Other linguistic publications of Humboldt, which had appeared in the *Transactions* of the Berlin Academy, the *Journal* of the Royal Asiatic Society, or elsewhere, were republished by his brother in the seven volumes of Wilhelm von Humboldt's *Gesammelte Werke* (1841-52). These volumes also contain poems, essays on aesthetic subjects and other creations of his prolific mind.

Many volumes of Humboldt's interesting correspondence with his contemporaries have been published. The principal publications are the Correspondence with Schiller (1830; new ed. by Lutzmann, 1889); with Goethe (ed. Bratranek, 1876); with J. R. Forster (ed. Forster, 1889); with F. H. Jacobi (ed. Leitzmann, 1892); with A. W. Schlegel (ed. Leitzmann, 1908); with Karoline von Humboldt (ed. Sydow, 3 vols., 1906-09); and a selection of letters to various correspondents (ed. K. Sell, 1924). A new edition of his *Gesammelte Werke* (1841-72, 7 vols.) was prepared for the Prussian Academy (15 vols., 1903-18). Of the many works dealing with W. von Humboldt see B. Gerhardt, *W. v. Humboldt als Staatsmann* (1896-99, 2 vols.); O. Harnack, *W. v. Humboldt* (1913); Leitzmann, *W. v. Humboldt* (1919).

HUMBUG, an imposture, sham, fraud. The word seems to have been originally applied to a trick or hoax, and appears as a slang term about 1750. The origin was unknown at that date.

HUME, ALEXANDER (c. 1557-1609), Scottish poet, second son of Patrick Hume of Polwarth, Berwickshire, was born probably at Reidbrais, a family house. In *An Epistle to Maister Gilbert Montcreif* (Moncrieff) he relates the course of his disillusionment. He says he spent four years in France before beginning to study law in the courts at Edinburgh (l. 136). After three years' experience there he abandoned law in disgust and sought a post at court (*ib.* l. 241). Still dissatisfied, he took orders, and became in 1597 minister of Logie, near Stirling, where he lived until his death. His best-known work is his *Hymns, or Sacred Songs* (1599).

The editions of Hume's verse are: (a) by Robert Waldegrave (1599); (b) a reprint of (a) by the Bannatyne Club (1832); and (c) by the Scottish Text Society (ed. A. Lawson) (1902). The last includes Hume's prose tracts.

HUME, ALLAN OCTAVIAN (1829-1912), English ornithologist and Indian administrator, son of Joseph Hume (q.v.), was born on June 6, 1829 and educated at Haileybury and London University. Entering the Indian civil service in 1849 he had a distinguished career in India. After his retirement in 1882 he devoted himself to furthering the aspirations of Indians. The Indian National Congress (see INDIA: History), which held its first session at Bombay in 1885, owes its existence to his exertions. He was the author of several works on ornithology, and presented his collections to the British Museum. He died at Norwood on July 31, 1912.

See W. Wedderburn, *Allan Octavian Hume C.B.: Father of the Indian National Congress* (1913); Allan O. Hume: *a Sketch of his Life and Services to India* (1912); and H. V. Lovett, *A History of the Indian Nationalist Movement* (1920).

HUME, DAVID (1711-1776), British philosopher, historian and political economist, was born at Edinburgh, on April 26 (O.S.), 1711. His father was owner of a small estate named Ninewells in Berwickshire. David was educated at home until 1723 when he entered Edinburgh university. An attack of hypochondria and a few unhappy months in a business house in Bristol led him in 1734 to visit France, where during the first three years of his stay at La Flèche, his speculations were worked into systematic form in the *Treatise of Human Nature*, the first two volumes of which appeared in Jan. 1739. The third volume, containing book iii., *Of Morals*, was published in the following year. Hume's own words best describe its reception. "It fell dead-born from the press, without reaching such distinction as even to excite a murmur among the zealots." In the *Treatise*,

which contains the most complete exposition of his philosophy, Hume refused to take for granted the rationality of the existence of the external world and critically examined the concepts of substance and cause. Naturally he was disappointed that the world did not see as clearly as he did the connection between the concrete problems agitating contemporary thought and the abstract principles on which their solution depended.

After the publication of the *Treatise* Hume retired to Ninewells and occupied himself with politics and political economy. In 1741 he published vol. 1 of his *Essays* which had immediate success. A second edition and a second volume followed in 1742. After failing to secure the chair of moral philosophy at Edinburgh in 1744, Hume became tutor, or keeper, to the marquis of Annandale, a harmless literary lunatic. This position, financially advantageous, was absurdly false, and finally Hume had to sue for arrears of salary.

In 1746 he became secretary to Gen. St. Clair, and was a spectator of the ill-fated expedition to France in that year. He again retired to Ninewells to prepare his *Philosophical Essays* (afterwards entitled *An Inquiry concerning Human Understanding*). In 1748 he accompanied Gen. St. Clair as secretary in the embassy to Vienna and Turin, and in the same year were published the *Philosophical Essays*, the most famous of his works, though less great than his original *Treatise*. The *Essays* contain, in more detail, application of philosophical principles to concrete problems, such as miracles, providence, immortality; but the briefer treatment of the discussions of book i. of the *Treatise* is a defect which renders the *Treatise* the more important work.

In 1749 Hume returned to Ninewells, enriched with "near a thousand pounds," but two years later moved to Edinburgh where he spent the greater part of the next 12 years. These years are the richest so far as literary production is concerned. In 1751 he published his *Political Discourses*, which had a great and well-deserved success both in England and abroad, and the recast of book iii. of the *Treatise*, called *Inquiry concerning the Principles of Morals*, of which he says that "of all his writings, philosophical, literary or historical, it is incomparably the best." At this time also we hear of the *Dialogues concerning Natural Religion* (posthumously printed 1779) which he had been induced to hold back on account of their sceptical spirit.

In 1751 Hume again failed to secure a professor's chair, but in the following year he received, in spite of accusations of heresy, the librarianship of the Advocates' Library in Edinburgh, small in emoluments (£40 a year) but rich in opportunity for literary work. Two years later he was preparing his *History of England* which he began with James I., considering that the political differences of his time took their origin from that period. On the whole his attitude in respect to disputed political principles seems not to have been at first consciously unfair. The *History* appeared in five volumes between 1754 and 1762. Hume was bitterly disappointed at the reception of the first volume. But within a few years the sale brought in a larger revenue than had ever before been known in his country to flow from literature, and placed him in comparative affluence. At the same time Hume's dissatisfaction had an important effect, for from the publication of the first two volumes dates his virulent hatred of everything English, of society in London, Whig principles, Whig ministers and the public generally (see Burton's *Life*, ii. 268, 417, 434). He was convinced that there was a conspiracy to destroy everything Scottish. The remainder of the *History* became little better than a party pamphlet.

Volume ii., published in 1756, carrying on the narrative to the Revolution, was better received than the first; but Hume then resolved to work backwards, and to show from a survey of the Tudor period that his Tory notions were grounded upon the history of the constitution. In 1759 this portion of the work appeared, and in 1761 the work was completed by the history of the pre-Tudor periods. The numerous editions of the various portions gave him opportunity of revision, which he employed to remove the "villainous seditious Whig strokes," and "plaguy prejudices of Whiggism." But, whatever its faults, the *History* was the first attempt at a comprehensive treatment of historic facts. the

first to introduce the social and literary aspects of a nation's life as only second in importance to its political fortunes.

While the *History* was in process of publication, Hume produced in 1757 *Four Dissertations: The Natural History of Religion, Of the Passions, Of Tragedy, Of the Standard of Taste*. Of these the second is a subtle piece of psychology, containing the essence of book ii. of the *Treatise*, and the first is a powerful contribution to the deistic controversy, carrying the war into the province of the theory of the general development of religious ideas, and contending that polytheism was the earliest as well as the most natural form of religious belief, and that theism or deism is the product of reflection upon experience.

In 1763 Hume accompanied Lord Hertford to Paris, doing the duties of secretary to the embassy, with the prospect of the appointment to that post. He was received with honour, and made many friends, among others D'Alembert and Turgot, the latter of whom profited much by Hume's economic essays. In 1766 he returned to Edinburgh. In 1767 he became under-secretary to Gen. Conway at the Foreign Office and spent two years in London. He settled finally in Edinburgh in 1769, having now through his pension and otherwise an income of £1,000 a year. The solitary incident of note in this period of his life is the quarrel with Rousseau. Hume did his utmost to secure for Rousseau a comfortable retreat in England, but his usually sound judgment seems at first to have been quite at fault with regard to his protégé. The quarrel which all the acquaintances of the two philosophers had predicted soon came, and no language had expressions strong enough for Rousseau's anger, which was, in fact, unreasonable. In one of his letters Hume describes his life in Edinburgh. The new house which was built under his own directions at the corner of what is now called St. David Street after him, became a centre of cultivated society. Hume's cheerful temper, his equanimity, his kindness to literary aspirants and to those whose views differed from his own won him universal respect and affection. He welcomed the work of his friends (e.g., Robertson and Adam Smith), and warmly recognized the worth of his opponents (e.g., George Campbell and Reid). He assisted Blackwell and Smollett in their difficulties and became the acknowledged patriarch of literature. In the spring of 1775 Hume was struck with a tedious and harassing though not painful illness, of which he died on Aug. 25, 1776.

Theory of Knowledge.—In the *Treatise* Hume attempted to apply the fundamental principles of Locke's empirical psychology to the construction of a theory of knowledge and the experimental method to the whole science of human nature. For him, as for Locke, the problem of psychology was the exact description of the contents of the individual mind, and the determination of the conditions of the origin and development of its conscious experience. Viewing the contents of mind as matter of experience, Hume could discover only the distinction expressed by the terms *impressions* and *ideas*. Ideas are secondary in nature, copies of data supplied we know not whence. All that appears in conscious experience as primary, as arising from some unknown cause, and therefore relatively as original, Hume designates by the term *impression*, and claims to imply by such terms no theory whatsoever as to the origin of this portion of experience. There is simply the fact of conscious experience, ultimate and inexplicable. The faculties of combining, discriminating, abstracting and judging, are merely expressions for particular modes of having mental experience, i.e., are modifications of *conceiving*. By this theory, Hume is freed from all the problems of abstraction and judgment. A comparative judgment is simplified into an isolated perception of a peculiar form, and a series of similar facts are grouped under a single symbol, representing a particular perception, and only by the accident of custom treated as universal.

Conscious experience then contains merely the succession of isolated impressions and their fainter copies, ideas bound together by merely natural or external links of connection, the principles of association among ideas. The foundations of cognition must be discovered by observation or analysis of experience so conceived. Firstly, there are certain principles of cognition which appear to rest upon and to express relations of the universal

elements in conscious experience, viz., space and time. The propositions of mathematics seem to be independent of special facts of experience, and to remain unchanged even when the concrete matter of experience varies. They are formal. In the second place, cognition, in any real sense of that term, implies connection between the present fact of experience and other facts, whether past or future. It appears to involve, therefore, some real relation among the portions of experience, on the basis of which relation judgments and inferences as to matters of fact can be shown to rest. The theoretical question is consequently that of the nature of the supposed relation, and of the certainty of judgments and inferences resting on it. Hume's well-known distinction between relations of ideas and matters of fact corresponds fairly to this separation of the formal and real problems in the theory of cognition, although that distinction is in itself inadequate and not fully representative of Hume's own conclusions.

With regard, then, to the first problem, the formal element in knowledge, Hume's chief discussions concern the nature of the space and time relations in our experience and the mode in which the primary data, or facts of mathematical cognition, are obtained. The nature of space and time as elements in conscious experience is considered by Hume in relation to the special problem of their supposed infinite divisibility. The ultimate elements of experience must be real units, capable of being represented or imagined in isolation. Whence then do these units arise? In what classes of impressions do we find the elements of space and time? By this conception of conscious experience, Hume has to give some explanation of the nature of space and time which shall identify these with impressions, and at the same time to recognize the fact that they are not identical with any single impression or set of impressions. Certain impressions, the sensations of sight and touch, he says, have in themselves the element of space, for these impressions have a certain mode of arrangement. This mode is common to coloured points and tangible points, and, considered separately, is the impression from which our idea of space is taken. All impressions and all ideas are received, or form parts of a mental experience only when received in a certain order, the order of succession. This manner of presenting themselves is the impression from which the idea of time arises. Hume here deliberately gives up his fundamental principle that ideas are but the fainter copies of impressions, for it can never be maintained that order of disposition is an impression, and, secondly, he fails to offer any explanation of the mode in which *coexistence* and *succession* are possible elements of cognition in a conscious experience made up of isolated presentations and representations. For the consistency of his theory, however, it was indispensable that he should insist upon the real, i.e., presentative, character of the ultimate units of space and time.

How are the primary data of mathematical cognition to be derived from any experience containing space and time relations in the manner just stated? It is important to notice that Hume distinctly separates geometry from algebra and arithmetic, i.e., he views extensive quantity as being cognized differently from number. He holds that geometry is an empirical doctrine, a science founded on observation of concrete facts. The rough appearances of physical facts, their outlines, surfaces and so on, are the data of observation, and only by a method of approximation do we come near to the propositions of pure geometry. He definitely repudiates a view often ascribed to him, and certainly advanced by many later empiricists, that the data of geometry are hypothetical. The foundation of all the science of number is the fact that each element of conscious experience is presented as a unit, and we are capable of considering any fact or collection of facts as a unit. This *manner of conceiving* is absolutely general and distinct and accordingly affords the possibility of an all-comprehensive and perfect science, the science of discrete quantity. Hume nowhere explains the origin of the notions of unity and number, but merely asserts that through their means we can have absolutely exact and arithmetical propositions. Upon the nature of the reasoning by which in mathematical science we pass from data to conclusions, Hume gives no explicit statement.

His theory of mathematics is a practical condemnation of his empirical theory of perception. He has not offered even a plausible explanation of the mode by which a consciousness made up of isolated momentary impressions and ideas can be aware of coexistence and number, or succession. The relations of ideas are accepted as facts of immediate observation, as being themselves perceptions or individual elements of conscious experience, and to all appearance they are regarded by Hume as being in a sense analytical, because the formal criterion of identity is applicable to them. It is applicable, however, not because the predicate is contained in the subject, but on the principle of contradiction. If these judgments are admitted to be facts of immediate perception, the supposition of their non-existence is impossible.

Real Cognition and Causation.—Real cognition, Hume points out, implies transition from the present impression to something connected with it. This thing can only be an impression, not itself present, but represented by its copy or idea. Now the supreme all-comprehensive link of connection is that of causation. The idea in question is, therefore, the idea of something connected with the present impression as its cause or effect. But this is explicitly the idea of the said thing as having had or as about to have existence—in other words, belief in the existence of some matter of fact. What, for a conscious experience so constituted is the precise significance of such a belief in real existence? Clearly the real existence of a fact is not demonstrable, for whatever is may be conceived not to be. Existence of any fact, not present as a perception, can only be proved by arguments from cause or effect. But as each perception is in consciousness only as a contingent fact, which might not be or might be other than it is, the mind can conceive no necessary relations or connections among the several portions of its experience.

If, therefore, a present perception leads us to assert the existence of some other, this can only mean that in some natural, *i.e.*, psychological, manner the idea of this other perception is excited, and that the idea is viewed by the mind in some peculiar fashion. The natural link of connection Hume finds in the similarities presented by experience. One fact or perception is discovered by experience to be uniformly or generally accompanied by another, and its occurrence therefore naturally excites the idea of that other. The ease and rapidity of the mental transition is the sole ground for the supposed necessity of the causal connection between portions of experience. The idea of necessity is not intuitively obvious; the ideas of cause and effect are correlative in our minds, but only as a result of experience.

The Self in Cognition.—The final problem of Hume's theory of knowledge is the discussion of the real significance of the two factors of cognition, self and external things. If there is nothing in conscious experience save what observation can disclose, while each act of observation is itself an isolated feeling (an impression or idea), it is manifest that a permanent identical thing can never be an object of experience. Whatever permanence or identity is ascribed to an impression or idea is the result of association with one of those "propensities to feign" which are due to natural connections among ideas. We regard as successive presentations of one thing the resembling feelings which are experienced in succession. Identity, then, whether of self or object, there is none, and the supposition of *objects*, distinct from impressions, is but a further consequence of our "propensity to feign."

In the *Appendix* to the *Treatise*, Hume confesses that, in confining all cognition to single perceptions and supplying no purely intellectual faculty for modifying and classifying their results, he has destroyed real knowledge altogether. He sees distinctly that, if conscious experience be taken as containing only isolated states, no progress in explanation of cognition is possible, and that the only hope of further development is to be looked for in a radical change in our mode of conceiving experience.

Theology and Ethics.—The important *Dialogues on Natural Religion* introduce three interlocutors, Dema, Cleanthes and Philo. The first represents a certain *a priori* view, then regarded as the safest bulwark against infidelity, of which the main tenets were that the being of God was capable of a *a priori* proof, and that, owing to the finitude of our facilities, the attributes and modes

of operation of deity were incomprehensible. The second is the typical deist of Locke's school, holding that the only possible proof of God's existence was *a posteriori* from design, and that such proof was, on the whole, sufficient. The third represents the type of completed empiricism or scepticism, holding that no argument, either from reason or experience, can transcend experience, and consequently that no proof of God's existence is possible. Cleanthes, who maintains that the doctrine of the incomprehensibility of God is hardly distinguishable from atheism, is compelled by Philo to reduce to a minimum the conclusion capable of being inferred from experience as regards the existence of God. Philo stresses the weakness of the analogical argument, points out that the demand for an ultimate cause is no more satisfied by thought than by nature itself, shows that the argument from design cannot warrant the inference of a perfect or infinite or even of a single deity, and finally maintains that, as we have no experience of the origin of the world, no argument from experience can carry us to its origin, and that the apparent marks of design in the structure of animals are only results from the conditions of their actual existence. So far as the *a priori* argument is concerned, reason can never demonstrate a matter of fact, and, unless we know that the world had a beginning in time, we cannot insist that it must have had a cause. Dema then brings forward the ordinary theological topic, man's consciousness of his own imperfection, misery and dependent condition. Nature is throughout corrupt and polluted, but "the present evil phenomena are rectified in other regions and in some future period of existence." Cleanthes, pointing out that from a nature thoroughly evil we can never prove the existence of an infinitely powerful and benevolent Creator, hazards the conjecture that the deity, though all-benevolent, is not all-powerful. Philo, however, pushing his principles to their full consequences, shows that unless we assumed (or knew) beforehand that the system of nature was the work of a benevolent but limited deity, we certainly could not, from the facts of nature, infer the benevolence of its Creator.

For Hume, ethics is not a purely rational science, since all our motives are desire for pleasure. Actions are virtuous when they contribute to the happiness of ourselves and others. Among virtues useful or agreeable to their possessor he includes discretion, industry, frugality, sobriety and considerateness. Among those useful or agreeable to others are justice, fidelity to compacts, and veracity, the first two being "artificial" virtues due to civilization and worthy of approbation because of their useful consequences. Because motives are involved in all action, Hume desires the freedom of the will.

Hume's theory of knowledge expresses what may be called psychological individualism or atomism; his ethics and doctrine of religion are but the logical consequences of this theory. So far as metaphysics is concerned he has given the final word of the empirical school, and all additions, whether from the specifically psychological side or from the general history of human culture, are subordinate in character. It is no exaggeration to say that the later English school of philosophy represented by J. S. Mill made in theory no advance beyond Hume; the groundwork of the *System of Logic* is a mere reproduction of Hume's doctrine of knowledge, and the treatment in the posthumous essays on theism is in substance identical with that of the *Dialogues on Natural Religion*.

Economics.—Hume's services to economics may be summed up in two heads: (1) he established the relation between economic facts and the fundamental phenomena of social life, and (2) he introduced into the study of these facts the new historical method. Thus, without naming it, he describes the subject-matter and indicates the true method of economic science. Of his economic essays, published in *Political Discourses* (1752) and *Essays and Treatises on Several Subjects* (1753), the most important are those on Commerce, on Money, on Interest, and on the Balance of Trade. In dealing with money, Hume refutes the mercantile school, which had tended to confound it with wealth. From the internal, as distinct from the international aspect, the absolute quantity of money, supposed as of fixed amount, in a country, is of no consequence, while a quantity larger than is required for

the interchange of commodities is injurious, as tending to raise prices and to drive foreigners from the home markets. It is only during the period of acquisition of money, and before the rise in prices, that the accumulation of precious metals is advantageous. This principle is perhaps Hume's most important economic discovery. Dealing with the phenomena of interest, he exposes the old fallacy that the rate depends upon the amount of money in a country. The reduction in the rate in general must result from "the increase of industry and frugality, of arts and commerce." In the matter of free-trade and protection he compromises. On the one hand, he condemns "the numerous bars, obstructions and imposts which all nations of Europe, and none more than England, have put upon trade." On the other hand, he approves of a protective tax on German linen in favour of home manufactures, and of a tax on brandy as encouraging the sale of rum and so supporting our southern colonies. With regard to taxation he says that the best taxes are those levied on consumption, especially on luxuries, for these are least heavily felt. He denies that all taxes fall finally on the land. Superior frugality and industry on the part of the artisan will enable him to pay taxes without mechanically raising the price of labour. For the modern expedient of raising money for national emergencies by way of loan he has a profound distrust. A national debt, he maintains, enriches the capital at the expense of the provinces; further, it creates a leisured class of stockholders, and possesses all the disadvantages of paper credit. Hume enunciated the principle that "everything in the world is purchased by labour, and our passions are the only cause of labour." Further, in analysing the complex phenomena of commerce, he is superior sometimes to Adam Smith, in that he never forgets that the ultimate causes of economic change are the "customs and manners" of the people, and that the true solution of problems is to be sought in the elementary factors of industry.

BIBLIOGRAPHY.—J. H. Burton's *Life and Correspondence of Hume* (2 vols., 1846); G. Birkbeck Hill, *Letters of Hume to William Strahan*; C. J. W. Francke, *David Hume* (Haarlem, 1907). Until 1874 the standard edition was that of 1826 (reprinted 1854), in 4 vols. The best modern edition is that in 4 vols. by T. H. Green and T. H. Grose (containing a valuable introduction and excellent bibliographical matter); the *Enquiry* and the *Treatise* were edited by L. A. Selby-Bigge (1894 and 1896). The *Treatise* appeared in Everyman's Library 2 vols. (1911).

HUME, JOSEPH (1777–1855), British politician, was born on Jan. 22, 1777, of humble parents, at Montrose, Scotland. After completing his course of medical study at the university of Edinburgh he sailed in 1797 for India, where he made a fortune. In 1812 he purchased a seat in parliament for Weymouth and voted as a Tory. When upon the dissolution of parliament the patron refused to return him he brought an action and recovered part of his money. Six years elapsed before he again entered the House, and during that interval he adopted the doctrines of James Mill and the philosophical reformers of the school of Bentham. He joined Francis Place (*q.v.*) and others in seeking to establish schools for them on the Lancastrian system, and promoting the formation of savings banks. In 1818, soon after his marriage with Miss Burnley, the daughter of an East India director, he was returned to parliament as member for the Border burghs. He was afterwards successively elected for Middlesex (1830), Kilkenny (1837) and for the Montrose burghs (1842). Hume became the self-elected guardian of the public purse, by challenging and bringing to a direct vote every single item of public expenditure. It was he who caused the word "retrenchment" to be added to the Radical programme "peace and reform." He fought the old

combination laws that hampered workmen and favoured masters; he brought about the repeal of the laws prohibiting the export of machinery and of the act preventing workmen from going abroad. He constantly protested against flogging in the army, the imprisonment of sailors and imprisonment for debt. He took up the question of lighthouses and harbours; in the former he secured greater efficiency, in the latter he prevented useless expenditure. He died on Feb. 20, 1855.

A *Memorial* of Hume was published by his son Joseph Burnley Hume (London, 1855).

HUMILIATI, the name of an Italian monastic order created in the 12th century. Its origin is obscure. A group of Lombards came to Rome with the intention of obtaining the pope's approval of the rule of life which they had spontaneously chosen; while continuing to live in their houses in the midst of their families, they wished to lead a more pious existence than of old, to abandon oaths and litigation, to content themselves with a modest dress, and all in a spirit of Catholic piety. The pope approved their resolve to live in humility and purity, but forbade them to hold assemblies and to preach in public; the chronicler adding that they infringed the pope's wish and thus drew upon themselves his excommunication. Their name Humiliati ("Humiles" would have been more appropriate) arose from the fact that the clothes they wore were very simple and of one colour. This lay fraternity spread rapidly and soon put forth two new branches, a second order composed of women, and a third composed of priests, to which Innocent III. granted a rule. His object was to reconcile the order with the Waldenses (*q.v.*), and, indeed, the rule reproduces several of the Waldensian propositions, ingeniously modified in the orthodox sense, but still very easily recognizable. It forbade useless oaths and the taking of God's name in vain; allowed voluntary poverty and marriage; regulated pious exercises; and approved the solidarity which already existed among the members of the association. Finally, by a singular concession, it authorized them to meet on Sunday to listen to the words of a brother "of proved faith and prudent piety," on condition that the hearers should not discuss among themselves either the articles of faith or the sacraments of the church. The bishops were forbidden to oppose any of the utterances of the Humiliati brethren, "for the spirit must not be stifled." So broad a discipline must of necessity have led back some waverers into the pale of the church, but the tradition of the independent Humiliati is confused with the history of the Waldenses throughout the later 12th century. The celebrated decretal promulgated in 1184 by Pope Lucius III. at the council of Verona against all heretics condemns at the same time as the "Poor Men of Lyons" "those who attribute to themselves falsely the name of Humiliati," at the very time when this name denoted an order recognized by the papacy. This order, though orthodox, was always held in tacit and ever-increasing suspicion, and, in consequence of grave disorders, Pius V. suppressed the entire congregation in February 1570–71.

See Tiraboschi, *Vetera humiliorum monumenta* (Milan, 1766); K. Müller, *Die Waldenser* (Gotha, 1886); W. Preger, *Beiträge zur Geschichte der Waldenser* (Munich, 1875); also art. "Humiliati" in the *Catholic Encyclopaedia*. (P. AL.)

HUMITE, a group of three related minerals consisting of basic magnesium fluo-silicates, with the formulae: chondrodite, $Mg_3[Mg(F,OH)_2][SiO_4]_2$; humite, $Mg_5[Mg(F,OH)_2][SiO_4]_3$; clinohumite, $Mg_7[Mg(F,OH)_2][SiO_4]_4$. Humite crystallizes in the orthorhombic and the two others in the monoclinic system, but between them there is a close crystallographic relation; the lengths of the vertical axes are in the ratio 5:7:9, and this is also the ratio of the number of magnesium atoms present in each of the three minerals. Such a relation between the crystallographic constants and the chemical composition is commonly known as a morphotropic relation.

The three minerals are strikingly similar in appearance, and can only be distinguished by the goniometric measurement of the complex crystals. They are honey-yellow to brown or red in colour, and have a vitreous to resinous lustre; hardness 6–6.5, specific gravity 3.1–3.2. The name humite, after Sir Abraham Hume

BY COURTESY OF MARGARET L. BODINE

RUBY-THROATED HUMMING BIRD (*TROCHILUS COLUBRIS*) THE ONLY HUMMING BIRD FOUND EAST OF THE MISSISSIPPI

This species is among the smallest of the family, averaging $3\frac{1}{2}$ inches from the tip of the bill to the end of the tail. The underparts of both male and female are gray, the head and back iridescent green, the plumage of the male (fig. 4) being further enriched with a ruby red throat. The birds were lured to the scene of the photographs by tiny brightly coloured bottles of sugared water, fastened on a vine

(1749-1839), was given in 1813 to the small and brilliant honey-yellow crystals found in the blocks of crystalline limestone ejected from Monte Somma, Vesuvius; all three species have since been recognized at this locality. Chondrodite (from *χόνδρος*, "a grain") was a name early (1817) in use for granular forms of these minerals found embedded in crystalline limestones in Sweden, Finland and at several places in New York and New Jersey. Large hyacinth-red crystals of all three species are associated with magnetite in the Tilly Foster iron-mine at Brewster, New York; and at Kafveltorp in Örebro, Sweden, similar crystals (of chondrodite) occur embedded in galena and chalcopyrite.

HUMMEL, JOHANN NEPOMUK (1778-1837), German composer and pianist, was born on Nov. 14, 1778, at Pressburg, in Hungary. In 1785 his father became conductor at Schikaneder's theatre in Vienna. Schikaneder was a friend of Mozart and the librettist of the *Magic Flute*, and introduced Hummel to Mozart who gave the boy instruction for two years. At nine years old Hummel toured Europe with his father as a "Wunderkind"; in his eleventh year he began to compose. After his return to Vienna he completed his studies under Albrechtsberger and Haydn; and at a later period he learned song-writing from Salieri. From 1804 to 1811 he was Kapellmeister to Prince Eszterhazy. Beethoven's Mass in C was performed in 1810, and a remark passed by Hummel caused an estrangement between the two which was only healed just before Beethoven's death. The years 1811 to 1815 were spent in Vienna, and after the peace Hummel began to tour Europe as pianist and conductor, having enormous success everywhere. He died in 1837 at Weimar, where for a long time he had been the musical conductor of the court theatre. Hummel wrote, amongst other things, several operas, both tragic and comic, and two grand masses (*Opp.* 80 and 111). More important are his compositions for the pianoforte (his two concertos in A minor and B minor, and the sonata in F sharp minor), and his chamber music (the celebrated septet, and several trios, etc.). His experience as a player and teacher of the pianoforte was embodied in his *Great Pianoforte School* (Vienna), and the excellence of his method was attested by his pupils, Henselt and Ferdinand Hiller. Hummel continued the traditions of the earlier Viennese school of Mozart and Haydn; his style alike as pianist and composer was marked by purity and correctness rather than by passion and imagination.

HUMMING-BIRD, the name applied to the beautiful little birds forming the family *Trochilidae*, which is confined to America. Their nearest allies are the swifts (*Micropodidae*). Of their internal characters, the most notable is the extreme development of the breast-bone and its keel in connection with the rapid wing-beat from which the birds derive their English name. This is particularly noticeable in the smaller forms. In the larger the wing-beat is slower (see Darwin, *Voyage of the Beagle*). The humming birds form a very homogeneous group, all small in size, varying in length from 8½ in. in *Patagonagigas* to 2½ in. in *Mellisuga minima*, which weighs under 2 grms. Within their limits, however, the *Trochilidae* present a remarkable diversity of form; the colouring is usually of a brilliance unequalled by larger birds (though the "hermits," forming the genus *Phaethornis*, are plainly coloured), and only to be described by comparisons with precious stones. The females are usually less brilliantly coloured than the males. Tails, wings and crests are all subject to modification, as is the length of the bill. The tongue is protrusible and forms an organ for the capture of insects and the imbibing of nectar.

It is advisable to mention that the birds called humming-birds in Africa and India are sun-birds (*Nectariniidae*), while in England the humming-bird hawk-moth (*Macroglossa stellarum*) is occasionally taken for a true Trochilid.

The humming-birds are distributed almost all over America, reaching Tierra del Fuego in the south and Sitka (as a summer visitor) in the north; but their metropolis is on the slopes of the northern Andes in Colombia. The "hermits" are confined to the Amazon valley, which is otherwise very poorly supplied with these birds. Eighteen species inhabit the United States, but some of these only just cross the frontier. On Mount Chimborazo and

elsewhere humming-birds are found at an elevation of 16,000ft., just below the level of perpetual snow. This is remarkable, as the heat-loss from such small birds is so great that it is to be expected that they should be confined to warm climates.

The habits of the humming-birds have been admirably treated by Waterton, Wilson, Audubon, Gosse, Wallace, Bates and others. The nest is solidly built, usually of vegetable down and spiders' webs. It is generally a cup-shaped structure, though the form is very variable and some species suspend their nests from stems, leaves or tendrils. The eggs, almost invariably two in number, are white and almost symmetrically pointed. The mother bird is very solicitous for her offspring.

See J. Gould, *Monograph of the Trochilidae*.

HUMMOCK, a small rounded knoll of ice rising above the general level of an ice-field, making sledge transport in the polar regions extremely difficult. Hummocky ice is caused by slow unequal pressure in the main body of the packed ice, and by local variations of texture and temperature at a later period.

HUMOUR, in the modern use of the term, signifies a perception of the comic or incongruous of a special sort; generally distinguished from wit, as being on the one side more subtle, or on the other side more vague. It is thus a term which not only refuses to be defined, but in a sense boasts of being indefinable; and it would commonly be regarded as a deficiency in humour to search for a definition of humour. The modern use of the term, however, is by no means the primary or necessary use of it; and it is one of the cases, rarer than is commonly supposed, in which derivation offers at least an approach to definition. Everybody knows that humour, in the Latin sense of "moisture," was applied here as part of the old physiological theory, by which the characters of men varied according to the proportions of certain different secretions in the human body; as, for instance, that the predominance of phlegm produced the phlegmatic humour. By the time of the full consolidation of the English language, it had thus become possible for Ben Jonson and others to use the word "humour" rather in the sense of "the ruling passion." With this there necessarily went an idea of exaggeration; and by the end of the process the character of a humorist was more or less identical with what we should call an eccentric. The next stages of the development, which are rather slow and subtle, correspond to the various degrees in which the eccentric has become conscious of his eccentricity. England has always been especially rich in these eccentrics; and in England, where everything was less logical and more casual than in other countries, the eccentric long remained, as we should say, half unconsciously and half consciously humorous. The blend, and the beginnings of the modern meaning, may perhaps be dated at about the time of the Waverley Novels, when Guy Mannering complains of Councillor Pleydell as "a crack-brained humorist." For Pleydell is indeed laughed at for his little vanities or whims; but he himself joins in the laugh and sees the humour of his humour. Since then the word has come to be used more and more exclusively of conscious humour; and generally of a rather deep and delicate appreciation of the absurdities of others. Nevertheless there clings to the word humour, especially when balanced against the word wit, a sort of tradition or atmosphere that belongs to the old eccentrics whose eccentricity was always wilful and not infrequently blind. The distinction is a fine one; but one of the elements remaining in this blend is a certain sense of being laughed at, as well as of laughing. It involves some confession of human weakness; whereas wit is rather the human intellect exerting its full strength, though perhaps upon a small point. Wit is reason on its judgment seat; and though the offenders may be touched lightly, the point is that the judge is not touched at all. But humour always has in it some idea of the humorist himself being at a disadvantage and caught in the entanglements and contradictions of human life. It is a grave error to underrate wit as something trivial; for certain purposes of satire it can truly be the sword of the spirit, and the satirist bears not the sword in vain. But it is essential to wit that he should bear the sword with ease; that for the wit the weapon should be light if the blow be heavy; that there should be no question of his being encumbered with his instrument or

laying open his guard. But humour can be of the finest and yet lay open its guard or confess its inconsistency. When Voltaire said, commenting on the judicial murder of Byng, "In England they kill one admiral to encourage the others," it would immediately be recognized as wit; though there is not a little in it that must be recognized as humour. But we rightly class Voltaire as a wit, because he represents the consistent human reason detecting an inconsistency. We shall be very wrong if we despise him as a wit; for that French clearness has depths of irony; there is, for instance, more than is seen at a glance in the very word "encourage." But it is true that the wit is here a judge independent of the judges, unaffected by the king or the admiral or the English court martial or the mob. He is abstract justice recording a contradiction. But when Falstaff (a model of the humorist become or becoming conscious) cries out in desperate bravado, "They hate us youth," the incongruity between the speech and the corpulent old humbug of a speaker is present to his own mind as well as to ours. He also discovers a contradiction, but it is in himself; for Falstaff really did bemuse himself with youthful companionship which he knew to be like a drug or a dream; and indeed Shakespeare himself, in one at least of the sonnets, becomes bitterly conscious of the same illusion. There is therefore in humour, or at least in the origins of humour, something of this idea of the eccentric caught in the act of eccentricity and brazening it out; something of one surprised in disarray and become conscious of the chaos within. Wit corresponds to the divine virtue of justice, in so far as so dangerous a virtue can belong to man. Humour corresponds to the human virtue of humility and is only more divine because it has, for the moment, more sense of the mysteries.

If there be so much of enlightenment to be gathered from the history of the word, there is very little to be gathered from any of the attempts at a scientific history of the thing. The speculations on the nature of any reaction to the risible belong to the larger and more elementary subject of laughter and are for the department of psychology; according to some, almost for that of physiology. Whatever be their value touching the primitive function of laughter, they throw very little light on the highly civilized product of humour. It may well be questioned whether some of the explanations are not too crude even for the crudest origins; that they hardly apply even to the savage and certainly do not apply to the child. It has been suggested, for example, that all laughter had its origin in a sort of cruelty, in an exultation over the pain or ignominy of an enemy; but it is very hard even for the most imaginative psychologist to believe that, when a baby bursts out laughing at the image of the cow jumping over the moon, he is really finding pleasure in the probability of the cow breaking her leg when she comes down again. The truth is that all these primitive and prehistoric origins are largely unknown and possibly unknowable; and like all the unknown and unknowable are a field for furious wars of religion. Such primary human causes will always be interpreted differently according to different philosophies of human life. Another philosophy would say, for instance, that laughter is due not to an animal cruelty but to a purely human realization of the contrast between man's spiritual immensity within and his littleness and restriction without; for it is itself a joke that a house should be larger inside than out. According to such a view, the very incompatibility between the sense of human dignity and the perpetual possibility of incidental indignities produces the primary or archetypal joke of the old gentleman sitting down suddenly on the ice. We do not laugh thus when a tree or a rock tumbles down, because we do not know the sense of self-esteem or serious importance within. But such speculations in psychology, especially in primitive psychology, have very little to do with the actual history of comedy as an artistic creation.

There is no doubt that comedy existed as an artistic creation many thousands of years ago, in the case of peoples whose life and letters we can sufficiently understand to appreciate the fine shades of meaning; especially, of course, in the case of the Greeks. It is difficult for us to say how far it existed in civilizations more remote of which the records are for

us more stiff and symbolic; but the very limitation of symbolism which makes it hard for us to prove its existence should warn us against assuming without evidence that it did not exist. We know more about Greek humour than about Hittite humour, at least partly for the simple reason that we know Greek better than we know any sort of colloquial Hittite; and while what applies to Hittite applies in a less degree to Hebrew, a case like that of early Hebrew presents something of the same problem of limitation. But without any attempts to settle such problems of scholarship, it is hard to believe that the highest sense of human satire was not present in the words of Job: "Truly you are wise and wisdom will die with you"; or that no perception of a poetic contrast was felt by so great a poet when he said of Behemoth, commonly identified with the hippopotamus: "Canst thou play with him as with a bird?" It is probable that the Chinese civilization, in which the quality of the quaint and the fantastic has flowered with a beautiful luxuriance for many centuries, could also quote fairly early examples of the same order of fancy.

In any case, humour is in the very foundations of our European literature, which alone is quite sufficiently a part of ourselves for the full appreciation of so subtle and sometimes sub-conscious a quality. Even a schoolboy can see it in such scenes of Aristophanes as that in which the dead man sits up in indignation at having to pay the toll of the Styx and says he would rather come to life again; or when Dionysus asks to see the wicked in hell and is answered by a gesture pointing at the audience. Before the period of intellectual controversies in Athens, indeed, we generally find in Greek poetry, as in the greater part of all human folk-lore, that the joke is a practical joke. To a robust taste, however, it is none the less of a joke for that. For the joke of Odysseus calling himself Noman is not, as some suppose, a sort of trivial pun or verbalism; the joke is in the gigantic image of the raging Cyclops, roaring as if to rend the mountains, after being defeated by something so simple and so small. And this example is worth noting, as representing what is really the fun of all the fairy-tales; the notion of something apparently omnipotent made impotent by some tiny trick. This fairy-tale idea is undoubtedly one of the primitive fountains from which flows the long winding stream of historic humour. When Puss In Boots persuades the boastful magician to turn into a mouse and be eaten, it almost deserves to be called wit.

After these two early expressions, the practical joke of the folk-tale and the more philosophic fun of the Old Comedy, the history of humour is simply the history of literature. It is especially the history of European literature; for this sane sense of the incongruous is one of the highest qualities balancing the European spirit. It would be easy to go through the rich records of every nation and note this element in almost every novel or play, and in not a few poems or philosophical works. There is naturally no space for such a survey; but three great names, one English, one French and a third Spanish, may be mentioned for their historical quality, since they opened new epochs and even their few superiors were still their followers. The first of these determining names is that of Chaucer, whose urbanity has done something to conceal his real originality. Mediaeval civilization had a very powerful sense of the grotesque as is apparent in its sculpture alone; but it was in a sense a fighting sentiment; it dealt with dragons and devils; it was alive, but it was very decidedly kicking. Chaucer brought into this atmosphere a cool air of true comedy; a sort of incongruity most incongruous in that world. In his personal sketches we have a new and very English element, of at once laughing at people and liking them. The whole of humorous fiction, if not the whole of fiction, dates from the Prologue of the *Canterbury Tales*.

Rather later, Rabelais opened a new chapter by showing that intellectual things could be treated with the energy of high spirits and a sort of pressure of physical exuberance, which was itself humorous in its very human abandon. He will always be the inspiration of a certain sort of genial impatience, and the moments when the great human mind boils over like a pot. The Renaissance itself was, of course, such a boiling, but the elements were some of them more poisonous; though a word should be said for

the tonics of that time, the humour of Erasmus and of More.

Thirdly, there appeared with the great Cervantes an element new in its explicit expression; that grand and very Christian quality of the man who laughs at himself. Cervantes was himself more chivalrous than most men when he began to mock at chivalry. Since his time, humour in this purely humorous sense, the confession of complexity and weakness already remarked upon, has been a sort of secret of the high culture of the West. The influence of Cervantes and Rabelais and the rest runs through all modern letters, especially English; taking on a shrewd and acid tang in Swift, a more delicate and perhaps more dubious taste in Sterne, passing on through every sort of experiment of essay or comedy, pausing upon the pastoral gaiety of Goldsmith or going on finally to bring forth, like a great birth of giants, the walking caricatures of Dickens. Nor is it altogether a national accident that the tradition has here been followed in England. For it is true that humour, in the special and even limited sense here given to it, humour as distinct from wit, from satire, from irony or from many things that may legitimately produce amusement, has been a thing strongly and specially present in English life and letters. That we may not in turn depreciate the wit and logic of the rest of the world, it will be well to remember that humour does originate in the half-conscious eccentric, that it is in part a confession of inconsistency; but, when all is said, it has added a new beauty to human life. It may even be noted that there has appeared especially in England a new variety of humour, more properly to be called Nonsense.

Nonsense may be described as humour which has for the moment renounced all connection with wit. It is humour that abandons all attempt at intellectual justification; and does not merely jest at the incongruity of some accident or practical joke, as a by-product of real life, but extracts and enjoys it for its own sake. "Jabberwocky" is not a parody on anything; the Jumbles are not a satire on anybody; they are folly for folly's sake on the same lines as art for art's sake, or more properly beauty for beauty's sake; and they do not serve any social purpose except perhaps the purpose of a holiday. Here again it will be well to remember that even the work of humour should not consist entirely of holidays. But this art of nonsense is a valuable contribution to culture; and it is very largely, or almost entirely, an English contribution. So cultivated and competent a foreign observer as M. Emile Cammaerts has remarked that it is so native as to be at first quite unmeaning to foreigners. This is perhaps the latest phase in the history of humour; but it will be well even in this case to preserve what is so essential a virtue of humour, the virtue of proportion. Humour, like wit, is related however indirectly, to truth and the eternal virtues; as it is the greatest incongruity of all to be serious about humour, so it is the worst sort of pomposity to be monotonously proud of humour; for it is itself the chief antidote to pride; and has been, ever since the time of the Book of Proverbs, the hammer of fools.

(G. K. C.)

American Humour, the name given to the peculiar vein of humour which has been characteristic in the literature of the United States and which has constituted one of its most eminent features. It may be said to consist principally of a peculiar and distinctive point of view, a willingness to see things as they are, a detachment from traditional reverences and conventional beliefs. It would seem reasonable to suppose that such a point of view naturally opened up before the vision of Europeans, settled in a new land and able to look with an unprejudiced eye upon the institutions and the ideas of the country from which they came. Thus the *Immocents Abroad* (1869), by Samuel Clemens (Mark Twain), is in reality a picture of Europe as seen from the summit of the Rocky Mountains.

Nearly all humour is accompanied by some form of wit as a vehicle of its verbal expression. American humour developed, as its concomitant, certain modes of wit which naturally went with it,—the verbalism of bad spelling, of slang speech and of exaggerated statement. These, too, reflect their origin in the environment of a new country, among people largely ignorant and wholly careless of the reverence of scholarship. The wit is the

lesser part of the product—the mere shell to hold the kernel, and often wears thin and becomes unintelligible and even tiresome to later readers.

It is difficult to assign an exact beginning for the appearance of American humour as such. There is plenty of it in the writings of Benjamin Franklin (1706–90), as for example in his *Autobiography* and his *Poor Richard's Almanack* (1732–57). Seba Smith, a graduate of Bowdoin College, in his *Life and Writings of Major Jack Downing* (1833), gave a definite lead, followed with even greater success by Judge Haliburton (1796–1865) of Nova Scotia (the famous Sam Slick), sometimes called, on insufficient evidence, the father of American humour. His "*Clockmaker, or Sayings and Doings of Samuel Slick of Slickville*" contains a vast mass of philosophy and anecdote retailed by a supposed Yankee clockmaker, intensely amusing to his generation, though scarcely readable in any large quantity to-day. The earlier half of the 19th century produced a number of humorists in prose and verse of a secondary order such as John Godfrey Saxe (1816–87) and Robert Newell (Orpheus C. Kerr, 1836–1901). But it remained for the period just following the Civil War to see the climax reached in the works of Artemus Ward (Charles Browne, 1834–67), Bret Harte (1839–1902) and Samuel L. Clemens (1835–1910). Ward made a sudden and phenomenal reputation as a joke-maker and a comic lecturer, carried London by storm (1866) and died an early and tragic death at Southampton (1867). Bret Harte's humorous poems, *Plain Language from Truthful James*, still survive, while Mark Twain's name and fame are household words. Honourable mention may be made also for the same period of Henry Shaw (Josh Billings, 1818–85) and of Edgar Wilson (Bill Nye, 1850–96). The closing years of the century saw the appearance of Mr. Finley Peter Dunne disguised as "Mr. Dooley," a vehicle of entertaining conversation, Irish in form but American within.

The humorists of America to-day are too numerous for exhaustive enumeration. Every journal carries its columnful. But it is not invidious to mention as typical Irvin Cobb (1876), Franklin P. Adams and Montague Glass. (S. LEA.)

HUMPERDINCK, ENGELBERT (1854–1921), German composer, was born at Siegburg on Sept. 1, 1854, and studied music under F. Hiller at Cologne, and under F. Lachner and J. Rheinberger at Munich. In 1879 a Mendelssohn scholarship enabled him to go to Italy, where he met Wagner and was invited to assist in the production of *Parsifal* at Bayreuth. After some years of travel he returned to Germany and settled at Frankfurt, where he was professor of composition at the Hoch Conservatorium and musical critic of the *Frankfurter Zeitung*. He had already made his mark as a composer in Germany with his orchestral work, *Humoreske* (1880), and the choral compositions *Das Glück von Edenhall* (1884) and *Die Wallfahrt nach Kevlaar* (1887), when he produced the charming children's opera, *Hänsel und Gretel* (1893), and became famous throughout Europe. In 1900 Humperdinck removed to Berlin, where he was head of a *Meisterschule* for composition. He died at New Strelitz on Sept. 27, 1921. Humperdinck's later works, like *Hänsel und Gretel*, owed much to folk-tunes, and showed a similar technical mastery, but none of them approached it in popular success, though *Königskinder* was well received.

See O. Besch, *Engelbert Humperdinck* (1915).

HUMPHREY (or HUMFREY), **LAWRENCE** (1527?–1590), president of Magdalen College, Oxford, and dean successively of Gloucester and Winchester, was born at Newport Pagnel. He was elected demy of Magdalen College in 1546 and fellow in 1548. He was one of the most promising pupils of Peter Martyr, and on Mary's accession obtained leave from his college to travel abroad. He lived at Basel, Zurich, Frankfurt and Geneva, making the acquaintance of the leading Swiss divines, whose ecclesiastical views he adopted. He returned to England at Elizabeth's accession, was appointed regius professor of divinity at Oxford in 1560, and was recommended by Archbishop Parker and others for election as president of Magdalen. The fellows

refused at first to elect so pronounced a reformer, but they yielded in 1561, and Humphrey gradually converted the college into a stronghold of Puritanism. In 1564 he and his friend Thomas Sampson, dean of Christ Church, were called before Parker for refusing to wear the prescribed ecclesiastical vestments; and a prolonged controversy broke out, in which Bullinger and other foreign theologians took part as well as most of the leading divines in England. In spite of Bullinger's advice, Humphrey refused to conform; and Parker wished to deprive him as well as Sampson. But the presidency of Magdalen was elective and the visitor of the college was not Parker but the bishop of Winchester; and Humphrey escaped with temporary retirement. Parker, in fact, was not supported by the council; in 1566 Humphrey was selected to preach at St. Paul's Cross, and was allowed to do so without the vestments. In that year, on the occasion of Elizabeth's visit to Oxford he wore his doctor's gown and habit, which the queen told him "became him very well"; and his resistance now began to weaken. He yielded on the point before 1571 when he was made dean of Gloucester. In 1578 he was one of the divines selected to attend the diet at Schmalkalden, and in 1580 he was made dean of Winchester. In 1585 he was persuaded by his bishop, Cooper, to restore the use of surplices in Magdalen College chapel. He died on Feb. 1, 1590, and was buried in the college chapel.

State Papers* (Dom. 1547-90); *Acts of the Privy Council*; Burnet's *Hist. Ref.*; Collier's *Eccles. Hist.*; Dixon's *Church Hist.* vol. vi.; *Dict. Nat. Biog.*

HUMPHREYS, ANDREW ATKINSON (1810-1883), American soldier and engineer, was born at Philadelphia on Nov. 2, 1810. He was the son of Samuel Humphreys (1778-1846), chief constructor U.S. navy, and grandson of Joshua Humphreys (1751-1838), the designer of the "Constitution" and other famous frigates of the War of 1812, sometimes known as the "father of the American navy." Graduating at West Point in 1831, he devoted himself chiefly to engineering. In the earlier part of the Civil War Humphreys was employed as a topographical engineer with the Army of the Potomac and rendered conspicuous services in the Seven Days' battles. It is stated that he selected the famous position of Malvern Hill, before which Lee's army was defeated. Soon after this he was assigned to command a division, and at the battle of Fredericksburg he distinguished himself greatly in the last attack of Marye's heights. He took part in the battle of Chancellorsville, and at Gettysburg commanded a division under Sickles. A few days later he became chief of staff to Gen. Meade, and this position he held throughout the Wilderness campaign. Towards the end of the war Gen. Humphreys succeeded Gen. Hancock in command of the famous II. Corps. The short campaign of 1865, which terminated in Lee's surrender, afforded him a greater opportunity of showing his capacity for leadership. After the war, now brevet major-general, he returned to duty as chief engineer of the U.S. army, and retired in 1879. He died at Washington on Dec. 28, 1883. Amongst his works may be mentioned *From Gettysburg to the Rapidan* (1882) and *The Virginia Campaigns of 1864-1865* (1882).

See Wilson, *Critical Sketches of some Commanders* (Boston, 1895); Henry Hollingsworth Humphreys, *Andrew Jackson Humphreys: a Biography* (1924).

HUMPHRY, OZIAS (1742-1810), English miniature painter, was born at Honiton and educated at the grammar school of that town. Attracted by the gallery of casts opened by the duke of Richmond, Humphry came to London and studied at Shipley's school; and later he left for Bath, where he lodged with Linley and became a great friend of his beautiful daughter, afterwards Mrs. Sheridan. In 1766 he was in London warmly encouraged by Sir Joshua Reynolds, who was always interested in Devonshire painters. He was a great friend of Romney, with whom in 1773 he went to Italy, staying, on his way to Dover, at Knole, where the duke of Dorset gave him many commissions. In 1785 he went to India, visiting the native courts, painting a large number of miniatures and making many beautiful sketches. His sight failed him in 1797, and he died in Hampstead in 1810.

See *The History of Portrait Miniatures*, by G. C. Williamson, vol. ii. (1904). (G. C. W.)

HUMUS (a Latin word meaning the ground), a product of decomposing organic matter. It is especially present in peat bogs, and also occurs in surface soils, to which it imparts a brown or black colour. It is one of the most important soil-constituents from the agricultural point of view; it modifies the properties of the soil by increasing its water-holding capacity and altering its colloidal nature. The chemical composition is very complex and has been much disputed.

See *Trans. Faraday Society* 17, p. 200-296 and 272-287 (1922); also E. J. Russell, *Soil Conditions and Plant Growth* (5th ed., 1927).

HUNALD, DUKE OF AQUITAINE, succeeded his father Odo, or Eudes, in 735. He refused to recognize the high authority of the Frankish mayor of the palace, Charles Martel, whereupon Charles marched south of the Loire, seized Bordeaux and Blaye, but eventually allowed Hunald to retain Aquitaine on promise of fidelity. At Charles's death in 741 Hunald declared war against the Franks, crossed the Loire and burned Châtres. Menaced by Pippin and Carloman, Hunald begged for peace in 745 and retired to a monastery, probably on the Isle of Ré. We find him later in Italy, where he allied himself with the Lombards and was stoned to death. He had left the duchy of Aquitaine to Waifer, who was probably his son, and who struggled for eight years in defending his independence against King Pippin. At the death of Pippin and at the beginning of the reign of Charlemagne, there was a last rising of the Aquitanians. This revolt was directed by a certain Hunald, and was repressed in 768 by Charlemagne and his brother Carloman. Hunald sought refuge with the duke of the Gascons, Lupus, who handed him over to his enemies. In spite of the opinion of certain historians, this Hunald seems to have been a different person from the old duke of Aquitaine.

See J. Vaissette, *Histoire générale de Languedoc*, vol. i. (ed. of 1872 seq.); Th. Breysig, H. Hahn, L. Oelsner, S. Abel and B. Simson, *Jahrbücher des deutschen Reichs*. (C. Fr.)

HUNAN, an important province of central China to the south of the Yang-tze but within its basin, the southern boundary following the sinuous crests of the Nan-shan (or Nan-ling) which forms the divide between the Yang-tze and Si-kiang drainage systems. The economic life of Hunan is essentially based on the valleys of two large rivers which converge on the Tung-ting lake, itself a reservoir and feeder of the Yang-tze.

Of these the Siang-kiang, rising in the Nan-ling and flowing due north to the lake, is the most important of all the southern tributaries of the Yang-tze. It has formed throughout Chinese history one of the two great corridor routes through the South China Highlands to the Si-kiang and the Canton delta, the water-parting ranges being crossed by the Che-ling pass at the head of the valley. It was a very early avenue of advance for the Chinese colonists from the Yang-tze valley and the prevailing language is Mandarin, but Mandarin of an older type than that of the south-west, peopled in much later centuries by immigrants from North China. In the strategic relations of central and south China the Siang valley has always been of critical importance and it was one of the main lines of advance of the Nationalist armies from Kwang-tung to Hankow in the winter of 1926-27. It was selected as the route for the main Peking-Hankow-Canton Trunk railway which has been completed along it to a point above Changsha, the capital city of the province. The river itself is of great use for navigation, although subject to considerable variations of level according to the season. River steamers drawing up to 8 ft. of water sail from Hankow up the Siang to Changsha and Siangtan except during the winter months. Launches ply upstream during most of the year to Hengchow, and above that city the river and its tributaries are navigable for junks for long distances.

The second great river of Hunan is the Yuen-kiang which, rising in the Kwei-chow plateau, drains the western third of the province and flows into the Tung-ting lake at its south-western extremity. Although more impeded by rapids than the Siang, the Yuen is navigable for small boats right into Kwei-chow province, and is the great artery for the transport of timber from the forests of

Kwei-chow and south-west Hunan to Hankow where there is a heavy demand for it for industrial and domestic purposes. It comes mainly in the form of rafts, floated down the Yuen into the Tung-ting Lake and thence to the Yang-tze. The Yuen valley affords the chief route from the Central Yang-tze to Kwei-chow and south-west China generally. A third river, the Tzu-kiang or Tan-ho (river of rapids) drains central Hunan between the Siang and Yuen basins and also flows into the Lake, but it is so impeded by rapids as to be of very little value for navigation and the trade of the middle and upper parts of its valley is chiefly carried on by the Siang route. Its focal point is Pao-king connected by road with Heng-chow on the Siang and Changteh, the chief collecting centre for the Yuen.

The great majority of the population of Hunan is concentrated in these three valleys and the lowlands around the Tung-ting lake on to which they converge. Yo-chow, at the outlet of the lake is the connecting link with Hankow and the Yang-tze trade. The agricultural production in the lowlands and especially in the reclaimed land around the lake is rich and varied, yielding a surplus available for commerce. Rice grown on the lake shores, in the valley bottoms and on the terraced slopes of the hills is the chief crop, and tea from the slopes of the valleys of the Lower Siang and its tributaries is an important commercial product, as is also tea oil. The cultivation of the mountain valleys is mainly of subsistence crops which include wheat, kaoliang, peas and groundnuts.

Hunan is of far more than agricultural importance. The most accessible coalfields of all south China, in the present state of communications, lie along the Siang valley. Those in the main valley itself, around Hengchow and Siangtan, and in the valley of the Lei tributary, are as yet worked only for local consumption but they are of great potential importance, partly on account of their quality, but especially because of their position on the half-completed Hankow-Canton trunk railway. A smaller field, the Pinghsiang, is even now worked by modern methods, and this, although actually within Kiangsi province, communicates through Hunan with its main market in the cities of Wu-Han by the Chuchow-Pinghsiang railway, a branch of the main line. Hunan ranks seventh among the provinces of China in coal reserves and in coal production. In addition to this wealth in coal, Hunan appears to have considerable reserves of such metallic ores as tin, lead-zinc and antimony. The tin-fields of the Nan-shan are not yet exploited and the lead-zinc ores of the upper Siang valley are worked only to a limited degree, but the province supplies the bulk of the antimony production of the world. The ores are mined in the valley of the Tzu-kiang and refined at Changsha.

The Hunanese have long had a reputation in China for strong provincial patriotism. The *Literati* class is well represented and a feature of the countryside is the large number of estates belonging to the Hunanese gentry, some of whom have played a notable part in public affairs. The population of the province according to the Post Office estimate of 1920 is over 28 millions, and three cities, Changsha, Changteh and Siangtang are reported as having over 200,000 inhabitants.

HUNDRED. In England the term "hundred" is particularly applied to an ancient territorial division intermediate between the *villa* and the county. Such subordinate districts were also known in different parts of the country by other names; e.g., *wapentakes* in Yorkshire, Lincolnshire, Nottinghamshire, Derbyshire, Rutland and Leicestershire; *wards* in Northumberland, Durham and Cumberland; while some of the hundreds of Cornwall were formerly called *shires*. In some parts of England a further intermediate division is to be found between the hundred and the county. Thus we have the *trithing* or *riding* (*q.v.*) in Yorkshire, the *lathe* in Kent, and the *rape* in Sussex. In Lincolnshire the arrangement is peculiar. The whole county was divided into the three sub-counties of Lindsey, Kesteven and Holland. The significance of the name hundred is a matter of some difficulty. The old theory, and perhaps the best, is that the hundred denoted first a group of a hundred families, and then the district which these families occupied. This is not inconsistent with another view, according to which the hundred was originally a term of measurement denot-

ing a hundred hides of land, for there is good reason for considering that the hide was originally as much land as supported one family. It is important to notice that in the document compiled before the Norman Conquest, and now known as the *County Hidage*, the numbers of hides in all the counties are multiples of a hundred, and that in many cases the multiples agree with the number of hundreds ascribed to a county in Domesday Book. The hundreds of Devon, however, seem never to have contained a hundred hides; but various multiples of five, such as 20, 40 and 60. Here, and in some of the other western counties, the hundreds are geographical divisions, to which a varying number of hides was attributed for fiscal purposes.

In the middle ages the hundred was chiefly important for its court of justice; and the word *hundredum* was as often applied to the court as to the district over which the court had jurisdiction. According to the compilation known as *Leges Henrici*, written shortly before 1118, it was held 12 times a year, but an ordinance of 1234, after stating that it had been held fortnightly in the reign of Henry II., declares that its ordinary sessions were henceforth to take place every three weeks (*Dunstable Annals*, 139). Existing court rolls show that from the 13th to the 15th centuries it usually sat 17 times a year, in some hundreds in a fixed place, in others in various places, but in no regular course of rotation. Twice a year a specially full court was held, to which various names such as *hundredum legale* or *hundredum magnum* were applied. This was the sheriffs' turn held after Easter and Michaelmas in accordance with the Magna Charta of 1217. The chief object of these sessions was to see that all who ought to be were in the frank-pledge, and that the articles of the view of frank-pledge (*q.v.*) had been properly observed during the preceding half-year. Each township of the hundred was represented by a varying number of suitors who were bound to attend at these half-yearly sessions without individual summons. If the proper number failed to appear the whole township was amerced, the entry on the rolls being frequently of the form "*Villata de A. est in misericordia quia non venit plenarie*." All the 17 courts, including the two full courts, had jurisdiction in trespass covenant and debt of less than 40 shillings, and in these civil cases such of the freeholders of the county as were present were judges. But the sheriff or the lord of the hundred was the sole judge in the criminal business transacted at the full courts.

Owing to the great fall in the value of money the hundred court began to decay rapidly under the Tudor sovereigns. They were for the most part extinguished by the County Courts Act, 1867, which enacts that no action which can be brought in a county court shall thenceforth be brought in a hundred or other inferior court not being a court of record. Until lately the most important of the surviving duties of the hundred was its liability to make good damages occasioned by rioters. By the Riot (Damages) Act, 1886, the liability was thrown on the police rate.

See Pollock and Maitland, *Hist. Eng. Law*; J. H. Round, *Feudal England* (1895); *Annales monastici*, "Rolls" series, iii. (Dunstable), 139; F. W. Maitland, *Domesday Book and Beyond* (1897). (G. J. T.)

HUNDRED DAYS, the name commonly given to the period between March 20 1815, the date on which Napoleon arrived in Paris after his return from Elba, and June 28 1815, the date of the restoration of Louis XVIII. The phrase *Cent Jours* was first used by the prefect of Paris, the comte de Chabrol, in his speech welcoming the king. See NAPOLEON, and FRANCE: *History*.

HUNDRED YEARS' WAR, THE. This name has been given by historians, not quite accurately, to the long struggle between England and France which, interrupted by two treaties and numerous truces, went on in an intermittent fashion from 1338 to 1453. Its fundamental cause was the anomaly by which the Plantagenet kings of England held an immense fief in southern France, the remains of the heritage of their ancestress Eleanor of Aquitaine. It was natural that successive kings of France should endeavour to reunite to their crown-lands all the broad counties along the Garonne which had slipped out of the direct control of the Carolingian monarchs during the dark ages. It was equally natural that the kings of England should endeavour to cling to their ancient inheritance. Their task was made possible by the

fact that so late as the 14th century French national consciousness was still undeveloped, and most of the towns and many of the nobles of the South preferred the rule of an absentee duke of Aquitaine at London—who left them to manage for themselves for the most part—to that of the king at Paris with his grasping lawyers and tax-gatherers always on the spot.

The real character of the Hundred Years' War was disguised to a certain extent by the absurd claim of Edward III. and his successors to the crown of France—a claim adopted without sincere conviction from purely political reasons. Indeed Edward did not assume the title of King of France till the war had been running for several years (1338–40), and he sold his pretensions for solid consideration in land at the treaty of Brétigny (1360). That Henry V. almost succeeded in turning the shadow into substance for a few years in the 15th century had nothing to do with King Edward's original claim. Henry conquered half France as the head of a French political faction rather than as an English dynastic claimant, and his son was only recognized as king at Paris so long as French party-spirit was stronger than French national spirit, whose resurrection was displayed in the career of Joan of Arc. The real character of the struggle is well shown by the fact that after Paris had been recovered by the enemy in 1436, Bordeaux still held out for its English "Duke of Aquitaine" for 15 years more, and after having been once subdued, rose again in the name of King Henry VI., and fought for another year in the cause of southern particularism.

The dynastic side of the Hundred Years' War is a depressing story. Of its widespread economic and commercial effects this is not the place to speak, though they had much to do with the making of modern England. Its military aspect is most important, not only in the history of England and France, but in that of the general development of the art of war in Europe. Its opening years saw the end of the supremacy of feudal cavalry as the dominating power in battle: its last years witnessed the first instances of general actions decided by artillery.

PERIOD I. 1338–45

Friction between the king of England as duke of Aquitaine and the duke's overlord at Paris had been intermittent for the last century. In 1338 it had reached one of its not infrequent crises, but the main cause of rupture was the help given by Philip of Valois to Edward's Scottish enemies. In retaliation Edward stirred up the Flemings and other Netherland neighbours of France, and bought the help of the Emperor Lewis of Bavaria. His first attempts, however, to invade northern France with an army composed for the most part of the emperor's vassals in the Low Countries were complete failures. And no profit was got by Edward's proclamation of himself as rightful king of France—a step which he took in order that the Flemings might be able to say that they were not engaged in a treasonable attack on their suzerain. For Flanders, unlike the rest of the Netherlands, owed homage to France (1340). The only profit which Edward got out of the first period of the contest was the complete destruction of the French fleet at the battle of Sluys (June 25, 1340), which gave him the command of the sea for 30 years,—no small boon, for in the early days of the war French squadrons had raided and sacked Southampton, Portsmouth, Hastings and other seaports. But on land there was no decisive fighting—though Edward was eager to try against the French the tactics which the English had learned in their Welsh and Scottish wars, and of which he himself had given a victorious example at Halidon Hill (1333). But Philip of Valois accepted no general action, and Edward was unlucky in his sieges of Tournai and other places on the northern border of France. The Flemish campaigns were a complete failure, nor did Edward meet with much success in an attempt to attack France on another flank—the duchy of Brittany—where he supported the claimant in a contested succession who had not the approval of King Philip. With his exchequer drained dry and his parliament growing discontented, Edward consented to a two-year truce, which covered the years March 1343–March 1345.

PERIOD II. 1346–60 CRÉCY AND POITIERS

Very different was the course of military affairs when the two

years of fitful truce ran out, and Edward invaded Normandy (July 1346) apparently with the object of drawing off the French from a dangerous attack on Guienne then in progress—but strategical objects are sometimes attributed to mediaeval generals on insufficient evidence. After wasting the whole duchy and capturing the rich town of Caen, Edward marched to the very gates of Paris; but when the whole power of France had been gathered against him, he judged that he had better not fight save under the most favourable tactical conditions. He swerved north, forced the passage of the Somme near its mouth, and then stood at bay, under the forest of Crécy, on a very cleverly chosen position, along a ridge of chalk downs, with a long easy slope like a *glacis* in front of him, and his flanks covered by the houses and enclosures of the villages of Crécy and Wadicourt. Edward had deliberately adopted the formation which had served the English well in their Scottish wars—central blocks of dismounted men-at-arms, with long wings of archers thrown out on each side. After a preliminary skirmish, in which Philip's advanced line of Genoese crossbowmen was shot to pieces by the English archery—who could give them six missiles for one—the cavalry charges began (Aug. 26, 1346). The fight of Crécy (*q.v.*) consisted in a dreadful slaughter by concentrated archery-shot of successive squadrons of the French knighthood; each feudal contingent pushed to the front as it came on the field, and charged up the long slope, to be riddled and finally brought to a stop by the thick flights of cloth-yard arrows which poured in from the flanks as well as the front. The futility of cavalry charges against trained archery in a favourable position was completely demonstrated, and Edward III. did not even need to put his reserves into action. Night only brought the battle to an end—and saw the wrecks of King Philip's chivalry disperse, leaving in front of the English line the bodies of John, king of Bohemia, the blind adventurer—the duke of Lorraine, ten counts and 1,500 gentlemen of coat armour—not to speak of thousands of mercenaries and retainers.

This frightful disaster to the cavalry arm shook to pieces the old theory of feudal war, which rested on the assumption that mailed knights charging in mass could ride over infantry of any sort. The English had taken to heart the results of Bannockburn, where cavalry had a severe lesson, and had gone over to the new tactics. Converging archery volleys, by highly trained professional bowmen, could prevent horsemen from closing, if the ground was favourable and steady supports of dismounted men-at-arms were in the line to give the archers confidence and flank-protection.

King Edward only utilized his victory at Crécy to carry out the siege of Calais, whose surrender after a long and obstinate defence gave him a permanent bridge-head across the Channel for further invasions of France (Aug. 4, 1347). Next summer both England and France were smitten by the awful plague of the Black Death, which swept away a fifth or a third of the population of both countries and upset all social conditions. It was no wonder that truces were concluded, which lasted for over two years; and were renewed—despite some local bickerings and raids by both sides—till 1354. Negotiation with John of France, who succeeded his father, Philip of Valois, in 1350, for a permanent peace, coming to nothing, Edward resumed his policy of invasions of France, but apparently was aiming at breaking the enemy's spirit by destructive raids rather than at the reduction of provinces, for the armies made broad trails of devastation across the land, but did not linger to besiege large towns. In this spirit he wasted northern France in 1355, while his son Edward the Black Prince harried Languedoc almost as far as the shore of the Mediterranean. The French refused battle and shut themselves up in fortified places. Next year the king's second son, John of Lancaster, ravaged Normandy, while the Prince of Wales made a second great sweep through central France as far as the gates of Bourges and Tours. While returning laden with plunder, towards Bordeaux, he found himself in contact near Poitiers (*q.v.*) with John of France and an army thrice as great as his own. The king had abandoned his passive defensive policy of the last two years, and had resolved to risk a general action, despite the English archery. Twice in recent combats on a small scale, at

Saintes (1351) and Mauron (1352), the French, when facing English archery, had dismounted the main body of their men-at-arms, and kept on horseback only small detachments of picked horsemen, who tried to turn the line, or to slip in by rapid movement without meeting the full effect of the volley. John tried these same tactics, judging, truly enough, that the fully armoured knight was much less vulnerable on foot than when mounted, and might hope to close with his enemy, if the latter was distracted by preliminary manoeuvres of lightly moving horsemen.

Unfortunately for King John, the Prince of Wales had got into a position which was absolutely unassailable by cavalry, the front line being covered by a long hedge along the brow of the hill of Maupertuis, with but a single gap in it. But the dismounted knights did reach the hedge, though much thinned by the arrow-flight, and very bitter and prolonged fighting took place all along it. But the first French line was beaten back at last, the second flinched and turned away, and only the third, under King John himself, fought out the battle to the end. It finally broke up and retired, leaving King John and his younger son Philip prisoners. This was not so entirely an archery battle as Crécy, but could not have been won without the archers.

Poitiers might have been as indecisive a victory as Crécy, so far as the ending of the war was concerned, if it had not been that the French king had been captured, and naturally desired to ransom himself. It cured his subjects of any wish for general actions, and for the next four years they allowed the armies of King Edward to range about the land doing mischief to the open country, and shut themselves up in walled towns and castles, till the enemy had eaten up the countryside and was forced to move on for want of food. This destructive but inconclusive system of raids might apparently have gone on for an indefinite time, if King John had not made up his mind that captivity was intolerable, and offered to sign almost any terms of peace that King Edward chose to inflict upon him. He assented in the Treaty of London (March 1359) to conditions so humiliating that the French States General refused to ratify them. But in the following winter King Edward conducted a raiding tour all through Picardy, Champagne and the Isle de France with such ferocity that the spirit of the enemy was broken, and the regent of France and the States General assented to the terms which King John had already accepted, and preliminaries of peace were signed at the village of Brétigny, near Chartres, on May 8, 1360.

By this instrument Edward resigned his claim to the French crown in return for receiving back the whole duchy of Aquitaine, as it had been held by his ancestress, Queen Eleanor, free of vassalage to the king of France. He most unwisely reclaimed many counties which had been for a century and a half in French hands, and had quite lost all remembrance of their Plantagenet dukes—Poitou, the Limousin, Quercy, Rouergue, Marche, the Angoumois—a vast holding peopled by unwilling subjects. In addition Edward kept his conquest of Calais, and received back the county of Ponthieu by the mouth of the Somme, which had belonged to his grandmother, Eleanor of Castile, the queen of Edward I. But humiliating as were these renunciations, the French felt even more bitterly the charge of 4,000,000 gold crowns imposed as the ransom of their king. John, though a well meaning man enough, was an incapable sovereign, and, as everyone said, was not worth the money. Moreover he died only a few years after the treaty had been drawn up. Naturally only the early instalments of the ransom money were ever paid. Odd as it may seem, the complete ratification of the treaty was never put on paper, though Edward duly dropped his French title and received all the lands that he had been promised. He handed over Aquitaine to be ruled by his son, the Black Prince, as a fief of England.

PERIOD III. FROM THE TREATY OF BRÉTIGNY (1360) TO THE PEACE OF 1396

For nine years after the Treaty of Brétigny there was nominal peace between England and France, though it did not prevent English and French auxiliaries taking part against each other in the civil war of the duchy of Brittany and the kingdom of Castile. It was, in great measure, the unwisdom of the Black Prince's

invasion of Spain—where he won, by force of archery, a great victory at Navarrete in 1367, but spent all his treasure and wrecked his own health—that led to the renewal of the French War. He had raised heavy sums in taxation from his unwilling subjects of the newly annexed regions, and in 1369 they rebelled, called for the aid of Charles V. as their rightful lord, and received it. There followed 11 years of unlucky war, in which the English gradually lost all the lands which had been ceded at Brétigny, and were reduced to their original holding in Guienne. The enemy, captained by the great Constable of France, Bertrand du Guesclin, always refused open battle—the terror of archery was still ever present. But while permitting the English to march unopposed in devastating raids through France, and observing a strict defensive behind walls when the invaders were in the field, the Constable worked on a deliberate plan of picking up by sudden surprises, often helped by treachery from within, outlying castles and cities where the enemy had no adequate garrisons, and from which his raiding army was far distant. The Black Prince, who might have made a good defence of his duchy, had collapsed under his Spanish fevers during the first campaign of the renewed war, and after taking the field once in a litter, and sacking the rebellious town of Limoges (1370), returned to England a broken invalid. The conduct of the war fell into the hands of John of Gaunt, duke of Lancaster, the Black Prince's younger brother. John was a convinced exponent of his father's old policy of bringing France to terms by continued circular raids and devastations. It failed completely, though the invasions themselves were sometimes of the most sweeping sort; in 1373 he marched, unfought, from Calais to Bordeaux, right past the gates of Paris. But he brought to Guienne only the wreck of an army; thousands had perished by the way from privation or in petty ambushes. Lancaster persisted in the same policy, and he and his younger brother, Thomas of Woodstock, led several more raids—almost as lengthy as the adventure of 1373 and quite as fruitless. Meanwhile region after region in the south was falling away to the French, and the command of the sea, won at Sluys in 1340, ceased to be certain after a naval defeat off La Rochelle in 1372.

Edward III. died in senile decay in 1377—his enemy Charles V. and Du Guesclin, the great Constable of France, both in 1380. After this the war slackened down. In England, and in France also, the Crown had fallen to a boy-king, oppressed with several ambitious and unscrupulous uncles, and in each country domestic politics took precedence of military adventure. It will be remembered that 1381 saw Wat Tyler's rebellion and all its wild scenes of massacre and reaction. But though there was no serious fighting after 1386, when there was much fear of a French invasion, and though the French encroachment in Aquitaine had nearly ceased, and a series of truces started in 1392, the war went on in theory till 1396. Then Richard II. having got the better of his uncles, concluded the peace of Paris with Charles VI. In form this odd document was only a truce for 30 years, on the territorial *status quo*, by which Richard kept Bordeaux and Bayonne and the Gascon lands between them, but tacitly abandoned all the other lost French dominions of his grandfather. As the agreement was technically only a truce, he was not forced to the humiliation of renouncing his vain title of King of France. But his marriage with Isabella, the young daughter of Charles VI., sufficiently showed that the 30 years' truce was really a permanent settlement of peace.

PERIOD IV. FROM 1396 TO 1414

When, three years only after the treaty of Paris, Richard II. was overthrown, imprisoned and finally murdered by his cousin Henry of Bolingbroke, it appeared at first quite likely that the fate of the French king's son-in-law would lead to war. But no open war followed—partly because Charles VI. relapsed into one of his intermittent fits of insanity, but much more because civil strife broke out in France between the Orleanist and the Burgundian parties, who were too much interested in each other's affairs to spare much attention for those of England. The Orleanist party, however, intermittently indulged in acts of hostility—sending auxiliaries to help the enemies of Henry IV.—the Scots

and the Welsh rebel Owen Glendower; and in 1403 the Constable and Admiral of France—both Orleanists—raided Plymouth and several Channel ports. In 1406, Orleanists and Burgundians, uniting for once, made attempts, the one on Guienne, the other on Calais—but both were foiled, and when in 1408, Burgundy murdered Orleans, the fight between their factions grew so much more bitter that molestations of the English coasts ceased, and civil war became permanent in France. Henry IV. was then able to revenge himself in much the same surreptitious ways that the French had been using in his earlier years. He played a most unscrupulous game—lending troops to Burgundy in 1411 and to the Orleanists in 1412, on the general principle that it was profitable to England that the French should have plenty of trouble at home.

PERIOD V. FROM 1414 TO 1422

Henry IV., long broken in health, died on March 20, 1413, leaving his usurped crown to the most capable and ambitious of all the Plantagenets, his son, Henry of Monmouth, the conqueror of France—a model of formal piety from the moment that he came to the throne, a great soldier and a very unscrupulous politician. He very deliberately resolved to attack France, with the idea that a successful foreign war was the best means of keeping his own unruly subjects in good temper. After making a secret pact with John of Burgundy, he sent ambassadors to Paris to renew all the old claims of Edward III.; not only was all Aquitaine to be returned to him, but he was to be given the hand of one of the king's daughters with a competent dowry, and to receive the long-forgotten arrears of the ransom-money of King John, the prisoner of Poitiers. The French were in the throes of civil war, and to stave off invasion made liberal offers of restoration of lands in Aquitaine, and even prepared to discuss the marriage question. Henry professed himself shocked at their meanness and declared war (April 1415).

On Aug. 10, 1415, Henry V. set sail for Normandy with a well equipped army of 12,000 men, of whom two-thirds were archers. He was a strategist of a very different sort from Edward III. and John of Gaunt, and set before himself the splendid if tedious task of conquering France castle by castle and county by county, not that of indulging in futile raids of devastation. On landing he sat down before Harfleur, the town which commanded the mouth of the Seine (Le Havre did not yet exist), and captured it by force of artillery and mining after a month's siege. This gave him a bridge-head in Normandy, whose conquest was his first aim. As autumn was now drawing on, he had to choose between going into winter quarters in Normandy or marching to Calais. He chose the latter course, probably with the idea that the French would try to stop him and risk a battle, which he desired most of all things. He was not wrong; after he had crossed the Somme with difficulty, he found the whole levy of the Orleanist faction in front of the village of Agincourt (*q.v.*) blocking the road to Calais (Oct. 25). Here was fought the last and most decisive of the great battles of the English archery. D'Albret, Constable of France and the duke of Orleans, used the tactics of Poitiers—an attack by a picked body of horse against the English front, followed by the advance of three solid lines of dismounted men-at-arms. And the result was the same as at Poitiers—the horsemen being shot down with ease. Henry found the French—weighed down by their heavy armour, on a front of ploughed fields sodden with October rain—lurching at a snail's pace towards him. After the archery had played upon them with good effect, he saw them flinch, and charged in upon them, knights and archers all together. They were rolled over in heaps and slaughtered miserably. The Constable was slain, the young Charles of Orleans—head of his faction—and the duke of Bourbon, taken prisoners. The Orleanist faction was for the moment almost annihilated, but finally made head under new leaders—the apathetic dauphin Charles becoming its nominal head, but the new Constable, Bernard of Armagnac, the real leader. And all such resistance as Henry was to meet was from this weakened party. The duke of Burgundy, under a secret agreement with the national enemy, held aloof from the war. Hence the renewed English invasion of France went on with steady progress—Normandy was conquered in three campaigns, 1417–

1418–19, with many sieges but no open battle in the field. Henry continued to make offers similar to those which he had formulated in 1414—he must have back all the old lands of Edward III. and the hand and dowry of the mad king's daughter, Catharine.

The whole aspect of affairs then suddenly changed owing to a murder. The Dauphin lured John of Burgundy to a conference on the Bridge of Montereau, and there the duke was assassinated under circumstances of calculated treachery (Sept. 1, 1419). Wildly indignant and left without a leader, the Burgundian faction suddenly threw itself into the arms of the English, and offered to accept Henry as ruler of France; their only desire was to avenge the murder of Montereau. The young Philip of Burgundy put himself at the head of the movement. Hence the Treaty of Troyes (May 21, 1420), by which Henry, on marrying the Princess Catharine, was to be acknowledged as "heir of France," whose crown was to be entailed on their issue, the insane Charles VI. being allowed to retain the royal title till his death. The dauphin was to be completely disinherited "on account of his enormous crimes." The marriage being consummated (June 2), Henry found himself in possession of all those parts of France where the Burgundian faction was predominant—including Paris and a great part of the east and north. But everywhere towns and regions which adhered to the other faction lay in patches among the Burgundian lands. The dauphin was recognized as regent and representative of his incapable father, everywhere south of the Loire.

As head of the Burgundian party, and leading armies half of which consisted of his French supporters, Henry started on the tedious task of conquering in detail all the provinces where his title was denied. In 1420–21–22 he had taken Sens, Montereau, Melun, Dreux, Compiègne and Meaux, and was pushing ever southward, when he succumbed (Aug. 31, 1422) to an attack of fever and dysentery contracted in the trenches during the siege of Meaux. His insane father-in-law died only two months later, so that the infant Henry of Windsor, his only child by the Princess Catharine, was hailed as king of France, no less than of England, in his cradle.

PERIOD VI. 1423–53. EXPULSION OF THE ENGLISH

The next 20 years saw the slow destruction of the work of Henry V. which had been from the first a triumph of misdirected military genius, assisted by the perverse spirit of French faction. Even if he had driven Charles across the Pyrenees or the Alps, it is incredible that his two realms could have held together after his death.

There was little to rouse sympathy or loyalty in the hearts of the French when a king in his second year and an English regent replaced the formidable Henry of Monmouth. The marvel is that the struggle went on so long after his death. But John, duke of Bedford, the little king's uncle, was a soldier of merit and the dauphin's favourites were not. Hence Bedford's victories of Cravant (Aug. 1, 1423) and Verneuil (Aug. 17, 1424), won with armies which were half French in composition, kept the unnatural fabric of the Anglo-French union together, and in 1428 Bedford's advance reached the Loire and laid siege to Orleans. The high-water mark of progress had been attained. But the force before Orleans was but a few thousands strong, and northern France was sick of the English domination. The Burgundians, after ten years, were beginning to forget the murder of Montereau and to remember that they were Frenchmen.

Only on these considerations can the astounding career of Joan of Arc become comprehensible. When the prophetic, or the witch as the English called her, presented herself before the puzzled dauphin and preached her crusade to his doubting ear, she represented the spirit of outraged and indignant France. He resolved to give her mission a trial. Obeying the "voices" which bade her march straight for Orleans under her white banner, she and her company entered the city (April 29, 1429), and she directed a series of sorties which broke the English lines, and finally caused the siege to be raised. This sudden display of spirit produced surprise and then panic among the enemy. "Before that day 200 English would drive 500 French before them—

but now 200 French would beat and chase 400 English." A series of disasters followed, ending in the battle of Patay (June 19, 1429), where, at Joan's orders, the French charged in "before the archers could fix their stakes," and destroyed a third or more of the army of Lord Talbot. She then conducted the dauphin to Reims, where, as she had promised him, he was duly crowned king: every town where there was not a large English garrison threw open its gates as she passed.

Probably the insurrection would have spread over the whole of northern France if Joan had been properly backed by her master's ministers and captains. But they secretly derided her inspiration in which the soldiers and peasantry believed, gave her grudging support, and when she failed in a surprise attack on Paris, removed her from her position as adviser and inspirer of the army. The revolt continued, however, to spread, though Joan herself, conducting a raid for the relief of Compiègne, fell by ill-chance into the hands of the Burgundians, who sold her to the regent Bedford. He handed her over to a spiritual court composed of French clergy of the opposite faction, and after many months of captivity she was condemned as a sorceress and heretic, and burned at Rouen on May 29, 1431.

But though Joan suffered the death of a martyr, the movement which she had set going never ceased, though its progress was slow when it was no longer conducted by an enthusiast, but by politicians and captains of mercenary bands. But the basic fact in the situation was that the Burgundians were gradually dropping away from the English alliance: Duke Philip himself finally consented to make terms with his father's murderer at the Peace of Arras (1435) and in the following year Paris fell into the hands of the French—the burgher militia having refused to man their walls, and allowing the enemy to enter, while the small English garrison took refuge in the Bastille, and were starved out in a few days (April 1436). The regent Bedford was spared the humiliation of seeing his life's work undone—he had died in the previous autumn at Rouen.

The most astounding thing in the last weary period of the Hundred Years' War is that the fall of Paris was not immediately followed by the expulsion of the English from the whole of France. The struggle went on for no less than 17 years longer: The English Government in stupid national pride refused to make peace, as they might, by surrendering their boy king's French title, and contenting themselves with retaining the ever-loyal Guienne, Calais, and perhaps Normandy, where they had fortified themselves very strongly. Charles of France was apathetic and his resources ran low, on account of the general exhaustion of his realm; nevertheless it is surprising that those hard-fighting veterans, the earls of Warwick and Shrewsbury and the young duke Richard of York, kept Normandy practically intact, considering that the parliament at home grudged both men and money for the war, and that every French town revolted when revolt was possible. There was a long episode of truce in 1444-48, when—a peace party having at last appeared in England, led by the earl of Suffolk—an accommodation was almost secured, the young king was married to a French princess, Margaret of Anjou, and the English claims dwindled down to the retention of Normandy and Guienne. But the negotiations failed, and war broke out again in 1449.

This time the end had come; the duke of Somerset, commanding in Normandy, was an incapable general, but a much better man might have failed when the enemy came against him with overwhelming numbers and a great train of artillery which blew castle after castle to pieces. By 1450 most of the towns of Normandy had fallen, and the duke was being beleaguered in Caen. To relieve him there came over from England a small army, the last but one that crossed the sea during the Hundred Years' War. It was led by two veteran soldiers, Sir Matthew Gough and Sir Thomas Kyriel, but only numbered 3,500 men. On its way towards Caen it was encountered and annihilated by French forces under the Constable Richemont and the count of Clermont at Formigny (April 15, 1450). This was a battle on a small scale, but of high tactical import: the English had formed themselves in their usual order in a position covered by orchards

and houses—dismounted men-at-arms in the centre, archers in long flanking wings. The French, instead of charging, brought up light field-guns opposite the archers and, keeping out of arrow range, played on the English line with roundshot till their opponents were goaded into advancing into the open to capture the guns. They were then charged in flank; a general hand to hand *mêlée* followed, and the French were completely victorious. Of all Kyriel's army only a few hundred got away. This was the end of the English in Normandy—Somerset surrendered Caen on June 24. Nothing now remained to King Henry VI. in the north save Calais.

The next year saw the French army directed against Guienne; no succour came from England; Jack Cade's rebellion was recently over and a bitter parliamentary contest between the dukes of York and Somerset was raging. The outworks of Bordeaux fell in May 1451, the city itself most unwillingly opened its gates on June 30. Bayonne, the last stronghold of Aquitanian loyalism, fell on Aug. 20. It looked as if the war had come to an end. But particularism was still strong: within six months of the fall of Bordeaux, Gascon nobles and burghers were visiting London to implore the aid of an English army and pledging themselves for revolt. The duke of York, as head of the English war party, prevailed on the king's council to make a final effort, and in Oct. 1452 the veteran Talbot, earl of Shrewsbury, the last surviving general of Henry V., came ashore in the Gironde with 3,000 men. On his arrival Bordeaux and all the minor towns rose in insurrection and expelled their French garrisons. But in the following summer the whole force of France was turned southward, and the fate of the duchy was settled. The French army, besieging the loyalist town of Castillon, had strengthened itself with trenches, palisades and guns of position against any relieving force. Talbot came against it with every man that he could raise, English or Gascon, but finding the enemy resolved not to leave his lines and fight in the open, risked an assault. Archery was of no use against entrenchments, and the relieving army tried to break through by main force in a great column. Its head was torn to pieces by a concentrated fire of artillery, and Talbot himself, overthrown by a roundshot, went down outside the trench. The assault having failed, the enemy sallied out from all sides of his lines and overwhelmed his leaderless troops. The last levy of Guienne and its English auxiliaries perished wholesale (July 17, 1453).

Yet so great was the hatred of the Bordelais for the French that they held out in despair for nearly three months after Castillon, and only surrendered when it became certain that no more help from England could be expected (Oct. 19, 1453). King Henry had just been struck with the first sudden access of the insanity which he inherited from his grandfather, Charles VI. of France, and the Wars of the Roses were about to begin. For 20 years no English ruler had the power or the leisure to think of sending troops to continue the long war overseas. This was the reason why secret emissaries from Guienne found no encouragement in London. It was a marvel that Calais did not share the fate of Bordeaux, and was still destined to remain English for a century, though in the stress of the Wars of the Roses, Queen Margaret of Anjou meditated selling it in exchange for a French mercenary army. If Charles VII. had been a man of energy, and not "*le bien servi*," he might have mastered the last English foothold in France. But though war continued for a few years more, and the Senéchal of Normandy sacked Sandwich so late as 1457, the struggle petered out obscurely, and ended in a truce made by the Lancastrian party with Louis XI., whom they secured as their ally in English civil strife. So ended a contest which had been an unmitigated curse both to England and to France.

(C. W. C. O.)

HUNEKER, JAMES GIBBONS (1860-1921), American musical critic, was born at Philadelphia, Jan. 31, 1860. A graduate of Roth's Military Academy, Philadelphia, he was a law student for a time, subsequently studying the piano in Philadelphia, Paris and New York. He became teacher of the piano at the National Conservatory, New York city, 1886-98, and musical and dramatic critic for the *New York Recorder* and *The Morning*

Advertiser. From 1900 to 1912 he was musical and dramatic critic for the New York *Sun*. In 1912 he joined the New York *Times* but returned to *The Sun* in 1919. He died in Brooklyn (N.Y.), Feb. 9, 1921. His writings on music, literature and art are notable for their style and popular appeal. Those published include *Chopin: the Man and his Music* (1900); *Overtures: Music and Literature* (1904); *Franz Liszt: a Study* (1911); *Ivory, Apes and Peacocks* (1915). He also supplied the text for Joseffy's edition of Chopin's works.

HUNGARIAN LANGUAGE. This language, a member of the Finno-Ugrian family of languages, is known in Hungarian as Magyar (pronounced Madyar), and is spoken by ten and a half millions of people, of whom half a million are in the United States.

Old Hungarian used a script akin to Old Turkish Runish script, but this was superseded about A.D. 1000 by the Roman character at the time of the adoption of Christianity.

The letters without exception retain the same sound value and are clearly pronounced in accented and in unaccented syllables.

The short vowels are *a, e, i, o, ö, u* and *ü*. They are pronounced thus: *a* like *a* in wall; *e* like *a* in man; *i* like *i* in little; *o* like *o* in corn; *ö* like French *eu* in Europe; *u* like *u* in full and *ü* like French *u* in buffet.

The long vowels are *ā, ē, ī, ō, ō̄, ū, ū̄* and are pronounced thus: *ā* like *a* in father; *ē* like *ai* in wait; *ī* like *ie* in field; *ō* like *o* in home; *ō̄* like French *eu* in *peux*; *ū* like *oo* in too and *ū̄* like *u* in French *nature*.

The simple consonants are *b, c, d, f, g, h, j, k, l, m, n, p, r, s, t, v, z*. The compound consonants are *cs (cz), dz, dzs, gy, ly, ny, sz, ty, zs*. *C* is pronounced like *ts* in bits; *g* like *g* in good; *j* like *y* in yard; *r* is rolled and *s* pronounced like *sh* in short. The other simple consonants are spoken as in English. The compound letters are pronounced thus: *cs (cz)* as *ch* in child; *oz=ts*; *dz* as *d* in English; *dzs* as *j* in jolly; *gy* as *d* in duty; *ly, ny, ty*, simply as two letters as in English; *zs* as *s* in pleasure.

Accent.—In single words the accent is always on the first syllable as *apa* (father), *eleven* (living). In syntactical compounds as noun and adjective, verb and adverb, noun and postposition, the accent remains on the first syllable.

Special Features.—Original Hungarian words never begin with a double consonant, except onomatopoeic words as *krákog* (to cough). The vowels are classed as high (*e, ē, i, ö, ü*) and low (*a, ā, o, u*). In conjugation, declension and combination the vowels are harmonized to conform to the vowel of the main root, thus: *ben* (in) with *ház* (house) is *ban: házban*; with a *kert* (garden) is a *kertben*; *vár* (to wait), *kér* (to ask), *tör* (to break) form *vártok—kértek, törtök*. Similar vowel changes express various meanings as *ez* (these), *az* (that); *itt* (here), *ott* (there). There is no grammatical gender. Compounds and verbal modifications are effected by a large number of suffixes. The active verb has two conjugations, definite and indefinite. The former is used when there is no object or when the object is not exactly defined. Causatives, frequentatives, potentials and diminutives are formed by affixes. Syntactical relations are mainly produced by affixes to the noun root. Thus *fej* (the head), *fejtől* (of the head), *fejnek* (to the head), *fejfel* (with the head), *fejben* (in the head). In some cases the suffix remains separate as postposition, thus: *a ház előtt* (before the house), *a ház mögött* (behind the house).

The relations of possession and number are indicated by suffixes, as *házam* (my house), *háza* (his or her house), *házunk* (our house), *tollam* (my pen), *tollaim* (my pens), *tollunk* (our pen), *tollaink* (our pens), *tollad* (thy pen), *tollaid* (thy pens).

Adjectives are not changed, thus: *a nagy ház* (a great house), *a nagy házak* (of a great house), *a nagy házban* (in a great house).

There is no word "to have": a dative form is used as in Latin, *nekem van könyvem* (to me is my book—I have a book). Hungarian has developed independently of its congeners for at least 2,000 years and is therefore marked by sharp differences especially in its phonetic system (see FINNO-UGRIAN LANGUAGES). Morphologically it has lost a dual form, still preserved in Ostjak and Wogul which also retain the objective conjugation. The

singular substantive is used after numerals and adjectives of quantity. The Christian name and title are used after the family name, thus: *Olmosy, Karoly tanár úr* (lit. Olmosy, Charles Professor Mr.).

VOCABULARY

Some 400 words form the common or original stock of the Finno-Ugrian languages and may be classified as (1) Numerals, (2) Pronouns, (3) Parts of the body, (4) Family terms, (5) Natural phenomena, (6) Plants, (7) Animals, (8) Tools and weapons, (9) Industries, (10) Property, (11) Places, etc. The words for horse (*ló*) and saddle (*nyereg*) belong to the original stock, testifying to the nature of the culture of their early ancestors.

The language was enriched about the time of Christ by the development of compound words and the use of suffixes, while a third period of development took place as the result of the spread of writing and learning (1750–1850).

Loan Words.—Contacts with alien cultures at various historical periods have added to the original stock. Thus, at an early period before the separation of the Finno-Ugrian groups, relations existed with an Eastern or Satem Indo-European group, from which some such words as *száz* (hundred), *szaru* (horn). The general Ugrian stock (c. 200 B.C.) borrowed such words as *arany* (gold), *hét* (seven), *ezer* (thousand). Hungarian took definite shape while living near to the Caucasus and in the 1st century A.D. came into contact with an Iranian language, predecessor of Ossete, and obtained such words as *asszony* (woman), *vár* (fort), *vásár* (market), *hid* (bridge), *tölgy* (oak). Turkish has provided many words since the 5th century—when the neighbouring Turkic-Bulgarian peoples taught them agriculture and pastoralism. *Búza* (wheat), *árpa* (barley), *eke* (plough), *alma* (apple), *szőlő* (grape), *bor* (wine), *bika* (bull), *ökör* (ox), *ürü* (mutton), *gyapju* (wool), *balta* (hatchet), *tükör* (mirror), *kapu* (door), *tenger* (sea), *betű* (letter). Personal names such as *Álmos, Árpád, Tas, Turul* were borrowed later under the first kings (11th to 13th centuries). A second Turkish invasion added such words as *koboz* (lute) and *árkany* (lasso). The third invasion, under the Osmanlis (15th to 17th centuries) brought *kávé* (coffee), *findzsa* (cup), *csizma* (boots). From Slavonic sources came words specially related to Christianity, to ecclesiastical and political organization, economic life and industries. German settlements and the long political relationship with the Hapsburgs added generally to the stock, while Old French—learnt by students in Paris—contributed somewhat. From Latin—for some time the speech of church and school, of education and legal administration—came a few words, especially in old Latin forms. Italy has provided terms in art, France in fashion, England in sport.

Etymological.—Analysis of current speech and of the written language shows that of 1,000 words 884 are Hungarian in origin, 38 come from Romance speech, Slavonic sources yield 33, German gives 15, while from Turkish (10) and other sources come 20 words; in all 88% Hungarian and 12% foreign. Another less favourable computation allows 65% to Hungarian and 35% to foreign sources.

HUNGARIAN LITERATURE. The Catholic ecclesiastics who settled in Hungary during the 11th century were mainly instrumental in establishing Latin as the predominant language of the court, the higher schools and public worship, and Latin continued to monopolize the chief fields of literature until the revival of the native language at the close of the 18th century. Amongst the earliest Latin works that claim attention are the "Chronicle" (*Gesta Hungarorum*), by the "anonymous notary" of King Béla, probably Béla II. (1131–1141), called in the light of recent

research "Petrus Magister" or "Paulus Magister," an ecclesiastic who had learned the profession of notary in Paris. His work describes the early ages of Hungarian history. Other early chronicles are the *Carmen miserabile* of Rogerius; the *Liber Cronicorum* of Simon Kézai (end of the 13th century), the so-called "Chronicon Budense," *Cronica Hungarorum*, printed at Buda in 1473, and the *Chronicon Rerum Hungaricarum* of John Thuróczi. An extraordinary stimulus was given to literary enterprise by King Matthias Corvinus, who attracted both foreign and native scholars to his court. Foremost amongst the Italians was Antonio Bonfini, whose work, *Rerum Hungaricarum Decades IV.*, comprising Hungarian history from the earliest times to the death of King Matthias, was published with a continuation by Sambucus (Basle, 1568). Marzio Galeotti, the king's chief librarian, wrote an historical account of his reign. The most distinguished of the native scholars was John Csezmiczai, *alias* Janus Pannonius, who composed Latin epigrams, panegyrics and epic poems. The best edition of his works was published by Count S. Teleki at Utrecht in 1784.

As there are no traces of literary productions in the native or Magyar dialect before the 12th century, the early condition of the language is concealed from the philologist. It is, however, known that the Hungarians had their own martial songs, and that their princes kept lyre and lute players who sang festal odes in praise of the national heroes. In the 11th century Christian teachers introduced the use of the Roman letters, but the employment of the Latin language was not formally decreed until 1114. (See Bowring, *Poetry of the Magyars*, Introd. xix.) It appears, moreover, that up to that date public business was transacted in Hungarian, for the decrees of King Coloman the Learned (1095-1114) were translated from that language into Latin. Among the literary relics of the 13th century are the *Halotti Beszéd* funeral discourse and prayer in Hungarian.

From the *Margit-legenda*, or "Legend of St. Margaret," composed in the early part of the 14th century, it is evident that from time to time the native language continued to be employed as a means of religious edification. Under the kings of the house of Anjou, the Magyar became the language of the court. The literary documents of this era have been published in a series called *Nyelvemléktár* under the aegis of the Hungarian Academy. The words of old Hungarian have been collected in the *Lexicon linguae hungaricae aevi antiquioris* (1890) and in the *Lexicon Vocabulorum Hungaricorum* (1902). To the early part of the 15th century must be assigned the legends of "St. Francis" and of "St. Ursula," and possibly the original of the *Enek Pannónia megvételeéről*, an historical "Song about the Conquest of Pannonia." But not until the dawn of the Reformation did Magyar begin in any sense to replace Latin for literary purposes. The period placed by Hungarian authors between 1437 and 1530 marks the first development of Magyar literature.

About the year 1437 two Hussite monks named Tamás and Bálint (*i.e.*, Thomas and Valentine) adapted from older sources a large portion of the Bible for the use of the Hungarian refugees in Moldavia. Other relics belonging to this period are the oath which John Hunyady took when elected governor of Hungary (1446); the *Síralomének Both János veszedelmén* (Elegy upon John Both), written by a certain "Gregori"; and the *Emlékdal Mátyás király Halálára* (Memorial Song on the Death of King Matthias, 1490). To these may be added the rhapsody on the taking of "Szabács" (1476); the *Katalin-Legenda*, a metrical "Legend of St. Catherine of Alexandria," extending to over 4,000 lines, and who shows already traces of the criticism of the Renaissance and of a mentality opposed to the philosophy of the middle ages; and the *Feddő enek* (Upbraiding Song) by Francis Apáthi.

Reformation Period.—In the next literary period (1530-1606) several translations of the Scriptures are recorded. Karádi in 1569 brought to light the earliest national drama, *Balassi Menyhért*. Among the native poets, mostly mere rhyming chroniclers of the 16th century, the best and most prolific writer was Tinódi. Székely wrote in prose, with verse introduction, a "Chronicle of the World" under the title of *Cronica ez világnac yeles dolgairól* (Cracow, 1559). Csáktornya and Kákony imitated the ancient

classical poets, and Erdösi introduced the hexameter. During the latter part of the 16th century and the beginning of the 17th two poets of a higher order appeared in Valentine Balassa, the earliest Magyar lyrical writer, a disciple of Petrarch and of the humanist poets, a poet of platonic love, and his contemporary John Rimay.

The melancholy state of the country consequent upon the persecutions of Rudolph I., Ferdinand II. and Leopold I., as also the continual encroachment of Germanizing influences under the Habsburgs, were unfavourable to the development of the national literature during the next literary period, dating from the Peace of Vienna (1606) to that of Szatmár (1711). A few names were, however, distinguished in theology, philology and poetry. In 1626 a Hungarian version of the Vulgate was published at Vienna by the Jesuit George Káldi, and another complete translation of the Scriptures, the so-called *Komáromi Biblia* (Komorn Bible) was made in 1685 by the Protestant George Csipkés, though it was not published till 1717 at Leyden. On behalf of the Catholics the Jesuit Peter Pázmán and others were the authors of various works of a polemical nature. Especially famous was the *Hodaegus, Kalauz* of Pázmán, which first appeared at Pozsony (Pressburg) in 1613. Among the Protestant writers were Némethi, Alvinczy, Alexander Felvinczy, Mártonfalvi and Melotai, who was attached to the court of Bethlen Gábor. Telkibányai wrote on "English Puritanism" (1654). Párispápai compiled an Hungarian-Latin Dictionary (Lőcse, 1708), and Apáczai-Csere, a Magyar Encyclopaedia (Utrecht, 1653). In polite literature the heroic poem *Zrínyiász* (1651), descriptive of the fall of Sziget, by Nicholas Zrínyi, marks a new era in Hungarian poetry. Zrínyi, who in his prose works reveals himself to be a disciple of Machiavelli, expressed in his grandiose writings the spirit of Catholic reform coupled with a baroque taste. The lyric and epic poems of Stephen Gyöngyösy, who sang the deeds of Maria Széchy, are samples rather of a general improvement in the style than of the purity of the language. From the appearance of the first extant printed Magyar work at Cracow in 1527 to the end of the period just treated, more than 1800 publications in the native language are known.

The period comprised between the peace of Szatmár (1711) and the year 1772 is far more barren in literary results than even that which preceded it. The exhaustion of the nation from its protracted civil and foreign wars, the extinction of the court of the Transylvanian princes where the native language had been cherished, and the prevalent use of Latin in the schools, public transactions and county courts, all combined to bring about a complete neglect of the Magyar language and literature. Among the few prose writers of distinction were Clément Mikes who has bequeathed us the most exquisite prose of the century in his memoirs in letter form (1717-58), where may be observed the influence of the English *Spectator*; the historian Michael Cserei; and Peter Bod, who besides his theological treatises compiled a history of Hungarian literature (1766). But the most celebrated writer of this period was the Jesuit Francis Faludi. On account of the classic purity of his style in prose, Faludi was known as the "Magyar Cicero." Not only as a philosophic and didactic writer, but also as a lyric and dramatic poet he surpassed all his contemporaries. Another pleasing lyric poet of this period was Ladislaus Amade, and of considerable merit are the sacred lyrical melodies of Paul Rádai in his *Lelki hódolás* (Spiritual Homage, 1715).

The next three literary periods stand in special relationship to one another, and are sometimes regarded as the same. The first two, marking respectively the progress of the "Regeneration of the Native Literature" (1772-1807) and the "Revival of the Language" (1807-30), were introductory to and preparatory for the third or "Academy," period, which began about 1830.

Regeneration of the Literature.—In consequence of the general neglect of the Magyar language during the reigns of Maria Theresa and her successor Joseph II., the more important prose productions of the latter part of the 18th century were written either in Latin or in German. The reaction in favour of the native literature manifested itself at first chiefly in the creation of various schools of poetry. Foremost among these stood the so-called "French" school, founded by George Bessenyei, the author of

several dramatic pieces, and of an imitation of Pope's *Essay on Man*, under the title of *Az embernek próbája* (1772). Bessenyei introduced the use of rhymed alexandrines in place of the monotonous Zrinian measure. Other writers of the same school were Laurence Orczy and Abraham Barcsay. The songs and elegies of Paul Anyos show great depth of feeling. Versifiers and adaptors from the French appeared also in Counts Adam and Joseph Teleki, and Joseph Péczeli, who translated Young's *Night Thoughts*. The chief representatives of the strictly "classical" school were David Baróti Szabó, Nicholas Révai, Joseph Rájnás and Benedict Virág. Among the works of Baróti Szabó is an abridged version of *Paradise Lost* (1802). Baróti, moreover, published (1810-13) a translation of Virgil's *Aeneid* and *Eclogues*. The "classical" school reached its highest state of culture under Virág, whose poetical works, consisting chiefly of Horatian odes and epistles, obtained for him the name of the "Magyar Horace." The *Poetai Munkai* (Poetical Works) of Virág were published at Pest in 1799. Of his prose works the most important is the *Magyar Szászadok* or "Pragmatic History of Hungary" (Buda, 1808). Vályi-Nagy, the first Magyar translator of Homer, belongs rather to the "popular" than the "classical" school. His translation of the *Iliad* appeared at Sárospatak in 1821. The establishment of the "national" or "popular" school is attributable chiefly to Andrew Dugonics. His national romances, especially *Etelka* (Pozsony, 1787) and *Az arany percek* (Pest and Pozsony, 1790), attracted public attention, and were soon adapted for the stage. Joseph Gvadanyi's trilogy *Falusi Nótárius* (Village Notary, 1790), as also his *Rontó Pál és gr. Benyovszky történeteik* (Adventures of Paul Rontó and Count Benyovszky), are humorous and readable, but careless in style. Of a more general character, and combining the merits of the above schools,—are the works of the authors who constituted the so called "Debrecen Class"; e.g., Michael Fazekas, author of an epic, *Ludas Matyi* (1817). Other precursors of the modern school were the poet and philologist Francis Verseghy; the gifted didactic prose writer, Joseph Kármán, who had published a sentimental novel in the manner of Werther, *Fanni hagyományai* (Memoirs and letters of Fanni 1794); the lyric poets, Szentjóbí, Szabó, Bacsányi (q.v.) and Dayka. Still more celebrated were Mihály Csokonai (q.v.) and Alexander Kisfaludy (q.v.). The first volume of Alexander Kisfaludy's *Himfy*, a series of short lyrics of a descriptive and reflective nature, appeared at Buda in 1801, under the title of *Kesergő szerelem* (Unhappy Love), and was received with great enthusiasm; nor was the success of the second volume *Boldog szerelem* (Happy Love, 1807), inferior. The *Regék*, or "Tales of the Past" (1807) still further increased Kisfaludy's fame; but in his dramatic works he was not equally successful. Journalistic literature in the native language begins with the *Magyar Hírmondó* (Harbinger) started by Matthias Ráth at Pozsony in 1780. Among the magazines the most important was the *Magyar Museum*, established at Kassa (Kaschau) in 1788 by Baróti, Kazinczy and Bacsányi. The *Orpheus* (1790) was the special work of Kazinczy, and the *Urania* (1794) of Kármán.

Revival of the Language.—Closely connected with the preceding period is that of the "Revival of the Language" (1807-30), with which the name of Francis Kazinczy (q.v.) is especially associated. He perfected the work of restoration begun by Baróti and amplified by Révai. Poetry and *belles lettres* still continued to occupy the chief place in the native literature, but under Kazinczy and his immediate followers a correctness of style and excellence of taste hitherto unknown soon became apparent. Kazinczy, in his efforts to accommodate the national language to the demands of an improved civilization, availed himself of the treasures of European literature, but thereby incurred the opposition of ardent nationalists. The opinions of his enemies were ventilated in a lampoon styled *Mondolat*. Daniel Berzsenyi, whose odes are among the finest in the Hungarian language, was the correspondent of Kazinczy, and like him a victim of the attacks of the *Mondolat*. But the fervent patriotism, elevated style, and glowing diction of Berzsenyi soon caused him to be recognized as a truly national bard. His friend, John Kiss, possesses some merit as the translator of Pope and Thomson. As a sonnet

writer none stands higher than Paul Szemere. The lyric poems of Francis Kölcsey can hardly be surpassed, whilst his orations exhibit not only his own powers, but the singular excellence of the Magyar language as an oratorical medium. Andrew Fáy is chiefly remembered for his *Eredeti Mesék* (Original Fables). The dramatic works of Charles Kisfaludy, brother of Alexander, won him enthusiastic recognition as a regenerator of the drama. His plays bear a distinctive national character. Not without interest to Englishmen is the name of Gabriel Döbrentei (q.v.), the translator of *Macbeth*, represented at Pozsony in 1825. Joseph Katona, author of the historical tragedy *Bánk Bán* (1820), is considered to be the greatest of the Hungarian dramatic poets. As authors of special works on philosophy, we find Samuel Köteles, John Imre, Joseph Ruszek, Daniel Ercsei and Paul Sárvári; as a theologian John Somossy; as an historian and philologist Stephen Horváth, who endeavoured to trace the Magyar descent from the earliest historic times; as writers on jurisprudence Alexander Kövy and Paul Szlemenics. For an account of the historian George Fejér, the laborious compiler of the *Codex Diplomaticus*, see FEJÉR.

Academy Period.—The establishment of the Hungarian Academy of Sciences (Nov. 17, 1830) marks the commencement of a new period. The language, nursed by the academy, developed rapidly, and showed its capacity for giving expression to almost every form of scientific knowledge. By offering rewards for the best original dramatic productions, the academy provided that the national theatre should not suffer from a lack of classical dramas. During the earlier part of its existence the Hungarian academy devoted itself mainly to the scientific development of the language and philological research. Since its reorganization in 1869 the academy has, however, paid equal attention to the various departments of history, archaeology, national economy and the physical sciences. The encouragement of polite literature was more especially the object of the Kisfaludy Society, founded in 1836, which published a complete translation of Shakespeare.

Foremost among epic poets, though not equally successful as a dramatist, was Mihály Vörösmarty (q.v.), who combines great power of imagination with elegance of language. Generally less varied and romantic, though easier in style, are the heroic poems *Augsburgi ütközet* (Battle of Augsburg) and *Aradi gyűlés* (Diet of Arad) of Gregory Czuczor, who was, moreover, very felicitous as an epigrammatist. In the epics of John Garay and the lyrics of Joseph Bajza are the first traces of the awakening of the classicism of Petöfi and Arany. As an original but rather heavy lyric and didactic poet we may mention Peter Vajda. Of a more distinctly national tendency are the lyrics of John Kriza and John Erdélyi, but the reputation of the latter was more especially due to his collections of folk-lore made on behalf of the Kisfaludy society. More popular than any of the preceding, and well known in England through Sir John Bowring's translation, are the lyrics of Alexander Petöfi (q.v.).

With Petöfi the greatest poet of the age is Jean Arany (1817-82) who by his short epic poems earned the name of "the ballad Shakespeare." He is considered the master of classical style. Among other poets of the period should be mentioned Coloman Tóth, author of several epic and dramatic pieces; John Vajda; Joseph Lévy, known also as the translator of Shakespeare; Paul Gyulai, not only a lyric and epic poet, but an impartial critical writer; Ladislaus Szelestey; Antony Várady, a patriotic and religious poet; Emil Ábrányi, known also as the translator of Rostand; Alexander Endrődy, the author of *Kurucdalok* (Rebel Songs); Joseph Kiss, in his ballads a disciple of d'Arany, but an original poet in his Jewish poems, and later founder of the ultra-modern revue *A Hét* (The Week, 1890); and Charles Szasz, better known as a translator than as an original poet.

Plays and Novels.—Meanwhile dramatic literature found many champions, of whom the most energetic was Edward Szigligeti, *proprie* Joseph Szathmáry, who enriched the Hungarian stage with more than 100 pieces. Of these the most popular are comedies and serio-comic national dramas. A less prolific but more classical writer appeared in Charles Obernyik, whose *George Brankovics* is one of the best historical tragedies in the

language. Several of the already mentioned lyric and epic poets were occasional writers also for the drama. To these we may add Sigismund Czákó, Lewis Dobsa, Joseph Szigeti, Ignatius Nagy, Joseph Gaal, Charles Hugo, Lawrence Tóth, Emeric Vahot, Alois Degré, Stephen Toldy and Lewis Dóczi, author of the popular prize drama *Csók* (The Kiss). *Az ember tragoediája* (The Tragedy of Man), by Emeric Madách (1861), is a dramatic poem of a philosophical and contemplative character, which even now remains a repertory piece at the National Theatre. Among successful dramatic pieces may be mentioned the *Falu rossza* (Village Scamp, 1875), of Edward Tóth, which represents the life of the Hungarian peasantry, and *Iskariot* (1876) by Anthony Várady. In the years between 1860 and 1880 a school called the "neo-romantic" reigned in the theatre (Jókai, Rákossy and Berczik), while the so-called popular drama was revived by Francis Csepreghy and Géza Gárdonyi.

Original romance writing, which may be said to have commenced with Dugonics and Kármán at the close of the 18th, and to have found a representative in Francis Verseghy at the beginning of the 19th century, was afterwards revived by Fáy in his *Bélték háza* (1832), and by the contributors to certain literary magazines, especially the *Aurora*, an almanack conducted by Charles Kisfaludy, 1821-30, and continued by Joseph Bajza to 1837. The Magyar novels, although enlivened by touches of humour, have generally rather a serious historical or political bearing. Especially is this the case with Nicholas Jósika's *Abafi* (1836), *A csehek Magyarországon* (The Bohemians in Hungary), and *Az utolsó Bátori* (The Last of the Báthoris), published in 1847. The same may be said of Baron Joseph Eötvös's *Karhausen* (1839) and *Falu jegyzője* (1845), translated into English (1850) by O. Wenckstern. Of the novels produced by Baron Sigismund Kemény, considered to be the greatest Hungarian novelist, who mingled in his historical works realism and romanticism, the most important are *A rajongók* (Fanatics, a Jewish sect in Transylvania in the 16th century) published in 1859, and *Zord Idő* (The Disastrous Era, 1862).

The graphic descriptions of Hungarian life in the middle and lower classes by Lewis Kuthy won for him temporary renown. Another popular writer of great originality was Gereben Vas. The fertile writer Paul Kovács excels more particularly in humorous narration. Pleasing humorous sketches are contained also in Ignatius Nagy's "Caricatures" or *Torzképek* (1844). But by far the most prolific and talented novelist that Hungary can boast of is Maurus Jókai (*q.v.*), whose power of imagination and brilliancy of style, no less than his true representations of Hungarian life and character, have earned for him a European reputation. Towards the end of the romantic period the versified novel with heroes in the manner of Byron and Pushkin became the mode. In this new genre the following deserve mention: *Romhányi* by Paul Gyulai, *Tündéröv* (The Fairy Zone, 1876) by John Bulla, *Déliabók hőse* (Hero of the Mirages, 1873) by Ladislas Arany, *Találkozások* (Reencounters, 1877) by John Vajda and *Ráskai Lea* (1887) by Zsolt Beöthy.

Science and History.—As regards works of a scientific character, the Magyars until recently were confessedly behindhand as compared with many other European nations. Indeed, before the foundation of the Hungarian academy in 1830, few such works claiming general recognition had been published in the native language. Even in 1847 astronomy, physics, logic and other subjects of the kind had to be taught in several of the lyceums through the medium of Latin. The violent political commotions of the next few years allowed but little opportunity for the prosecution of serious studies; the subsequent quieter state of the country, and gradual re-establishment of the language as a means of education, were, however, more favourable to the development of scientific knowledge.

In the department of philosophy Hungary could boast a few authors of independent and original thought. Of these one of the most notable is Cyril Horváth, whose treatises published in the organs of the academy display a rare freedom and comprehensiveness of imagination. The philosophical labours of the already mentioned John Erdélyi and of Augustus Greguss won for them

well-deserved recognition, the latter especially being famous for his aesthetical productions, in which he appears to follow out the principles of Vischer.

The labours of Stephen Horváth in the preceding period had prepared the way for future workers in the field of historical literature. Specially meritorious among these are Michael Horváth, Ladislaus Szalay, Paul Jászay and Count Joseph Teleki. The *Magyarok története* (History of the Magyars), first published at Pápa (1842-46), is the most famous of Michael Horváth's numerous historical productions. Ladislaus Szalay's *Magyarország története* (History of Hungary, 1852-61) is a most comprehensive work, showing more particularly the progress of Hungarian legislative development in past times. Count Joseph Teleki is famed chiefly for his *Hunyadiak kora* (The times of the Hunyadys, 1863). In particular departments of historical literature we find Alexander Szilágyi, some of whose works, like those of Ladislaus Kőváry, bear on the past of Transylvania; Charles Lányi and John Pauer, authors of treatises on Roman Catholic ecclesiastical history; John Szombathi, Emeric Révész and Balogh, writers on Protestant church history; William Fraknoi, biographer of Cardinal Pázmán, and historian of the Hungarian diets; and Aaron Sziládi, Joseph Podhradczky, Charles Szabó, John Jerney and Francis Salamon, who have investigated and elucidated many special historical subjects. For the mediaeval history of Hungary the *Mátyáskori diplomatikai emlékek* (Diplomatic Memorials of the Time of Matthias Corvinus), issued by the academy under the joint editorship of Ivan Nagy and Baron Albert Nyáry, affords interesting material. Among the many historians of Magyar literature Francis Toldy *alias* Schedel holds the foremost place. For philological and ethnographical research into the origin and growth of the language none excels Paul Hunfalvy. He is, moreover, the warm advocate of the theory of its Ugrio-Finnic origin, as established by the Uralian traveller Anthony Reguly, the result of whose labours Hunfalvy published in 1864, under the title *A Vogul föld és nép* (The Vogul Land and People). Between 1862 and 1866 valuable philological studies bearing on the same subject were published by Joseph Budenz in the *Nyelvtudományi Közlemények* (Philological Transactions).

As compilers and authors of works in various scientific branches allied to history, may be particularly mentioned—in statistics and geography, Alexius Fényes, Emeric Palugyay, John Hunfalvy, Charles Keleti, Leo Beöthy and Paul Király; in travel, Ignatius Goldziher, Ladislaus Magyar, John Xantus, John Jerney, Count Andrassy, Ladislaus Podmaniczky, Paul Hunfalvy; in astronomy, Nicholas Konkoly; in archaeology, Bishop Arnold Ipolyi, Florian Rómer, Emeric Henszlmann, Baron Albert Nyáry and Francis Pulszky; in Hungarian mythology, Bishop Ipolyi and Anthony Csengery; in numismatics, John Erdy and Jacob Rupp; and in jurisprudence, Augustus Karvassy, Theodore Pauler, Gustavus Wenczel, John Fogarasi and Ignatius Frank.

Notwithstanding the exertions of Paul Bugát to arouse an interest in the natural sciences by the establishment in 1841 of the "Hungarian Royal Natural Science Association," no general activity was manifested in this department of knowledge, so far as the native literature was concerned, until 1860, when the academy organized a special committee for the advancement of mathematical and natural science. The principal contributors to the "Transactions" of this section of the academy were—for anatomy and physiology, Coloman Balogh, Eugene Jendrassik, Joseph Lenhossék and Lewis Thanhoffer; for zoology, John Frivaldszky, John Kriesch and Theodore Margó; for botany, Frederick Hazslinszky, Lewis Jurányi and Julius Klein; for mineralogy and geology, Joseph Szabó, Max Hantken, Joseph Krenner, Anthony Koch and Charles Hoffman; for physics, Baron Lorando Eötvös, Coloman Szily and Joseph Sztoczek; for chemistry, Charles Than and Vincent Wartha; for meteorology, Guido Schenzl. Among the authors of scientific monographs should be mentioned the names of Otto Hermann, Anthony Kerpely and Thomas Kosutány.

Literature Since 1880.—The number of Magyar writers has since 1880 increased to an extent hardly expected by the reading public in Hungary itself. In 1830 there were only ten Magyar

periodical publications; in 1880 we find 368; in 1885 their number rose to 494; in 1890 to 636; and at the beginning of 1895 no fewer than 806 periodical publications, written in the Hungarian language, appeared in Hungary. Since that time (1895) the number of periodical as well as of non-periodical literary works has been constantly rising, although, as in all countries with a literature of rather recent origin, the periodical publications are, in proportion to the whole of the output, far more numerous than the non-periodical. This remarkable increase in the quantity of literary work was, on the whole, accompanied by a fair advance in literary quality.

In lyrical poetry the influence of Heine, Schopenhauer and Nietzsche made itself felt, while the inner tradition followed the ways traced out by Petöfi and Arany: the fight between the modern influences from abroad and the classical Hungarian traditions, began, though feebly, in this early period. Among the poets who first came to the fore in the '60s several were active after 1880: Victor Dalmady, Ladislav Arany, Emil Ábrányi. Julius Revczky (1855-99) inclined to the occidental rather than to the specifically Magyar type of poets, initiating an aristocratic and pessimistic school of poetry. Others were Joseph Kiss, Alexander Endrődi and Odon Jakab; Louis Pósa, the charming children's poet; Andor Kozma, Hungary's greatest satirical poet; Gustave Csengey, Jean Dengi, Antoine Radó and Louis Palagyi; Eugène Heltai, the initiator of the light "chanson" in the Parisian manner; Jules Rudnyánszky, Árpád Zemplényi, Emil Makai, etc.

Among Hungarian novels we may distinguish four dominant genres. The first is represented almost exclusively by Maurus Jókai (q.v.). To the school so perfectly represented by Jókai belong Árpád Kupa, Róbert Tábori, Julius Werner, etc. The second class of Hungarian modern novelists is led by the well-known Koloman Mikszáth, a poet endowed with originality, a charming naïveté, and a freshness of observation from life. A close observer of the multifarious low life of Hungary, Mikszáth has, in his short stories, given a delightful yet instructive picture of all the minor varied phases of the peasant life of the Slavs, the *Palócok*, the Saxons, the town artisan. Amongst his numerous works may be mentioned *A jó palócok* ("The Good Palócok," Slav peasants); *Egy választás Magyarországon* ("An Election in Hungary"); *A tekintetes vármegye* ("The Worshipful County") and *Szent Peter esernyője* ("St. Peter's Umbrella," Eng. trans. by Miss B. W. Worswick). Mikszáth has had considerable influence upon other writers. Such are Victor Rákosi (*Sípulus tárcái*, "The Essays of Sípulus"; Alexius Benedek, the author of numerous distinctly sympathetic and truly Magyar tales, fables and novels, one of the most gifted and deserving literary workers of modern Hungary; Géza Gárdonyi Stephen Bárony, etc. The third class of Magyar novelists comprises those cosmopolitan writers who take their method of work, their inspiration and even many of their subjects from foreign authors. A people with an intense national sentiment, such as the Hungarians, do not as a rule incline towards permanent admiration of foreign-born or imported literary styles; and accordingly the work of this class of novelists has frequently met with very severe criticism on the part of various Magyar critics. Yet it can scarcely be denied that several of the "foreign" novelists have contributed a wholesome, if not quite Magyar, element of form or thought to literary narrative style in Hungary. Probably the foremost among them is Sigismund Justh (*A puszta könyve*, "The Book of the Puszta," prairie of Hungary; *Frümmus*). Other novelists belonging to this school are: Desiderius Malonyai, Julius Pekár (*Dodó főhadnagy problémái*, "Lieutenant Dodó's Problems") Thomas Kóbor, Stephen Szomaházy, Zoltán Thury, Sigismund Gyarmathy, etc. In the fourth class may be grouped such of the latest Hungarian novelists as have tried, and on the whole succeeded, in clothing their ideas and characters in a style peculiar to themselves. Besides Stephen Peteler and Zoltán Ambrus must be mentioned especially Francis Herczeg, who has published a number of very interesting studies of Hungarian social life (*Simon Zsuzsa*, "Susanna Simon"; *Fenn és lent*, "Above and Below"); and Alexander Bródy (*Don Quixote kisasszony*, "Miss Don Quixote";

Faust orvos, "Faust the Physician").

Dramatic literature, liberally supported by the king and the Government, and aided by magnificent theatres in the capital and also in the provinces (the finest provincial theatre is in Kolozsvár, in Transylvania), developed remarkably. In the modern drama three great and clearly differentiated groups may be distinguished. First the neo-romantic group, whose chief representatives are Eugen Rákosi and Louis Dóczi. To the same school belong Louis Bartók, Anton Váradi and Alexander Somló. The next group of Hungarian dramatists is dominated by the master spirit of Gregor Csiky (q.v.). Among Csiky's most promising disciples is Francis Herczeg (already mentioned as a novelist), author of the successful society comedy, *A Gyurkovics leányok* ("The Misses Gyurkovics") and *Három testőr* ("Three Guardsmen"). Árpád Berczik's *Nézd meg az anyját* ("Look at her Mother"), *A protekció* ("Patronizing"), also followed on the lines of Csiky. The third group of dramatic writers take their subjects, surroundings and diction from the folk-life of the villages (*népszínmű*, "folk-drama"). The greatest of these dramatists has so far been Edward Tóth (*Toloncz*, "The Ousted Pauper").

Philosophy and Science.—In philosophy there has been a remarkable increase of activity, partly assimilative or eclectic and partly original. Peter Bihari and Maurice Kármán have in various writings spread the ideas of Herbart. After the school of Comte, yet to a large extent original, is the *Az ember és világa* ("Man and his World") of Charles Böhm, who in 1881 started a philosophical review (*Magyar Filozófiai Szemle*), subsequently edited by Joseph Bokor. Realism, more particularly of the Wundt type, is represented by Emericus Pauer, *Az etikai determinizmus* ("Ethical Determinism"), and Eugen Posch (*Az időről*, "On Time"). On a Thomistic basis John Kiss edited a philosophical review (*Bölcséleti Folyóirat*); on similar lines have worked Ákos Mihályfi, Augustin Lubrich and others. Neo-Hegelianism was cultivated by Eugen Schmitt, efficiently assisted by Joseph Alexander Simon. F. Medveczky (formerly a German author under the name of Fr. von Bärenbach) espoused Neo-Kantism (*Társadalmi elméletek és eszmények*, 1887, "Social Theories and Ideals"). The Hungarian scholar Samuel Brassai published, in 1896, *Az igaz pozitív filozófia* ("The True Positive Philosophy"). Amongst the ablest and most zealous students of the history of philosophy are Bernhard Alexander, under whose editorship, aided by Joseph Bánóczy, a series of the works of the world's great thinkers appeared, and Andrew Domanovszky, author of an elaborate History of Philosophy, etc.

Juristic literature has been stimulated by the activity in positive legislation. On Jan. 1, 1900, a new criminal code, thoroughly modern in spirit, was put in force; and in 1901 a Civil Code Bill, to replace the old Hungarian customary system, was introduced. Among the newer writers on common and commercial law may be mentioned Wenczel, Zsögöd, Gustave Schwartz, Alexander Plósz, Francis Nagy; on constitutional law, Korbuly, Ernest Nagy, Kmety, Ferdinandy, Béla Grünwald, Julius Andrássy and Emerik Hajnik; on administration, Georg Fésüs and Csiky; on finance, Mariska and Exner. Among the later writers on statistics are Konek, Keleti, Láng, Földes, Jekelfalussy, Ráth and Vizaknai.

Among the more important political works are the various monographs of Gustavus Beksics on the Dualism of Austria-Hungary, on the "New Foundations of Magyar Politics" (*A magyar politika új alapjai*, 1899), on the Rumanian question, etc.; the writings of Ákos Beöthy, Victor Concha (systematic politics), Géza Ferdinandy (historical and systematic politics), Béla Földes (political economy), Julius Mandello (political economy), Alexander Matlekovics (Hungary's administrative service; *Államháztartás*, 3 vols.), J. Pólya (agrarian politics), and the late Augustus Pulszky.

In history there has been great activity. The millennial festivities in 1896 gave rise to the publication of what was then the most extensive history of the Hungarian nation (*A magyar nemzet története*, 1895-1901), ten large and splendidly illustrated volumes, edited by Alexander Szilágyi, with the collaboration of the best specialists of modern Hungary, Joseph Hampel, J. B. Kuzsinszky, Géza Nagy, H. Marczali, Anton Pór, Schönherr, V. Fraknói,

Árpád Károlyi, David Angyal, Coloman Thaly, Géza and Aladár Ballagi.

Literary criticism was actively pursued. Among the more authoritative writers Paul Gyulai and Zsolt Beöthy represented the conservative school; younger critics, e.g., Zoltan Ferenczy and Ladislás Négyessy, have shown themselves somewhat too ready to follow the latest Norwegian or Parisian sensation.

20th Century Literature.—Hungarian literature at the beginning of the 20th century was on the brink of a revolution. The intellectual life of the country was undergoing a crisis. After 1,000 years of a history, sometimes glorious but more often tragic, Hungary was faced by new difficulties which threatened her very life: the social question, the defence of her civilization and her language against the Slav and Teutonic races, and the antagonism between the essentially rural nature of the Hungarian people and the Americanism and cosmopolitanism of the capital, Budapest.

Writers were divided into two camps: the traditionalists and the moderns. This division still persists. The older generation, inspired by Hungarian nationalism, had joined in the celebration of the country's 1,000th anniversary in 1896 and had accepted modern civilization but remained firmly opposed to cosmopolitanism and radicalism. They still longed for the Hungarian steppes and the old folk songs. From this generation originated what is known as the Turanian movement, which draws its inspiration and its themes from the East and endeavours to arouse in the Hungarian people the consciousness of their non-European origin. The numbers of this older generation diminish year by year. The patriotic and classical poets, Joseph Lévy (1825–1918) and Alexander Endrödi (1850–1920), towards the end of their lives burst again into song. In 1910 Hungary lost the novelist Koloman Mikszáth, the most notable successor of Jókai. Among contemporary writers of this school are the poets Jules Vargha and André Kozma, the novelist Ferencz Herczeg and the critic and essayist Eugene Rákosi, their organ being the review *Budapesti Szemle*.

In opposition to the older generation were the moderns, who hailed the advent of capitalism and industrialism in place of the old provincial spirit. These intellectual radicals wished to eliminate from literature all national characteristics, and to promote the cause of realism with its materialistic philosophy. They turned their faces towards the West, not the chauvinistic West, but the home of cosmopolitanism and anti-nationalism. The moderns gathered their forces in the early years of the 20th century, using as their rallying point a review with the symbolic title *Nyugat*, edited by Ignatus. Round it gathered the young poets of the symbolist and romantic school. Chief among these men was André Ady, an original Magyar genius, whose primitive and prophetic gifts place him in the first rank of Hungarian poets. Influenced as he was by French symbolism as well as by the works of Zola, he drew inspiration also from the days before the school of Arany, from the melancholy, sometimes crudely expressed, Protestant hymns of the 16th century, from the songs of the rebels against the Austrians, from the archaic and primitive beauties of the Hungarian Bible. He tilts against conventional morality and describes love with all the voluptuousness of the realist: a trait which is, in fact, common to all the moderns. He is distinguished by a certain aristocracy of mind, as, for instance, in his attitude towards the Nietzschean cult of the Ego, but in his general outlook, and in his hedonistic glorification of blood and treasure, and above all, in his sympathy for the poor and despised, he inclines towards Socialism.

Compared with him, modern lyrical poets such as Michael Babits, Jules Juhász, Désiré Kosztolányi, Árpád Tóth, Gabriel Oláh, Ernő Szép have confined themselves to pure aestheticism, seeking to express the emotions of a cultivated, almost neurasthenic, minority. The realistic novelists found a successor in Sigismond Móricz, whose preoccupation with brutish peasants and corrupt petty tradesmen reflect his political tendencies. His work is the antithesis of that of idealistic novelists such as Géza Gárdonyi (d. 1923) and Cécile Tormay.

When the World War broke out, these two camps, the traditionalists and the moderns, were still divided by a great gulf.

Cosmopolitan literature was silent for a time. The poets of tradition hailed the conflict with acclamation. One poet, a soldier, Géza Gyóni, in a language learnt from the moderns, turning his back on *l'art pour l'art*, succeeded in expressing the horrors and pathos of the War. The moderns were not long in making themselves heard, but, as might have been expected, their pacifist leanings were only accentuated by what had happened.

The final disaster, and the revolution of Oct. 1918 unmasked the political connections of *Nyugat*; its contributors joined hands with the rabble. In the intoxication of the first success the moderns threw off the mask. Their review declared itself to be definitely on the side of the revolution and of Count Karolyi. They looked forward to the end of the old feudal agricultural Hungary, the Hungary of officialdom, of the nobility and of the nationalist writers grouped around both.

During its four months' reign Bolshevism kept literature under strict control. Newspapers were suppressed and the right of publication withdrawn. A single publisher held all the world of thought in fee: the State printed nothing but propagandist papers and pamphlets. The socialized theatres were forced to produce plays in celebration of the revolution. Futurist and expressionist writers alone were protected and subsidized by the "literary directory." This upheaval brought no good to literature. Expressionism pushed to extremes led nowhere.

The Growth of Nationalism.—After the brief Soviet régime literature set itself to assist in the task of national regeneration. With no definite theories of art or literary programme it expressed the grief of the divided country and its longing for the lost provinces. Although historic Hungary was divided into five parts, Magyar literature kept its unity. In political Hungary the novel took the place of the lyrical poetry of the pre-War period. Désiré Szabó, in his loftily conceived work, describes the great cataclysm of the World War and the determined defence made by the Hungarians, in both the material and moral spheres, against the foreign invader.

Hungarian literature from this time onward endeavoured to break the bonds of torpid decadence and of anti-national radicalism, and to place before a people, struggling in the shadows of adversity, a new conception of the world which should be healthy, energetic and modern, thus again proving that Hungarian literature has always been something more than a mere exercise in aesthetics. Modern drama is striving to create new and lasting values, both poetic and philosophical. Romanticism has reappeared, and talented dramatists such as Ferencz Herczeg, Ferencz Molnár, Louis Biró and Melchior Lengyel have attained to well-deserved success in the theatres of Europe, and even in those of America.

In discussing Hungarian literature we must not forget that of the lost provinces of Hungary. In Transylvania in particular there has been a remarkable renaissance. The reawakening of a feeling for the mother country has also made itself felt in the Northern Carpathians. There, poets such as the Transylvanian Végvári often express under pseudonyms the sadness which, as Magyars, they cannot but feel. The remote districts saw a veritable renaissance of lyricism: Louis Aprily in Transylvania, Ladislás Mécs and Ladislás Ölvédi in Slovakia.

Latterly it is the novel that has interested Hungary above all else. Lyric poets strive to write "great" novels such as those of Kosztolányi, who wrote a romance about *Nero the Decadent* (*A Véres költő*, The Poet soiled with Blood). Babits, who essayed to compose an epic in prose and verse of the three generations of modern Hungary (*Halálfi*, Son of Death) and Louis Kassak, the ex-workingman writer, with his autobiographical romance (*Egy Ember élete*, A Man's Life). There was an equal harvest of critical works, and nowadays the appearance of an essay causes more stir than did a poem before the War. A desperate fight has developed about the poet Ady, in which all the critics of the country are taking part, e.g., Jean Horváth, Elemér Császár, Albert Berzeviczy, Alexandre Makkai, Eugène Dóczy, Ladislás Négyessy, Julius Szekfü, Eugène Rákosi, to name only the most important. The younger generation wishes to break down the ideology of the past and to adapt itself to the new aims

of the nation. Count Klebelsberg has happily expressed its aims in the word "neo-nationalism." There was a similar renaissance of philosophical thought which manifested itself throughout the whole domain of intellectual life. The leader of this idealistic philosophy is Ákos Pauler. Besides the periodicals (*Napkelet, l'Orient, Minerva, Magyar Szemle, Revue Magyare, Széphalom, Parnasse*) a portion of the daily press contributes to this constitutional "progressivism." The object of all is to maintain a higher cultural level than that of the neighbouring peoples. There are historians of the first rank in Berzeviczy, Skekfü, Hóman, Lukinich, and Szinnyi, Melich and Gombocz are distinguished linguists. The cultural congress of the Finnish, Estonian and Hungarian people held at Budapest in 1928 has shown that in future not only will Hungary look towards the West for its culture but it will engage in cultural co-operation with the Turko-Finnish peoples.

HUNGARY, one of the succession states of the old Austro-Hungarian empire, is a landlocked country in central Europe lying between the Alps and the Carpathians and including parts of the two great tectonic basins of the middle Danube. Area, 35,911 sq.m.

Physical Structure.—Broadly considered the physical structure is simple. The structural backbone is formed by a spur of the central and limestone zones of the Alps, which forms the Hungarian Mittelgebirg. Commencing in the Bakony forest (2,340 ft.), between the river Raab and Lake Balaton it trends from south-west to north-east, being continued by the detached ranges of Vertés (1,575 ft.) and Pilis (2,476 ft.). The stratified formations are quite varied ranging from Permian to Recent and are associated with basalt, andesite and other volcanic rocks, which increase in proportion towards the Danube. This group of highlands separates the Little Hungarian plain (Kis-Alföld) to the north-west from the downlands of the Drava-Danube angle to the south-east. The former, of which only that part on the right of the Danube now belonging to Hungary will be considered, is drained by the lower Raab and its tributaries and flooded by Pliocene strata heavily overlaid by Recent deposits, coarse river gravels, sands and alluvium with patches of loess. Except where swampy as in the region of the Little Schütt island of the Danube and the Hanság marshes this is a rich wheat and sugar-beet district passing gradually east, west and south through rolling downs to forested hills, where occasional stores of lignite and iron-ore supply the fundamentals of manufacture.

South and east of Lake Balaton (*q.v.*) the true downland of Transdanubia occurs. Here, too, intensive agriculture is favoured by vast deposits of loess and loam, deeply seamed by parallel north-west to south-east streams, whose water ultimately reaches the Danube directly or by way of the Drava and the Sió. Rising as a mountainous island from this undulating territory is the massif of the Mecsek hills where outcrops of numerous post-Carboniferous formations Triassic and Jurassic limestones combine with granites, diorites and other igneous rocks to diversify the landscape while on the eastern flank of the hills coal supplies add to the number and character of its human activities. Occasional patches of alkaline soil along the river courses suggest the conditions so common east of the Danube. This river forms the northern frontier from just below Bratislava to the confluence with the Ipeľ, a left-bank tributary. A few miles below, at Višegrad, it turns around the Pilis heights and takes its southward course. East of the river lies the Great Hungarian plain

(Nagy-Alföld) but its southern third, *i.e.*, the Bačka, between the Danube and Tisa, and the Banat, east of the Tisa, is no longer under Hungarian rule.

Despite the uniformity of relief great variations exist in soil conditions, and therefore in agricultural pursuits, on this plain. For the most part alluvium and alluvial loess are the principal soils but near its northern edge Tertiary deposits, mainly of

THE BOUNDARIES OF THE PRESENT KINGDOM OF HUNGARY, APPROVED BY THE PEACE CONFERENCE IN 1920

Miocene age, appear at the surface particularly along the line of the northern highlands, where they are associated with coarse alluvial fans and eruptive rocks, the latter dating from the volcanic activity accompanying the fractures and subsidence which originated the basin. Alternations of marine and lacustrine conditions during Miocene and Pliocene time built up thick deposits of debris from the surrounding highlands, coarsely graded from the margins to the centre of the basin, and these were in part covered by wind-borne material, loess and sand, in which subsequent drainage has developed broad alluvial-floored channels. Drainage, the work of the Danube, Tisa and their tributaries, is indecisive and is supplemented by an extensive system of canals, dikes and river-regularization, yet despite these efforts large areas are still liable to floods and to the formation of alkaline soils. The northern highlands continue in broken form the line of the Mittelgebirges, with the contrast that they are richer in eruptive rocks. From the Danube eastward to the Zagyva rise the Börzsöny (3,080 ft.), and the Cserhat (2,130 ft.), groups, between the Zagyva and the Hernád, the Matrá (3,315 ft.), mainly trachytes, and the Bükk, a complex of Carboniferous shales, Jurassic limestones and volcanics, while beyond the Hernád to the frontier stretches part of the Eperjes-Tokaj volcanic range, renowned for the fertility of its soil and the quality of its vineyards.

The climate of Hungary is transitional between oceanic and continental. The three great climatic regions of Europe, the West European, East European and Mediterranean, here struggle for supremacy. The mean annual temperature ranges from 48° F in the north to 52° F in the south and in general the country shows a positive isanomalous temperature. The annual range of temperature varies from 40-47° F, but may in exposed districts of the Nagy-Alföld greatly exceed the higher figure. The distribution of precipitation over the land shows a decrease in amount eastwards. The greatest quantity is received on the western slopes of the Bakony forest where from 30-35 in. fall per annum; the driest region is the middle Tisa with less than 15 in. in dry years, though sheltered regions such as the south-east slopes of the

THREE ARCHITECTURAL MONUMENTS OF BUDAPEST

1. The Houses of Parliament, built by Almerý Steindl in 1893-1902, in Parliament Square on the Rudolph Quay of the Danube. This is a Gothic structure 870 feet in length, with a dome 325 feet high, and is one of the most imposing as well as one of the largest legislative palaces in the world
2. The Agricultural Museum, an exact replica of Vajda-Hunyad, a Renaissance castle in Transylvania. This is one of a group of buildings in the City Park of Budapest, representing the chief characteristics of Hungarian architecture of all periods
3. A replica by Ignatius Alpar of the porch of the abbey church at Jak; another unit in the architectural group in the City Park

Hegyalja are very dry. Most rain falls in May and June (June, 13% of year's total) with a tendency towards a secondary maximum, caused by Mediterranean influences, in late autumn (October, 10% of year's total) particularly in the Drava-Danube angle. On the Nagy-Alföld the rainfall occurs mainly during occasional storms but elsewhere it is more evenly distributed. The high summer temperatures while excellent for wheat and maize are dangerous when rainfall is below the average, and when this is associated with heavy winds disastrous sandstorms and crop destruction follow. One of the characteristics of the climate of most value to the people is the long autumn whereby the ripening of delicate crops, e.g., vine and other fruits, is assured. The critical feature of the climate from the agricultural point of view is the uncertainty of sufficient rainfall; history shows a series of droughts and famines owing to the small margin of safety.

The response of natural vegetation to these climatic conditions is clear where original examples unaltered by man are found. The characteristic covering of the Transdanubian lands is deciduous woodland, oak, beech, lime and chestnut, but these disappear rapidly towards the Nagy-Alföld where *steppe* conditions prevail. These are probably of human production for along the stream courses small "gallery" woods of alder-willow association are common.

Population and Settlement.—The population of Hungary (1926, estimated at 8,457,852; area, 35,911 sq.m.) is predominantly of Magyar speech and origin, the estimated 1926 percentages according to speech being Magyar 89.8, German 6.8, Slovak 1.7, others 1.7. According to religious belief 64.3% are Roman Catholics, 2.3% Greek Catholics, 27% Protestants and 5.6% Jews. The German minority is not concentrated but exists as enclaves principally in Budapest, along the western frontier and in the Bakony forest and the Danube-Drava angle. The Slovaks, too, are distributed but in small groups in and near the capital and in the county of Bekes of the south-eastern frontier zone. The Jewish element, a powerful economic influence, is urban and representatives are found in most of the large towns, especially in the capital.

The Danube in its north-south course from Visegrad to the Yugoslav frontier divides Hungary into two contrasted regions. West of the river in Transdanubia, the old Pannonia, a tradition of culture, relatively free from interruption, is carried back to pre-Roman days and is based upon settled conditions and agricultural prosperity. Further, conditions of climate are here more favourable than on the Nagy-Alföld where natural difficulties and periodic invasions have disturbed settlement and retarded the development of intensive agriculture. The capital, too, with its eyes on the West and susceptible to the same cultural influences that have shaped Transdanubia, is less representative of life on the great plain where habits, customs and costumes retain much of their primitive stamp. The difference of physical conditions and history are reflected in the land utilization, the forms of settlement and house-types. Thus Transdanubia falls into three regions, the *Kisalföld* where on a denuded plain about 350–425 ft. above sea-level the population carries on an advanced and balanced agriculture based on wheat, rye, fodder plants and cattle-rearing, the central highland belt including the Lake Balaton district where forestry, fishing, mining and tourist traffic supplements a similar intensive agriculture and the Danube-Drava angle, which resembles the second region but has more advanced mining and agriculture.

On these three regions the unit of settlement is the village, either the *Haufendorf* or the *Runddorf* on the plains and the *Strassendorf* along the valleys of the highlands. On the Nagy-Alföld two great regions are recognizable, the Danube-Tisa interstream area, with its lines of dunes and marshy hollows, often floored with alkaline soil, and scanty drainage and, at a lower level, the true steppe east of the Tisa with its vast stretches of cereal land and cattle pastures. On these regions are the great "farmer-towns" of Hungary, enormous agglomerations of people, mainly agricultural, grouped in settlements, the results of grouping for defence, that are but slowly developing the characteristics of true urban centres. Such are Debrecen Kecskemét, Czegled and

Szeged, where many of the population live, while practising an extensive agriculture or semi-nomadic cattle-herding miles distant on the plain. In recent times small isolated houses (single *tanyas*) and self-contained villages (grouped *tanyas*) have commenced to rise in the vast spaces between these towns and to develop from seasonal to permanent homes. In these isolated districts tradition dies hard and a sturdy peasantry treasures a conservatism of outlook that, fostered by difficulties of communication, resists the impact of modern ideas. Both regions of the Nagy-Alföld sweep up to the rich vine-clad and forested slopes of the northern highlands where mining and tourists enlarge the human interests.

Agriculture.—Agriculture is the basis of Hungarian life. Of the entire population of Hungary in 1926 about 55.8% were engaged in agricultural work as compared with 30.1% in industrial and commercial activities. In the five years which preceded the World War, Hungary's agricultural production showed a gradual but constant development in consequence of the draining of flooded areas and the extended use of agricultural machines and artificial manures. This development was arrested by the war, the succeeding revolutions, the occupation of the country by foreign Powers and by the provisions of the Peace Treaty. Owing to the scarcity of labour, draught animals and manure, the arable land, amounting to 5,600,000 hectares, could not be properly cultivated, and a considerable decrease of production resulted. The downward tendency reached its lowest level in the years 1919–20; from that time progress, at first slow and later quicker, was visible, some crops showing a yield which compared favourably with those of pre-war years.

Of the total area 63.6% is arable, 17.9% meadowland and rough pasture and 11.8% forest. Prior to 1918 large estates were very common but since that date they have gradually declined in relative proportion as the result of agrarian reform measures, not always with advantageous results upon the yields of crops. Climatic catastrophes take heavy toll of crops and cause great fluctuations in the annual yields, e.g., in 1913, 28% of the sown area in the Tisa counties failed through storm, flood and drought. Generally, yields have declined since 1918 in response to the acute stress accompanying readjustment. The greatest acreage is devoted to wheat (1926—3,757,337 ac.) which is followed by maize (1926—2,668,236 ac.), rye (1926—1,748,010 ac.), barley (1926—1,063,869 ac.) and potatoes (1926—627,322 ac.). Wheat reaches its greatest intensity along the middle Tisa and in the Körös region but is well-distributed except in the highlands and sandy areas of the Nyírség and Danube-Tisa plateaux where its place is taken by rye, a crop also prominent in Transdanubia. Maize, too, is general with concentrations in the drier regions of high summer temperature, e.g., east of the Tisa and along the fertile borderland of the southern frontier. Potatoes and root crops are closely associated with the intensive farming of Transdanubia and to a lesser extent with the sandy areas.

The following table shows the yield of seven principal crops:—

(In metric quintals)

Crop	Average of the years 1911–15	In 1920	In 1926	In 1927
Wheat	19,950,076	10,322,119	20,386,825	20,639,315
Rye	8,042,139	5,143,169	7,980,011	5,732,785
Barley	7,141,212	4,718,519	5,553,891	5,076,992
Oats	4,404,705	3,237,901	3,600,067	3,152,202
Maize	15,055,696	12,742,081	19,443,212	17,602,402
Potatoes	19,458,893	20,722,294	18,746,228	18,072,151
Sugar beet	15,019,512	6,398,261	14,446,177	12,840,849

The figures for 1927 are provisional.

The values in millions of pounds sterling of the seven principal crops mentioned above amounted in 1920 to 14.2, 1921 to 22.7, 1922 to 29.4, 1923 to 33.0, 1924 to 51.6, 1925 to 56.8, 1926 to 44.6, and in 1927 to 57.2. Before the war the same seven crops produced in the territory of present Hungary (calculated on the basis of the prices of 1913) had a value of £48,400,000. The total value of the agricultural products is now about £80,000,000.

The cultivation of vines, fruit and garden produce is important. More than half of the vineyard area is in the drift sand districts which are immune from phylloxera and the vine acts as a binder. Elsewhere it dominates the volcanic southern slopes of the Mittelgebirges overlooking Lake Balaton and those of the Hegyalja from which comes the famous Tokaj wine. Fruit culture is prominent in Transdanubia and the inter-stream land of the Danube-Tisa, notably at Kecskemét, Czigled and Félégyháza, (apricots, apples), in the Hernad valley (cherries) and the environs of Szeged. The growth of early vegetables for export, fresh or preserved, increases rapidly near the large towns and certain districts specialize in particular products, e.g., melons in the county of Heves, peppers at Szeged and onions at Makó. Commercial plants have always been to the fore and include tobacco on the Nyírség plateau, hemp on the drier regions of the Nagy-Alföld, flax in the moister districts of Transdanubia, sugar-beet (1926—159,901 ac.) in small quantities evenly distributed over the country and hops in the Hernad valley.

The breeding of stock follows cereal production as the most important aspect of Hungarian agriculture. In 1927 the numbers of animals were as follows:—Cattle, 1,805,438; sheep, 1,610,716; pigs, 2,386,664; horses, 903,326. Cattle-rearing exists in two stages of development. On the Nagy-Alföld it is passing from extensive to intensive conditions. Alkaline and other soils unsuited to cereals, such as the Bugacs *puszta* near Kecskemét and the vast Hortobágy steppe west of Debrecen, still pasture enormous numbers of sheep, cattle and horses tended by semi-nomadic herdsmen, many of the cattle being the descendants of the native white longhorned breed, but west of the Danube rearing is intensive, associated with stall-feeding and heavy production of fodder plants and large numbers of Simmenthal cattle appear. Here the organized development of dairy-farming is most advanced though modern methods are spreading fast over the whole country. The national love of horses and their general use in daily life cause them to be bred in many centres. Pigs, chiefly of the *Mangalica* lard-producing breed, are most commonly found on the smaller properties, e.g., in Western Hungary, near the towns as at Budapest and in the maize region of the Körös-Maros. Sheep are bred for milk and coarse wool to supply local needs and are found in greatest numbers on the slopes of the Mittelgebirges and northern highlands and the natural pastures of the Nagy-Alföld. Other stock interests include goats on small holdings, poultry in the wheat districts of the plains, particularly in Transdanubia, where rapid access to the markets of Vienna and Budapest has fostered scientific poultry-farming and bee-keeping. Fish are mainly obtained from the Danube, Tisa and Lake Balaton.

Forestry is of limited importance, for coniferous trees are uncommon and the surrounding highlands are the natural sources of supply. On the plains afforestation with pseudo-acacia and Canadian poplar is increasing to meet the demands for shelter and shade for cattle and houses.

Land mortgage loans granted by the principal financial institutions in Hungary amounted in 1913 to £167.7 million, or 41% of their capital. The land mortgage loans granted by the same concerns at the end of 1924 amounted to only £83,000 or 0.3% of their capital. In other words, the land in Hungary was practically free of all mortgage, owing to the depreciation of the currency. In 1926 the 9.3 million hectares of land in Hungary were worth £582.2 million, of which the 5.6 million hectares of arable land were valued at £406.5 million.

Mineral Wealth.—Hungary has few minerals. No Carboniferous coal exists but Liassic black coal of poor quality is mined in the Mecsek hills. The 1926 output of coal was 6,156,987 metric tons. Lignite is obtained from Tata, south of Esztergom and west of Budapest, the Bükk mountains and at Salgótarján, north of the Cserhat group. Large quantities of fuel however must be imported from Upper Silesia and Czechoslovakia. Iron-ore is mined near the sources of the Hernad at Rudóbánya and upon this depend the iron and steel foundries of the Miskolcz district. Lime and building stone are obtained at various parts of the highland ranges while materials for brickmaking are widespread

over the whole country. There are also large deposits of bauxite.

Industries.—The total production of Hungarian industries (present territory) in 1913 amounted to 1,641.6 million gold crowns, and in 1926 to 1,868.8 million gold crowns, i.e., an increase of 13.8%. The production per factory averaged 790,000 gold crowns in 1913 and 620,000 gold crowns in 1926, i.e., a diminution of 21.5%. The value of the average working capacity of one worker was 7,485 gold crowns in 1913 and 9,000 gold crowns in 1926, i.e., a nominal increase of 20.2%.

The dominant industries of Hungary are those based upon agriculture, with flour-milling taking first place. The greatest concentration is in Budapest with nearly a hundred large and modern steam mills while all the large towns have important milling interests. There are also numerous medium-sized and small enterprises distributed throughout the country using wind or water power. The industry is very sensitive to conditions affecting the crop yield and to the tariff policies of neighbouring countries. Sugar-refining has suffered by the loss of its richest areas of supply but is still an important article of export and prepared in 13 factories. The largest refineries are found at Szerencs in the Hernad valley, at Mezöhegyes, Szolnok and Hatvan; there are also several west of the Raab (output 1926—174,625 tons raw sugar). Spirit and alcohol distilleries using potato, maize and sugar-beet as raw material are numerous in Transdanubia and the Nyírség district with great concentration in and near Budapest. The quantity produced is about double the home demand and, since a large surplus of raw materials is available, may be expected to increase. Breweries on a commercial scale are centred at Köbánya near Budapest and through shortage of supplies, chiefly Slovakian hops, have declined in production; they are primarily concerned with the home demand. The annual production exceeds 14 million gallons. In addition a thriving malt industry enjoys a good central European market. Leather, based partly on domestic, partly on foreign hides, is prepared in a number of tanneries (49 in 1924), particularly in Budapest, yet still on a scale insufficient for the country's needs.

Tobacco is prepared principally in the capital and near the large tobacco plantations of the north-east, but not on a scale sufficient to meet domestic needs. Other industries include the preparation of foodstuffs, e.g., salami (Budapest, Debrecen and Szeged), and preserved vegetables, vegetable oils and jams (Budapest and Kecskemét), confectionery, starch and soap, candles and fertilizers, mainly in the capital.

The second group of industries comprises hardware and machinery. Pig-iron and steel are prepared at Salgótarján and Miskolcz (1926 pig-iron—187,812 metric tons; steel—324,679 metric tons) and sent to the engineering shops of Budapest and Győr where the majority of the machine work is concentrated, but foreign supplies are also necessary. Agricultural implements, boats, rolling stock and electrotechnical apparatus are the principal products.

Textile working employs some 35,000 workers in about 200 factories (1924—93,000 spindles, 8,260 looms). Cotton leads and the largest interests are in Budapest, with smaller factories at Pápa, Szombathely, Szeged, etc. Budapest is also a centre of woollen manufactures which are, however, better distributed in the larger towns of Transdanubia. Hemp and flax weaving are very important, the former in the Nagy-Alföld (Szeged, Csanád and Békés), the latter in Transdanubia also; in neither case is the supply sufficient to meet the home demands.

Other forms of industry include limeburning, brickmaking, glassworking in the northern highlands, cement manufacture in the Vertés and Pilis districts and the refining of oil (Budapest).

Foreign Trade.—The figures for the eight years ending 1927 are given in the table on next page.

The adverse balance of over £12,000,000 shown by the provisional figures of 1927 is due largely to the lower foreign prices obtainable for cereals, especially flour. Quantitatively, there does not appear to have been any appreciable decrease in the exports for 1927, and the total agricultural production is increasing. The increase in imports reflects the improvement of internal purchasing power and the efforts of the Government in the direction of freer

Year	Imports	Exports	Excess of imports	Increase of	
				Imports	Exports
	In millions of pounds sterling			Expressed in index numbers	
1920 .	17.3	6.8	10.5	100	100
1921 .	21.6	10.5	11.1	125	155
1922 .	22.4	13.7	8.7	129	201
1923 .	17.6	14.1	3.5	101	206
1924 .	29.2	23.9	5.3	168	350
1925 .	30.8	29.1	1.7	177	426
1926 .	34.2	31.2	3.0	197	456
1927 .	41.5	28.7	12.8	240	422

The figures for 1927 are provisional.

trade, as well as cheaper and larger foreign credits. As the increased imports consist mainly of materials it is reasonable to assume that they will improve national production.

Trade Conventions.—The breaking up of the Austro-Hungarian monarchy, with its single customs union, into seven independent customs territories naturally proved a handicap to close trade relations between Hungary and her neighbours. In the beginning of 1925 an autonomous customs tariff was brought into force. Although the new duties—partly for the protection of home industries and partly as a basis of bargaining—were relatively high, there was a marked increase of imports, indicating that the duties were by no means prohibitive. By the end of 1927 Hungary had concluded commercial agreements with 20 States on the basis of the most favoured nation clause, and definitive commercial treaties with eight other States on the basis of special tariff concessions. Negotiations with other and particularly with neighbouring States were proceeding, though slowly, with a view to substituting the existing provisional agreements by definitive treaties. Among the many obstacles was the unwillingness of adjacent States to avail themselves of the direct transit facilities offered by the Hungarian railway lines. As a result of this diversion of traffic to more roundabout routes, encouraged by artificial rates, Hungary's ton-kilometre railway figures have fallen steadily—an instance of the problems that confront any solution of the economic difficulties in the Danubian basin.

Administration and Education.—Hungary is now a monarchy without a king, governed by a regent, Admiral Horthy. Its legislature comprises two houses, an upper and a lower. The former contains six classes of members, viz.:—(1) Elected representatives of former hereditary members, about 38 in number, (2) Members elected by County and Municipal authorities, about 50, (3) Heads of representative religious communities, about 31, (4) certain distinguished personages, e.g., judges and high State officials, (5) representatives of scientific bodies and chambers of commerce, about 40, and (6) Life members nominated by the regent. The Lower House numbers 245 members, 200 of whom are representative of rural constituencies and elected by open ballot.

The franchise is granted to males of more than 24 years who have satisfactorily completed an elementary school course and to females of more than 30 years if earning their own living, or with a satisfactory proof of higher education, or the wives of graduates of high schools or colleges, or the mothers of three children. Local administration is not so forward and is subject to much governmental control. Two divisions exist, viz.:—(1) communes where the representative body consists half of members elected for six years and half of heavy taxpayers, with an official body whose members are appointed for life. All persons of more than 20 years who have paid State taxes for two years are enfranchised; (2) the counties and towns ranking as independent, each class being a representative body similar to that of the Communes elected for six years, with an executive committee of officials.

Education has rapidly improved in recent years but is compulsory only between the ages of 6 and 12. According to 1920 statistics 15.4% of the population over 6 years was illiterate. Educational institutions are divided into a number of classes

including infants, elementary, primary, industrial and commercial, secondary, training colleges, technical high schools, universities and certain special grades, e.g., religious and legal. In the period 1925–26 there were 6,438 elementary schools with 656,349 pupils and 16,705 teachers; 1,092 agricultural schools, 400 schools for apprentices, 366 of these being for industrial workers, the remainder for commercial students, 43 training colleges for elementary teachers, 375 primary schools with 87,161 pupils and 3,892 teachers and 6 training colleges for primary teachers. The middle schools, comprising gymnasia, *real* schools, etc., provide a course covering 8 years and out of 61,757 pupils more than 50,000 are boys. The universities are located at Budapest (1926—5,393 students), Debrecen (952), Pécs (1,005) and Szeged (1,135), while there are also about 120 schools offering specialized agricultural, industrial and commercial courses.

Rearrangement of frontiers, following the Treaty of Trianon 1920, has altered the course of much of Hungarian economy especially in the east where the old market towns have been lost, but Budapest (*q.v.*) has always gathered to itself by a zone system of communication and other means many of the threads of life within the present limits of the country and, as the centre and source of inspiration of a State with a “keystone” position astride the middle Danube, can yet do much to restore the country to prosperity, to foster the progress of eastern Europe and to link it more closely with the West.

Hevesy, *Nationalities in Hungary* (London, 1919); F. Heiderich, *Wirtschaftsgeographie Karten und Abhandlungen zur Wirtschaftskunde der (Länder der ehemaligen) österreichisch-ungarischen Monarchie* (Vienna, 1916–22).

(W. S. L.; W. Go.)

Defence.—The strength of the present-day Hungarian Army is governed by the provisions of the Treaty of Trianon, signed in June 1920, which abolished compulsory service, limited the strength of the army to a total of 35,000, including officers and depot troops, laid down a maximum and minimum establishment for army formations, prescribed the length of service for all ranks, limited the manufacture of arms and munitions and forbade their import, and also forbade all natures of “mobilization.” The terms were similar to those imposed upon Austria (*q.v.*).

Recruiting is by voluntary enlistment for 12 years service, of which 6 may be spent on furlough, with facilities for extension of service. Until July 1922 all officers had served in the old army, with an obligation not to retire until the age of 40. Vacancies are now filled by cadets who have spent 4 years at the Military School. Service in the Hungarian Police and Royal Hungarian Gendarmerie is for 20 years for officers, 6 for other ranks, with facilities for extension. The budget strength of the army according to latest returns was 34,708 including 1,478 officers and the gendarmerie and police 9,598, including 1,440 officers.

The Higher Command includes the military bureau of the Governor, the ministry of national defence with the army commander-in-chief and inspectors of the different arms, the Budapest fortress command, the Varpalota garrison command and various inspectorates. The peace distribution of the army is on a territorial basis, its functions, according to treaty, being confined to maintaining order and to “controlling the frontiers.” There is no military air service. An agreement has been arrived at for the control of civil aviation in Hungary.

ECONOMY AND FINANCE

Budget.—According to the programme of reconstruction drawn up in mutual agreement by the League of Nations and the Hungarian Government a deficit of £4.2 million was estimated for the

first fiscal year—1924-25—of the reconstruction period, but in fact that financial year closed with a surplus of £3.8 million. For 1925-26 provision was made in the programme of reconstruction for a deficit of £2.1 million, but instead there was a surplus of £3.4 million. These favourable results were improved upon in the fiscal year 1926-27, when—in spite of appreciable reduction in taxation—there was a record surplus of £5.2 million.

Of the 253,800,000 gold kronen which were raised under the auspices of the League of Nations for Hungarian reconstruction only 69,500,000 gold kronen, or less than 28%, were actually used to cover budget deficits and that was in the first half year of the reconstruction period. It was thus possible to use the balance of the loan as a productive investment for the development of Hungary's economic life between 1925 and 1928. In Dec. 1927, the League released the last portion of the loan, viz., 33 million gold kronen, for productive investment in Hungary during the fiscal year 1928-29. The various surpluses of the budgets recorded above were used for the same purpose.

In the fiscal year 1927-28, the following were the principal items of the Budget:—

	Million pounds sterling.
State debts	3.236
Treaty charges	0.209
Expenditure for personnel	9.114
Subsidies to independent administrations for personnel and pensions	1.647
Pensions	3.411
Total, with other expenditure	27.089
Revenue	27.096
Estimated surplus	£0.007

The total expenditure of the State is covered by taxation and departmental receipts. State enterprises are separated from State administration. These enterprises—posts, telegraphs, telephones, state railways, state iron, steel and machine works, state domains and forests, silk production, coal-mining and the postal savings banks—are operated without a charge on the budget. In 1927-28 they were paying their way and had a surplus for investment purposes.

State Debt.—The total Hungarian State debt amounted to £329,800,000 sterling before the war, which represents a burden of £15.7 *per capita* of population. The debt of present Hungary, as constituted under the Peace Treaty, amounted (reparation debt not included) to £57,255,000 sterling at the end of June 1927, due allowance having been made for the allocation of the pre-war debt and of part of the war debt as provided by the Peace Treaty. Of this amount £3,509,000 represents the funded internal debt, £44,575,000 the funded foreign debt and £9,171,000 the floating debt. The burden *per capita* of the population amounts to £6.8, much less than the pre-war burden, mainly in consequence of the depreciation in the value of the internal obligations of the State.

Savings and Credit.—The Hungarian Government contracted no foreign or other loans after the League loan was raised, and steadfastly refused to give its guarantee to any non-Governmental loan. It obtained from parliament wide powers for controlling foreign borrowing by municipal and other bodies. These powers were used drastically, and the Government have only approved foreign borrowing in cases where production would be increased. The eagerness, however, of foreign lenders to give credit to Hungarian enterprise—especially dollar credits—made the position often rather difficult. How the credit situation changed in Hungary can be judged from the fact that whereas in 1925 the first Cities loan could only be contracted in New York at 82, with 7½% interest, in May 1927 the City of Budapest obtained \$20,000,000 at a net price of 88½, at 6% interest. Towards the end of 1927 the Association of Hungarian Mortgage Institutes raised \$7,000,000 at 93½, with 7% interest. The service of foreign loans represented in 1927 only 2.8% of the national income.

Internal savings accumulated steadily. Deposits in the postal savings bank and in the 13 principal Budapest banks amounted on Dec. 31, 1927, to 56.3% of the pre-war figure—the total being £37,636,200. This contributed to the reasonableness of the rates of interest prevailing in Hungary. These were between 7% and

9½% in Budapest, according to the standing of the borrower, and between 8% and 12% in the rural districts at the end of 1927. The bank rate was unchanged during 1927 at 6% as compared with 12½% in March 1925.

Taxation.—Prior to the middle of 1924, the start of reconstruction, the Hungarian Government had recourse to various taxation expedients and coercive measures in order to protect the revenues from the then ever-depreciating currency. Owing to the war, the revolution and the Rumanian occupation, there were also outstanding arrears due for some three or four years which had lost almost all value in consequence of the intervening depreciation of the krone.

Faced with these conditions, the Government in 1920 raised a forced loan by the stamping of notes—amounting to 50% of the currency then in circulation. In 1921 the turn-over tax was introduced, which amounted at first to 1.5% and later to 3% on the sale price of each article and on each handling. Thus, in many instances, it amounted to a tax of 12%. In 1922 land taxes were made payable in wheat or wheat values with a view to obtaining revenue in a non-depreciating medium. At the beginning of 1924 the Government was again compelled to resort to another forced loan from those liable to property and income tax.

In the course of the reconstruction the collection of taxes in wheat was dropped; in Aug. 1925 the turn-over tax was reduced from 3% to 2%, and in Feb. 1926 the State's participation in house rents was abolished.

In consequence of the constantly increasing State revenues, the Government, at the beginning of 1927, continued the alleviation of the tax burden, which was retarding economic recovery. The land tax and the house tax were both reduced, but the proceeds of the latter continued to rise as house rent restrictions were gradually abolished. The tax-free minimum exemption from income tax was slightly raised, the rates of the taxes were reduced, and the more important foodstuffs were completely exempted from the turn-over tax. In spite of these reductions State revenues did not decrease, thanks to the improvement in general conditions.

In the financial year ending June 30th, 1927, the revenues derived by the State from direct taxes were divided as follows: house tax, 51.8; income tax, 47.9; land tax, 40.6; corporation tax, 13.2; property tax, 12.5; sundry taxes, 0.4; total, 166.4 million pengös.

In the same fiscal year indirect taxation yielded 564.4 million pengös. The total burden of State and municipal taxation was roughly estimated at about 88.3 pengös.

Currency.—During the existence of the Dual Monarchy, Hungary and Austria had a joint monetary system and a joint bank of issue. After the outbreak of the revolution the Austro-Hungarian bank was able for some time to continue its work in Hungary, but the Bolshevik régime seized the entire stock of notes. When these began to run short the Soviet republic issued its own notes. After the collapse of Soviet rule in 1919, the Hungarian Government issued the necessary decree to enable the Austro-Hungarian bank to continue its statutory work as "manager of the Hungarian business of the Austro-Hungarian bank."

In March 1920 the Government ordered the stamping of the notes of the Austro-Hungarian bank which were in circulation within the country, and requisitioned 50% of these notes as a forced loan in order to secure, so far as possible, the carrying on of the State administration without constant application to the note printing press. As the creation of a special issuing institution appeared to be inevitable in consequence of the liquidation under the Peace Treaties of the Austro-Hungarian bank, the State itself provisionally established the Royal Hungarian State Note Institute (M. Kir. Allami Jegyintézet), which began its activities on Aug. 1, 1921. The notes of the Austro-Hungarian bank, which had been provided with the Hungarian stamp, were exchanged in the same year against State notes.

When the State Note Institute commenced its work, the financial and economic position was such as to compel the State to cover its budgetary requirements not from revenues but by means of the note printing press. This naturally resulted in the gradual depreciation of the crown. The forced loan raised by stamping

2. The Fisher Bastion and Coronation Church on the Castle Hill in Buda. The Coronation Church, the oldest in Budapest, dates from the 13th century and is used in all important ceremonies. The Fisher Bastion is part of the mediaeval city wall

notes had covered the budget deficit only for a short time. In 1921 the Government had recourse to a non-recurring capital levy, but by the time most of the proceeds reached the treasury the value of the crown had so depreciated as to nullify these efforts. In the first half of 1921 the exchange rate of the crown rose temporarily in Zürich from 1.05 to 2.85 Swiss francs (100 crowns), owing to the impression created by the taxation and other plans of the then minister of finance, M. Hegedus. When it was seen that these plans were impossible of realization, and as Hungary's balance of payments became more and more unfavourable, the crown continued to fall, until in March 1924 it reached 0.0085 Swiss francs for 100 crowns. As a result of long negotiations the League of Nations loan was raised, and the restoration of normal economic and currency conditions was thus made possible (see *Political History*). All restrictions in foreign exchange were abolished in Oct. 1925.

On Dec. 31, 1925, the currency *per capita* of the population was approximately 43 gold crowns. In the latter part of 1925 the new monetary unit was chosen and named the pengő, divided into 100 fillér; 3,800 new units go to 1 kg. of fine gold, so that 1 pengő contains 0.26315789 grammes of fine gold. The currency reform law passed on Nov. 6, 1925, provides for the minting of gold coins for 20 and 10 pengős from an alloy consisting of 900 parts of gold to 100 parts of copper, so that 3,420 pengős will be struck from 1 kg. of this alloy. The National bank is required to buy gold in bars at a fixed price without limit, and on demand. Silver coins of one pengő can be put into circulation to a total nominal value of not more than 45,000,000 pengős.

From Jan. 1, 1927, the pengő was the obligatory unit of account in Hungary. The rate of conversion from the old to the new currency was 12,500 paper crowns to one pengő, or one gold crown—1.1585365 pengő. 1 pengő is therefore equal to 0.0359388 pound sterling or 0.1748985 dollar.

Central Bank.—The re-establishment of an independent bank of issue was in the forefront of the programme of reconstruction. The Hungarian National bank was founded, with a capital of 30,000,000 gold crowns and commenced its activities on June 24, 1924. From that day the State notes then in circulation were regarded as bank notes. Under its statutes the bank is precluded from lending to the State, and is required to maintain against its note circulation, plus sight liabilities minus State debt, a percentage of cover in precious metal and stable foreign exchanges, on an ascending scale, beginning at 20% during the first five years. The bank return of Dec. 31, 1927, showed the proportion of cover to be 46.4%. Since July 1924 the currency has been stable on a sterling basis. In Oct. 1925 the basis of stabilization became gold, and all restrictions on dealings in foreign exchange were abolished.

The following table shows the development of the note circulation:—

Date	Issuing institution	Circulation in paper crowns
Dec. 31, 1920.	Hungarian management of Austro-Hungarian Bank	14,307,808,630
Aug. 1, 1921.	State Note Institute	15,787,175,750
Dec. 31, 1921.	State Note Institute	25,174,941,187
Dec. 31, 1923.	State Note Institute	931,337,334,630
June 24, 1924.	Hungarian Nat. Bank	2,520,113,700,576
Dec. 31, 1924.	Hungarian Nat. Bank	4,513,989,561,419
Dec. 31, 1925.	Hungarian Nat. Bank	5,193,937,447,500 (415,514,995.79 pengős)
Dec. 31, 1926.	Hungarian Nat. Bank	5,885,874,791,705 (470,869,983.34 pengős)
Dec. 31, 1927.	Hungarian Nat. Bank	486,754,101.32 pengős

On Dec. 31, 1927, there were also in circulation—apart from

the above mentioned bank-notes—1 pengő coins, and 50, 20, 10, 2 and 1 fillér small coins to the nominal value of 40,258,639.39 pengős.

HISTORY

The history of the countries which were later to constitute the kingdom of Hungary, up to the close of the Roman period, will be found under PANNONIA and DACIA. The Romans were succeeded by Germanic tribes, and they in turn by the Huns (*q.v.*). After the death of Attila (455), his kingdom declined, and Germanic (Gothic) tribes again entered Pannonia and Dacia. The 6th century A.D. found the Lombards established in Pannonia, the Gepidae in Dacia. In 567 the Avars (*q.v.*), allying themselves with the Lombards, crushed the Gepidae, and in the following year occupied Pannonia, the Lombards migrating to Italy. As the Avar kingdom declined, the western and northern portions of Hungary recovered independence under Slavonic rulers. In 791–797 Charlemagne crushed the Avars, and established the first Ostmarks (see AUSTRIA) which probably occupied all the land between the Danube and the Save. North of the Danube, the important Slavonic kingdom of Moravia (*q.v.*) was founded about 828, while the heritage of the Avars east of the Danube is believed, on slight authority but with great probability, to have been under the suzerainty of the Bulgars.

Arrival of the Magyars.—In 894 the Magyars (*q.v.*) made their first authenticated raid into Moravia. The early history of this race is still a matter of learned dispute. Their own traditions declare them to have entered Hungary first with the Huns; leaving it, to have sojourned somewhere in eastern Europe (both the Caucasus and the Volga are mentioned in these traditions) and then to have crossed the Don, passed by Kiev, and re-entered Hungary through the Vereczka pass. It is certain that they were in south-east Russia in the 9th century, if not before, and probably between the Don and the Kuban rivers; and they appear at one time to have been vassals of the Khazars (*q.v.*). Driven westward by the Petchenegs (*q.v.*) they arrived at the mouth of the Danube in 889; expelled thence by the Petchenegs and Bulgars, they entered Pannonia for final settlement in 895 or 896, under their leader, Árpád. They easily subdued the scattered population of the central plain, crushed the empire of Great Moravia in 906, and defeated the German forces gathered to meet them in 907. They were now firmly established in Hungary; although Transylvania was probably not truly conquered until at least a century later.

During the following 70 years we know little of the internal history of the Magyars. Árpád died in 907, and his immediate successors, Zsolt (907–947) and Taksony (947–972), are little more than chronological landmarks. During this period the Magyar horsemen ravaged Thuringia, Swabia and Bavaria, and defeated the Germans on the Lechfeld in 924, whereupon the German king, Henry I., bought them off for nine years, employing the respite in reorganizing his army. In 933 the war was resumed, and Henry defeated the Magyars at Gotha and at Ried (933). The only effect of these reverses was to divert them elsewhere. In 934 and 942 they raided the Eastern empire, and were bought off under the very walls of Constantinople. In 943 Taksony led them into Italy, and in 955 they ravaged Burgundy. The same year the emperor Otto I. overwhelmed them at the famous battle of the Lechfeld (Aug. 10, 955). This catastrophe convinced the leading Magyars of the necessity of accommodating themselves as far as possible to the empire, especially in the matter of religion. Christianity had already begun to percolate Hungary. The only question was which form of Christianity were the Magyars to adopt, the eastern or the western? Alarmed at the sudden revival of the Eastern empire, which under the Macedonian dynasty extended once more to the Danube, thus becoming the immediate neighbour of Hungary, Duke Géza, who succeeded Taksony in 972, resolved to accept Christianity from the more distant emperor of the West. Accordingly an embassy was sent to Otto II. at Quedlinburg in 973, and in 975 Géza and his family were baptized.

COSTUME, DATING FROM MIDDLE AGES, WORN IN A MEZOKOVESD VILLAGE IN HUNGARY

During his reign, however, Christianity did not extend much beyond the limits of his court.

Stephen I.—Géza's successor, Stephen I. (*q.v.*), was one of the great constructive statesmen of history. His reign (997-1038) resulted in the firm establishment of the Hungarian church and the Hungarian State: in 1001 Pope Sylvester II. recognized Magyar nationality by endowing the young Magyar prince with a kingly crown. Hungary was divided into dioceses, with a metropolitan see at Esztergom (Gran). But the Benedictines, whose settlement in Hungary dates from the establishment of their monastery at Pannonhalma (*c.* 1001), were the chief pioneers. The monks built villages for the colonists who flocked to them, teaching the people western handicrafts and methods of agriculture; and they were soon followed by foreign husbandmen and handicraftsmen, who were encouraged to come to Hungary by reports of the abundance of good land there and the promise of privileges.

In endeavouring to establish his kingship on the Western model Stephen based his new principle of government, not on feudalism, but on the organization of the Frankish empire. Central and western Hungary (the south and north-east still being desolate) were divided into 46 counties. At the head of each county was placed a count nominated by the king, whom he was bound to follow to battle, and to whom he was responsible. Two-thirds of the revenue of the county went into the royal treasury, the remaining third the count retained for administrative purposes. It is significant for the whole future of Hungary that no effort was or could be made by Stephen to weld the heterogeneous races under his crown into a united kingdom; the non-Magyars, unless, as was frequently the case, granted special privileges, were ruled by the royal governors as subject races, forming—in contradistinction to the "nobles"—the mass of the peasants, upon whom until 1848 nearly the whole burden of taxation fell. The right, not often exercised, of the Magyar nobles to meet in general assembly and the elective character of the Crown, Stephen also did not venture to touch.

A troubled 40 years (1038-77) divides the age of St. Stephen from the age of St. Ladislas. In 1046 and 1061 there were two dangerous pagan risings, while from the south and south-east two separate hordes of fierce barbarians (the Petchenegs in 1067-68, and the Cumans in 1071-72) burst over the land. For a time Hungary was in great danger of being forced into dependence on the German empire. In 1041 the emperor, Henry III., made an excuse of the fugitive king Peter's appeal for help, to ravage Hungary, and after his victory at Ménfő (July 5, 1044) he restored Peter and received an oath of fealty from him. In 1051 and 1052 Henry again invaded Hungary but was defeated by Andrew I. (1046-66) and his brother Béla, afterwards king Béla I. (1060-63). Finally the attention of the emperor, Henry IV., was distracted from his Hungarian ambitions by the outbreak of the investiture conflict (1076), when Géza I. shrewdly applied to Pope Gregory VII. for assistance, and submitted to accept his kingdom from him as a fief of the Holy See. The immediate result of the papal alliance was to enable Hungary, under both Ladislas I. (1077-95) and his capable successor Koloman (Kálmán) (1095-1116), to extend her dominion abroad by conquering Croatia and part of the Dalmatian coast. By a series of laws Ladislas improved the administration of justice and the local government of the counties, while Koloman regulated and simplified the whole system of taxation, and promoted trade by a systematic improvement of the ways of communication. The *magna via Colomanni regis* was in use for centuries after his death.

Rivalry with the Eastern Empire.—Throughout the greater part of the 12th century the chief impediment in the way of the external development of the Hungarian monarchy was the Eastern empire, which, under the first three princes of the Comnenian dynasty, dominated south-eastern Europe. On the accession of Manuel Comnenus in 1143 the struggle became acute. Manuel, who was the grandson of St. Ladislas and had Hungarian blood in his veins, aimed at the suzerainty of Hungary, by placing one of his Magyar kinsmen on the throne. He successfully supported the claims of three pretenders to the Magyar throne, and finally made

Béla III. (1173-96) king of Hungary, on condition that he left him, Manuel, a free hand in Dalmatia. The intervention of the Greek emperors had important consequences for Hungary. Politically it increased the power of the nobility at the expense of the Crown, every competing pretender endeavouring to win adherents by distributing largesse in the shape of Crown-lands. Ecclesiastically, it weakened the influence of the Catholic Church in Hungary, the Greek Orthodox Church, which permitted a married clergy and did not impose the detested tithe, attracting thousands of adherents even among the higher clergy. But the Eastern empire ceased to be formidable on the death of Manuel (1180), and Hungary helped materially to break up the Byzantine rule in the Balkan peninsula by assisting Stephen Nemanya to establish an independent Serbian kingdom, originally under nominal Hungarian suzerainty. Béla conquered Galicia and took the title "Rex Galicie"; he endeavoured to strengthen his own monarchy by introducing the hereditary principle, crowning his infant son, Emerich, as his successor during his own lifetime, a practice followed by most of the later Arpáds.

The Golden Bull.—Unfortunately his two immediate successors, Emeric (1196-1204) and Andrew II. (1205-35), weakened the royal power in attempting to win support by lavish grants of the Crown domains, they increasing the already excessive influence of the Magyar oligarchs. In 1222 the so-called Golden Bull was promulgated. It has been called the Magna Carta of Hungary, but really constituted an attempt to defend the monarchy by strengthening the lesser nobles against the magnates. Feudalism was attacked by decrees that the title and estates of the lords-lieutenant of counties should not be hereditary. On the other hand, the principle of the exemption of all the nobles from taxation was confirmed, as well as their right to refuse military service abroad.

Béla IV. (1235-1270) is best known as the regenerator of the realm after the subsidence of the Tatar deluge of 1241-42 (*see* BÉLA IV.), but his two great remedies, wholesale immigration and castle-building, only sowed the seeds of fresh disasters. Thus the Cuman colonists, mostly pagans, whom he settled in vast numbers on the waste-lands, threatened to overwhelm the Christian population; while the numerous strongholds, which he encouraged his nobles to build as a protection against future Tatar invasions, subsequently became so many centres of disloyalty. To bind the Cumans still more closely to his dynasty, Béla married his son, Stephen V. (1270-72), whom he had crowned "junior rex" in 1254, to a Cuman girl. Neither Stephen nor his son, Ladislas IV. (1272-90), was strong enough to make headway against the disintegrating influences all around him. The latter was so completely caught in the toils of the Cumans that the Holy See was forced to intervene to prevent the relapse of the kingdom into barbarism, and Ladislas perished in the crusade that was preached against him. His successor, the last Arpád, Andrew III. (1290-1301), though he conducted a successful war against the emperor Rudolph, who claimed Hungary for his son Albert, as a vassal State, was yet incapable of controlling the Hungarian magnates. After eight years' civil war (1301-08) the crown of St. Stephen finally passed into the capable hands of Charles Robert of Anjou.

During the Arpád dominion the nomadic Magyar race had adopted western Christianity and founded a national monarchy on the western model. While the monarchy was absolute, and thus able to concentrate in its hands all resources of the State, Hungary successfully withstood pagan reaction from within and pressure from without. But the weakness of the later Arpáds, the depopulation of the realm during the Tatar invasion, and the civil discords of the 13th century, brought to the front a powerful class of barons which gradually absorbed the ancient county system, while the ancient royal tenants became the feudatories of the great nobles. This political revolution met with determined opposition from the Crown, which resulted in the utter destruction of the Arpáds.

House of Anjou.—It was reserved for the two great princes of the house of Anjou, Charles I. (1308-42) and Louis I., "the Great" (1342-82), to rebuild the Hungarian State. Their task was made easier by the decimation of the Hungarian magnates during the civil wars. Both these monarchs were absolute. The national

assembly (Országgyűlés) was still summoned occasionally, but the real business of the State was transacted in the royal council, where the able men of the middle class, principally Italians, held confidential positions. The lesser "gentry" were protected against the tyranny of the magnates, and the growth of towns encouraged by grants of privileges. Under Charles the whole fiscal system was reformed, and Louis established a system of protective tariffs. A law of 1351 which, while it confirmed the Golden Bull in general, abrogated the clause (iv.) by which the nobles had the right to alienate their lands, was enacted to preserve the large feudal estates as part of the new military system. Louis's efforts to increase the national wealth were largely frustrated by the Black Death, which ravaged Hungary from 1347 to 1360, and again during 1380-81, carrying off at least one-fourth of the population.

The foreign policy of the Angevin kings was on the whole successful. Charles married Elizabeth, the sister of Casimir the Great of Poland; he reconquered the Banate of Macsó from Serbia, and subdued Bosnia in 1328. Louis, by virtue of a compact made by his father 31 years previously, added the Polish crown to that of Hungary in 1370. Thus, during the last 12 years of his reign, the dominions of Louis the Great included the greater part of Central Europe, from Pomerania to the Danube, and from the Adriatic to the Dnieper.

The Angevins were less successful towards the south, where the first signs of the Turkish menace were appearing. In 1353 the Ottoman Turks crossed the Hellespont from Asia Minor; in 1360 they conquered southern Bulgaria. In 1371 they penetrated to the heart of old Serbia. In 1380 they threatened Croatia and Dalmatia. Hungary herself was now directly menaced. The Árpád kings had encircled their whole southern frontier with military colonies, largely composed of non-Magyar nationalities. But a redistribution of territory had occurred in these parts, which converted most of the old banates into semi-independent and violently anti-Magyar principalities, while in Walachia and Moldavia the growing Vlach nation threw off the shadowy Hungarian yoke altogether in the 14th century (*see RUMANIA*). In Bosnia the persistent attempts of the Magyar princes to root out the sect of the Bogomils (*q.v.*) had alienated the Bosnians, and in 1353 Louis was compelled to buy the friendship of Tvrtko by acknowledging him as king of Bosnia. Both Serbia and Bulgaria were by this time split up into half a dozen principalities which, for religious and political reasons, preferred paying tribute to the Turks to acknowledging the hegemony of Hungary. Thus, towards the end of his reign, Louis found himself cut off from the Greek emperor, his sole ally in the Balkans, by a chain of bitterly hostile Greek-Orthodox States, extending from the Black sea to the Adriatic.

At the death of Louis the Great in 1382, his young daughter Mary, who was betrothed to Sigismund of Luxembourg, was crowned queen; but the Horváthys, a great Croatian noble family, offered the crown to Charles III. of Naples, who accepted it, and was crowned as Charles II. on Dec. 31, 1385. Thirty-eight days later he was murdered at the instigation of the queen-dowager, Elizabeth, who was determined to rule Hungary during her daughter's minority. In July of the same year Elizabeth was murdered in her turn, by the Horváthys. Mary herself would doubtless have shared the same fate, but for the speedy intervention of her fiancé, Sigismund, whom a diet, by the advice of the Venetians, had elected king on March 31, 1387. He married Mary in June the same year, and she shared the crown with him till her death in 1395. Louis the Great's other daughter, Hedwig, was crowned queen of Poland (1384) and forced to marry Jagello, grand-duke of Lithuania.

Sigismund.—During the long reign of Sigismund (1387-1437), who was crowned Holy Roman emperor in 1410, Hungary was confronted with the Turkish peril. The insubordination of the feudal levies was largely responsible for the defeat of the combined armies of Christendom, under Sigismund's leadership, at Nicopolis, in 1396; and the king was hampered, at a time when he might have taken advantage of the collapse of the Turks before the Tatars under Tamerlane, by the enmity of the pope, who saddled him with a fresh rebellion of the Magyar nobles (who set up Ladislas of Naples as king in 1403, but were suppressed at

Pápcz), and two wars with Venice, resulting ultimately in the total loss of Dalmatia (*c.* 1430). After the recovery of the Turks under Mohammed I. and Murad II. (1421-51), Sigismund, realizing that Hungary's strategy must be strictly defensive, elaborately fortified the whole southern frontier, and converted the little fort of Nándorfehérvár (Belgrade), at the junction of the Danube and Save, into an enormous first-class fortress. In 1435 he carried out an army-reform project, by which the nobles and principal towns were bound to maintain a *banderium* of 500 horsemen, or a proportional part thereof, thus supplying the Crown with a standing army.

Sigismund's need of money forced him to conciliate the diet, which was essentially an assembly of notables, lay and clerical, though free and royal towns were invited to send deputies to the diet of 1397. Sigismund was on good terms with his nobles, who supported him against attempted exactions of the popes; but it was at this time that feudalism began to spread over Hungary and especially in the wild tracts where the king's writ did not run. Simultaneously from the west came the Hussite propagandists teaching that all men were equal, and that all property should be held in common. The result was a series of dangerous popular risings (the worst in 1433 and 1436) in which heresy and communism were inextricably intermingled. With the aid of inquisitors from Rome, the evil was literally burnt out, but not before provinces, especially in the south and south-east, had been utterly depopulated. They were repopulated by Vlachs.

Sigismund was succeeded in 1438 by Albert V., duke of Austria, who had married his only daughter, Elizabeth. In the same year he was elected king of the Romans and crowned king of Bohemia. In 1439 he died of dysentery, in the course of a campaign against the Turks. The widowed queen was about to bear a child, which if it turned out to be a son, would be heir to the throne; but the leading nobles, fearing the results of a long minority, offered the crown to Wladislaw III., king of Poland, who accepted it in March 1440 and was crowned in July as Wladislaw I. In the meantime Queen Elizabeth had given birth to a son, who was crowned in May as Ladislaw V., and she appealed for help to the emperor Frederick III. and to the Hussite leader, John Giskra. The resulting civil war was terminated only by the death of Elizabeth on Dec. 13, 1443.

John Hunyadi.—All this time the pressure of the Turks upon the southern provinces of Hungary had been continuous, but their efforts had so far been frustrated by the ban of Szörény, John Hunyadi, the fame of whose victories, notably at Nagyszeben in 1442 and near Sofia in 1443, encouraged the Holy See to place Hungary for the third time at the head of a general crusade against the infidel. The king accepted the leadership of the Christian league, and was on the point of quitting his camp at Szeged for the seat of war, when envoys from Sultan Murad arrived with the offer of a ten years' truce on such favourable conditions that Hunyadi persuaded the king to conclude the peace of Szeged in July. Two days later the papal legate, Cardinal Cesarini, absolved the king from his promise to observe the peace, and in November the latter suffered death and overwhelming defeat at Varna. (*See HUNYADI, JÁNOS.*)

The diet of 1446 now elected Hunyadi governor of Hungary. Before he could turn his attention to the Turks, Hunyadi had to negotiate with Jan Giskra, a Hussite mercenary who held the wealthy mining towns, nominally for the infant king, Ladislaw V., still detained at Vienna by his kinsman, the emperor, while the western provinces were held by Frederick himself. At the same time Hunyadi was thwarted by the great nobles, who resented the position to which he had risen. He lost the battle of Kosovo in 1448 owing to treachery, and it was at his own expense that he fortified Belgrade in 1454, forcing Mohammed II. to raise the siege and return to Constantinople in 1456. Hunyadi died in camp in the same year, and after the murder of his elder son, Laszlo (1457), and the death of Ladislaw V. six months later, Matthias Hunyadi, the younger son, was elected king as Matthias I. (*q.v.*) on Jan. 23, 1458.

In 1459 the emperor Frederick II. was elected king of Hungary by a party of nobles, but by a treaty of 1462 he was finally forced

to recognize Matthias as king. After a victorious campaign against the Turks in 1463, Matthias turned his attention to Bohemia. In 1468, with the sanction of the emperor and of the pope, who had declared Podiebrad of Bohemia to be a usurper, he entered that country, and in 1469 was crowned king by the Catholic nobles; but by the Peace of Olmütz (1478) Matthias was obliged to recognize the right of Wladislav, Podiebrad's successor, to share the title of king, and to rule over all except Moravia, Silesia and Lausitz. To do all this Matthias was compelled to take in hand the question of army reform. Putting aside the old feudal levies, he formed the nucleus of a standing army by recruiting mercenaries from the Magyars, Czechs and Croatians. Matthias used this army as a police force to maintain order and to collect taxes where they were refused.

Despite the enormous expense of maintaining the army, Matthias, after the first ten years of his reign, was never in want of money. By this time the gentry took part in the legislature. But the poorer deputies frequently agreed to make grants for two or three years in advance, so as to be saved the expense of attending every year, and allowed the king to assess as well as to collect the taxes, which consequently tended to become regular and permanent. Matthias re-codified the Hungarian common law, cheapened and accelerated legal procedure, and created an efficient official class. He founded the University of Pressburg (*Academia Istropolitana*, 1467) and revived the declining University of Pécs. He also laboured strenuously to develop and protect the towns, multiplied municipal charters, and materially improved the means of communication. His Silesian and Austrian acquisitions were also very beneficial to trade, throwing open as they did the Western markets to Hungarian produce.

Throughout Matthias's reign the Eastern question was never acute; on the Turkish invasion of Transylvania in 1479, he won another great victory at the Field of Bread (*Kenyermezo*) on Oct. 13, and only after his death did the Ottoman empire become a menace to Christendom. His hands were tied by the unappeasable enmity of the emperor and the emperor's allies. In 1477, and again in 1485, Matthias was provoked to lay siege to Vienna; the second time, when the city fell (June 1), Matthias annexed Austria, Styria and Carinthia, and transferred his court to Vienna, where, on April 6, 1490, he died.

Period of Decline.—In the reign of János (John) Corvinus, the natural son and successor of Matthias, came the reaction against the latter's purely personal, and therefore artificial, dominion (*see* CORVINUS, JÁNOS). The nobles and prelates, who detested the severe and strenuous Mattheian system, found a monarch after their own heart in Wladislav Jagello, since 1471 king of Bohemia, who as Wladislav II. (1490–1516) was elected unanimously king of Hungary by the assembly of Rákos on July 15, 1490. Wladislav was, from first to last, the puppet of the Magyar oligarchs. At the diet of 1492 he consented to live on the receipts of the treasury, which were barely sufficient to maintain his court, and engaged never to impose any new taxes on his Magyar subjects. The dissolution of the standing army, including the Black Brigade, was the immediate result of these decrees, and the disgraceful peace of Pressburg was concluded between Wladislav and the emperor Maximilian on Nov. 7, 1491, whereby Hungary retroceded all Matthias's Austrian conquests, together with a long strip of Magyar territory, and paid a war indemnity equivalent to £200,000.

The 36 years which elapsed between the accession of Wladislav II. and the battle of Mohács are the most melancholy and discreditable period of Hungarian history. The prelates and magnates enjoyed inordinate privileges, while openly repudiating their primal obligation of defending the State against extraneous enemies. The great nobles were often at perpetual feud with the towns, whose wealth they coveted. Everywhere the civic communities were declining. Many of them, notably Visegrád, were deprived of the charters granted by Matthias. The whole burden of taxation rested on the shoulders of the peasants.

The condition of the peasants at this time was very wretched, and in 1514 large numbers of them, who had been assembled by Bakocz for a crusade against the Turks, broke out into rebellion

instead, under the leadership of György Dozsa (*q.v.*). After the suppression of the rising by the nobility, under John Zápolya, the "Savage Diet" met to punish the rebels. The peasants were henceforth bound to the soil and committed absolutely into the hands of "their natural lords." About the same time, at the instance of the diet in 1507, Werbőczy drew up the *Tripartitum*, the famous codification of Hungarian customary law, which sanctioned the liberties of the great class of Hungarian nobles as against the sovereign and the peasantry. Though never formally passed into law, it continued until 1845 to be the only document defining the relations of king and people, of nobles and their peasants, and of Hungary and her dependent States.

Subjection by the Turks.—Wladislav II. died on March 13, 1516. His son Louis, a child of ten, was pronounced of age, but the government remained in the hands of Cardinal Bakócz till his death in 1521, when the supreme authority was disputed between the lame palatine, István Báthory, and his rival, the leader of the middle-class party, István Werbőczy (*q.v.*), who alternately held the office of palatine, while, in the background lurked János Zápolya (*see* JOHN ZÁPOLYA, KING OF HUNGARY), voivode of Transylvania, patiently waiting till the death of the feeble and childless king (who, in 1522, married Maria of Austria) should open for him a way to the throne. Everyone felt that a catastrophe was approaching. The first blow fell on Aug. 29, 1521, when Sultan Suleiman captured the southern fortresses of Sabác and Belgrade. For another five years, while Suleiman was occupied with the conquest of Egypt and the siege of Rhodes, the final assault was suspended. But in the spring of 1526 came the tidings that the Sultan had quitted Constantinople to conquer Hungary. On July 28 Péterwardein fell after a valiant resistance. The diet at Buda proclaimed the young king dictator. Louis at once formed a camp at Tolna, whence he issued despairing summonses to the lieges, and, by the middle of August, some 25,000 ill-equipped gentlemen had gathered around him. On the advice of Tomori, archbishop of Kalocsa, the only noble who had made any effort at defence, Louis decided not to wait for reinforcements from Zápolya, who was still hesitating; he marched southwards to the plain of the Mohács, where, on Aug. 29, the Hungarians, after a two hours' fight, were annihilated; the king perished on his flight from the field. The sultan refused to believe that the pitiful array he had so easily overcome could be the national army of Hungary. Advancing with extreme caution, he occupied Buda on Sept. 10, but speedily returned to his own dominions, carrying off with him 105,000 captives. By the end of October the last Turkish regular had quitted Magyar soil, and one quarter of Hungary was as utterly destroyed as if a flood had passed over it. (C. A. M.)

PARTITION OF HUNGARY AND TURKISH RULE

The Turks having retired, John Zápolya, voivode of Transylvania, was elected king by the diet (Oct. 14, 1526), but he was a powerless dependent on Turkish support, and a second diet in 1527 elected Ferdinand I. (1527–64), archduke of Austria (emperor from 1556), who had married King Louis's sister. Suleiman supported Zápolya, and an internecine struggle went on till 1538, when by the secret treaty of Nagyvarad (Grosswardein) Hungary was divided, Ferdinand taking Croatia, Slavonia and the western counties, and Zápolya the remaining two-thirds, with the royal title, and Buda as his capital. Zápolya died in 1540 and his infant son, John Sigismund (1540–71), was elected, in spite of the peace of Nagyvarad, which formally acknowledged Ferdinand's right to the succession. Ferdinand asserted his right and laid siege to Buda in spite of the remonstrances of Martinuzzi (*q.v.*), Zápolya's able adviser, who knew that Suleiman would not allow the emperor to reign at Buda.

This brought a new Turkish invasion which lasted till 1547, when the exigencies of a war with Persia induced Suleiman to grant a truce. Hungary was partitioned, Ferdinand keeping his former share subject to payment of an annual tribute; Transylvania and some adjacent counties were assigned to John Sigismund, with the title of prince; the rich central plain of Hungary, the Alföld, was annexed to the Turkish empire. This settlement lasted with some changes for 150 years. Throughout this time the

national sentiment and what remained of national liberties found their best expression in Transylvania, where Turk and Habsburg were equally hated. The efforts of the Habsburgs to conquer Transylvania led to fresh Turkish invasions in 1552 and 1556, the latter being Suleiman's last descent on Hungary, and memorable for the heroic defence of Szigetvár by Miklós Zrinyi. The truce of Adrianople suspended hostilities from 1568 to 1593, but frontier warfare was incessant and Habsburg relations with Transylvania were almost always bad. The Habsburg ruling over other States, and regarding "royal" Hungary (*i.e.*, their own portion of that country) as an unimportant border province, were constantly wounding Magyar sentiment. The office of palatine was suspended; and the country was governed from Vienna. Under Maximilian (1564-76) and Rudolph II. (1576-1608) the Magyar nobles were harassed and spoliated under trumped-up charges of treason, and the latter added religious to political persecution.

The Reformation.—The teaching of the Reformation had been steadily gaining ground; the corrupt Church had lost its hold on the people; the nobles, mostly Calvinists, coveted its riches, and Lutheran doctrines prevailed largely among the parochial clergy. In Turkish Hungary all creeds were tolerated, though the Catholics were always suspected as pro-Habsburg; in Transylvania toleration for both confessions was obtained in 1557. But the Counter-Reformation and the rise of the Jesuits changed the situation. The extirpation of Protestantism was the objective, and as Protestantism was then identical with Magyarism the fate of each was equally involved, and the protests of the local diets were ignored. The persecution was fiercest during the "Long War" (1593-1606), a confused struggle in which Transylvania was pitted against the Turks, the emperor Rudolph II., and Michael of Moldavia. Sigismund II., Bathory, prince of Transylvania (1581-1600), gained a brilliant victory over the Turks, whose power was declining, but Transylvania was finally subdued by the imperial general, Basta. A reign of terror at once began, intended to Germanize the principality, and bring it back to Catholicism. Every kind of robbery and extortion was practised on the richer land owners and adherents of the reformed creeds.

Fortunately a deliverer appeared in Stephen Bocskay (*q.v.*), a wealthy nobleman and originally an adherent of the emperor. Elected prince of Transylvania on May 5, 1605, he called the Turks to his aid, over-ran northern Hungary, and raided Austrian territory. At the peace of Vienna, June 23, 1606, he obtained for his people religious liberty and political autonomy, an amnesty and restoration of the confiscated estates, and his own recognition as sovereign prince of an enlarged Transylvania. He also negotiated the truce of Zsitvatorök (Nov. 1606) between the emperor and the sultan, which on payment of £400,000 freed the former from the humiliating annual tribute to the Porte, and established a working equilibrium between the three parts of Hungary, whose position was further improved when the archduke Matthias, who had negotiated the treaty with Bocskay, was elected king of royal Hungary in 1608, as Matthias II. (1608-19).

Transylvanian Hegemony.—For the next 50 years Transylvania (*q.v.*) continued as the bulwark of Magyar liberty. Circumstances were favourable, as the whole strength of the empire was absorbed by the Thirty Years' War, and the princes who succeeded Bocskay were men of great ability, who gained for their country a power out of proportion to its real strength. Gabriel Bethlen (*q.v.*), who reigned from 1613 to 1629, was three times at war with the emperor, and twice crowned king of Hungary. His successor George Rákóczy I. (1630-48) also invaded royal Hungary, and at the peace of Linz (Sept. 16, 1645) forced the reluctant emperor to grant full autonomy and religious liberty to Catholics and Protestants, and to acknowledge the sway of Rákóczy over the north Hungarian counties, the threat of calling in the Turks ensuring submission.

The power of Turkey, after a long decline, again became formidable when the able and energetic vizier, Mohammed Kuprili (*q.v.*), became supreme at Constantinople in 1656. He deposed George Rákóczy II. (1648-60), who had ruined his principality in a mad venture for the throne of Poland, and by 1661 Transylvania had become a Turkish feudatory State. Royal Hungary was

next invaded by his son, Fazil Ahmed, but with little success, the Turks being heavily defeated by Montecuculi at St. Gothard on Aug. 1, 1664, and the Peace of Vasvár (Aug. 10) gave Hungary a respite from invasion for 20 years.

Catholic Reaction.—Far more important was the change which about this time was bringing Hungary back to Catholicism. The soul of the movement was the great Jesuit preacher and writer, Peter Pázmány (*q.v.*), primate from 1616 to 1637. His policy was to convert the nobles and gentry, assured that in the end the people would follow their example. The educational system of the Jesuits gave them a great advantage and the crown of Pázmány's labours was the foundation of a great Catholic university at Nagyszombat (1635), and a Hungarian translation of the Bible, to supersede the current Protestant version.

The reaction in religion coincided with a sustained attack on political liberty. Nationalist aspirations were naturally opposed to a system of imperial government based on Divine right, and for 100 years the upper classes were subject to a cruel discipline. They were treated as an inferior race, excluded from office, their privileges over-ridden. Leopold I. (1657-1705) left the government of the country in the hands of two bigoted Magyar prelates, Gyorgy Szelepesényi and Lipót Kollonic. The abortive conspiracy of Peter Zrinyi, who with three other magnates was publicly executed (1671), was followed by wholesale arrests and confiscations, and for a time legal government was superseded (patent of March 3, 1673) by a committee presided over by Kollonic. Large numbers of Protestant ministers were haled before this tribunal for alleged conspiracy; of these 236 were "converted" or confessed to acts of rebellion. The rest stood firm and were sentenced to death, commuted to slavery in the Neapolitan galleys, in spite of urgent protests from Sweden and the German Protestant States.

Liberation from the Turks.—In 1678 Count Tököli was the leader of a dangerous revolt which, for some time, made him master of northern Hungary. Encouraged by Tököli's success, the vizier, Kara Mustapha, and the war party at Constantinople resolved to complete the conquest of the rest of the country. Alarmed for the safety of Vienna, and stirred up by Pope Innocent I., Leopold reluctantly allied himself with John III. Sobieski, king of Poland, and gave the command of his armies to Prince Charles of Lorraine. The war lasted 16 years, and after beginning with the siege of Vienna (July 14-Sept. 12, 1683) and its relief by Sobieski, put an end to the Turkish dominion in Hungary. In 1684 the Pope succeeded in uniting the empire, Poland, Venice and Muscovy in the Holy League against the Turks, and was rewarded by a series of triumphs, culminating in the recapture of Buda (1686) and Belgrade, and the recovery of Bosnia (1689). In 1690 the Turks rallied under the vizier, Mustapha Kuprili, brother of Fazil Ahmed, regained Serbia and Bulgaria, placed Tököli on the throne of Transylvania, and took Belgrade by assault (Oct. 6); but in 1691 Kuprili was defeated and slain at Slankamen by the margrave of Baden. For six years the war languished but in 1697 Prince Eugene of Savoy routed the Turks at Zenta (Jan. 26, 1699), leaving the emperor the whole of Hungary except the "Banat," the territory enclosed by the rivers Theiss and Maros.

Francis Rákóczy.—The expulsion of the Turks and the peace of Karlowitz left the Magyars sullen and embittered. They had little share in the victories, which had been gained by foreign armies; the war taxation had been crushing, and this combined with the ruthless repression of civil and religious liberty to make the whole nation ripe for rebellion. Yet Leopold judged the time opportune for changing Hungary from an elective to a hereditary monarchy (Oct. 1687), and for abrogating the clause in the Golden Bull which authorized armed resistance to unconstitutional acts of the sovereign. The terrorized and weakened diet was incapable of resistance, so the immediate effect of the Peace of Karlowitz was to strengthen the existing despotism. Bishop Kollonic was at the head of affairs, and his plan was to repopulate the regained territories, which were in a state of terrible dilapidation, by a vast immigration of German and Croatian colonists. Magyar landlords were forcibly deprived of their estates, which were divided among the newcomers. No redress could be obtained and the whole nation was seething with discontent. The opportunity

to break out came when the emperor, involved in the War of the Spanish Succession, withdrew almost all his troops from Hungary. There was an immediate rebellion, which found a leader in Francis Rákóczy II. (*q.v.*) (1704–11), elected prince by the diet on July 6, 1704. The armies he raised were numerous but ill-equipped, and without artillery. Louis XIV. aided him with money, but the defeat of the French at Blenheim enabled the emperor to send an army into Hungary, and in 1705 Rákóczy was badly defeated. In 1707 two Rákóczyan diets deposed the Habsburgs and formed an interior Government with Rákóczy at its head, till a national king could be elected, but Joseph I. (1705–11), who succeeded Leopold, refused to come to terms with his subjects, though pressed to do so by his allies.

In 1708 Rákóczy was again defeated at Trenesen, this time decisively, though a guerrilla war still went on. But in 1711 Joseph died and was succeeded by his brother, Charles VI. (1711–40), a man of different stamp. A congress met at Szátmár (April 27, 1711), and peace was restored on the basis of a general amnesty, full religious liberty, and the inviolability of Magyar rights and privileges.

UNION UNDER THE HABSBURG

The Pragmatic Sanction.—The peace of Szátmár ended the long strife between the Magyars and the Habsburgs and opened a new era of reconciliation. The next century and a half witnessed the reopening of the great central plain, the Magyarization of its mixed races, German, Croat, Slovak, Serb, and other nationals, and the formation there of a compact and vigorous race, speaking one language, attached to the same institutions. The first changes, however, strengthened the Government rather than the nation. Thus in 1715 a standing army was set up, the diet, however, retaining the right of fixing the number of recruits and voting the necessary supplies. Important judicial and military reforms were carried and the magistrates and officials made responsible to the king alone, and all measures adopted were of a centralizing tendency. But it was to the diet assembled at Pressburg that Charles III. appealed in 1723 to grant the Pragmatic Sanction which settled the succession in favour of his daughter, Maria Theresa. The law as enacted set up a contract which remained the basis of the relations between Crown and nation till 1848. Hungary was declared to be an integral part of the Habsburg dominions, and Charles swore to preserve the Hungarian Constitution intact, with all its rights, laws and privileges.

During the reign of Charles VI. there were two Turkish wars. The first, beginning in 1716, was terminated by the peace of Passarowitz (July 21, 1718), by which the Temesköz was freed from the Turks, and Serbia, northern Bosnia and Little Walachia were once more incorporated with Hungary. But by the peace of Belgrade (Sept. 1, 1739), which terminated the second war, all these conquests, except the Banate of Temesvar were lost.

Enlightened Despotism.—With Maria Theresa (1740–80), the age of enlightened despotism began. Deeply grateful for Magyar services in the War of the Austrian Succession, she used her authority to benefit her people; but she would not share it with them. She appointed no palatine, nor was any diet summoned after 1764, but her people loved and trusted the great queen and felt themselves safe in her hands. Large sums were spent on schools and universities, and her benevolence extended to the serfs, who found in the feudal prescription of 1767, which restored to them the right of transmigration, a measure of protection against the exactions of their landlords. To all the Magyars she was especially gracious, and her court was crowded with the nobles who had stood by her in the stormy commencement of her reign. Joseph II. (1780–90) had the same ideals as his mother but less practical sense. He aimed at the amalgamation of all his dominions under an absolute sovereign, the whole to be uniform in language, laws and administration. Almost all the reforms he tried to force on his reluctant subjects were salutary; but they offended prejudices and, particularly, privileges. He refused to be crowned, and he roused national feeling by making German the official language in Hungary (1774), and by abolishing the ancient county assemblies, and set the privileged classes against him by proclaim-

ing equal liability to taxation, and by attempting to improve the relations between the peasants and landlords. Before his death in 1790, he retracted some of his edicts and restored the Constitution. Leopold II. (1790–92) found his country on the brink of a revolt, and his first task was to undo Joseph's work, to restore the privileges of the Magyar nobles, and to confirm the national liberties by the laws of 1790–91. The reconciliation was timely, for Francis I. (1792–1835), who succeeded Leopold, received a declaration of war from the French Legislative Assembly immediately after his succession. Further reform was checked, for the time, by the Government's reactionary policy, due to the Jacobin terror. The Magyars stood loyally by the empire during the revolutionary years, unshaken by Napoleon's attempts to seduce them from their allegiance. Ignaz Jozsef Martinovics and the Hungarian Jacobins vainly conducted revolutionary propaganda.

Hungarian Revival.—When peace came Hungarian feeling remained conservative, though there were undercurrents, literary and artistic, noble and plebeian, which set towards the liberalism which was pervading western Europe. But in 1823 an unconstitutional war tax and levy of recruits caused a burst of indignation, and the withdrawal of the edicts at the diet summoned in 1825. It led also to the formation of a Liberal party eager for reforms and strongly opposed to Metternich's system of inertia. The chief leaders were Széchenyi (*q.v.*), Deák, Count Batthyány, Baron Eötvös, and the fiery and eloquent Louis Kossuth (*q.v.*). Each successive diet showed a growth in Liberal strength, and on the accession of Ferdinand I. (1835–48) the Government took strong repressive measures, and Kossuth and other leaders were imprisoned. But the nation was not to be cowed; the Diet of 1839 insisted on their release, laws were passed making Hungarian the official language, and relieving the peasants from some of their feudal obligations.

After 1843 there was some disintegration in the Liberal ranks; Kossuth's violent speeches and articles in the first Hungarian political newspaper, *Pesti Hírlap*, which he started in 1841, and his advocacy of armed reprisals alarmed Széchenyi and the moderates, though as usual the extremists prevailed. New concessions were wrung from the reluctant Government, mixed marriages being legalized, and the nobles losing their monopoly of official positions.

Revolution of 1848.—Continued dissensions among the Liberals led to the formation of a Centre Party by the Moderates, and Széchenyi even joined the Government. However, just before the election of 1847, Deák succeeded in reuniting all Liberals on the common platform of the "Ten Points" afterwards known as the March laws: responsible government; popular representation; the incorporation of Transylvania; right of public meeting; absolute religious liberty; universal equality before the law; universal taxation; the abolition of serfdom with compensation to the landlords; abolition of the *aviticum*—an obsolete land-tenure. The elections gave the Progressives a complete victory, and all efforts to bring about a compromise with the Government were fruitless, and it was proposed to dissolve the diet. But in Feb. 1848 tidings reached Pressburg of the revolution at Paris and its repercussions throughout Germany, where every Government was threatened with overthrow. Kossuth's motion for the appointment of an independent responsible ministry was accepted by the lower house. The emperor hesitated, but on March 13 the Vienna revolution broke out and Metternich fled to England, and yielding to pressure or panic the harassed monarch appointed Count Louis Batthyány premier of the first responsible Hungarian ministry, which included Kossuth as minister of finance and Széchenyi as minister of home affairs. The March laws were enacted at Pressburg and received the royal assent (April 10); and Hungary became a virtually independent State. The aspirations of the Magyars were assured the support of the German Democrats who, for the moment, were in power at Vienna, but in the national movement a cleavage now appeared.

Jellačić and the Non-Magyar Races.—The increasing Magyar national chauvinism and especially the attempt to impose the Magyar language universally, had stimulated a national reaction among the Southern Slavs, Slovaks and Rumanians; each sought for themselves a separate national existence, and the franchises of the

new constitution had been so limited that the Slavs seemed to be threatened with political annihilation. The Imperial Government was at first hostile to this movement, hoping that its concessions to the Magyars would secure their support against revolution elsewhere; a hope that seemed justified by Batthyány's consent to send Hungarian troops for the war in Italy. That the emperor was led to encourage Slav aspirations was due partly to the violence of the Kossuth party, now dominant at Budapest, partly to the influence of Baron Jellačić (*q.v.*), who was made Ban of Croatia in April. Jellačić, a soldier and a loyal servant of the emperor, advised him to break the power of the Magyar and German revolutionaries by means of the Slavs who were equally hostile to both, and set up against the dualism favoured at Budapest and Vienna the federal system favoured by the Slavs. This policy he pursued with masterly skill. His first acts were to repudiate the authority of the Hungarian diet, to replace Magyar officials with ardent "Illyrians" (as the advocates of the Southern Slav movement were then called), and to proclaim martial law. Under pressure from the palatine and Batthyány, the emperor ordered him, on May 7, to desist from his separatist plans and to take his orders from Budapest. He not only refused to obey, but, probably with the connivance of the Government, convened the Croatian diet at Agram on June 5, of which the first act was to declare the independence under the Habsburgs of the South Slav districts of Austria and Hungary. Dismissed from his office on June 10 at the instance of Batthyány, Jellačić went to Innsbruck, whither Ferdinand had retired, and in an interview convinced him of the loyalty of his intentions, and returned to Croatia with practically unfettered discretion. Meantime the Hungarian Government had been playing into his hands. At a time when everything depended on the army, they had destroyed the main tie which bound the Austrian court to their interests by tampering with the fidelity of the Hungarian army to the Crown. A National Guard had been created, and the disaffected troops bribed by increased pay to desert their colours and join the new force, and in June the garrison of Budapest had taken an oath to the new constitution. All hope of crushing revolutionary Vienna with Magyar aid being at an end, Jellačić was free to carry out his policy of uniting the forces of the Southern Slavs with the imperial army. The alliance was cemented in July by a military demonstration of which Jellačić was the hero, and followed by a Government announcement that the basis of the Austrian State was "the recognition of the equal rights of all nationalities."

Jellačić Invades Hungary.—The Hungarian diet, which met on July 2, at once took up the challenge. It was dominated by Kossuth, whose inflammatory orations, denouncing the treachery of the Slavs, precipitated a crisis which the moderates of the cabinet were powerless to avert. At his instance the diet refused to vote supplies for the Croat troops, and ordered a levy of 200,000 men and a national defence loan of £4,500,000. Desultory fighting had already begun in the south, and a bloody insurrection of the Rumanians began in Transylvania, and in September Ferdinand, emboldened by Radetzki's victory at Custoza (July 25) and the resulting truce in Italy, refused his sanction to the measure passed by the diet in July. Jellačić, reinstated in all his honours, crossed the Drave on Sept. 11, with 36,000 Croat troops and advanced to Lake Balaton. This made the Kossuth party supreme at Budapest; Széchenyi had lost his reason; Deák and Eötvös retired into private life, and Batthyány unhappily consented to remain in office, though hardly in power. The Palatine, Archduke Stephen, resigned his office on Sept. 24, and as a last effort for compromise, and with Batthyány's approval, General Count Lamberg was sent to take command of all the troops, Magyar and Slav, and to bring about an armistice. The diet, on Kossuth's motion, and on a technical point, ordered the troops not to obey their new commander. Next day Lamberg was torn to pieces on the bridge of Budapest by an infuriated mob. War was now inevitable; Batthyány retired, and a royal proclamation on Oct. 2 placed Hungary under martial law, with Jellačić as commander-in-chief. He was defeated at Pákozd on Sept. 29, and on an order to certain Viennese regiments to march to his assistance, a new insurrection broke out in Vienna on Oct. 3, and the em-

peror again fled from the capital. His army, under Prince Windischgrätz, laid siege to Vienna, and as the revolutionists of Austria and Hungary were closely allied, a large body of the new Honved militia was despatched by the committee of national defence which had replaced the defunct Hungarian cabinet. They were defeated at Schwechat (Oct. 31), and Vienna surrendered the following day.

The War of Independence.—The Austrian army having triumphed, the reactionary Schwarzenberg ministry was appointed in November to wipe out all traces of the revolution. Next month the feeble but well-meaning emperor abdicated in favour of his nephew, Francis Joseph (1848-1916). The new emperor was a youth of 18, who could be little more than the mouthpiece of Schwarzenberg's policy and might claim to be uncommitted to the constitutional obligations reluctantly accepted by his uncle. The Budapest diet refused to acknowledge the title of the new sovereign, declaring it to be invalid under Hungarian law, and called the nation to arms to resist the encroachment. This gave the revolt a show of legality and served to conciliate the military chiefs, who hated the idea of a republic, and refused to consider themselves rebels; actually, till the close of the revolt, Kossuth was ruler of Hungary.

The army of Prince Windischgrätz entered Hungary on Dec. 15, and was allowed to occupy the western counties and Budapest (Jan. 5, 1849), with little opposition, the Magyar Government and diet retiring to Debreczen behind the Theiss. A last attempt at reconciliation was made by moderates of the diet, but Windischgrätz insisted on unconditional submission; Deák, Batthyány and their friends retired into private life. Kossuth's plan of campaign was to give battle in the marshy regions of the interior, but there was no real accord between him and the Magyar military chiefs. The first sign of discord was a proclamation issued on Jan. 15 by Görgei (*q.v.*) who commanded on the upper Danube, declaring the war to be a struggle for constitutional rights and denouncing republican aspirations. This was at the beginning of a campaign in mid-winter, in which Görgei showed remarkable military talents; but his success caused jealousy in official quarters, and Dembinski, a Polish refugee, was given the chief command in Feb. 1849. The Austrian army advanced, and after a bloody two days' battle at Kápolna (Feb. 26-27) Dembinski was forced to retreat behind the Theiss. He resigned the command and was succeeded by Görgei, who led the Honved army to a series of victories. Ably seconded by Klapka and Damjanich, he pressed forward and Szolnok, Isaszeg and Nagysarló were stages in a triumphal progress which ended in the raising of the siege of Komárom and the recapture of Buda on May 25. Meanwhile the changing fortunes of the war had destroyed all hope of compromise. Early successes and the victory of Kápolna had confirmed the Austrian court in its policy of unifying the empire. A proclamation was issued in March in the emperor's name, establishing a constitution for the empire, in which Hungary, cut up into half-a-dozen administrative districts, was little more than the largest of several subject provinces. This manifesto reached Debreczen simultaneously with the news of the recapture of Buda. It was met with a proclamation, equally ill-judged, in which Kossuth and the diet declared the independence of Hungary and the exclusion of the house of Habsburg from the throne, and elected Kossuth president of the Hungarian republic (April 14). This rash step completed the alienation of the military from the civil administration; henceforth Görgei acted in complete independence.

Intervention of Russia.—Meanwhile their disasters in Hungary had compelled the Austrians to accept the assistance which Nicholas, tsar of Russia, offered in the spirit of the Holy Alliance. An Austro-Russian alliance was announced in May and a common plan of campaign arranged. The Austrian general, Count Haynau, was to attack from the west, the Russian prince Paskevitch from the north, the two encircling armies converging on the mid-Theissian counties. The Magyars were hopelessly outnumbered and divided among themselves; they had no plan of campaign and no commander, Görgei having been deposed by Kossuth. Haynau's victorious advance compelled a decision:

the Government, abandoning Budapest, retired first to Szeged and finally to Arad. The Russians were by this time approaching the Theiss. The last pitched battle of the war was fought at Temesvár, when Dembinski was utterly routed (Aug. 9), and on the 13th Görgei, who had been appointed dictator, surrendered with his whole army to the Russian general, Rüdiger, at Világos. The rest of the army and the fortresses followed his example, and the garrison of Komárom capitulated after a heroic defence. Kossuth, Dembinski, Bem and others took refuge in Turkey. Görgei had secured his personal safety, but his unfortunate companions-in-arms underwent the penalties of martial law as administered by the "butcher Haynau." On Oct. 6, 1849, 13 generals were hanged or shot at Arad, and Batthyány, who had taken no part in the war, was shot at Budapest the same day. The anniversary is still a day of national mourning. This holocaust ushered in a régime of military tribunals, dragooning and wholesale confiscations.

The "Bach System" and "Provisorium."—From 1851 to 1860 Hungary lived under a despotism called the "Bach System," after Baron Bach, the Austrian minister of the interior. Historic Hungary did not exist for the bureaucrats, mostly German, Czech or Galician, who administered the counties under an imperial council responsible to the emperor alone. Such of the reforms of 1848 as ministered to material prosperity were not neglected, and a new and better system of finance was inaugurated. But the system took no root in the soil; the soul of the nation rejected it, and the slightest impact from within or without could not fail to overthrow it.

Meanwhile the ill-compacted empire sustained repeated shocks. The Crimean War isolated her in Europe and cost her the friendship of Russia; the Italian War in 1859 had shown her military weakness; the headship of Germany was passing to Prussia. Some concession to the subject races was thought advisable. In 1857 the emperor visited Hungary, and the estates of political offenders were restored to them. In 1859 it was decreed that the language spoken in the higher schools should be regulated according to circumstances of nationality, and the October Diploma of 1860 offered the shadow of local autonomy and a constitution as a sop to allay Magyar discontent. It won some favour from those Magyar magnates who had not broken with the court, but the nation rejected it on the advice of Deák, now the most influential man in Hungary. The February Patent (1861), the work of Anton von Schmerling, had somewhat more substance in it; after long debate it was rejected, again by the advice of Deák, by a diet assembled at Pressburg. In an address to the Crown, drawn up by him, the diet prayed for the restoration of the political and territorial integrity of Hungary, the coronation of the king, and the restitution of the fundamental laws. Thereupon the diet was dissolved on Aug. 21, and the taxes were levied by military execution: the so-called *Provisorium* had begun.

But the international situation became so urgent that the court was again driven to concessions. The emperor came to Buda in June 1865 and a provisional Government was formed; the February constitution was suspended and in December the diet was summoned. A composition with Austria was generally desired, and by none more than by Deák, who commanded the votes of two-thirds of the deputies. A committee was appointed to draft a new Constitution, based on the Pragmatic Sanction (1722), but its labours were interrupted by the Seven Weeks' War with Prussia. The Peace of Prague (Aug. 1866), which excluded Austria from Italy and Germany, made the fate of the Habsburg monarchy absolutely dependent on a compromise with the Magyars. The negotiations were carried out by Deák and Baron Beust, and were far advanced on the reassembly of the diet in November. In Feb. 1867 a responsible independent Hungarian ministry was formed under Count Julius Andrassy (*q.v.*), and in March the new Constitution was adopted by 200 votes to 89.

(X.)

THE DUALIST PERIOD

The Compromise of 1867.—The Compromise (Law 12 of 1867) established the so-called Dualist system between Austria and Hungary; the two countries had hitherto been united only in

their common dynasty (the legal sanction for which was afforded by the Pragmatic Sanction of 1722) and by the work of the central authorities in Vienna, whose activities, however, in so far as applied to Hungary, constituted an infringement of Hungarian law and sovereignty. Under the Compromise Hungary recognized this situation to this extent, that matters vital to national defence were entrusted to three common Ministries, to be held alternately by Austrians and Hungarians: these being Foreign Affairs, War and Finance (the last-named resting chiefly on the customs receipts); while Hungarian sovereignty was recognized in the appointment of an independent Ministry, responsible to the Hungarian parliament. Dualism, in the eyes of its creator, Deák, meant complete parity, combined with a sort of *de facto* union Hungarian parliament. Dualism, in the eyes of its creator, Deák, prevailed on Francis Joseph to "deign to grant the other lands" (*i.e.*, Austria) "constitutional rights" (Law. A. 12, 1867). The common ministries were submitted to the control of "delegations" or committees of the Austrian and Hungarian parliaments. On the basis of this constitution Francis Joseph had himself crowned king of Hungary on June 8, 1867.

First Phase of Dualism.—The difficulties of Dualism became apparent even under the first minister-president, Count Julius Andrassy (*q.v.*). Led by the archduke Albert, governor-general of Hungary after the defeat of 1849, the generals who had attained such influence at the court of Vienna in the absolutist period opposed the efforts of what they called the "trans-Leithan half of the empire" to attain parity, particularly in military matters. It was only after a long struggle that Andrassy succeeded in recovering the military frontier from the military administration and restoring in it the old county system. The same court and military circles wished to join France against Prussia in 1870 in a war of revenge. Andrassy, as Hungarian minister-president, prevented this, and thus saved the new State of Austria-Hungary from being drawn into the French disaster, and the war from spreading to other States. In Hungary itself many elements were hostile to dualism and to any community of existence with Austria. They listened to the voice of Kossuth, the leader of 1848, now living in voluntary exile. Shortly before Francis Joseph's coronation, Kossuth, in his open "Cassandra letter," had accused Deák of treachery to the rights of the nation. The pure Magyars of the Alföld supported Kossuth and elected a parliamentary opposition which took its stand on the so-called "1848 constitutional basis" and called for revision or revocation of Dualism and a pure personal union with Austria. The 1848 politicians adopted a negative attitude towards all demands of the State throughout the period of Dualism, voted against the budgets and military estimates, and attempted to discredit the Dualist Governments as traitors to the nation.

Threatened at once in Vienna and in Hungary, and supported solely by the emperor-king, who throughout his life remained strictly loyal to his coronation oath, and upheld the Law 12 of 1867, the Hungarian minister-presidents, from Andrassy on, were often forced to employ subterfuges to secure the majorities necessary for the conduct of affairs. As the 1848 ideas were most prevalent in the poorer classes, the franchise was from the first so restricted as to confine all political influence to educated circles. The maintenance of Dualism was secured, first and foremost, by enlisting the "gentry," who had lost the greater part of their estates through the agrarian reform decreed under Art. 9 of the Law of 1848, and executed during the period of absolutism of 1852-53 with the deliberate purpose of breaking the Hungarian aristocracy. As State officials and deputies, this class now became the chief supporters of the Dualist Governments. After Andrassy had become common minister for foreign affairs in 1871, his successors in the premiership of Hungary ruled with the help of the "gentry" and the new Jewish capitalists. The rich natural resources of Hungary had begun to be exploited, railways had been built, mines and factories started, and the profits increased the solidity of the '67 Governmental party, while the '48 party were, where possible, excluded from it. It was, however, only after the death of Deák, a Puritan who refused to take any office, that this was developed into a regular system by Koloman Tisza

TYPES FROM DIFFERENT PARTS OF HUNGARY

1. Interior of a home in Mezökövesd, showing women wearing the elaborately embroidered peasant costume. In the background is a porcelain stove of the kind generally used in peasant houses
2. A "Csikos" or herdsman of the Hortobágy, the vast steppe west of the town of Debreczen. These horsemen are famous for daring riding and skill with the lasso
3. A couple from Mezökövesd, a market town about 140 miles from Budapest, in northern part of the great plains, where the traditional costumes and customs are fully preserved
4. Girls of Mezökövesd in Sunday dress
5. Church-going costume for the women of a small town of Hungary
6. The children of a gypsy settlement dancing in the town square. The music and dances are traditional, having been handed down from father to son for many generations
7. Two gypsies of Hungary. These nomadic people are numerous all over central Europe and an effort is being made to gather them into settlements, at least for the harsh winter months

(*q.v.*), whose prolonged period of office (1875-90) made the Government party resting on the landed gentry and capital (the "Liberal Party" or "Free Principle Party") into a permanent institution. He introduced strict discipline into his party, which was most necessary, since the Government was forced year by year, in the interests of Dualism, to pass unpopular laws, such as the military estimates for the "common" army, with its headquarters in Vienna and German word of command. Hungary was making rapid strides in prosperity and culture (this was the "classic" age of Hungarian literature, founded by the great writer Árvány), and deeply resented the system under which the supreme decisions on foreign policy and war were withdrawn from the nation and debated in Vienna in the German tongue, the constitutional influence due to the Hungarian premier not always receiving due weight. The German-speaking army in Hungary was the occasion of continual conflicts; there were repeated students' riots and patriotic demonstrations against army decrees, or against the maintenance of the Hentzi monument in Budapest (Hentzi was the Austrian general who defended Buda in 1849 against Görgei's national army); these flames being vigorously fanned by old Kossuth from Turin. Koloman Tisza fell over a bill affecting Kossuth's rights of Hungarian citizenship.

Second Phase of Dualism.—His successors, Count Julius Szápáry (1890-92), Alexander Wekerle (1892-95), Baron Desider Bánffy (1896-99), and Koloman Széll (1899-1903), had still greater difficulties to face. Resistance was increasing, both in Austria and in Hungary. The first fatal mistake had been to provide for a revision of the Austro-Hungarian customs tariff every ten years. In the parliamentary discussions on these occasions—they were particularly stormy in 1897—the differences between agrarian Hungary and industrial Austria grew acute; the Hungarians complained that their country was treated as a colonial market for the Austrian factories, and they increasingly demanded an independent customs territory. Similar difficulties arose over the commercial treaties with foreign States, which had also to be concluded in common with Austria, and in army questions, the latter due mainly to the preference shown to German and Slav officers for high positions. No Hungarian was able to reach a leading position on the Austro-Hungarian general staff up to the end of the World War. Thus dislike of Dualism grew more acute in Hungary; not only the Kossuth Party worked in this direction, but also other politicians who, while remaining loyal to the Compromise, yet looked on it as elastic and aimed at altering its provisions by constitutional methods: creating an independent customs territory, giving the Hungarian element in the army its due, and creating an autonomous national bank. Among these were Count Albert Apponyi (*q.v.*), and later, the younger Count Julius Andrássy (*q.v.*). Francis Joseph, however, would allow no alteration in the Compromise, and these efforts could thus lead only to embittered parliamentary struggles. The number of malcontents increased after the Wekerle Government introduced a reform of the marriage law on liberal lines in 1894; a new opposition party, the Catholic Peoples' Party, came into being, led by Count Ferdinand Zichy (1829-1911), and supported by wide circles of Hungarian, German and Slovak peasantry. The minister-president, Bánffy, was only able to break the power of this party in the elections of 1896 by the most extreme means, forcible intervention by the gendarmerie. In the same year the nation and its king celebrated together its jubilee, the millenary of the occupation of Hungary by the Magyars. Yet events were shaping towards a rupture with the sovereign and the Compromise. When Count Stephen Tisza (*q.v.*), as minister-president, attempted to make parliamentary discussion possible in the interests of the army estimates by changing the standing orders and was defeated at the elections (1905), the king first tried the expedient attempted in Austria, of reforming the franchise, to put the nationalist gentry and middle classes in a minority against the workmen and national minorities. When this attempt (Baron Géza Fejerváry's Ministry, 1905-06) broke down on the resistance of the counties, he entrusted the power to the united parties of the Opposition (Wekerle's Ministry, 1906-10), who promised to respect the Compromise. This coalition ministry included

both Apponyi, Andrássy and Francis Kossuth, son of the old revolutionary, now dead. Public opinion, however, failing to receive from this ministry the anticipated changes in the Compromise, soon abandoned it. At the next elections the old '67 Party returned in triumph, and remained in power till the World War, after being reorganized by Stephen Tisza, who was minister-president for the second time, 1913-17.

It was only with great difficulty, however, that Tisza succeeded in carrying the army estimates in the last years preceding the World War. In the '48 Party the influence of the leaders compromised in the Wekerle Ministry was now superseded by that of Count Michael Károlyi (*q.v.*), who introduced extreme tendencies into the Party of Independence. At the same time, symptoms of social unrest appeared. The Socialist Party, which was Marxist in creed, made several unsuccessful efforts to find new followers among the agricultural labourers; but in the first decade of the 20th century it found an ally in the Radical Party, composed of semi-Socialistic bourgeoisie, doctors, lawyers and merchants, which aimed at a complete remodelling of social conditions with the assistance of general suffrage. Its leader, Oscar Jászi, failed to win the nationalist middle classes for his movement, and his propaganda, which was in part directed against the Church, only deepened the conflicts between the Hungarian middle classes and the Jews out of which his party was largely recruited.

National Struggles.—At the same time the question of the national minorities, for which Europe at that time possessed no universally accepted principles, also became acute. After the long period of Turkish rule in the 16th and 17th centuries, the diminished ranks of the Hungarians had been replaced in many parts of the country by Germans, Serbs, Rumanians and Slovaks, who were encouraged, and in some cases introduced, by the Viennese Government. In earlier times there was no linguistic struggle, the official language being the neutral one of Latin. Only when, in the age of national reforms, the first half of the 19th century, the Magyar language was, in the struggle against the Government in Vienna, made the official language of Hungary, did the other nations, whose own cultural development was just beginning, feel themselves put at a disadvantage. After 1849 the absolutist Government introduced German as the official language, this being again replaced by Magyar in 1867. To protect the interests of the other nationalities, Deák and Baron Eötvös, the minister of education, a humanist philosopher, brought in Law 44, 1868, on "national equality," which ensured persons of language other than Magyar the use of their own language in justice and administration, allowed any language desired by one-fifth of the persons present to be used in the protocols of county and city meetings, and left all persons full liberty to use any language they wished in such meetings. Later, the county representative bodies usually allowed languages other than Magyar to be used only when 50% of those present were non-Magyars; and this led to continual complaints from the Slovak, Rumanian and Serb deputies. The Government was also obliged by law to provide facilities for any person, in any part of Hungary, to receive secondary education in his mother tongue, and also allowed communities, churches and individuals to found and maintain schools, which received equality of status with the State schools. Under this law the Rumanians had six secondary and 2,870 primary schools, which were maintained by the Rumanian Church with State assistance. Of the 16,929 primary schools in Hungary in 1913, 3,970 gave instruction in language other than Magyar; the figures for secondary schools being 215 and 17 respectively. In 1913-14 the Hungarian State paid 3,041,861 crowns to the schools giving instruction in a language other than Magyar. The State, however, thinking primary schools the best means of propagating the Magyar language, established these mostly in the non-Magyar districts, and neglected education in the essentially Magyar Alföld. The new middle classes of non-Magyar nationality which issued from these State schools grew increasingly ambitious of political power. Their leaders were inspired by the example of Austria, where the general suffrage had broken the supremacy of the Germans, and everything was tending towards a federative system with a Slavonic majority. These ambitions were encouraged by the heir

to the throne, the archduke Francis Ferdinand (*q.v.*), whose interest in the unity of the army also led him to wish to break the supremacy of the Magyars. He advocated replacing Dualism by Trialism, creating a third Slavonic State out of the southern Serbo-Croat parts of Austria and Hungary, with Bosnia, and thus putting Hungary in a minority of 1:2. The situation was further complicated by the irredentist agitation conducted by the fellow-countrymen beyond the frontier of the various nationalities (*e.g.*, the Marmaros trial in 1911 respecting Ruthenian irredenta, supported by Russia; the Klausenburg Memorandum trial of 1893 against Rumanian irredentists; the attempt on the life of the Hungarian bishop in Debrecin, Feb. 1914, etc.). The main object of the Government was the preservation of the old frontiers against such endeavours, and even Count Tisza, who in his second term of office made several attempts to reach an understanding with the nationalities, especially the Rumanians, was obliged to the last to oppose general suffrage, because he feared that it would have meant the supremacy of the nationalities, assisted by the Hungarian Socialists (the Magyars numbered 54.5% of the total population), and therewith a federalization of the State. To prevent this, the abortive, Andrassy draft of 1908 had attempted to combine general franchise with plural voting for the educated classes.

THE WORLD WAR AND AFTER

The World War found Hungary in the throes of a parliamentary struggle conducted by all shades of the opposition, from Albert Apponyi to Michael Károlyi, against Tisza's attempt, supported by the Crown, to maintain the Compromise intact. Tisza's voice was the only one raised in the Crown councils of July 7 and 19, 1914, after the murder of the heir to the throne, against war and for giving the ultimatum to Serbia such a form as to make the avoidance of war possible. When on the death of Francis Joseph (Nov. 21, 1916), the archduke Charles succeeded him as Charles IV. of Hungary, Tisza's obstinate fidelity to the prosecution of the war at Germany's side displeased the new sovereign. At the outbreak of the war, the parties of the Opposition had sworn a Truce of God; but by 1917 they had forgotten it. Losses, privations and increasing food shortage, together with the absence of any prospect of final victory held out by the Austrian and German generals, kept the population in continuous unrest. On April 25, 1917, the Socialists, Károlyi's party and Jászi's Radicals, founded the Democratic Electoral Bloc. Charles called on Tisza to submit a draft for an extension of the suffrage, whereupon Tisza resigned. The cabinets of Count Maurice Esterházy (June 15–Aug. 20, 1917) and Alexander Wekerle (Aug. 20, 1917–Oct. 31, 1918) attempted, without real success, to meet the increasing desire for a division of the common institutions of 1867, especially of the army, which was still under Austrian leadership. The nationalist discontent was accompanied by agitation for general suffrage, largely due to the propaganda of Jászi's Radicals, which, after Tisza's fall, was subject to no restraint. In the last two years of the World War, while every able-bodied young man was at the front, these questions of internal politics were debated violently behind the front and in parliament, and the masses, especially in the capital, moved further to the left than they had in the preceding 50 years.

Revolution and Armistice.—After the capitulation of Bulgaria (Sept. 29, 1918), the failure of the Piave offensive (where 46% of the troops engaged were Magyar), and the collapse on the German eastern front, the leaders of the Government, civil and military, abandoned their resistance. On Oct. 25 a "National Council" was formed out of bourgeois Radicals, under the presidency of Michael Károlyi, with the programme of dissolving parliament, introducing general suffrage and concluding a speedy peace. Popular demonstrations demanded a Károlyi Government. The archduke Joseph, whom the king appointed to clear up the situation, gave the minister-presidency to Count John Hadik, who was, however, unable to prevent the National Council, assisted by a few companies of mutinous troops, from occupying the municipal Government of Budapest on Oct. 30 and 31. The military authorities allowed no bloodshed. The king appointed

Károlyi minister-president; Jászi and several Socialists entered the cabinet. On Oct. 31 Tisza was murdered in his villa; the Government failed to bring the murderers to justice. Councils of soldiers, students, workmen and peasants, on the Russian model, formed themselves in the Magyar districts, while farther out, Slovak, Rumanian, Croat and Serb National Councils were formed, and took over the administration of the districts concerned. Károlyi's Government hoped by its pacifist attitude to buy peace on all fronts; it disarmed the soldiers returning from the Italian and Russian fronts, and the minister of war, Bela Linder, declared: "I wish to see no soldiers." Jászi negotiated with the Slovak National Councils, whom he hoped to induce to accept a division of Hungary by cantons, on the Swiss model, although they had already joined themselves with the newly-constituted Czech Government and the advancing Rumanian army. The Rumanian, Serb and Czech forces, although quite weak, occupied the frontier districts deep into the solid Magyar territories; the army under the German field-marshal, Mackensen, who had been commanding on the Balkan front, was forbidden to return through Hungary, and Mackensen was himself arrested, to prove that Hungary had abandoned the German alliance. On Nov. 8 Károlyi and Jászi were obliged by General Franchet d'Esperay, at the armistice of Belgrade, to accept the *de facto* occupation of these territories.

The Hungarian Republic.—On Nov. 13 Charles IV., in a proclamation issued from Eckartsau, renounced "participation in the conduct of State affairs"; on Nov. 16 the National Council proclaimed the "Hungarian People's Republic" and dissolved both houses of Parliament. On Nov. 19 Bela Kun (*q.v.*), a former insurance agent, arrived from captivity in Russia, on a forged passport, with the intention of organizing a revolution of the proletariat on the Bolshevik model. The October revolution was the work of the radical bourgeoisie and the industrial workmen; the former, however, had no following among the masses, and soon lost their leading rôle in the cabinet, as leader of which Károlyi, as president of the State, had appointed Dionys Berinkei. The Government possessed no armed forces, and its bourgeois ministers of war, who wished to reorganize the troops still available, were chased out, one after the other, by street demonstrations of the Soldiers' Councils, which were already organized on Bolshevik lines. The impotence of the bourgeois parties gave full scope to the single compactly-organized force in the country—that of the socialistic industrial labourers. Their leaders used their position in the Government to force all State employees into the Marxist trade unions, the membership figures of which rose in October from 251,000 to 721,000, and to 1,500,000 in the first half of 1919. The offices of several bourgeois newspapers were wrecked by the Socialists, so that after a few months it looked as though the urban populations could oppose no resistance to a purely socialistic Government. It was hoped to win over the peasants in the country by promises of agrarian reform, and a mortgaged estate of Count Károlyi's was distributed among them; but this had little effect on the peasants, so that the Government did not venture to introduce general suffrage—the main point in the programme of the National Council—or hold any elections.

Socialist-Communist Alliance.—The Socialists hoped that this anarchy would establish their own power; but this was challenged by the Bolsheviks under Kun, who, assisted by the Soldiers' Council, won over the remaining troops, and on Feb. 20, 1919, attacked the buildings of the Socialist newspaper, killing seven police and injuring 80. The Government, on the insistence of the bourgeoisie, had Kun arrested; but the Socialist leaders realized the strength of the Communist agitation. When, then, the nationalist bourgeoisie and peasants saw that the pacifist attitude of the Government bore no fruit with the Entente, and that Col. Vyx, representing the Entente in Budapest, allowed the Czechs, Serbs and Rumanians to cross the line of demarcation and occupy further portions of Hungarian territory, the bourgeois politicians whom the National Council had thrust aside began to bestir themselves again to organize their forces against further foreign occupation and internal anarchy. In view of this danger the Socialists found it necessary to ally themselves with the

Bolsheviks. The occasion was Col. Vyx's Note of March 20, which allowed the Rumanians to occupy a further 2,000 sq. km. of Hungarian territory. It seemed probable that the country would revolt against this demand and overthrow the "pacifist" Government. Károlyi accordingly resigned the presidency on the 21st, and the Socialist minister of education in his cabinet, Sigmund Kunfi, went to Kun in prison and concluded an agreement with him whereby the Socialists and Communists were to take over the power jointly and establish the Soviet Republic of Hungary. The whole Social Democratic Party united *en bloc* with the Communists. Pending the decision of the Third International, the new party was styled the "Socialist Party of Hungary"; it was to take over the power at once in the name of the proletariat; the dictatorship was to be wielded by the Workmen's, Soldiers' and Peasants' Councils; immediate steps were to be taken to organize a "class army" and disarm the bourgeoisie; a reign of terror was to be proclaimed to ensure the rule of the proletariat; and a close military and spiritual alliance made with the Russian Soviet Government.

The Soviet Republic.—The power was taken over from Károlyi, by agreement with the latter, on the night of March 21, with the help of the Marxist workmen. Alexander Garbai, a mason, became president of the Soviet State, but the real ruler was Kun, who acted as people's commissary for foreign affairs. Of the 11 people's commissaries eight were Jews, and the local representatives of the Soviet were also largely Jews; this fact was largely responsible for the subsequent outbreak of anti-Semitism in Hungary. The introduction of Communism embittered all sections of the population except the industrial labourers; on the first day of the Soviet régime all businesses and houses in the towns were confiscated as communal property, and the merchants forced to sell their stocks on credit for the Government, which, however, gave them no new supplies. Trade was declared a State monopoly; but the State had no apparatus ready, so that all forms of purchase and sale died after a few weeks. All banks were expropriated, their depots looted, as were rich residences. The factories were obliged to close down for lack of raw materials, and the workmen transferred to the Red Army. Intellectual workers were organized by the State in unions; writers were paid by the State and forced to work at its orders. All bourgeois newspapers were stopped; only Communist pamphlets were allowed to appear. The chief danger for the Soviet lay in the peasants, who ceased supplying the towns with foodstuffs, and, although the large estates had been expropriated on paper, supported the counter-revolution and made several local risings. To repress these, the Government founded a special corps, the "Lenin-boys," of released convicts, and sent armoured trains into the rebellious districts. The number of murders committed by these terrorists was 585, not counting isolated murders committed by local "revolutionary tribunals." Leading bourgeois politicians were arrested as hostages; in Budapest alone, 481. Many of them fled to Szeged, which was occupied by the French, or to Vienna. To divert the bitterness from himself, Kun sent the Red Army against the Czechs, and drove them out of Kaschau and the surrounding district. On Clemenceau's protest of June 8, however, he withdrew the troops, and on June 13 actually recognized the cession of the northern part of Hungary. The demoralized Red troops were sent on July 20 against the Rumanians. The more patriotic among them, however, deserted home, and the Rumanians began to advance over the Theiss towards Budapest. The Soviet Government, threatened at once by the Rumanians and the counter-revolution, resigned on Aug. 1. Kun, with most of the people's commissaries, fled to Vienna, whence they were presently sent to Russia via Germany.

Rumanian Occupation.—After Kun's flight, it was hard to form a Government. Peidl's purely Socialist Government, which succeeded Kun, was overthrown by some counter-revolutionaries on Aug. 7, who then elected the archduke Joseph governor, while he entrusted them with the Government (Friedrich Government). As the Rumanians had occupied Budapest since Aug. 4, cutting off all communications with the rest of Hungary, this Government was quite powerless, and the archduke was forced by the Entente

to retire. While this situation reigned, the Bolshevik officials were expelled in the country districts, without the control of the State authority. A counter-revolutionary Government with a small army had been formed in Szeged during the Bolshevik period, but was unable to come to Budapest on account of the Rumanian troops of occupation. The Rumanians requisitioned army supplies from the occupied districts, and when they retired behind the Theiss on Nov. 14, they took with them live-stock, rolling stock, industrial machinery, and even typewriters from the Government offices, to the total value, as estimated by the Entente commissioner, Col. Loree, of £3,750,000. Four Entente generals were sent to Budapest to protect the Hungarians against injustice. On the departure of the Rumanians, Sir George Clerk, representing the Entente, demanded a cabinet composed of representatives of all parties, and Charles Huszar replaced Friedrich as minister-president (Nov. 25, 1919–March 15, 1920).

Establishment of the Counter-revolution.—The Szegedin army under vice-admiral Nicholas Horthy (*g.v.*) was now able to come to Budapest. Elections were held, on the basis of general, secret suffrage, for a new National Assembly, to sit for two years and restore order after the revolutions. The elections of Jan. 25, 1920, brought a Conservative, Christian, and partly anti-Semitic majority, which included many representatives of the peasants. By Art. 1 of 1920 the National Assembly restored the legal continuity of the Constitution, and also formally dissolved the link with Austria; by Art. 45 of 1921 Hungary was proclaimed to be still a kingdom, but the decision respecting the execution of the sovereign power was postponed to a later date, Admiral Horthy, commander-in-chief of the national forces, being elected regent on March 1, 1920.

The first three ministries, those of Huszar, of Alexander Simonyi-Semadam (March 15–July 19, 1920) and of Count Paul Teleki (July 19, 1920–April 14, 1921), had to face many difficulties at home and abroad. At home the reaction and revenge against the Communist régime led to excesses. "Detachments," led by officers, executed Communists without judicial authority; these illegal bodies had to be dissolved by the Government with the help of the police and national army. The victims of this counter-revolutionary persecution numbered 307. These excesses were exploited by Jászi's Octobrists and Kunfi's Social Communists, most of whom had fled to Vienna, as a "White terror"; and the Amsterdam International, at the instance of the Austrian Socialists, proclaimed a boycott against Hungary (June 20–July 3, 1920), but with no great effect. The National Assembly also accepted the Treaty of Trianon, which the Hungarian delegation had had to sign on June 4, 1920, without obtaining a discussion of it with the Entente Powers. The treaty took from Hungary, and gave to her neighbours, 192,000 sq. km. of her area of 283,000; 10,782,000 of her population of 20,886,487, and 30%, or 3,300,000, of the 9,945,000 pure Magyars. The neighbour States expelled to Hungary in all 30,000 of these Hungarians, mostly officials and intellectuals, with their families. They returned without homes or situations, increased the unrest in Hungary, and involved the State in much expense. The peasants were quieted by the agrarian reform (Art. 36 of 1920) carried through by Stephen Szabó-Nagyatád, himself a small peasant, and minister of agriculture in Teleki's cabinet. This measure made 1,300,000 "joch" available for the landless peasants, and provided them with the land for 250,000 houses. The universal impoverishment under the heavy financial conditions of the reparations clauses of the Treaty of Trianon could not, however, be averted. At the end of the Bolshevik period the Hungarian crown stood at 80% under par; after the peace treaty it fell to 0.0003, while the rate for loans rose to 40–50% per mensem. Speculation was rife. No efforts of the successive finance ministers, neither the stamping of the currency notes—a measure taken to avoid a further inflation—nor the sequestration of 20% of the cash deposits of the shares and 17% of the larger estates, could remedy the situation. Trade and industry stagnated, Hungary's neighbours who, with the exception of Austria, had constituted themselves as the "Little Entente," imposed frontier restrictions and threatened on several occasions to re-occupy Hungarian territory, *e.g.*, on the two occasions

(March 7 and Oct. 29, 1921) when King Charles returned to Hungary. On each occasion Charles called on the Ministry and the regent to hand over the power to him. On his second return he appointed a ministry of his own, but was defeated at Buda-örs by Government troops and sent to Madeira by order of the Entente. After the second attempt the National Assembly was obliged, at the wish of the Entente Powers and by an ultimatum from the Czechoslovak foreign minister, dated Oct. 30, to declare the Habsburgs to have forfeited the throne (Law 47 of 1921). The question of the sovereign's person was postponed till a later date. Relations with Austria were troubled by the fact that the Treaty of Trianon ceded to that Power the western portion of Hungary; but the Austrian occupation was prevented by irregular detachments, consisting mostly of refugees from the States of the Little Entente. The Protocol of Venice (Oct. 12, 1921) finally provided for a plebiscite in the town and district of Sopron (Oedenburg). As this went in Hungary's favour, the districts where it was taken were not ceded to Austria. (See BURGENLAND.)

The Bethlen Cabinet.—The consolidation of the internal and foreign situation was due to the cabinet of Count Stephen Bethlen (*q.v.*), who succeeded Teleki on April 14, 1921. Bethlen succeeded in composing a working majority, the "Party of Unity," out of the small agriculturalists, reinforced by intellectuals, large proprietors, and commercial circles. With this party, Bethlen commanded the second National Assembly (June 1922–Nov. 1926). He restored the second chamber by Laws 26 of 1925 and 22 of 1926, abolishing secret ballot for the lower house, except in the towns. In the upper house Bethlen reduced the magnates' representatives to 38, 40 being elected by corporations, 76 by the towns and counties, and 40 nominated by the Government. In the lower house of the new parliament, which met on Jan. 25, 1927, Bethlen's party received 79% of the total mandates. With this powerful majority he liquidated the last counter-revolutionary movements, and excluded a few extreme nationalist deputies from his party. These persons, led by Prince Louis Windischgrätz, were prosecuted for forging French francs for irredentist purposes, and condemned on May 28, 1926, to long terms of imprisonment.

Economic Reconstruction.—The internal political situation consolidated, it was possible to carry through the financial reconstruction of Hungary with the help of the League of Nations. (See section *Economy and Finance*.) Even after this, however, the economic situation remained difficult. The State was obliged to maintain many thousands of refugees, housing was still in arrears, industry, cut off from its markets and sources of supply, had to readapt itself. In social legislation, Hungary remodelled her workmen's insurance, prepared old age insurance for all workmen and employees, and founded several hundred scholarships for students entered at foreign universities.

The economic situation could not really improve until the many import and export restrictions, passport difficulties and tariff barriers of Central Europe were abolished. Hungary's relations with her neighbours were also clouded by the question of her minorities within their frontiers; in the case of the optants in Transylvania (*q.v.*) she appealed to the League of Nations. In other respects Hungary, as a member of the League of Nations, had concluded a network of commercial and other treaties, and recovered her place in the European system.

The chief difficulty lay in the establishment of more cordial relations with the States of the "Little Entente," whose primary purpose was the maintenance intact of the provisions of the Treaty of Trianon, while Hungarian public opinion demanded its revision, in view of the attribution by it of various districts with Magyar majorities to Hungary's neighbours, and the sometimes insufficient protection accorded to these minorities. Hungary concluded treaties of friendship with Turkey (Dec. 18, 1923); with the United States (June 24, 1925) and with Italy (April 5, 1927), the last-named being also an arbitration treaty. Further arbitration treaties were concluded with Austria (April 10, 1923) and Switzerland (June 18, 1924). Friendly relations with Italy were cemented by several ministerial visits, the Bethlen Ministry in particular stressing the importance of this relationship.

BIBLIOGRAPHY.—(a) Sources: The oldest Hungarian document dates

from 1101 (the foundation by St. Stephen of the Abbey of Pannonhalma-Szent Martin). The oldest narrative is the *Gesta Hungarorum* (12th century). The best of the many collections of documents is that issued by the Hungarian Academy of Sciences (114 vols.). More recent documents, from the archives in Budapest and Vienna, are issued by the Hungarian Historical Society. (b) Works: Most works on Hungarian history, since the 16th century, are in Magyar, but important works appeared in Latin in the 18th century, e.g., Katona's *Historia critica regum Hungariae* (42 vols., 1779–1810). The *Bibliographia Hungarica*, vols. i–iii, issued by the Hungarian Institute at the University of Berlin, gives a list of works on Hungary in languages other than Magyar. Among modern works, see H. Marczali, *Ungarische Verfassungsgeschichte* (Tübingen, 1910) and *Hungary in the 18th Century* (trans. A. B. Yolland, 1910); A. B. Yolland, *Hungary* (1917); J. Szekfű, *Der Staat Ungarn* (Stuttgart, Berlin, 1918); L. Büdáy, *Dismembered Hungary* (1922) (statistics on the effects of the Treaty of Trianon); Count Paul Teleki, *The Evolution of Hungary* (Williamstown, 1923, bibl.); A. Domanovsky, *Die Geschichte Ungarns* (Munich, 1923) (latest full account); M. Károlyi, *Fighting the World: the Struggle for Peace* (1924); O. Jászi, *Revolution and Counter-revolution in Hungary* (1924) (these two works put the case for the Socialists and Democrats); F. Eckhart, *Introduction à l'histoire hongroise* (1928); current numbers of the *Ungarische Jahrbücher* (Berlin, quarterly, 1921 seq.) and the *Revue des Etudes hongroises et finno-ougriennes* (1923 seq.). (J. Sz.)

HUNGER and THIRST are highly unpleasant sensations which arise when there is bodily need for food and water. Both hunger and thirst should be sharply distinguished from appetite, a desire for food or drink which past experience has proved to be pleasant. Commonly the requirements of the body are provided by regular meals, tempting the appetite, and only when these fail do hunger and thirst appear. Appetite may be regarded as a primary and hunger and thirst as a secondary defence against the dangers of a serious reduction of the food and water supplies in the body.

Hunger has been described as an ache or uncomfortable pang or gnawing sensation, usually localized in the lower chest or upper abdomen. Associated with this central core of feeling there may be lassitude, drowsiness, faintness, headache, irritability and restlessness, in various degrees and combinations. Two views regarding the nature of hunger have been advocated: (1) that it is a "general sensation," and (2) that it has a local origin.

The idea that hunger is a general sensation is based on the assumption that as the food supplies of the body decrease, nerve cells in the brain are stimulated directly by the impoverished blood, and the sensation results. The body's food supplies may be greatly reduced, however, as in starvation, without the sensation of hunger. And after eating, the hunger pangs cease long before food can be digested and absorbed into the blood stream. Furthermore, the pangs can be temporarily suppressed by swallowing indigestible materials. These facts indicate that the sensation is not due directly to lack of nutriment. Again, hunger pangs are known to be intermittent, lasting between a half-minute and a minute, reappearing after the lapse of approximately another minute, and so forth; there is no evidence that the bodily supplies are intermittently deficient. Finally, the idea that hunger is a general sensation fails to account for the common reference to the stomach region as its place of origin.

The theory that hunger is of local origin has been supported by the discovery that the empty or nearly empty stomach contracts at fairly regular intervals and that after the start of each contraction a hunger pang is experienced. The activity of the empty stomach occurs in cycles. It begins with occasional weak single contractions lasting about 30 seconds; they may fade out or they may become more vigorous and appear at shorter intervals, accompanied by increased tonus of the gastric muscle; the tonus may develop into a cramp-like state. Not only are the single contractions associated with hunger pangs, but the cramp-like state is associated with a continuous ache or gnawing sensation. After such a cycle the stomach relaxes and is inactive for a time; but after a rest the same phenomena are repeated. Examination of the stomach by means of the X-rays has shown that the essential change underlying the hunger pang is a strong contraction of the encircling muscles of the lower third of the stomach. There is evidence of simultaneous contractions of the small intestine, but little attention has been paid to them.

The hunger contractions occur during sleep. They are stopped by chewing and temporarily by swallowing. They cease during intense emotional states such as joy, fear and anger. They are weakened and may be completely abolished by smoking, the effects apparently varying with the "strength" of the tobacco. They may be banished for ten or 15 minutes by pulling a belt tightly about the waist. Very vigorous muscular exercise inhibits the contractions, but after the exercise they may be more intense than before. They persist after the stomach has been disconnected from the central nervous system and are therefore an inherent feature of that organ.

Although hunger pangs are due to strong gastric contractions, these pangs, like other sensations, are modified in their relative intensity by other conditions. Thus, the sensations of hunger may be absent in fever or during prolonged starvation, although the contractions are going on. On the other hand, the sensations may be especially strong if they receive attention.

The conditions for the occurrence of hunger contractions are not yet clearly understood. When the sugar concentration in the circulating blood is reduced about 25%, hunger contractions increase. If the blood-sugar level is raised, they cease. They may be related, therefore, to need for the most generally useful energy-yielding material in the body, viz., glucose.

Thirst.—The sensation of thirst centres about a disagreeable dryness and stickiness of the inner surfaces of the mouth and throat, especially the palate. When thirst is marked, food cannot be chewed and swallowed and even sugar does not dissolve on the tongue.

Conditions which dry the mouth and throat arouse the sensation. Breathing hot dry air, prolonged speaking and singing, repeated chewing of desiccated food, the lessening of salivary secretion by fear and anxiety are all attended by thirst. Also losses of fluid from the body—as in sweating, diarrhoea, haemorrhage and lactation—give rise to the same sensation. Both local and general causes of thirst have been recognized, therefore, and correspondingly it has been explained, like hunger, as a local and as a general sensation.

Thirst is explained as a general sensation by the more concentrated state of the blood after prolonged deprivation of water. Thirst becomes prominent, however, before any change in the blood is demonstrable. Another argument for the general sensation is that if swallowed water is lost through a gastric fistula, it does not satisfy and drinking continues; but if the fistula is closed, a single drink soon assuages the desire for more. This is not a conclusive argument, however, because water retained in the body may moisten the mouth and thereby abolish the local unpleasant dryness.

A theory that thirst has a local origin is based on the biological consideration that it would first be manifest in air-inhabiting animals, exposed to loss of water from the body. Air when breathed moves across a region of the throat likely to be readily dried because lined with flat cells and provided with relatively few glands. A new feature in air-inhabiting animals are the salivary glands. Interestingly enough these glands are either absent or rudimentary in mammalian forms (cetacea) which have returned to an aquatic existence. The presence or absence of salivary glands in large groups of animals, corresponding to exposure or non-exposure of the mouth to desiccating air, indicates that their function is to protect the mouth and throat against drying. This idea is confirmed by the reflex flow of saliva which occurs when the mouth tends to dry. Saliva consists of about 99% water. If the body is not supplied with water the blood is long maintained in an unchanged state by a withdrawal of water from storage in muscles, glands and skin. The salivary glands suffer along with the other structures, but since they need water for their service they are peculiarly affected by the withdrawal. They cannot secrete adequately, therefore the mouth dries, and the unpleasant sensation of dryness and stickiness (thirst) results.

The theory that the salivary glands act as sensitive indicators of bodily need for water because they serve to keep the mouth and throat moist and because they require water to perform that function, receives support from a number of experiments. Atro-

pine, which stops salivary secretion without lessening the water content of the blood, brings on marked thirst. Animals with the ducts of the salivary tied drink almost incessantly. Finally, water lack results in a gradually lessened flow of saliva under equal stimulations, and the drinking of water restores the original flow. Thus the evidence that thirst is a general sensation can be simply explained in terms of the local service of the salivary glands.

It is possible that the sensation of thirst may be stimulated in the course of the nerve paths from mouth and throat to the cerebral cortex. Certainly very slight injuries of the base of the brain below the optic thalamus cause insatiable thirst and the drinking of enormous amounts of water. This is characteristic of the disease diabetes insipidus. The relation of such pathological states to physiological thirst is still obscure.

HUNGERFORD, WALTER HUNGERFORD, BARON (d. 1449), English soldier, belonged to a Wiltshire family. His father, Sir Thomas Hungerford (d. 1398), became speaker of the House of Commons in 1377, through the influence of John of Gaunt, and is the first person formally mentioned in the rolls of parliament as holding the office. Walter Hungerford also served as speaker. He fought at Agincourt and was an envoy at the council of Constance and the congress of Arras. An executor of Henry V.'s will and a member of the council under Henry VI., Hungerford became a baron in 1426, and he was lord treasurer from 1426 to 1431.

HUNGERFORD, a town of Berkshire, England, extending into Wiltshire, 61 m. W. by S. of London by rail. Pop. (1921) 2,784. It is situated in the valley of the Kennet and lies on the Kennet and Avon canal. It has agricultural trade. John of Gaunt, duke of Lancaster, presented to the citizens manorial rights, including common pasture and fishing. The trout of the Kennet are numerous and carefully preserved. Hungerford is also a favourite hunting centre.

HUNINGUE (HÜNINGEN), a town of France, department of Haut-Rhin (Alsace), on the left bank of the Rhine and a branch of the Rhine-Rhone canal, 3 m. N. of Basle by rail. Pop. (1926), 3,685. The town grew round a fortress at a Rhine crossing. The duke of Lauenburg took it from the Imperialists in 1634 and Louis XIV. of France later bought it. Vauban fortified it (1679-81) and a Rhine bridge was then built. The fortress was dismantled after 1815. The town makes chemicals, molasses, watches and cigars.

HUNNERIC (d. 484), king of the Vandals, was a son of King Gaiseric, and was sent to Italy as a hostage in 435 when his father made a treaty with the emperor Valentinian III. After his return to the Vandal court at Carthage, he married a daughter of Theodoric I., king of the Visigoths; but when this princess was suspected of attempting to poison her father-in-law, she was mutilated and was sent back to Europe. Hunneric became king of the Vandals on his father's death in 477. Like Gaiseric he was an Arian, and his reign is chiefly memorable for his cruel persecution of members of the orthodox Christian Church in his dominions. Hunneric's second wife was Eudocia, a daughter of Valentinian III. and his wife Eudocia. (See VANDALS.)

HUNNIS, WILLIAM (d. 1597), English musician and poet, was as early as 1549 in the service of William Herbert, afterwards earl of Pembroke. In 1550 he published *Certayne Psalmes . . . in Englishe metre*, and shortly afterwards was made a gentleman of the Chapel Royal. During the reign of Mary he was implicated in plots against the queen, and was imprisoned for some time. In 1566 he was made Master of the children of the Chapel Royal. No complete piece of his is extant, perhaps because of the rule that the plays acted by the children should not have been previously printed. In his later years he purchased land at Barking.

Hunnis's extant works include *Certayne Psalmes* (1549), *A Hive full of Hunnye* (1578), *Seven Sobbes of a sorrowful Soule for Sinne* (1583), *Hunnies Recreations* (1588), 16 poems in the *Paradise of Dainty Devices* (1576), and two in *England's Helicon* (1600). See Mrs. C. Carmichael Stopes's tract on William Hunnis, reprinted (1892)

from the *Jahrbuch der deutschen Shakespeare Gesellschaft*.

HUNS, a name given to at least four peoples, whose identity remains obscure. (1) The Huns, who invaded the East Roman empire from about A.D. 372 to 453 and were most formidable under the leadership of Attila. (2) The Hungarians or Magyars who crossed the Carpathians into Hungary in A.D. 898 and mingled with the races they found there. (3) The White Huns (*Λευκοὶ Οὐννοί* or Ephthalites *q.v.*), who troubled the Persian empire from about 420 to 557 and were known to the Byzantines. (4) The Hūnas, who invaded India during the same period. It is most probable that the last two are identical and although it cannot be proved that the Magyars are descended from the horde which sent forth the Huns in the 4th century, it is possible that they were originally Ephthalites. Our present knowledge of the history and distribution of the Huns tends to support this view. In the 1st century A.D. the Chinese drove the Hiung-nu westward, and while one division of the Huns remained in Transoxiana and Afghanistan, another pushed further west and rested near the southern Urals. From this point the Huns invaded Europe, and when their power collapsed, after the death of Attila, many of them may have returned to their original haunts. Possibly the Bulgarians and Khazars were offshoots of the same horde. The Magyars may very well have gradually spread first to the Don and then beyond it, until in the 9th century they entered Hungary. Authorities are not even agreed as to the branch of the Turanians to which the Huns should be referred; the physical characteristics of these nomad armies were very variable and there is no certain ethnic or linguistic identification. Hiung-nu seems not to be a particular but a general term for warlike nomads. The warlike and vigorous temper of the Huns has led many writers to regard them as Turks. The Turks were perhaps not distinguished by name or institutions from other tribes before the 5th century, but the Huns may have been an earlier offshoot of the same stock. Apart from this the Hungarians may have received an infusion of Turkish blood not only from the Osmanlis but from the Kumans and other tribes who settled in the country.

History.—The authentic history of the Huns in Europe practically begins about the year A.D. 372, when under a leader named Balamir (or, according to some mss. Balamber) they began a westward movement from their settlements in the steppes lying to the north of the Caspian. After crushing, or compelling the alliance of various nations unknown to fame (Alpilzuri, Alcidezuri, Himari, Tuncarsi, Boisci), they at length reached the Alani, a powerful nation which had its seat between the Volga and the Don; these also, after a struggle, they defeated and finally enlisted in their service. They then proceeded, in 374, to invade the empire of the Ostrogoths (Greutungi), ruled over by the aged Ermanaric, or Hermanric, who died (perhaps by his own hand) while the critical attack was still impending. Under his son Hunimund a section of his subjects promptly made a humiliating peace; under Withemir (Winithar), however, who succeeded him in the larger part of his dominions, an armed resistance was organized; but it resulted only in repeated defeat, and finally in the death of the king. The representatives of his son Witheric put an end to the conflict by accepting the condition of vassalage. Balamir now directed his victorious arms still farther westward against that portion of the Visigothic nation (or Tervingi) which acknowledged the authority of Athanaric. The latter entrenched himself on the frontier which had separated him from the Ostrogoths, behind the "Greutung-rampart" and the Dniester; but he was surprised by the enemy, who forded the river in the night, fell suddenly upon his camp, and compelled him to abandon his position. Athanaric next attempted to establish himself in the territory between the Pruth and the Danube, and with this object set about heightening the old Roman wall which Trajan had erected in the north-eastern Dacia; before his fortifications, however, were complete, the Huns were again upon him, and without a battle he was forced to retreat to the Danube. The remainder of the Visigoths, under Alavivus and Fritigern, now began to seek, and ultimately were successful in obtaining (376), the

permission of the emperor Valens to settle in Thrace; Athanaric meanwhile took refuge in Transylvania, thus abandoning the field without any serious struggle to the irresistible Huns. For more than fifty years the Roman world was undisturbed by any aggressive act on the part of the new invaders, who contented themselves with over-powering various tribes which lived to the north of the Danube. In some instances, in fact, the Huns lent their aid to the Romans against third parties; thus in 404-405 certain Hunnic tribes, under a chief or king named Uldin, assisted Honorius in the struggle with Radagaisus (Ratigar) and his Ostrogoths, and took a prominent part in the decisive battle fought in the neighbourhood of Florence. Once indeed, in 409, they are said to have crossed the Danube and invaded Bulgaria under perhaps the same chief (Uldin), but extensive desertions soon compelled a retreat.

About the year 432 a Hunnic king, Ruas or Rugulas, made himself of such importance that he received from Theodosius II. an annual stipend or tribute of 350 pounds of gold (£14,000), along with the rank of Roman general. Quarrels soon arose, partly out of the circumstance that the Romans had sought to make alliances with certain Danubian tribes which Ruas chose to regard as properly subject to himself, partly also because some of the undoubted subjects of the Hun had found refuge on Roman territory; and Theodosius, in reply to an indignant and insulting message which he had received about this cause of dispute, was preparing to send off a special embassy when tidings arrived that Ruas was dead and that he had been succeeded in his kingdom by Attila and Bleda, the two sons of his brother Mundzuk (433). Shortly afterwards the treaty of Margus (not far from the modern Belgrade) was ratified; this treaty provided for Roman tribute to Attila, the surrender of fugitives, the institution of free markets and regulations as to alliances with other powers. The Romans held to the treaty and during the ensuing eight years the Huns made their extensive conquests in Scythia, Media and Persia.

In 445 Bleda died, and two years afterwards Attila, now sole ruler, undertook one of his most important expeditions against the Eastern empire; on this occasion he pushed southwards as far as Thermopylae, Gallipoli and the walls of Constantinople; peace was cheaply purchased by tripling the yearly tribute (which accordingly now stood at 2,100 pounds of gold, or £84,000 sterling) and by the payment of a heavy indemnity. In 448 again occurred various diplomatic negotiations, and especially the embassy of Maximinus, of which many curious details have been recorded by Priscus his companion. Then followed, in 451, that westward movement across the Rhine which was only arrested at last, with terrible slaughter, on the Catalaunian plains (according to common belief, in the neighbourhood of the modern Châlons, but more probably at a point some 50m. to the south-east, near Mery-sur-Seine). The following year (452) that of the Italian campaign, was marked by such events as the sack of Aquileia, the destruction of the cities of Venetia, and that historical interview with Pope Leo I. which resulted in the return of Attila to Pannonia, where in 453 he died (*see* ATTILA). Almost immediately afterwards the empire he had amassed rather than consolidated fell to pieces. His too numerous sons began to quarrel about their inheritance, while Ardaric, the king of the Gepidae, was placing himself at the head of a general revolt of the dependent nations. The inevitable struggle came to a crisis near the river Netad in Pannonia, in a battle in which 30,000 of the Huns and their confederates, including Ellak, Attila's eldest son, were slain. The nation, thus broken, rapidly dispersed, exactly as the White Huns did after a similar defeat about a hundred years later. One horde settled under Roman protection in Little Scythia (the Dobruja), and others in Dacia Ripensis (on the confines of Serbia and Bulgaria) or on the southern borders of Pannonia. Many, however, appear to have returned to what is now South Russia, and may perhaps have taken part in the ethnical combinations which produced the Bulgarians.

The chief original authorities are Ammianus Marcellinus, Priscus, Jordanes, Procopius, Sidonius Apollinaris and Menander Protector.

(C. El; A. N. J. W.)

HUNSDON, HENRY CAREY, 1ST BARON (c. 1524-1596), English soldier and courtier, was a son of William Carey (d. 1529); his mother was Mary (d. 1543), a sister of Anne Boleyn, and he was consequently cousin to Queen Elizabeth. Member of parliament for Buckingham under Edward VI. and Mary, he was knighted in 1558, was created Baron Hunsdon in 1559, and in 1561 became a privy councillor and a knight of the Garter. In 1568 he became governor of Berwick and warden of the east Marches, and he gained a decisive victory over the northern rebels under Leonard Dacre near Carlisle in February 1570. In 1583 he became lord chamberlain, but he did not relinquish his post at Berwick. Hunsdon was one of the commissioners appointed to try Mary queen of Scots; after Mary's execution he went on a mission to James VI. of Scotland, and when the Spanish Armada was expected he commanded the queen's bodyguard. He died in London, at Somerset House, on July 23, 1596.

HUNSTANTON, seaside resort of Norfolk, England, on the east shore of the Wash, 112 m. N. by E. from London by rail. Pop. (1921) 4,289. The new watering-place is about 1 m. from the old village. The parish church of St. Mary is a Decorated building; Hunstanton Hall is a Tudor building of brick. At Brancaster, 6 m. E., there is a Roman fort which formed part of the defences of the *Litus Saxonicum* (4th cent. A.D.).

HUNT, ALFRED WILLIAM (1830-1896), English painter, son of Andrew Hunt, a landscape painter, was born at Liverpool on Nov. 15, 1830. Most of his pictures are in private ownership; but his "Windsor Castle" is in the Tate gallery, "Working Late" in the Walker art gallery, Liverpool, and others at South Kensington. He died in London on May 3, 1896.

See *Exhibition of Drawings in Water Colour by Alfred William Hunt*, Burlington Fine Arts Club (1897); H. C. Marillier, *The Liverpool School of Painters* (1904).

HUNT, HENRY (1773-1835), English reformer, was born at Upavon, Wilts., on Nov. 6. He was for many years the most prominent among the more extreme English reformers under the oppression of Sidmouth and Castlereagh: indeed, after the defection of Burdett he had a position which was almost that of recognized leader. In person, training and character, he much resembled William Cobbett (*q.v.*). He was tall, florid and bulky; a typical English farmer both in occupation and appearance; he was as pugnacious, as unreasonable, as devoted and as vain as his more famous rival; he was possibly more courageous. But *littera scripta manet*: Cobbett wrote magnificent English which has preserved him a growing fame; Hunt is forgotten because we can no longer hear the voice and eloquence which gave him the name of Orator Hunt. He first adopted radical principles in 1806 and continued his agitation at a persistent series of public meetings and dinners until Aug. 1819 when he presided at the great meeting at St. Peter's fields, Manchester, which was attacked by the yeomanry (see PETERLOO). The white hat, which he wore on that occasion and which was stated to have been stove in by a sword cut, became the badge of reform, and for several years to wear a white hat was as symbolical as later it was to wear a red tie. He was sentenced to imprisonment for two and a half years; from his prison he sent out *A peep into a jail*, an exposure of Ilchester gaol which had its share in promoting prison reform. He took a great share in causing the *crescendo* of indignation which eventually overturned the oligarchy in 1832. In 1830 he was himself elected M.P. for Preston, a borough which, by virtue of a scot-and-lot franchise, was one of the very few with a working class electorate. In Parliament he presented a petition for women's rights, and moved (despite his farming connection) against the Corn Laws. But the Reform Act of 1832, in granting the vote to the middle class and standardizing the franchise, necessarily disfranchised the mass of the electors at Preston. Hunt lost his seat in the election of 1833 and died on Feb. 15, 1835.

See *Memoirs of Henry Hunt Esq.*, by himself (1820-22); R. Huish, *Life of Hunt* (1836).
(R. W. P.)

HUNT, HENRY JACKSON (1819-1889), American soldier, was born in Detroit, Mich., on Sept. 14, 1819, and graduated at the U.S. Military Academy in 1839. He served with great gallantry in the Mexican War, became captain in 1852, and major in 1861. His professional attainments were great, and in 1856 he was a member of a board entrusted with the revision of light artillery drill and tactics. He took part in the first battle of Bull Run in 1861, and soon afterwards became chief of artillery in the Washington defences. As a colonel on the staff of General McClellan he organized and trained the artillery reserve of the Army of the Potomac. Throughout the Civil War he contributed more than any officer to the effective employment of the artillery arm. With the artillery reserve he rendered the greatest assistance at the battle of Malvern hill, and soon afterwards he became chief of artillery in the Army of the Potomac. On the day after the battle of South Mountain he was made brigadier-general of volunteers. At the Antietam, Fredericksburg and Chancellorsville, he rendered further good service, and at Gettysburg his handling of the artillery was conspicuous. When the U.S. army was reorganized in 1866 he became colonel of artillery and president of the permanent artillery board. In 1883 he retired to become governor of the Soldiers' Home, Washington, D.C. He died on Feb. 11, 1889. He was the author of *Instructions for Field Artillery* (1860).

HUNT, JAMES HENRY LEIGH (1784-1859), English essayist and poet, was born at Southgate, Middlesex. His father had been a lawyer in Philadelphia, and had left the United States because of his loyalist sympathies. The son, who was educated at Christ's Hospital, began writing verse as soon as he left school, and soon became a constant contributor to the newspapers. In 1808 he became editor of the *Examiner*, a clever journal owned by his brother John. The brothers were sent to prison for an attack in the *Examiner* on the prince regent. The offensive phrase was "a fat Adonis of 50." Leigh Hunt's imprisonment had compensations, for it brought Byron, Moore, Brougham and other friends of liberty to see him in prison. Another joint enterprise of the Hunt brothers was a quarterly, the *Reflector*. The essays published as *The Round Table* (2 vols., 1816-17), conjointly with William Hazlitt, appeared in the *Examiner*.

In 1816 Leigh Hunt wrote his *Story of Rimini*, which established his fame as a poet. Though few read it now, the poem is important in the history of English poetry, because in it Hunt went back to the rhythms of Chaucer and Spenser and thus became one of the pioneers of the new romantic school. In 1818 appeared a collection of poems entitled *Foliage*, followed in 1819 by *Hero and Leander*, and *Bacchus and Ariadne*. In the same year he reprinted these two works with *The Story of Rimini* and *The Descent of Liberty* with the title of *Poetical Works*, and started the *Indicator*, in which some of his best work appeared. Both Keats and Shelley belonged to the circle gathered around him at Hampstead, which also included William Hazlitt, Charles Lamb, Bryan Procter, Benjamin Haydon, Cowden Clarke, C. W. Dilke, Walter Coulson, John Hamilton Reynolds and other men of liberal sympathies. After Shelley's departure for Italy Leigh Hunt's financial situation became desperate. Marianne Hunt (*née Kent*), his rather unattractive wife, wrote to Mrs. Shelley, with the result that Leigh Hunt was invited to go out to meet Shelley and Byron at Pisa. Byron provided the Hunts and their family (there were seven children) with a lodging in the Villa Lanfranchi, and Leigh Hunt was to publish a liberal paper. But Byron was annoyed when he learned that Leigh Hunt had no longer a share in the *Examiner*, and the connection proved an unhappy one. Nevertheless, though Byron was not always gracious, he made substantial payments to Hunt, and before he left for Greece made over to John Hunt exceedingly valuable copyrights. The ill-starred *Liberal* existed through four quarterly numbers. The Hunts remained in Italy until 1825. After his return to England Hunt revenged himself for the slights he had received from Byron in the ill-judged *Lord Byron and some of his Contemporaries* (1828), which brought down on him the scorn of Moore.

From that time onwards Leigh Hunt's life was a constant

struggle with sickness and poverty. He edited various papers, and published many admirable volumes of criticism, but was often dependent on Mrs. Shelley's kindness until in 1847 he received a Civil List pension. Hunt was a generous critic, and had a fresh open mind which recognized genius before it was acknowledged elsewhere. He had been one of the first to recognize a great poet in Keats, and he lived to welcome the early poems of Tennyson. He died at Putney on Aug. 28, 1859. His most important later works were two excellent selections (1844 and 1846) from the English poets, *A Book for a Corner* (2 vols., 1849), *Autobiography* (3 vols., 1850), *Table Talk* (1851). His narrative poems, original and translated, many of the shorter of which are minor classics, were collected as *Stories in Verse* (1855). Leigh Hunt excelled especially in narrative poetry, of which "Abou ben Adhem" and "Solomon's Ring" are excellent examples on a small scale.

Leigh Hunt's other works include: *Amyntas, A Tale of the Woods* (1820), translated from Tasso; *The Seer, or Common-Places refreshed* (2 pts., 1840-41); three of the Canterbury Tales in *The Poems of Geoffrey Chaucer, modernized* (1841); *Stories from the Italian Poets* (1846); *Men, Women and Books* (2 vols., 1847); *The Old Court Suburb* (2 vols., 1855; ed. A. Dobson, 1902); selections from Beaumont and Fletcher (1855); and, with S. Adams Lee, *The Book of the Sonnet* (Boston, 1867). His *Poetical Works* (2 vols.), revised by himself and edited by Lee, were printed at Boston, U.S.A., in 1857, and an edition (London and New York) by his son, Thornton Hunt, appeared in 1860. Among volumes of selections are: *Essays* (1887), ed. A. Symonds; *Leigh Hunt as Poet and Essayist* (1889), ed. C. Kent; *Essays and Poems* (1891), ed. R. B. Johnson for the "Temple Library"; *Prefaces by Leigh Hunt, Mainly to his Periodicals*, ed. R. Brimley Johnson (1928).

His *Autobiography* was revised by himself shortly before his death, and edited (1859) by his son Thornton Hunt, who also arranged his *Correspondence* (2 vols., 1862). Additional letters were printed by the Cowden Clarkes in their *Recollections of Writers* (1878). The *Autobiography* was edited (2 vols., 1903) with full bibliographical note by R. Inghen. A bibliography of his works was compiled by Alexander Ireland (*List of the Writings of William Hazlitt and Leigh Hunt*, 1868). There are short lives of Hunt by Cosmo Monkhouse ("Great Writers," 1893) and by R. B. Johnson (1896).

HUNT, RICHARD MORRIS (1828-1895), American architect, was born in Brattleboro (Vt.) on Oct. 31, 1828. He studied in Europe (1843-54), mainly in the École des Beaux Arts at Paris, and in 1854 was appointed inspector of works on the buildings connecting the Tuileries with the Louvre. Under Hector Lefuel he designed the Pavillon de la Bibliothèque, opposite the Palais Royal. In 1855 he returned to New York, and was employed on the extension of the Capitol at Washington. He designed the Lenox library (now torn down) and the *Tribune* buildings in New York; the Theological library, and Marquand chapel at Princeton; the Divinity college and the Scroll and Key building at Yale; the Vanderbilt mausoleum on Staten island, and the Yorktown monument. For the administration building at the World's Columbian exposition at Chicago in 1893 Hunt received the gold medal of the Institute of British Architects. Among the most noteworthy of his domestic buildings were the residences of W. K. Vanderbilt and Henry G. Marquand in New York city; George W. Vanderbilt's country house at Biltmore, and several of the large "cottages" at Newport (R.I.), including "Marble House" and "The Breakers." Hunt was the leader of a school that has established in the United States the manner and the traditions of the Beaux Arts. He took a prominent part in the founding of the American Institute of Architects, and from 1888 was its president. His talent was eminently practical; and he was almost equally successful in the ornate style of the early Renaissance in France, in the picturesque style of his comfortable villas, and the monumental style of the Lenox library. There is a beautiful memorial to Hunt in the wall of Central Park, opposite the site of the old Lenox library building, from designs by Daniel C. French and Bruce Price. He died on July 31, 1895.

HUNT, THOMAS STERRY (1826-1892), American geologist and chemist, was born at Norwich (Conn.), on Sept. 5, 1826. He became interested in natural science, and in 1845 he was elected a member of the Association of American Geologists and Naturalists at Yale (1849). In 1848 he read a paper in Philadelphia *On Acid Springs and Gypsum Deposits of the*

Onondaga Salt Group. At Yale he became assistant to Prof. B. Silliman, Jr., and in 1846 was appointed a chemist to the geological survey of Vermont. In 1847 he was appointed to similar duties on the Canadian geological survey at Montreal under Sir William Logan, and this post he held until 1872. In 1859 he was elected F.R.S., and he was one of the original members and president of the Royal Society of Canada. He died in New York city on Feb. 12, 1892.

His publications include *Chemical and Geological Essays* (1875, ed. 2, 1879); *Mineral Physiology and Physiography* (1886); *A New Basis for Chemistry* (1887, ed. 3, 1891); *Systematic Mineralogy* (1891). See an obituary notice by Persifer Frazer, *Amer. Geologist* (xi. Jan. 1893), with portrait. A complete bibliography of his work is given in *Bulletin of the Geol. Soc. of America*, vol. 4, p. 379.

HUNT, WILLIAM HENRY (1790-1864), English water-colour painter, was born in London, on March 28, 1790. He was apprenticed about 1805 to John Varley, the landscape-painter, with whom he remained five or six years, exhibiting three oil pictures at the Royal Academy in 1807. He exhibited regularly at the Society of Painters in Water-colour, of which he became a full member in 1827. He died on Feb. 10, 1864. Hunt was one of the creators of the English school of water-colour painting. His subjects, especially those of his later life, are extremely simple; but, by the delicacy, humour and fine power of their treatment, they rank second to works of the highest art only.

HUNT, WILLIAM HOLMAN (1827-1910), English artist, was born in London on April 2, 1827. His father was the manager of a city warehouse. In his thirteenth year Holman Hunt worked in an office, but employed his leisure in reading, drawing and painting. In his 17th year he entered the Royal Academy schools, where he met his lifelong friend John Everett Millais, then a boy of 15. In 1846 Holman Hunt sent to the Royal Academy his first picture, "Hark!", which was followed by "Dr. Rochcliffe performing Divine Service in the Cottage of Joceline Joliffe at Woodstock," in 1847, and "The Flight of Madeline and Porphyrio" (from Keats's *Eve of St. Agnes*) in 1848. In this year he and Millais, with the co-operation of Dante Gabriel Rossetti and others, initiated the Pre-Raphaelite movement. Typical examples of the new creed were furnished in the next year's Academy by Millais's "Isabella" and Holman Hunt's "Rienzi vowing to obtain Justice for the Death of his Young Brother." His "Valentine protecting Sylvia from Proteus" (1851) was praised by Ruskin and gained a prize at Liverpool; it is reckoned as the finest of Holman Hunt's earlier works.

In 1854 he achieved his first great success by the famous picture of "The Light of the World," an allegorical representation of Christ knocking at the door of the human soul. "The Light of the World" was presented by the owner to Keble College. In 1904 Holman Hunt completed a second "Light of the World" which is hung in St. Paul's Cathedral, the execution of which was due to his dissatisfaction with the way in which the Keble picture was shown.

In January 1854 Holman Hunt left England for Syria and Palestine with the desire to revivify on canvas the facts of Scripture history. The first fruit of this idea, which may be said to have dominated the artist's life, was "The Scapegoat," a solitary outcast animal standing alone on the shores of the Dead Sea, with the mountains of Edom in the distance, seen under a gorgeous effect of purple evening light. It was exhibited at the Royal Academy in 1856, together with three Eastern landscapes. His next picture (1860), one of the most elaborate and most successful of his works, was "The Finding of our Saviour in the Temple." Like all his important pictures, it was the work of years. Many causes contributed to the delay in its completion, including a sentence of what was tantamount to excommunication (afterwards revoked) passed on all Jews acting as models. The picture is now in the Birmingham Municipal Art Gallery. Holman Hunt's next great religious picture was "The Shadow of Death." This work was presented to Manchester by Sir William Agnew. After two years' absence Holman Hunt returned to Jerusalem in 1875, where he was engaged upon his great work, "The Triumph of the Innocents," which proved to be the most serious labour of his life. He executed two versions; of these one is in the Liverpool,

the other in the Birmingham Art Gallery. "The Ship," painted on board a P. and O. steamer on the voyage to Palestine in 1875, is now in the Tate gallery. His most important later work is "May-Day, Magdalen Tower."

Holman Hunt remained entirely unaffected by the various movements in the art-world after 1850. His ambition was always "to serve as high priest and expounder of the excellence of the works of the Creator." His *History of Pre-Raphaelitism*, a subject on which he could speak as a first authority, but not without dissent from at least one member of the P.R.B., was published in 1905. On Sept. 7, 1910, he died in London, and he was buried in St. Paul's Cathedral. He was a member of the Order of Merit.

Bayliss, *Five Great Painters of the Victorian Era* (1902); H. W. Shrewsbury, *Brokers in Art* (1920). (C. MON.; X.)

HUNT, WILLIAM MORRIS (1824-1879), American painter, was born at Brattleboro (Vt.), on March 31, 1824. He attended at Harvard, but his real education began when he accompanied his mother and brother to Europe, where he studied with Couture in Paris and then came under the influence of Jean François Millet. The companionship of Millet had a lasting influence on Hunt's character and style, and his work grew in strength, beauty, and seriousness. He was the real introducer of the Barbizon school to America, and he more than any other turned the rising generation of American painters towards Paris. On his return in 1855 he painted some of his most beautiful pictures, all reminiscent of his life in France and of Millet's influence. Such are "The Belated Kid," "Girl at the Fountain," "Hurdy-Gurdy Boy," etc. But the public called for portraits, and it became the fashion to sit to him. Among his best paintings of this kind are those of William M. Evarts, Mrs. Charles Francis Adams, the Rev. James Freeman Clarke, William H. Gardner, Chief Justice Shaw, and Judge Horace Gray. Unfortunately many of his paintings and sketches, together with five large Millets and other art treasures collected by him in Europe, were destroyed in the great Boston fire of 1872. Among his later works American landscapes predominated. They also include the "Bathers" (twice painted) and the allegories for the senate chamber of the State capitol at Albany (N.Y.), now lost by the disintegration of the stone panels on which they were painted. Hunt was drowned at the Isles of Shoals on Sept. 8, 1879. He wrote *Talks about Art* (London, 1878).

HUNTER, JOHN (1728-1793), British physiologist and surgeon, was born on Feb. 13, 1728, at Long Calderwood, in the parish of East Kilbride, Lanarkshire, being the youngest of the ten children of John and Agnes Hunter. His father, who died on Oct. 30, 1741, aged 78, was descended from the old Ayrshire family of Hunter of Hunterston; his mother, *née* Paul, came from Glasgow. Young Hunter worked for some time at cabinet-making, under his brother-in-law, but presently obtained from his brother William (*q.v.*) permission to aid, under Mr. Symonds, in making dissections in his anatomical school, then the most celebrated in London, intending, should he be unsuccessful there, to enter the army. He arrived in London in September 1748, about a fortnight before the beginning of his brother's autumnal course of lectures.

Hard-working, and singularly patient and skilful in dissection, Hunter had by his second winter in London acquired sufficient anatomical knowledge to be entrusted with the charge of his brother's practical class. In the summer months of 1749-1750, at Chelsea Military Hospital, he attended the lectures and operations of William Cheselden, on whose retirement in the following year he became a surgeon's pupil at St. Bartholomew's where Percivall Pott was one of the senior surgeons. In 1754 he became a surgeon's pupil at St. George's Hospital, where he was appointed house-surgeon in 1756. During the period of his connection with Dr. Hunter's school he solved the problem of the descent of the testes in the foetus, traced the ramifications of the nasal and

olfactory nerves within the nose, experimentally tested the question whether veins could act as absorbents, studied the formation of pus and the nature of the placental circulation, and with his brother earned the chief merit of practically proving the function and importance of the lymphatics in the animal economy. On June 5, 1755, he entered as a gentleman commoner at St. Mary's Hall, Oxford, but his instincts would not permit him, to use his own expression, "to stuff Latin and Greek at the university."

An attack of inflammation of the lungs in the spring of 1759 having produced symptoms threatening consumption, Hunter obtained in October 1760 the appointment of staff-surgeon in Hodgson and Keppel's expedition to Belleisle. With this he sailed in 1761. In the following year he served with the English forces on the frontier of Portugal. Whilst with the army he acquired the extensive knowledge of gunshot wounds embodied in his important treatise (1794) on that subject. When not engaged in the active duties of his profession, he occupied himself with physiological and other scientific researches. Thus, in 1761, off Belleisle, the conditions of the coagulation of the blood were among the subjects of his inquiries. Later, on land, he continued the study of human anatomy, and arranged his notes and memoranda on inflammation; he also ascertained by experiment that digestion does not take place in snakes and lizards during hibernation, and observed that enforced vigorous movement at that season proves fatal to such animals, the waste so occasioned not being compensated, whence he drew the inference that, in the diminution of the power of a part attendant on mortification, resort to stimulants which increase action without giving real strength is inadvisable. A ms. catalogue by Hunter, probably written soon after his return from Portugal, shows that he had already made a collection of about two hundred specimens of natural and morbid structures.

On arriving in England early in 1763, Hunter, having retired from the army on half-pay, took a house in Golden Square, and began to practise as a surgeon. Most of the metropolitan practice at the time was held by P. Pott, C. Hawkins, Samuel Sharp, Joseph Warner and Robert Adair; and Hunter sought to eke out his at first slender income by teaching practical anatomy and operative surgery to a private class. His leisure was devoted to the study of comparative anatomy, to procure subjects for which he obtained the refusal of animals dying in the Tower menagerie and in various travelling zoological collections. In connection with his rupture of a tendo Achillis, in 1767, he performed on dogs several experiments which, with the illustrations in his museum of the reunion of such structures after division, laid the foundation of the modern practice of cutting through tendons (tenotomy) for the relief of distorted and contracted joints. In the same year he was elected F.R.S.

His first contribution to the *Philosophical Transactions*, with the exception of a supplement to a paper by J. Ellis in the volume for 1766, was an essay (June 18, 1772) on post-mortem digestion of the stomach, written at the request of Sir J. Pringle, in which he explained that phenomenon as a result of the action of the gastric juice. The subjects and dates of his subsequent papers in the *Transactions*, the titles of which give little notion of the richness of their contents, are as follows: The torpedo (1773); air-receptacles in birds, and the Gillaroo trout (1774); the *Gymnotus electricus*, and the production of heat by animals and vegetables (supplemented in 1777), (1775); the recovery of people apparently drowned (1776); the free martin (1779); the communication of smallpox to the foetus in utero, and the occurrence of male plumage in old hen pheasants (1780); the organ of hearing in fishes (1782); the anatomy of a "new marine animal" described by Home (1785); the specific identity of the wolf, jackal and dog (supplemented in 1789), the effect on fertility of extirpation of one ovary, and the structure and economy of whales (1787); observations on bees (1793); and some remarkable caves in Bayreuth and fossil bones found therein (1794). With these may be included a paper by Home, from materials supplied by Hunter, on certain horny excrescences of the human body.

On Dec. 9, 1768 he was elected a surgeon to St. George's Hospital, and, soon after, a member of the Corporation of Surgeons.

He now began to take house-pupils. Among these were Edward Jenner, who became a friend and correspondent, W. Guy, Dr. P. S. Physick of Philadelphia and Everard Home, his brother-in-law. William Lynn and Sir A. Carlisle, though not inmates of his house, were frequent visitors there. His pupils at St. George's included John Abernethy, Henry Cline, James Earle and Astley Cooper. In 1770 he settled in Jermyn Street, in the house which his brother William had previously occupied; and in July 1771 he married Anne, the eldest daughter of Robert Home, surgeon to Burgoyne's regiment of light horse¹.

From 1772 till his death Hunter resided during autumn at a house built by him at Earl's Court, Brompton, where most of his biological researches were carried on. There he kept for the purpose of study and experiment the fishes, lizards, blackbirds, hedgehogs and other animals sent him from time to time by Jenner; tame pheasants and partridges, at least one eagle, toads, silkworms and many more creatures, obtained from every quarter of the globe. Bees he had under observation in his conservatory for upwards of twenty years; hornets and wasps were also diligently studied by him. On two occasions his life was in risk from his pets—once in wrestling with a young bull, and again when he fearlessly took back to their dens two leopards which had broken loose among his dogs.

Hunter, ever cautious of confounding fact and hypothesis, besought of nature the truth through the medium of experiments and observations. "He had never read Bacon," says G. G. Babington, "but his mode of studying nature was as strictly Baconian as if he had." To Jenner, who had offered a conjectural explanation of a phenomenon, he writes, on the 2nd of August 1775: "I think your solution is just; but why think? why not try the experiment? Repeat all the experiments upon a hedgehog as soon as you receive this, and they will give you the solution." It was his axiom however, "that experiments should not be often repeated which tend merely to establish a principle already known and admitted, but that the next step should be the application of that principle to useful purposes" ("Anim. Oecon." *Works*, iv. 86). In his toxicological and other researches, in which his experience had led him to believe that the effects of noxious drugs are nearly similar in the brute creation and in man, he had already, in 1780, as he states, "poisoned some thousands of animals."

In 1772 Hunter, in order effectually to gauge the extent of his own knowledge, and also correctly to express his views, which had been repeatedly misstated or ascribed to others, began his lectures on the theory and practice of surgery. Though Pott, indeed had perceived that the only true system of surgery is that which most closely accords with the curative efforts of nature, a rational pathology can hardly be said to have had at this time any existence; and it was generally assumed that a knowledge of anatomy alone was a sufficient foundation for the study of surgery. Hunter, unlike his contemporaries, to most of whom his philosophic habit of thought was a mystery, and whose books contained little else than relations of cases and modes of treatment, sought the reason for each phenomenon that came under his notice. The principles of surgery, he maintained, are not less necessary to be understood than the principles of other sciences; unless, indeed, the surgeon should wish to resemble "the Chinese philosopher whose knowledge consisted only in facts." Too much attention, he remarked, cannot be paid to facts; yet a multitude of facts overcrowd the memory without advantage if they do not lead us to establish principles, by an acquaintance with which we learn the causes of diseases. Hunter's course, which latterly comprised eighty-six lectures, delivered on alternate evenings between the hours of seven and eight, lasted from October to April. Some teachers of his time were content to dismiss the subject of anatomy and surgery in a course of only six weeks' duration. His

class was usually small and never exceeded thirty. He was deficient in the gifts of a good extempore speaker, being in this respect a remarkable contrast to his brother William; and he read his lectures, seldom raising his eyes from the manuscript. His manner with his auditory is stated to have been embarrassed and awkward; and his language always unadorned; but that "his expressions for the explaining of his new theories rendered his lectures often unintelligible" is scarcely evident in his pupils' notes still extant. In January 1776 Hunter was appointed surgeon-extraordinary to the king. He began in the same year his Croonian lectures on muscular motion, continued annually, except in 1777, till 1782; they were never published by him, being in his opinion too incomplete. In 1778 appeared the second part of his *Treatise on the Natural History of the Human Teeth*, the first part of which was published in 1771. It was in the waste of the dental alveoli and of the fangs of shedding teeth that in 1754-1755, as he tells us, he received his first hint of the use of the absorbents. Abernethy (*Physiological Lectures*, p. 196) relates that Hunter, being once asked how he could suppose it possible for absorbents to do such things as he attributed to them, replied, "Nay, I know not, unless they possess powers similar to those which a caterpillar exerts when feeding on a leaf."

Hunter in 1780 read before the Royal Society a paper in which he laid claim to have been the first to make out the nature of the utero-placental circulation. His brother William, who had five years previously described the same in his *Anatomy of the Gravid Uterus*, thereupon wrote to the Society attributing to himself this honour. John Hunter in a rejoinder to his brother's letter, dated the 17th of February 1780, reiterated his former statement, viz. that his discovery, on the evening of the day in 1754 that he had made it in a specimen injected by a Dr. Mackenzie, had been communicated by him to Dr. Hunter. Thus arose an estrangement between the two Hunters, which continued until the time of William's last illness, when his brother obtained permission to visit him.

In 1783 Hunter was elected a member of the Royal Society of Medicine and of the Royal Academy of Surgery at Paris, and took part in the formation of "A Society for the Improvement of Medical and Chirurgical Knowledge," for the *Transactions* of which he wrote many papers. In 1783 he purchased the twenty-four years' leasehold of two houses, the one on the east side of Leicester Square, the other in Castle Street with intervening ground. Between the houses he built in 1783-1785, at an expense of above £3,000, a museum for his anatomical and other collections which by 1782 had cost him £10,000. The new edifice consisted of a hall lighted from the top, with a gallery all round, and having beneath it a lecture theatre. In April 1785 Hunter's collections were removed into it.

In May 1785, Hunter sat to Sir Joshua Reynolds for his portrait. He proved a bad sitter, and Reynolds made little satisfactory progress, till one day Hunter, while resting his somewhat upraised head on his left hand, fell into a profound reverie—one of those waking dreams, seemingly, which in his lectures he has so well described, when "the body loses the consciousness of its own existence." The painter then sketched out the admirable portrait which is in the possession of the Royal College of Surgeons. Among the subjects of Hunter's physiological investigation in 1785 was the mode of growth of deer's antlers. By experiment on a buck he found that under "the stimulus of necessity," to use a phrase of the experimenter, the smaller arterial channels are capable of rapid increase in dimensions to perform the offices of the larger². It happened that, in the ensuing December, there lay in one of the wards of St. George's Hospital a patient admitted for popliteal aneurism. Should the surgeon, following the usual and commonly fatal method of treatment, cut down upon the tumour, and, after tying the artery above and below it, evacuate its contents? Or should he adopt

¹Mrs. Hunter died on Jan. 7, 1821, in Holles Street, Cavendish Square, London, in her seventy-ninth year. The words for Haydn's English canzonets were supplied by her, and were mostly original poems; of these the lines beginning "My mother bids me bind my hair" are, from the beauty of the accompanying music, among the best known. (See R. Nares in *Gent. Mag.* xci. pt. 1, p. 89, quoted in Nichols's *Lit. Anec.*, 2nd ser., vii. 638.)

²In his *Treatise on the Blood*, p. 288, Hunter observes: "We find it a common principle in the animal machine, that every part increases in some degree according to the action required. Thus we find . . . vessels become larger in proportion to the necessity of supply, as for instance, in the gravid uterus; the external carotids in the stag, also, when his horns are growing, are much larger than at any other time."

the procedure, deemed by Pott generally advisable, of amputating the limb above it?

It was Hunter's aim in his practice, even if he could not dispense with the necessity, at least to diminish the severity of operations, which he considered were an acknowledgment of the imperfection of the art of healing, and compared to "the acts of the armed savage, who attempts to get that by force which a civilized man would get by stratagem." Since, he argued, the experiment with the buck had shown that collateral vessels are capable of continuing the circulation when passage through a main trunk is arrested, why should he not, in the aneurism case, leaving the absorbents to deal with the contents of the tumour, tie the artery in the sound parts, where it is tied in amputation, and preserve the limb? Acting upon this idea, he ligatured his patient's femoral artery in the lower part of its course in the thigh, in the fibrous sheath enclosing the space since known as "Hunter's canal." The leg was found, some hours after the operation, to have acquired a temperature even above the normal. At the end of January 1786, that is, in six weeks' time, the patient was well enough to be able to leave the hospital. Thus Hunter inaugurated an operation which has been the means of preserving to hundreds life with integrity of limb.

Early in 1786 Hunter published his *Treatise on the Venereal Disease*, which, like some of his previous writings, was printed in his own house. Towards the end of the year appeared his *Observations on certain parts of the Animal Oeconomy*, which, besides the more important of his contributions to the *Philosophical Transactions*, contains nine papers on various subjects. In 1786 Hunter became deputy surgeon-general to the army; his appointment as surgeon-general and as inspector-general of hospitals followed in 1790. In 1787 he received the Royal Society's Copley medal, and was also elected a member of the American Philosophical society. On account of the increase in his practice and his impaired health, he now obtained the services of Home as his assistant at St. George's Hospital. The death of Pott in December 1788 secured to him the undisputed title of the first surgeon in England. He resigned to Home, in 1792, the delivery of his surgical lectures, in order to devote himself more fully to the completion of his *Treatise on the Blood, Inflammation and Gun-shot Wounds*, which was published by his executors in 1794. In this, his masterpiece, the application of physiology to practice is especially noticeable. Certain experiments described in the first part, which demonstrate that arterialization of the blood in respiration takes place by a process of diffusion of "pure air" or "vital air" (i.e., oxygen) through membrane, were made as early as the summer of 1755.

Hunter died on Oct. 16, 1793, while attending a board meeting at St. George's Hospital. His remains were interred privately on Oct. 22, 1793, in the vaults of St. Martin's in the Fields. Thence, on March 28, 1859, through the instrumentality of F. T. Buckland, they were removed to Abbot Islip's chapel in Westminster Abbey, to be finally deposited in the grave in the north aisle of the nave, close to the resting-place of Ben Jonson.

CONTRIBUTIONS TO SCIENCE

To attempt to set forth what in Hunter's teaching was new to pathology and systematic surgery, or was rendered so by his mode of treatment, would be well-nigh to present an epitome of all that he wrote on those subjects. "When we make a discovery in pathology," says Adams, writing in 1818, "we only learn what we have overlooked in his writings or forgotten in his lectures." Surgery, which only in 1745 had formally ceased to be associated with "the art and mystery of barbers," he raised to the rank of a scientific profession. His doctrines were, necessarily, not those of his age: while lesser minds around him were still dim with the mists of the ignorance and dogmatism of times past, his lofty intellect was illumined by the dawn of a distant day.

Hunter was of about medium height, strongly built and high-shouldered and short-necked. He had an open countenance, and large features, eyes light-blue or grey, eyebrows prominent, and hair reddish-yellow in youth, later white, and worn curled behind; and he dressed plainly and neatly. He rose at or before six, dis-

sected till nine (his breakfast hour), received patients from half-past nine till twelve, at least during the latter part of his life, and saw his outdoor and hospital patients till about four, when he dined, taking, according to Home, as at other meals in the twenty years preceding his death, no wine. After dinner he slept an hour; he then superintended experiments, read or prepared his lectures, and made, usually by means of an amanuensis, records of the day's dissections. "I never could understand," says W. Clift, "how Mr. Hunter obtained rest: when I left him at midnight, it was with a lamp fresh trimmed for further study, and with the usual appointment to meet him again at six in the morning." H. Leigh Thomas records that, on his first arrival in London, having by desire called on Hunter at five o'clock in the morning, he found him already busily engaged in the dissection of insects.

Rigidly economical of time, Hunter was always at work, and he had always in view some fresh enterprise. To his museum he gave a very large share of his attention, being fearful lest the ordering of it should be incomplete at his death, and knowing of none who could continue his work for him. At the time of his death he had anatomized over 500 different species of animals, some of them repeatedly, and had made numerous dissections of plants. The manuscript works by him, appropriated and destroyed by Home, among which were his eighty-six surgical lectures, all in full, are stated to have been "literally a cartload"; and many pages of his records were written by Clift under his directions "at least half a dozen times over, with corrections and transpositions almost without end."

The Hunterian Collections.—In accordance with the directions given by Hunter in his will, his collection was offered for purchase to the British government. But the prime minister, Pitt, on being asked to consider the matter, exclaimed: "What! buy preparations! Why, I have not money enough to purchase gun-powder." He, however, consented to the bestowal of a portion of the king's bounty for a couple of years on Mrs. Hunter and her two surviving children. In 1796 Lord Auckland urged upon the government the advisability of acquiring the collection, and on June 13, 1799, parliament voted £15,000 for this purpose. Its custodianship, after refusal by the College of Physicians, was unanimously accepted by the Corporation of Surgeons on the terms proposed. These were in brief—that the collection be open four hours in the forenoon, two days every week, for the inspection and consultation of the fellows of the College of Physicians, the members of the Company of Surgeons and persons properly introduced by them, a catalogue of the preparations and an official to explain it being at those times always at hand; that a course of not less than 24 lectures on comparative anatomy and other subjects illustrated by the collection be given every year by some member of the Company; and that the preparations be kept in good preservation at the expense of the Corporation, and be subject to the superintendence of a board of sixteen trustees.

The fulfilment of these conditions was rendered possible by the receipt of fees for examinations and diplomas, under the charter by which, in 1800, the Corporation was constituted the Royal College of Surgeons. In 1806 the collection was placed in temporary quarters in Lincoln's Inn Fields, and the sum of £15,000 was voted by parliament for the erection of a proper and commodious building for its preservation and extension. This was followed by a grant of £12,500 in 1807. The collection was removed in 1812 to the new museum, and opened to visitors in 1813. The greater part of the present edifice was built in 1835, at an expense to the college of about £40,000; and the combined Hunterian and collegiate collections, having been rearranged in what are now termed the western and middle museums, were in 1836 made accessible to the public. The erection of the eastern museum in 1852, on premises in Portugal Street, bought in 1847 for £16,000, cost £25,000, of which parliament granted £15,000; it was opened in 1855.

HUNTER, SIR ROBERT (1844-1913), English lawyer and philanthropist, was born on Oct. 27, 1844. In 1882 he became solicitor to the General Post Office. He devoted much of his time to safeguarding the rights of the public in regard to open spaces and the preservation of rights of way, and was one of the principal promoters of the Commons Preservation Society founded in 1865. In 1868 he became its hon. solicitor, and successfully conducted suits for preserving Wimbledon and Wandsworth Commons and for recovering a portion, wrongfully enclosed, of Epping Forest. Ashdown Forest, Hampstead Heath, Hindhead and the New Forest were safeguarded by him. He was made K.C.B. in 1911, and died at Haslemere on Nov. 6, 1913.

HUNTER, ROBERT (d. 1734), colonial governor of New York, New Jersey and Jamaica, was the son of James and Margaret (Spalding) Hunter of Hunterston, Ayrshire, Scotland. Forsaking his apprenticeship as an apothecary, Hunter joined the British army and fought at Blenheim (1704) under Marlborough, with whom he seems to have been personally acquainted. In 1707 Hunter was chosen lieutenant-governor of Virginia, but on the way to America he was captured by the French, remaining as their prisoner until exchanged for the bishop of Quebec. Hunter was commissioned as governor of New York and the Jerseys in 1709. Accompanying the new executive to America in 1710 were 3,000 Palatine refugees who were ordered to undertake the production of naval stores. This Hudson river venture proved to be a failure despite the governor's intense interest and expense in the project. Hunter's career in America was characterized by a series of political and religious entanglements, but he was one of the best loved administrators ever selected by England. He played an important rôle both at the New London congress (1711) and at New York in preparing the colonial contingents for the last campaign of Queen Anne's War. In 1719 Hunter returned to England, and for several years was consulted as an authority on colonial affairs by the board of trade. His last commission was the governorship of Jamaica which office he held until his death on March 31, 1734. (R. L. BE.)

HUNTER, ROBERT MERCER TALIAFERRO (1809-1887), American statesman, was born in Essex county, Va., on April 21, 1809. He entered the University of Virginia in his 17th year and was one of its first graduates; he then studied law at the Winchester (Va.) law school, and in 1830 was admitted to the bar. From 1837 to 1843 and from 1845 to 1847 he was a member of the National House of Representatives, being speaker from 1839 to 1841; and from 1847 to 1861 he was in the Senate, where he was chairman of the finance committee (1850-61). He is credited with having brought about a reduction of the quantity

of silver in the smaller coins; he was the author of the Tariff Act of 1857 and of the bonded-warehouse system, and was one of the first to advocate civil service reform. In 1853 he declined President Fillmore's offer to make him secretary of State. At the national Democratic convention at Charleston, S.C., in 1860 he was the Virginia delegation's choice as candidate for the presidency of the United States, but was defeated for the nomination by Stephen A. Douglas. Hunter did not regard Lincoln's election as being of itself a sufficient cause for secession, and in Jan. 1861 he proposed an elaborate but impracticable scheme for the adjustment of differences between the North and the South, but when this and several other efforts to the same end had failed he quietly urged his own State to pass the ordinance of secession. In 1861-62 he was secretary of State in the Southern Confederacy; and in 1862-65 was a member of the Confederate senate, in which he was, at times, a caustic critic of the Davis administration. He was one of the commissioners to treat at the Hampton Roads conference in 1865, and after the surrender of General Lee was summoned by President Lincoln to Richmond to confer regarding the restoration of Virginia in the Union. From 1874 to 1880 he was treasurer of Virginia, and from 1885 until his death near Lloyds, Virginia, on July 18, 1887, was collector of the port of Tappahannock, Virginia.

See Martha T. Hunter, *A Memoir of Robert M. T. Hunter* (Washington, 1903) for his private life, and D. R. Anderson, *Robert Mercer Taliaferro Hunter*, in the John P. Branch Historical Papers of Randolph Macon College (vol. ii. No. 2, 1906), for his public career. See also "Correspondence of Robt. M. T. Hunter, 1826-1876," ed. by Charles Henry Ambler, *Amer. Hist. Assoc. Ann. Report*, 1916, vol. ii.

HUNTER, WILLIAM (1718-1783), British physiologist and physician, the first great teacher of anatomy in England, was born on May 23, 1718, at East Kilbride, Lanark. He was the seventh child of his parents, and an elder brother of the still more famous John Hunter (q.v.). He was educated at Glasgow university, and then studied medicine under William Cullen at Hamilton. He then studied in Edinburgh and at St. George's hospital, London. In 1746 he lectured on operative surgery for a society of naval practitioners and won a great reputation for the fullness and thoroughness of his teaching. Little by little Hunter renounced surgical for obstetric practice, in which he excelled. He was appointed a surgeon-accoucheur at the Middlesex hospital in 1748, and at the British Lying-in hospital in 1749. He built a house, with lecture and dissecting-rooms, in Great Windmill street, whither he removed in 1770. Here was accommodated his collection, comprising anatomical and pathological preparations, ancient coins and medals, minerals, shells and corals. The whole collection, together with his fine library and an endowment of £8,000, by his will became, after the lapse of 20 years, the property of the University of Glasgow, where the collection may still be seen.

Hunter made several contributions to the *Medical Observations and Enquiries* and the *Philosophical Transactions*. In his paper on the structure of cartilages and joints, published in the latter in 1743, he anticipated what M. F. X. Bichat 60 years afterwards wrote concerning the structure and arrangement of the synovial membranes. His *Medical Commentaries* (pt. i., 1762, supplemented 1764) contains, among other like matter, details of his unseemly disputes with the Monros as to who first had successfully performed the injection of the *tubuli testis* (in which, however, both he and they had been forestalled by A. von Haller in 1745), and as to who had discovered the true office of the lymphatics, and also a discussion on the question whether he or Percivall Pott ought to be considered the earlier to have elucidated the nature of *hernia congenita*, which, as a matter of fact, had also been previously explained by Haller. In the *Commentaries* is exhibited Hunter's one weakness—an inordinate love of controversy. In 1762 he was consulted by Queen Charlotte, and in 1764 was made physician-extraordinary to her Majesty. His great work, *The Anatomy of the Gravid Uterus, exhibited in Figures*, was published in 1774. His posthumous works are *Two Introductory Lectures* (1784), and *Anatomical Description of the Human Gravid Uterus* (1794), which was re-edited by Dr. E. Rigby in 1843. Hunter was never married, and was a man of

frugal habits. He was an early riser, and a man of untiring industry. He is described as being in his lectures, which were of two hours' duration, "both simple and profound, minute in demonstration, and yet the reverse of dry and tedious"; and his mode of introducing anecdotal illustrations of his topic was most happy. Lecturing was to him a pleasure, and, notwithstanding his many professional distractions, he regularly continued it, because, as he said, he "conceived that a man may do infinitely more good to the public by teaching his art than by practising it." His great work, *The Anatomy of the Gravid Uterus*, was published in 1774. His posthumous works are *Two Introductory Lectures* (1784), and *Anatomical Description of the Human Gravid Uterus* (1794).

HUNTER, SIR WILLIAM WILSON (1840–1900), British publicist, son of a Glasgow manufacturer, was born at Glasgow on July 15, 1840. He was educated at Glasgow university, Paris and Bonn, and entered the Indian civil service in 1862. In 1869 the governor-general asked Hunter to submit a scheme for a comprehensive statistical survey of the Indian empire. The early period of his undertaking was devoted to a series of tours which took him into every corner of India. He himself supervised the statistical accounts of Bengal (20 vols., 1875–77) and of Assam (2 vols., 1879). The various statistical accounts, when completed, comprised no fewer than 128 volumes. *The Imperial Gazetteer of India*, condensed from this mass of material, appeared in 9 volumes in 1881 (2nd ed., 14 vols., 1885–87; 3rd ed., 26 vols., including atlas, 1908). After his retirement he arranged with the Clarendon Press to publish a series of *Rulers of India*, to which he himself contributed volumes on Dalhousie (1890) and Mayo (1892). He died at Oaken Holt on Feb. 6, 1900.

HUNTING, the pursuit of game and wild animals, for profit or sport; equivalent to "chase" (like "catch," from Lat. *captare*, Fr. *chasse*, Ital. *caccia*). The circumstances which render necessary the habitual pursuit of wild animals, either as a means of subsistence or for self-defence, generally accompany a phase of human progress distinctly inferior to the pastoral and agricultural stages. Resorted to as a recreation, however, the practice of the chase in most cases indicates a considerable degree of civilization, and sometimes ultimately becomes the almost distinctive employment of the classes which are possessed of most leisure and wealth. It is in some of its latter aspects, viz., as a "sport," pursued on fixed rules and principles, that hunting is dealt with here. (See also GAME LAWS.)

ENGLISH PRACTICE

Stag Hunting.—At an early period stag hunting was a favourite recreation with English royalty. It seems probable that in the reign of Henry VIII. the royal pack of buckhounds was kennelled at Swinley, where, in the reign of Charles II. (1684), a deer was found that went away to Lord Petre's seat in Essex; only five got to the end of this 70m. run, one being the king's brother, the duke of York. George III. was a great stag hunter, and met the royal pack as often as possible. In *The Chase of the Wild Red Deer*, Collyns says that the earliest record of a pack of staghounds in the Exmoor district is in 1598, when Hugh Pollard, Queen Elizabeth's ranger, kept one at Simonsbath. The succeeding rangers of Exmoor forest kept up the pack until some 200 years ago, the hounds subsequently passing into the possession of Mr. Walter of Stevenstone, an ancestor of the Rolle family. Successive masters continued the sport until 1825, when the fine pack, descended probably from the bloodhound crossed with the old southern hound, was sold in London. In 1827 Sir Arthur Chichester got a pack together again. Stag hunting begins on Aug. 12, and ends on Oct. 8; it begins again about Ladyday, and lasts till May 10. The mode of hunting with the Devon and Somerset hounds is briefly this: the whereabouts of a warrantable stag is communicated to the master by that important functionary the harbourer; a few couple of steady hounds called tufters are then thrown into cover, and, having singled out

a warrantable deer, follow him until he is forced to make for the open, when the body of the pack are laid on. Very often a considerable period elapses before the stag breaks, but a run over the wild country fully atones for the delay.

Hare and Otter Hunting.—Hare hunting, which must not be confounded with Coursing (*q.v.*), is an excellent school both for men and for horses. It is cheaper than any other kind, and does not need so large an area of country. Hare hunting requires considerable skill. Beckford even goes so far as to say: "There is more of true hunting with harriers than with any other description of hounds. . . . In the first place, a hare, when found, generally describes a circle in her course which naturally brings her upon her foil, which is the greatest trial for hounds. Secondly, the scent of the hare is weaker than that of any other animal we hunt, and, unlike some, it is always the worse the nearer she is to her end." Hare hunting is essentially a quiet amusement; no hallooing at hounds nor whip-cracking should be permitted; nor should the field make any noise when a hare is found, for, being a timid animal, she might be headed into the hounds' mouths. Capital exercise and much useful knowledge are to be derived by running with a pack of beagles. There are the same difficulties to be contended with as in hunting with the ordinary harrier, and a very few days' running will teach the youthful sportsman that he cannot run at the same pace over sound ground and over a deep ploughed field, up hill and down, or along and across furrows.

Otter hunting, which is less practised now than formerly, begins just as all other hunting is drawing to a close. When the waterside is reached an attempt is made to hit upon the track by which the otter passed to his "couch," which is generally a hole communicating with the river, into which the otter often dives on first hearing the hounds. When the otter "vents," or comes to the surface to breathe, his muzzle only appears above water, and when he is viewed or traced by the mud he stirs up, or by air bubbles, the hounds are laid on. Notwithstanding the strong scent of the otter, he often escapes the hounds, and then a cast has to be made. Otter hunting can claim to have been a royal sport, being mentioned in the reign of King Henry II. Roughly speaking, the season begins in April and extends into October, though, as in foxhunting, the weather has to be taken into consideration. The modern method of hunting otters differs from that employed in bygone days when the spear and net were used, for to-day the work is largely left to the hounds and terriers. There were in 1926 18 packs of otterhounds.

Fox Hunting.—It is only within comparatively recent times that the fox has come to be considered as an animal of the higher chase. William Twici, indeed, who was huntsman-in-chief to Edward II., and who wrote in Norman French a treatise on hunting, mentions the fox as a beast of venery, but obviously as an altogether inferior object of sport. The precise date of the establishment of the first English pack of hounds kept entirely for fox hunting cannot be accurately fixed. In any case, since fox hunting began, the system of the sport has been much changed. In our great-grandfathers' time the hounds met early, and found the fox by the drag, that is, by the line he took to his kennel on his return from a foraging expedition. Hunting the drag was doubtless a great test of nose, but many good runs must have been lost thereby, for the fox must often have heard the hounds upwind, and have moved off before they could get on good terms with him. The woodlands are neither so large nor so numerous as they formerly were, while there are many more gorse covers; therefore, instead of hunting the drag up to it, a much quicker way of getting to work is to find a fox in his kennel; and, the hour of the meeting being later, the fox is not likely to be gorged with food, and so unable to take care of himself at the pace at which the modern foxhound travels.

Cub hunting, carried out on a proper principle, is one of the secrets of a successful season. To the man who cares for hunting, as distinct from riding, September and October are not the least enjoyable months of the whole hunting season. As soon as the young entry have recovered from the operation of "rounding," arrangements for cub hunting begin. The hounds must

have first of all walking, then trotting and fast exercise, so that their feet may be hardened, and all superfluous fat worked off by the last week in August. So far as the hounds are concerned, the object of cub hunting is to teach them their duty; it is a dress rehearsal of the November business. In company with a certain proportion of old hounds, the youngsters learn to stick to the scent of a fox, in spite of the fondness they have acquired for that of a hare when at walk. When cub hunting begins, a start is made at an early hour, and then the system is adopted of tracking the cub by his drag. A certain amount of blood is of course indispensable for hounds, but it should never be forgotten that a fox cub of seven or eight months old, though tolerably cunning, is not very strong; the huntsman should not therefore, be over-eager in bringing to hand every cub he can find.

Modern Developments.—The years immediately preceding the World War were in many ways the golden age of this great English sport. Money was plentiful and it was noticeable that newcomers to the country-side were inclined to favour hunting rather than shooting. Increased facilities for transport enabled people to hunt from towns. Horse-breeding and hound-breeding had been placed on a sound basis, and hunting, generally, had been organized and stabilized under the supreme authority of the Masters of Foxhounds Association. Then came the war. The drain on horses was tremendous; subscription lists dropped to practically nothing; and, worst of all, at the height of the submarine menace, the feeding of hounds became an almost insoluble problem. The expense was enormous and there was a considerable outcry to the effect that hounds should be suppressed altogether as useless animals which consumed useful food. In 1917-18 hunting very nearly ceased altogether, and had it once come to an end it is extremely improbable that it would have been revived. The Association of M.F.H., however, in collaboration with Sir William Burton, tackled the problem. All over the country the number of hounds was reduced, the reduction being effected partly by killing off hounds, but mainly by drafting large numbers out of the country, notably to America, and by breeding fewer.

These drastic measures had their reward. Not only was hunting saved, but it was far easier for the staffs, greatly depleted by the war, to deal efficiently with these reduced packs. Further, half a century of hound shows had given the general breeder a very sound idea at what to aim; so that, in spite of these reductions, not only was the total number of hounds in England in 1925 very nearly up to the pre-war strength, but the quality of English hounds was as high as ever. Not a single well-known hunt ceased to exist.

Post-war Developments.—The end of the war by no means put an end to the difficulties which faced hunting. Judicious reductions, compensated for by breeding on sound lines, settled the hound difficulty. The question of horses largely answered itself by the release of an enormous number of animals from the army. After the war, too, whether as a direct result or not it is impossible to say, there was a decided improvement in the quality of the horses; this has been accentuated by the judgments given at horse shows. Before the war the show animal and the hunter were two distinct types; the animal that won prizes was not always likely to prove of much use across country and vice versa. But after the war the show animal was displaced by the real hunter, who is quite capable of winning a prize in the show ring in the summer and a point-to-point in the spring, the ideal at which to aim. The subscriber difficulty was also automatically solved by the return of the armies and, at any rate immediately after the armistice, there were more people hunting than before the war.

Speaking generally, then, fox-hunting recovered in a surprising way from the direct consequences of the war. But an indirect consequence still had a great and adverse effect on the sport, namely, the change in the social and territorial conditions of rural England. This began before 1914, but was enormously accentuated by the war. In the old days rural England was largely in the hands of the great landowners, who were probably hunting men themselves, or at any rate supporters of hunting, and their tenant farmers, who took their cue from their landlord. Then

came the extensive sales of landed property, due to the heavy taxation of the war period and after with its adverse effects on the sport.

Hunting countries whose borders extend up to the limits of towns are in danger of losing portions of their territory, and in some hunts this has already taken place. The great increase in poultry farms and the advent of the smallholder is not in the interests of hunting, though up to the present matters in general have been amicably arranged by the aid of the poultry fund and tact and good-feeling. The various outbreaks of foot-and-mouth disease affected hunting for the time being, and helped to bring about that depression in agriculture which became so marked in 1927. One of the least of the evils of the failure of so many farmers to make headway owing to the difficulties of the social and political situation has been the fact that far fewer are able to follow hounds than was the case, say, before the war, though the good feeling towards the chase has in no wise diminished. The fact that the farmer, who has in the great majority of cases been a staunch supporter of hunting, has fallen upon evil times has naturally inclined masters to come to his succour as much as possible. Even in fashionable countries followers are requested to avoid doing unnecessary damage, and not to jump fences when hounds are not running, while, in order to assist farmers and to prevent stock straying, all followers of hounds are particularly requested to shut gates and also to instruct their second horsemen to do the same, both when following the hunt and on the way home.

Hunting is still as popular as ever, though the difficulties of carrying on have increased, largely owing to the expenditure, which has doubled and even trebled in places. The fact that large estates in this country have in very many cases been sold and subdivided has naturally affected hunting in various ways. In far too many cases the earth stopping is not done anything like as systematically as it used to be, and this may in the future have serious effects. Another drawback that hunting has to face is that in making roads suitable for motor traffic the slippery nature of the surfaces adopted has rendered riding on roads unusually dangerous.

The increasing use of barbed wire should be noted, though in most countries there is an arrangement to take it down during the hunting season and replace it at the end, or at least to have the obstacle properly marked; but the real trouble is what may be termed the forgotten strand in a hedge, which has been the cause of several serious accidents.

Packs.—When railways were first started in England dismal prophecies were made that the end of hunting would speedily be brought about. Much the same was predicted about the motor-car. But on the whole results have been the reverse. While in some counties the sport has suffered, townsmen who formerly would have been too far from a meet can now secure transport for themselves and their horses in all directions; and as a consequence, meets of certain packs are not advertised because of the number of strangers who would be induced to attend. The sport was never so vigorously pursued as at the beginning of the 20th century, 19 packs of staghounds being kept in England and four in Ireland, over 170 packs of foxhounds in England, ten in Scotland and 23 in Ireland, with packs of harriers and beagles too numerous to be counted. The chase of the wild stag is carried on in the west country by the Devon and Somerset hounds, which hunt three or four days a week from kennels at Exford; by the Quantock; and by a few other local packs.

Packs of foxhounds vary, from large establishments in the "Shires," the meets of which are attended by hundreds of horsemen, some of whom keep large stables of hunters in constant work, to small kennels in the north of England, where the field follow on foot. The "Shires" is a recognized term, but is nevertheless somewhat vague. The three counties included in the expression are Leicestershire, Rutlandshire and Northamptonshire. Several packs which hunt within these limits are not supposed, however, to belong to the "Shires," whereas a district of the Belvoir country is in Lincolnshire, and to hunt with the Belvoir is certainly understood to be hunting in the "Shires." The Shire

3. The Frohnau stag-hunting pack getting away into open country

hounds include the Belvoir, the Cottesmore, the Quorn, the Fernie and the Pytchleys; for besides the Pytchley proper there is a pack distinguished as the Woodland. It is generally considered that the cream of the sport lies there, but with many of the packs which are generally described as "provincial" equally good hunting may be obtained. Round about London a man who is bent on the pursuit of fox or stag may gratify his desire in many directions. The Essex and the Essex Union, the Old Surrey and Burstow and the Surrey Union, the Old Berkeley, the West Kent, the Hertfordshire, the Crawley and Horsham, the Puckeridge are amongst the foxhounds; and as regards stag-hounds there are the Berks and Bucks, which was substituted for the Royal Buckhounds, within easy reach of the capital.

Modern Horses and Hounds.—Questions are constantly raised as to whether horse and hounds have improved or deteriorated in modern times. It is probable that the introduction of scientific agriculture has brought about an increase of pace. Hounds hunt as well as ever they did, are probably faster on the whole, and in the principal hunts more thoroughbred horses are employed. For pace and endurance no hunter approaches the English thoroughbred; and for a bold man who "means going," a steeplechase horse is often the best animal that could be obtained, for when he has become too slow to win races "between the flags," he can always gallop much faster, and usually lasts much longer, than animals who have not his advantage of blood. The quondam "chaser" is, however, usually apt to be somewhat impetuous at his fences. But it must by no means be supposed that every man who goes out hunting desires to gallop at a great pace and to jump formidable obstacles, or, indeed, any obstacles at all. A large proportion of men who follow hounds are quite content to do so passively through gates and gaps, with a canter along the road whenever one is available. A few of the principal packs hunt five days a week, and sometimes even six, and for such an establishment between 60 and 75 couples of hounds are requisite. A pack which hunts four days a week will be well supplied with anything between 50 and 60 couples—some hunts do with less,—and for two days a week from 20 to 30 will suffice. The young hound begins cub-hunting when he is some 18 months old, and as a rule is found to improve until his third or fourth season, though some last longer than this. Often, however, when a hound is five or six years old he begins to lack speed. Exceptional animals naturally do exceptional things, and a famous hound called Potentate is recorded by the 8th duke of Beaufort to have done notable service in the hunting field for 11 seasons.

Hunt Servants.—Servants necessary for a pack include the huntsman, the duties of whose office a master sometimes fulfils himself; two whippers-in, and often a kennel huntsman, though the 18th Lord Willoughby de Broke (d. 1902), a great authority, laid it down that "the man who hunts the hounds should always feed them." In all but the largest establishments the kennel huntsman is generally called the "feeder." It is his business to look after the pack which is not hunting, to walk them out, to prepare the food for the hunting pack so that it is ready when they return, and in the spring to attend to the wants of the matrons and whelps. A kennel huntsman proper may be described as the man who does duty when the master hunts his own hounds, undertaking all the responsibilities of the huntsman except actually hunting the pack. It may be said that the first duty of a huntsman is to obtain the confidence of his hounds, to understand them and to make himself understood; and the intelligence of hounds is remarkable. If, for example, it is the habit of the huntsman to give a single note on his horn when hounds are drawing a covert, and a double note when a fox is found, the pack speedily understand the significance. The problems of scent are certainly no better comprehended now than they were more than a hundred years ago when Peter Beckford wrote his *Thoughts on Hunting*. The subject of scent is full of mysteries. The great authority already quoted, the 8th duke of Beaufort, noted as a very extraordinary but well known fact for example, "that in nine cases out of ten if a fox is coursed by a dog during a run all scent ceases afterwards, even when you get your hounds to the line of the fox beyond

where the dog has been." This is one of many phenomena which have always remained inexplicable. The duties of the whipper-in are to a great extent explained by his title. Whilst the huntsman is drawing the covert the whipper-in is stationed at the spot from which he can best see what is going on, in order to view the fox away; and it is his business to keep the hounds together when they have found and got away after the fox. There are many ways in which a whipper-in who is not intelligent and alert may spoil sport; indeed the duke of Beaufort went so far as to declare that "in his experience, with very few exceptions, nine days out of ten that the whipper-in goes out hunting he does more harm than good." In woodland countries, however, a good whipper-in is really of almost as much importance as the huntsman himself; if he is not alert the hounds are likely to divide, as when running a little wide they are apt to put up a fresh fox. The earth-stopper "stops out" and "puts to"—the first expression signifying blocking, during the night, earths and drains to which foxes resort, the second performing the same duties in the morning so as to prevent the fox from getting to ground when he has been found. In the interests of humanity care should be taken that the earth-stopper always has with him a small terrier, as it is often necessary to "stop-out" permanently; and unless a dog is run through the drain some unfortunate creature in it, a fox, cat or rabbit, may be imprisoned and starved to death. This business is frequently performed by a gamekeeper, a sum being paid him for any litter of cubs or fox found on his beat.

Cost of Hunting.—With regard to the expenses of hunting, it was calculated before the war that a master of hounds should be prepared to spend at the rate of £500 a year for every day in the week that his hounds are supposed to hunt. This is probably rather under than over the mark, and the cost of hunting three days a week, if the thing be really properly done, will most likely be nearer £2,000 than £1,500. The expenses to the individual naturally vary so much that no figures can be given. As long ago as 1826, 27 hunters and hacks were sold for 7,500 guineas, an average of over £290; and when Lord Stamford ceased to hunt the Quorn in 1853, 73 of his horses fetched at auction an average of close on £200. Early in the 19th century, when on the whole horses were much cheaper than they are at present, 700 and 800 guineas are prices recorded as having been occasionally paid for hunters of special repute. A man may see some sport on an animal that cost him £40; others may consider it necessary to keep an expensive establishment at Melton Mowbray or elsewhere in the shires, with a dozen or more 500-guinea hunters and a corresponding staff of servants. Few people realize what enormous sums of money are annually distributed in connection with hunting. At least ten million pounds change hands every season, and numbers of the population in a good hunting season may expect to benefit by the sport. Horses must be fed; the wages of grooms and helpers be paid; saddlery, clothing, shoeing, etc., are items; farmers, innkeepers, railway companies, fly-men and innumerable others benefit more or less directly. (A. E. T. W.; X.)

FOX-HUNTING IN AMERICA

Fox-hunting in America dates from a very early period, though just how early it is difficult to ascertain. We find indefinite statements of early settlers from England who brought hounds, horses and even foxes over with them, but nothing definite until we find that Lord Fairfax, who settled on the Northern Neck in Virginia, in 1739, imported hounds in 1742, and kept up a regular establishment for fox-hunting at his country seat.

In 1766, the Gloucester Fox Hunting Club was organized by a number of gentlemen of Philadelphia, and a pack, which was said to have sprung from imported English blood, was maintained until 1818, when the club disbanded. At the initial meeting, held Dec. 13, 1766, the membership of the club was about 125, among them a great number of well-known historical personages. Capt. Samuel Morris was president, and his negro slave, "Old Natty," served the club as kennel-man and huntsman from 1769 until the Revolution. In 1775 the pack consisted of 14½ couples of hounds, and in 1778, when the kennels were on the Delaware, near Gloucester Point, of

16 couples. It seems probable that these hounds were very similar to those used in England for fox-hunting at that time. If this was the case, it is curious to note the development in the two countries, for the Rose Tree hounds, which now hunt over a neighbouring territory, are of the so-called American type, which is vastly different from the existing English type, and yet both could probably trace back to the same parent stock.

The half-dozen packs which hunt the country about Philadelphia are all prone to claim their origin from this club, and it is certain that it is very easy to trace the gradual development of fox-hunting in and about the Quaker city along these lines. Going further south, we find in that oldest of American sporting journals, *The American Turf Register and Sporting Magazine*, that there were many private packs owned and hunted about Baltimore, and even much farther south, and although there was no organized hunting at that time, these packs were the nucleus from which the southern hunt clubs have sprung.

Almost contemporaneous with the Gloucester Fox Hunting Club was the Brooklyn Hunt, founded 1789. Previously, in 1770, one John Evers maintained and hunted a pack of fox-hounds at Hempstead, Long Island. Hounds, horses and hunt servants were said to have been brought from England, and among the subscribers to the pack was George Washington, Esquire. The Revolutionary War put an end to these pioneer efforts, and as was the case with the hunting about Philadelphia, there was a period of inactivity among the fox-hunters; but we can trace the origin of many of the northern packs directly to the ante-Revolution organization.

Going still further north, to Canada, we find that the Montreal Hunt, founded in 1826, is the oldest organized hunt on the continent which can show a continuous record of sport. Of course, England maintained garrisons in all the principal Canadian cities, and it was natural that these military organizations should bring with them their national sport. Looking through the records of the Montreal Hunt, and also those of its somewhat younger sister, the Toronto Hunt, founded in 1843, we find that both have been largely supported in this way.

Fox-hunting in America is almost contemporary with fox-hunting in England, but the development in England has been much more rapid, and the whole game has been carried out on a much more scientific basis than in the United States and Canada. Conditions in England differ widely from those in America in the following particulars: First, in the climate, which makes a considerable difference in the scenting conditions; second, in the conformation of the country hunted over—it is much easier to stay with hounds in England than in America; third, the nature of the quarry—in England foxes are protected by popular feeling, whereas in America, or at any rate the greater portion of it, the fox is considered vermin and has to shift for himself from the first; and finally, the method of pursuing the sport. The diversity of these conditions, and for that matter, the diversity which exists among the hunting countries in America—which, it must be realized, cover an area comprising nearly the whole of the United States and southern Canada—is so great that it is impossible for any one type of hound to show the best sport under these widely varying conditions. The result has been the development of hounds which differ in type and conformation to a marked degree.

During the last 30 years there has been a tremendous growth of hunting. Organizations have sprung up all over the United States and Canada and particularly in the West, where a great interest is being shown in the sport. The scale on which hunting is carried on in America as compared to England will seem very small, but it must be remembered that hunting in America, while not in its infancy, is at least in its adolescence.

There were in 1928 over 100 packs of hounds in America which are officially "recognized" by the Hunts Committee of the National Steeplechase and Hunt Association, and by the Masters of Foxhounds Association of America; which latter body has jurisdiction over all hunting matters. Each hunt is required to file with the secretary of the Masters of Foxhounds Association of America a map showing the area hunted, and any disputes as to the boundaries between hunts is settled by the executive committee of this association, whose decision is final. This executive committee is

composed of the president, vice-president and secretary of the association, ex officio, and also representatives from the middle West, Virginia, Maryland, Pennsylvania, New York and New Jersey, New England and Canada; thus giving a full representation to the entire area. The Hunts Committee, on the other hand, which is composed of delegates from the National Steeplechase and Hunt Association, and also from the areas described, has jurisdiction over all matters pertaining to hunt race meetings, and working in conjunction with the Masters of Foxhounds Association, with whom there is a reciprocal agreement, forms what might be termed a complete tribunal for the government of hunting.

Of the 100 packs mentioned, some 25 are used for drag-hunting. There is in America a very large class of sportsmen—good sportsmen they are, too—who cannot give up two, or even one whole day a week to fox-hunting. These men get through their business at two or three in the afternoon, hasten into the country, jump on their horses and want their gallop. With the drag they can get it, and in no other way. The fences at most of the places where drag packs flourish are big and stiff, and certainly they have chosen no child's game as a substitute for the real thing.

But to get back to fox-hunting proper. Starting at the north, in Canada, we find (1928) two hunts, mentioned above, in existence. Working south to New England, we find 23 packs of hounds. New York and New Jersey have 13, among them the Meadow Brook, which is a direct descendant of the Brooklyn Hunt. Pennsylvania, Delaware and Maryland contain 27 packs of recognized hounds, while Virginia and the Carolinas have 26. In the middle West, we find a group, for the most part newly organized, of 17, and these are on the increase steadily. Finally, it will be interesting to note that there is an organized pack of hounds for each arm of the service in the United States army—the Cavalry School Hunt, with kennels at Ft. Riley, Kan.; the Artillery Hunt, with kennels at Ft. Sill, Okla.; and the Infantry School Hunt, at Ft. Benning, Georgia.

Some of these packs are composed of American hounds, hunted in the American way, by American huntsmen; some are half-bred hounds, hunted by both American and English huntsmen; and some are composed of hounds either imported from the best English kennels or bred from stock so imported, and hunted by English hunt servants. Each organization has developed hunting along methods which for the period of years of its existence have seemed to produce the best results.

Henry Higginson and Julian Ingersoll Chamberlain, *The Hunts of the United States and Canada* (1908), and *Hunting in the United States and Canada* (1928); Ernest Gee, *Memoirs of the Gloucester Fox Hunting Club* (1927). In addition to the above, much information can be gleaned from the files of the *American Turf Register and Sporting Magazine*, copies of which can be found in some of the principal public libraries in America, although the work is almost unobtainable to-day; and *Baily's Hunting Directory*, which receives its information annually from the Masters of Foxhounds Association of America. (A. H. H.)

HUNTING AND FISHING, PRIMITIVE. Archaeological evidence and observations on the most backward peoples of the present day show an appreciation of animal food, and, in the case of existing hunters, considerable ingenuity in methods of capturing it. The earliest teeth suggest that man was omnivorous, eating flesh as well as vegetable products; primitive hearths contain animal bones intentionally smashed with stones for the extraction of the marrow; and stone weapons have been found embedded in vertebra and skull of Palaeolithic reindeer (Dordogne) and Neolithic ox (Cambridge). The cave paintings of western Europe are presumed to represent the efforts of hunters to obtain success in their hunting by magical means. Primitive man everywhere depended on hunting and fishing for his supply of animal food. Later, hunting is accessory to agriculture, provides variety in the vegetable diet, and survives as sport or recreation; or is required to protect flocks and herds against predatory beasts. Primitive agriculture is often the work of the women while the men are hunters. But where nature is sufficiently lavish in vegetable food, or where land mammals are comparatively few and small, hunting is of secondary importance to fishing, and fishing to horticulture. It is of least importance to purely pastoral people among whom,

except for defence or sport, it is often entirely disregarded, while for many of them all meat save that from their herds is tabu.

At the present day hunting peoples, together with the game on which they depend, are being encroached upon and crowded out by pastoral or agricultural peoples. When hunters can no longer shift their hunting grounds, when game diminishes or disappears, they must find some other food supply or die. As a purely hunting group they cease to exist. They may be actually exterminated, like the Tasmanians, and, to a large extent, the Bushmen of South Africa; they may be artificially protected and preserved, like the Amerinds of North America, and the Australians; they may survive with the help of agriculture, like many central African peoples; or augment their living by trade, like many of the Eskimo groups. But in their original state hunting peoples are now found only in unsettled districts, in areas too barren, remote, unhealthy or otherwise unattractive for settlers. In Africa the equatorial forest region preserves its pygmies and marginal Bantu hunters, the barren semi-desert of the Kalahari its scanty tribes of Bushmen, and sporadic groups of hunting peoples are found in isolated patches such as the Bauchi highlands of Nigeria and elsewhere. In the tundra region of Asia, animals are hunted as much for fur as for food, and the general use of firearms raises the hunting above the primitive level; but to the east, the Ainu in northern Yezo and the Kuriles still shoot with small bows and poisoned arrows and maintain themselves by fishing and hunting. In the south of the continent the forested and hilly parts of Ceylon shelter the Vedda, and the jungles of southern India contain tribes such as the Kadir of the Anaimalai hills and the Kurumba of the Nilgiris. Further to the east the isolated Andaman islands, the thick jungle of the Malay peninsula, and neighbouring islands, and parts of the Philippines all contain primitive hunters and collectors, as do the open arid plains of Australia. In North America the Eskimo, a typical hunting and fishing people, fringe the north coast and its islands and the easternmost end of Asia; on the north-west coast the Salish, Nootka, Tshimshian and other tribes, live in one of the best hunting grounds of the world, between the mountains and the sea. The caribou and other deer in the tundra and northern plains, and bison in incredible herds in the heart of the continent (from the upper waters of the Saskatchewan to the Gulf of Mexico) maintained hunting tribes until the coming of the whites. In South America the river basins of the Guianas and the Amazon are still occupied by little-known hunting tribes, usually partly dependent on cassava made from manioc. To the south, from the interior of the Argentine to the Horn is more or less open country where the guanaco (wild llama) was abundant, and, with smaller game and fish, supported nomadic hunters. In this area the Spaniards introduced cattle, which ran wild over the plains, and wild horses, to be trained to follow in pursuit. Some of the Gran Chaco hunters cultivated a little maize but this was unknown to the Patagonians, and in the extreme south the Fuegians, like the Eskimo, depend more on sea produce than on land.

Except in cases of co-operative hunting, as among the Amerinds and in the Congo region, a hunting group is small in numbers. Its first demand is for space. The land must be unoccupied and the game free from disturbance, for a hunting community needs one to ten miles, and in barren areas up to 500 miles, per head of the population. Families are small, children few, and many succumb to the inevitable hardships of the life. The group wanders within a recognized area, camping at convenient spots, but no settled life is possible.

PRIMITIVE INVENTIVENESS

Hunting Methods.—Methods of hunting vary with the nature of the country and of the animal hunted, the ingenuity and inventiveness of the hunters and the materials at their disposal. The Australians have few and plain weapons: their traps and snares are, for the most part, simple and obvious. They depend on their stone or bone-tipped spears, wooden clubs and missile club or boomerang. They stalk both emus and kangaroos, use pituri plant decoctions to stupefy emus at waterholes, and exploit the curiosity of the bird by luring it on to a pitfall in which it is speared. The Bushman of the Kalahari will run an unwounded

springbok to a standstill in the hottest part of the day, keeping the animal constantly on the move, preventing it from lying down, until, by reason of the hot sand getting between its hoofs, it sinks exhausted to the ground. The Eskimo pursue sea-birds in their kayaks, following them by the bubbles when they rise, and, by tiring them out, catch them by hand. They also run down fawns in the spring, driving them into deep snow, a method used by the Plains Indians for killing the floundering bison.

Disguise, Traps, Snares, etc.—Patience and cunning of a higher order are seen in the devices by which the hunter conceals his approach and the various nooses, snares, nets, traps, game-pits and decoys, found almost universally among primitive hunters. The Australian covers his head with water-weeds as he swims after water-fowl, or approaches the emu carrying a leafy branch to prevent the bird noticing him. The Bushman scatters a handful of dust over his head to make himself the same colour as the dry grass, or plaits a kind of saddle of grass, sticks some ostrich feathers in it and places it on his shoulders, holding up a long stick with the head curved to look like an ostrich. He imitates the actions of the bird, feeding, running, preening its feathers, and, always moving up wind, contrives to get as near as possible to the flock before discharging his poisoned arrow. Sometimes the imitation is too realistic, and the cock bird, resenting the advances of a rival, attacks the little hunter. The Navaho hunter stalks deer disguised in a deer skin, and the Blackfoot puts on a bison skin when stalking bison. Nooses, snares, traps and pitfalls are very varied and the peculiarities of the animal to be lured are carefully studied; human ingenuity being pitted against animal cunning.

Firing the bush or prairie is a common method of startling game, which can easily be trapped or knocked over in terrified flight. Fire is used by the Zande for elephant hunting. When a herd is discovered a large circle surrounding it is fired simultaneously, and the entrapped animals, crowded together, bewildered by the flames and blinded by the smoke, are unable to defend themselves and not a single beast escapes.

Weapons.—Any stick or stone can be picked up at random to knock over birds and small game, but specially shaped clubs or throwing sticks are common, such as the African knobkerry and the Australian waddy, which have developed into the more specialized trombash of the Upper Nile or the Australian boomerang (*q.v.*). The Australian spear is often only a stick, with its end hardened in the fire, though barbs may be added, or stone heads fixed in with "gum." The knife is a sharpened stone or made of the leg bone of the emu. In Australia, as in Arctic America, the spear is propelled by the spear-thrower to give greater range. Except in Australia bows and arrows are the universal weapons of primitive hunters, varying according to the skill of the maker, the materials at his disposal and the prospective victims. (See BOWS AND ARROWS.) The blow-pipe or blow-gun (*q.v.*) is more silent than bow and arrow and, with its poisoned darts, is one of the deadliest weapons in the hands of the primitive hunter.

Poisons.—Poisons are both animal and vegetable, and consist of many ingredients which are mixed with secrecy and magic. The central Australians catch emu by pounding up pituri (*Duboisia Hopwoodii*) leaves with water as a bait; the bird becomes stupefied and is easily speared. In parts of the Amazon region the poison is assaca sap, and all the hunters carry with them little bags of salt, which acts as an antidote. The Macusi of British Guiana make their famous *curare* ("urali") poison from the climbing *Strychnos toxifera*, mixed with other plants, adding black and red ants, and the poison fangs of snakes. The Punan poison in Borneo is the dried juice of the upas tree. The Bushmen of South Africa have a wide range of vegetable poisons, using, as well as *Strychnos*, *Euphorbia*, *Digitalis*, *Strophanthus* and the "Bushman poison bush," *Acocanthera venenata*. They add snake poison glands, poisonous spiders and scorpions, and in particular the little and specially deadly caterpillar called "ngwa."

Dogs.—Dogs are used to smell out, track, beat up and chase game, and their remains are found in deposits of Neolithic and earlier ages, though the Australian never trained the native dingo

to help him catch his prey. The hunting dogs of the Lillooet of British Columbia were carefully trained and treated; one good dog was worth a large dressed elk skin. As a rule the treatment of dogs by Indians compares very unfavourably with that of the Eskimo. Among the Eskimo seal-hunting would be scarcely possible without the help of dogs, who smell out the breathing holes under the snow. Dogs help the Labrador Eskimo in hunting the polar bear. Among the Gilyaks of the Amur river the dog is held in high esteem for at death the soul of the hunter passes into his favourite dog, which is fed with choice food and finally sacrificed on his master's grave. The Nagas of Manipur hunt in large numbers while the dogs drive out the game. Custom provides for the dogs (or owners of the dogs) a share of the quarry which is known as the dog's share. The "dog's share" is a recognized part of the spoil in Africa and in Melanesia. Lean, half-starved and savage tempered Bushman dogs accompany their masters: they attack leopard or hyena with courage born of hunger. The little yellow hunting dogs of central Africa are trained as beaters in the Congo. Some 10 or 12 men or boys go out to hunt duiker (antelope) and small game in the Ituri forest, armed with spears and two or three savage little prick-eared long-tailed pit-dogs of a peculiar breed.

Fishing.—Fishing is commonly accessory to hunting and as widely distributed, but more restricted in its range, since purely fishing peoples are found only on the banks of large rivers or lakes or on sea coasts. Here, however, if the fish are abundant, fishers are able to maintain a more settled life than hunters on land, supporting themselves entirely on their catch, for food and trade. They are also less isolated than hunting peoples. Fish are not easily exterminated, and large groups can live in fishing villages, while the water provides a means of intercommunication.

There are whole tribes among whom fish forms the staple food all the year round. The Indians on the banks of the great rivers of north-west America where sturgeon grow to an extraordinary size, could catch and dry enough fish to last from one season to the next, and if not, there is scarcely a month in which some species of "salmon" cannot be caught. The Eskimo are great fishermen and in the winter live mainly on sea or river produce. In the summer the women fish while the men hunt, and dried or frozen fish and seal meat form the winter provisions. At the other extremity of the continent the Fuegians, a sea-shore people, fish from their frail boats made of bark and train their dogs to assist them by plunging into the water and driving the fish. Fishing is important on all the great rivers of Siberia, where people without reindeer are dependent on natural resources. The Gilyaks and Golds of the Amur river live entirely on fish and on the bears which crowd down to join in the fishing, when the salmon "run." Transparent fish skin supplies the windows for the half-underground houses, and, in former days, the clothing was of salmon skin, ornamented with carp skin, a fashion now abandoned, though fish skin shoes are commonly worn in the summer.

Many people are mainly if not entirely dependent on fishing in Africa, living on the banks of the great rivers or on the shores of the great lakes. With the negroes of Melanesia and throughout the islands of the Pacific, fish, dugong and turtle are especially welcome as a change in the ordinary vegetable diet. In some islands anything connected with fishing is too sacred to be touched by women, and all but certain fish are tabu to them. In Samoa the men take their netting with them to the council meeting, and in New Zealand no woman may approach a net-maker. In south-eastern Asia, in the Malay archipelago and on the Chinese coast, are families and groups of families who seldom land on shore and never settle there for any length of time. Their homes are their boats, and fishing is their livelihood, supplemented by trade, or by piracy. The peaceful Mawken of the Mergui archipelago are almost entirely self-supporting, trading their surplus fish, trepang and other sea produce, to the Chinese, in exchange for a little grain or spirit, or cloth; the boat is the house, with convenient notches for the children to clamber in and out, and if obliged by storm to take refuge on land, the deck awning forms the temporary hut.

FISHING METHODS

Primitive fishing methods consist merely in the collecting; the fish are caught by hand, speared or shot with bow and arrow. The Australians catch catfish with their feet, or stirring up the water, hit or spear the fish coming to the surface. The Bushmen spread grass on the surface of a pool, then, wading in, push the grass and fish into the shallows where they are easily caught. Further north, near Stanley pool, as the river shrinks in the dry season, fish are scooped out of pockets in the rocks with gourds, a pint or more at a dip. And when the sukai, the "fish of fishes" (*Onchorynchus*) are crowding up the Fraser river to spawn, "so that it is almost possible to cross the river upon their backs" or the oolichan (*Thaleichthys pacificus*) chokes the river in a plentiful run, the Salish Indians spear them in hundreds or scoop them up in buckets.

Spears, bows and arrows are the principal weapons for fishing as for hunting, to which may be added harpoons for larger fish and sea mammals; nets are fairly general, from the small hand nets, mainly used by women and children in shallow water and at low tide, to enormous seine or drag nets stretching right across reaches of the rivers or shallows of the sea; but the use of hook and line, though found among many primitive fishers, is not universal. The Andamanese, most skilful fishermen, use no hook or line; the central Australians had no hooks before the coming of the white man, and neither nets nor hook and line were known to the Tasmanians. The Bushmen have barbed harpoons for fishing, but rely on baskets instead of nets. In Torres straits the Murray islanders wade into the sea with conical baskets to scoop up the sardine-like shoals of *tup*. In central Australia nets made of rushes, without floats or sinkers, are stretched from tree to tree or stakes, and left there. If a man wants some fish, he swims out and helps himself.

Fire and Poison.—Fire is here man's ally, as in hunting, and fish are everywhere lured to destruction by the light of a torch. Poison is also commonly used. In Africa circles of *Euphorbia* stakes are planted in a river, and the fish become entangled and stupefied; or bruised stems of poisonous plants are thrown in, and the helpless fish float to the surface. The Polynesians mix *Tephrosia piscatoris* or *Barringtonia speciosa* with taro as a poison bait and catch the fish by hand.

Dogs and Sucker-fish.—The dog is occasionally used to drive fish (Fuegians, Ainu, and not unknown in England and Ireland) as otters are trained on the Yangtse; while in Chinese lakes and canals cormorants dive for fish, with a cord round their necks to prevent the catch from being swallowed. In Australia and Torres straits, as in Central America, sucker-fish (*Echeneis naucrates* or *remora*) are used for catching small turtle. The fish is thrown out of the canoe with a line attached to the tail, and, attaches itself to the turtle. The line may then be drawn in, together with the turtle, or it acts as a guide to a man who swims down and gives it a finishing blow.

Kite-fishing.—Kite-fishing is found sporadically from the Malay region to Santa Cruz island in Melanesia.

Property.—The recognition of definite rights over hunting grounds or fishing waters is usually clearly established and poaching vigorously resented by the rightful owners, who are sometimes, however, placated by a share of the spoil. The Eskimo form an exception to this rule, for it is recorded that they have no strict divisions of hunting territory, holding that food belongs to everyone. The rights of the individual or the hunting group over the game killed were sometimes definitely fixed. Usually the man whose arrow first struck the animal, or first struck it in a vital part, had first claim. In the Andaman islands a pig belongs to the man whose arrow first strikes it, but a bachelor must be content to see it distributed by one of the older men, all the best parts going to his seniors, while he and his contemporaries have to be satisfied with the inferior parts.

Magic.—Magic plays a very important part in primitive hunting and fishing, and a man relies for his success as much on supernatural as on natural means, while ill-success is ascribed less to lack of skill and inadequate weapons, than to failure in some preliminary ritual, or to the stronger magic of some rival force. HUNTING DOG, *Lycaon pictus*, an African wild dog, differing from the rest of the family in having only four toes on each foot, and in its blotched coloration of ochry yellow, black, and white. The species is nearly as large as a mastiff, with long limbs, broad flat head, short muzzle, and large erect ears. These wild dogs hunt in packs, and are found in nearly the whole of Africa south and east of the Sahara. The statement of Gordon Cumming that a pack "could run into the swiftest or overcome the largest and most powerful antelope," is abundantly confirmed, and these dogs do great damage to sheep flocks.

WILD HUNTING DOG OF AFRICA
(LYCAON PICTUS)

HUNTINGDON, EARLS OF. GEORGE HASTINGS, first earl of Huntingdon¹ (c. 1488-1545), was the son and successor of Edward, second Baron Hastings (d. 1500), and the grandson of William, Baron Hastings, who was put to death by Richard III. in 1483. He was created earl of Huntingdon in 1529, and he was one of the royalist leaders during the suppression of the rising known as the Pilgrimage of Grace in 1536. His eldest son FRANCIS, the second earl (c. 1514-1561), was a close friend and political ally of John Dudley, duke of Northumberland, sharing the duke's fall and imprisonment after the death of Edward VI. in 1553; but he was quickly released, and was employed on public business by Mary. His brother Edward (c. 1520-1572) was one of Mary's most valuable servants; a stout Roman Catholic, he was master of the horse and then lord chamberlain to the queen, and was created Baron Hastings of Loughborough in 1558, this title becoming extinct when he died.

The second earl's eldest son HENRY, the third earl (c. 1535-1595), married Northumberland's daughter Catherine. His mother was Catherine Pole (d. 1576), a descendant of George, Duke of Clarence; and, asserting that he was thus entitled to succeed Elizabeth on the English throne, Huntingdon won a certain amount of support, especially from the Protestants and the enemies of Mary, queen of Scots. In 1572 he was appointed president of the council of the north and during the period between the flight of Mary to England in 1568 and the defeat of the Spanish armada, twenty years later, he was frequently employed in the north of England. He was for a short time in 1569 one of the custodians of Mary. Lady Elizabeth Hastings (1682-1739), daughter of Theophilus, the seventh earl, was famous for her charities and her piety. Her beauty drew encomiums from Congreve and from Steele in the pages of the *Tatler*, and her other qualities were praised by William Law. She was a benefactor to Queen's college, Oxford. THEOPHILUS (1696-1746), the ninth earl, was the husband of the famous Selina, countess of Huntingdon (q.v.). The earldom became dormant in 1789, and was not revived until 1818.

See H. N. Bell, *The Huntingdon Peerage* (1820).

¹The title of earl of Huntingdon had previously been held in other families (see HUNTINGDONSHIRE). The famous Robin Hood (q.v.) is said to have had a claim to the earldom.

HUNTINGDON, DANIEL (1816-1906), American artist, was born in New York on Oct. 14, 1816. In 1835 he studied with S. F. B. Morse, and produced "A Bar-Room Politician" and "A Toper Asleep." Subsequently he painted some landscapes on the Hudson river and in 1839 went to Rome. On his return to America he painted portraits and began the illustration of *The Pilgrim's Progress*, but his eyesight failed and in 1844 he went back to Rome. Returning to New York in 1846 he devoted his time chiefly to portrait-painting, although he had painted many genre, religious and historical subjects. He was president of the National Academy 1862-70, and again 1877-90. He died on April 19, 1906, in New York city.

HUNTINGDON, SELINA HASTINGS, COUNTESS OF (1707-1791), English religious leader and founder of a sect of Calvinistic Methodists, known as the Countess of Huntingdon's Connection, was the daughter of Washington Shirley, 2nd Earl Ferrers. She was born at Stanton Harold, near Ashby-de-la-Zouch, Leicestershire, on Aug. 24, 1707, and in 1727 married Theophilus Hastings, 9th earl of Huntingdon. In 1739 she joined the first Methodist society in Fetter Lane, London. On the death of her husband in 1746 she threw in her lot with Wesley and Whitefield in the work of the great revival. Isaac Watts, Philip Doddridge and A. M. Toplady were among her friends. In 1748 she gave Whitefield a scarf as her chaplain, and he frequently preached in her London house in Park Street to audiences that included Chesterfield, Walpole and Bolingbroke. In her chapel at Bath there was a curtained recess dubbed "Nicodemus's corner," where some of the bishops sat incognito to hear him. Lady Huntingdon spent her ample means in building chapels in different parts of England, e.g., at Brighton (1761), London and Bath (1765), Tunbridge Wells (1769), and appointed ministers to officiate in them, under the impression that as a peeress she had a right to employ as many chaplains as she pleased. In 1768 she converted the old mansion of Trevecca, near Talgarth, in South Wales, into a theological seminary for young ministers for the connection.

Up to 1779 Lady Huntingdon and her chaplains continued members of the Church of England, but in that year the prohibition of her chaplains by the consistorial court from preaching in the Pantheon, a large building in London rented for the purpose by the countess, compelled her, in order to evade the injunction, to take shelter under the Toleration Act. This step placed her legally among dissenters. Till her death in London on June 17, 1791, Lady Huntingdon continued to exercise an active, and even autocratic, superintendence over her chapels and chaplains. She successfully petitioned George III. in regard to the gaiety of Archbishop Cornwallis's establishment, and made a vigorous protest against the anti-Calvinistic minutes of the Wesleyan Conference of 1770, and against relaxing the terms of subscription in 1772. Her 64 chapels and the college were bequeathed to four trustees. In 1792 the college was removed to Cheshunt, Hertfordshire, where it remained till 1905, when it was transferred to Cambridge.

See *The Life of the Countess of Huntingdon* (2 vols., 1844); A. H. New, *The Coronet and the Cross, or Memorials of Selina, Countess of Huntingdon* (1857); Sarah Tyler, *The Countess of Huntingdon and her Circle* (1907).

HUNTINGDON, municipal borough and county town of Huntingdonshire, England, on the left bank of the Ouse, 59 m. N. of London by rail. Pop. (1921) 4,184. Huntingdon (*Huntandun*, *Huntersdune*) was recovered from the Danes c. 919 by Edward the Elder, who raised a castle there, probably on the site of an older fortress. In 1010 the Danes destroyed the town. The castle was among those destroyed by order of Henry II. At the time of the Domesday Survey Huntingdon was divided into four divisions, two containing 116 burgesses and the other two 140. Most of the burgesses belonged to the king. King John in 1205 granted them the liberties and privileges held by other boroughs and increased the farm to £20. The borough was incorporated by Richard III. in 1483, and in 1630 Charles I. granted a new charter, which remained in operation until 1835. The burgesses were represented in parliament by two members from 1295 to 1867, when the number was reduced to one, and in 1885 they ceased to be separately represented. Huntingdon owed its prosperity to its

situation on the Roman Ermine Street, and is the centre of an agricultural district. The market held on Saturday was granted to the burgesses by King John. During the Civil Wars Huntingdon was several times occupied by the Royalists, but was a great Puritan centre. It forms a twin town with Godmanchester.

The town consists principally of one street, about a mile long, in the centre of which is the market-place. The parish church of St. Mary occupies the site of the priory of Augustinian Canons already existing in the 10th century, in which David Bruce, Scottish earl of Huntingdon, was buried. All Saints' church has slight remains of the original Norman church. Some Norman remains of the hospice of St. John the Baptist founded by David, king of Scotland, at the end of the 12th century were incorporated in the buildings of Huntingdon grammar school, once attended by Oliver Cromwell and by Samuel Pepys. Hinchbrooke House, an Elizabethan mansion chiefly of the 16th century, and the seat of the Cromwell family, occupies the site of a Benedictine nunnery. A racecourse is situated in the bend of the Ouse to the south of the town.

HUNTINGDON, a borough in the central part of Pennsylvania, U.S.A., beautifully situated on the Juniata river, 150 m. E. of Pittsburgh; the county seat of Huntingdon county. It is on Federal highway 22, and is served by the Huntingdon and Broad Top Mountain and the Pennsylvania railways. The population was 7,051 in 1920 (95% native white). Coal, iron, fire-clay, limestone and white sand abound in the vicinity, and water power is supplied by the river. The borough has a number of manufacturing industries which make use of the natural resources. It is the seat of the State Industrial Reformatory (opened 1888) and of Juniata college, founded in 1876 by the Church of the Brethren (Dunkers). Huntingdon was laid out in 1767 under the direction of Dr. William Smith, then provost of the college (which became the university) of Pennsylvania, and was named after the countess of Huntingdon, who had contributed liberally to that institution. It was incorporated as a borough in 1796.

HUNTINGDONSHIRE (HUNTS), an east midland county of England, bounded north and west by Northamptonshire, south-west by Bedfordshire and east by Cambridgeshire. Among English counties it is the smallest with the exception of Middlesex and Rutland, having an area of 366 sq. miles. All the stratified rocks are of Jurassic age, except a small area of Lower Greensand north of Pottton. The Greensands form low, rounded hills. A narrow strip of Inferior Oolite reaches from Thrapston by Oundle to Wansford near Peterborough. It is represented about Wansford by the Northampton sands and by a slight development of the Lincolnshire limestone. The Great Oolite Series has at the base the Upper Estuarine clays; in the middle, the Great Oolite limestone, which forms the escarpment of Alwalton Lynch; and at the top, the Great Oolite clay. The Cornbrash is exposed along part of the Billing brook, and in a small inlier near Yaxley. Over the remainder of the county the lower rocks are covered by Oxford clay, about 600 ft. thick. All the strata have a general dip towards the south-east.

Much glacial drift clay with stones covers the older rocks; it is a bluish clay, often containing masses of chalk. The Fens on the eastern side of the county are underlain by Oxford clay, which here and there projects through the prevailing newer deposit of silt and loam. There are usually two beds of peat or peaty soil separated by a bed of marine warp. Black loamy alluvium and valley gravels, the most recent deposits, occur in the valleys of the Ouse and Nene. Calcareous tufa is formed by the springs near Alwalton. Oxford clay is dug for brick-making at Fletton, St. Ives, Ramsey and St. Neots. The Bedford Levels occupy about 50,000 ac. in the north-east. The Ouse skirts the borders of the county near St. Neots, and after flowing north to Huntingdon runs eastwards past St. Ives into Cambridgeshire on its way to the Wash. The Kym, from Northamptonshire, joins the Ouse at St. Neots, while the Alconbury brook falls into it at Huntingdon. The Nene forms for 15 m. the north-western border of the county, and quitting it near Peterborough, enters the Wash below Wisbech, in Cambridgeshire. The course of the old River Nene flows eastward midway between Huntingdon and Peterborough, and about

1½ m. N. by E. of Ramsey it is intersected by the Forty Foot, or Vermuyden's Drain, a navigable cut connecting it with the old Bedford river in Cambridgeshire.

Early History.—Prehistoric objects of all ages, except the upper Paleolithic, have been discovered. They were found chiefly along the upper valleys of the Nene and Great Ouse, the borders of the Fens, and other dried up river courses. The reason for this distribution is that the river valleys are composed of gravel while the higher lands are of clay and were therefore forested in early times. Finds of flint in this latter area are sporadic and may date from as late as the Roman period. The later invaders seem to have pierced the county by coming up the rivers from the Wash and to have settled on the first non-Fen land which they found. Finds of British coins suggest that in the century before the Roman Conquest of A.D. 43, Huntingdon formed part of the political organization of the Catuvellauni. Ermine street ran athwart the county and where it crossed the valleys of the Ouse and Nene there were important settlements. In the latter valley during the Roman period pottery making was an important industry.

The Gyrwas, an East Anglian tribe, early in the 6th century worked their way up the Ouse and the Cam as far as Huntingdon. After their conquest of East Anglia in the latter half of the 9th century, Huntingdon became an important seat of the Danes. About 915 Edward the Elder wrested the fen-country from the Danes, repairing and fortifying Huntingdon, and a few years later the district was included in the earldom of East Anglia. Religious foundations were established at Ramsey, and St. Neots by the Benedictines in the 10th century and a cell at St. Ives before the Conquest.

In 1011 Huntingdonshire was again overrun by the Danes and in 1016 was attacked by Canute. A few years later the shire was included in the earldom of Thored (of the Middle Angles), but in 1051 it was detached from Mercia and formed part of the East Anglian earldom of Harold. Shortly before the Conquest, however, it was bestowed on Siward, and became an outlying portion of the earldom of Northumberland passing to David of Scotland. After the separation of the earldom from the crown of Scotland during the Bruce and Balliol disputes, it was conferred in 1336 on William Clinton; in 1377 on Guichard d'Angle; in 1387 on John Holand; in 1471 on Thomas Grey, afterwards marquess of Dorset; and in 1529 on George, Baron Hastings, whose descendants now hold it.

The Norman Conquest was followed by a general confiscation of estates, only four or five thanes retaining lands. In the Domesday survey it is recorded that the abbot of Ramsey held 26 manors while most of the other holdings were divided between the crown and the sheriff, Count Eustace of Boulogne. This shrievalty was united with Cambridgeshire in 1154 and has remained united until the present day, except from 1637 to 1643 when they were independent of each other. The boundaries of the county have scarcely changed since the time of the Domesday Survey, except that parts of the Bedfordshire parishes of Everton, Pertenhall and Keysoe and the Northamptonshire parish of Hargrave were then assessed under this county. There were castles at Huntingdon, Kimbolton and Connington. The second is now a mansion. Other famous mansions are Hinchbrooke House at Huntingdon, the home of the Cromwells and Elston Hall, rebuilt in 1660, which has a collection of rare books of devotion. Huntingdonshire was formerly in the diocese of Lincoln but in 1837 was transferred to Ely. At the end of the 11th century it was constituted an archdeaconry, comprising the deaneries of Huntingdon, St. Ives, Yaxley, St. Neots and Leightonstone, and the divisions remained unchanged until the creation of the deanery of Kimbolton in 1879. During the reign of the conqueror the Benedictines established a nunnery at Hinchbrooke while in 1147 the Cistercian abbey was founded at Sawtry, 7 m. W. of Ramsey. In the same century the Austin canons established priories at Huntingdon and Stonely and towards the end of the 13th century the Austin Friars had a house at Huntingdon. Almost the only remains of these religious houses are ruins at Ramsey and St. Ives. The most interesting churches for Norman architecture are Hartford near

Huntingdon, Old Fletton near Peterborough, Ramsey and Alwalton, a singular combination of Norman and Early English. Early English churches are Kimbolton, Alconbury, Warboys and Somersham, near Ramsey, and Hail Weston near St. Neots. Decorated are Orton Longueville and Yaxley, Perpendicular, St. Neots, Connington near Ramsey and Godmanchester.

In 1174 Henry II. captured and destroyed Huntingdon castle; during the Wars of the Roses the town was captured and sacked by the Lancastrians. The county resisted the illegal taxation of Charles I. and protested against the arrest of the five members. Hinchbrook, however, was held for the king by Sir Sydney Montagu, and in 1645 Huntingdon was sacked by the Royalist forces. During the reign of Charles I. Little Gidding, a village 9 m. north-west of Huntingdon, was the home of a religious "family" established by Nicholas Ferrar.

Industries.—Huntingdonshire has always been mainly an agricultural county. At the time of the Domesday Survey it had 31 mills, besides fisheries in its meres and rivers. The woollen industry flourished from Norman times, and previous to the draining of its fens in the 17th century, turf-cutting, reed-cutting for thatch and the manufacture of horse-collars from rushes were carried on in Ramsey and district. In the 17th century saltpetre was manufactured. In the 18th century yarn spinning, pillow-lace making and the straw-plait industry flourished in the St. Neots district, where it survives; pillow lace was also manufactured at Godmanchester. In the early 19th century there were two large sacking manufactures at Standground, and brewing and malting were largely carried on. In 1926 the total acreage under crops and grass was 201,964. On the drained pasturage a large number of cattle is fed. The gravel of the Ouse valley is often covered by fine black loam deposited by the overflow of the river, and its meadows form very rich pasture grounds. The milk is used chiefly for the rearing of calves, while cattle, principally shorthorn, are fattened and sold. The village of Stilton had formerly a large market for cheese. The chief breeds of sheep are the Leicester and Lincoln, and pig-breeding is extensively practised. Wheat, barley, oats, potatoes, beans and peas are the chief crops and sugar beet in 1926 occupied over 3,000 acres. 11,485 acres were under clover and rotation grasses. During the last quarter of the 19th century there was a large decrease in the areas of grain crops and of fallow, and an increase in that of permanent pasture. Market-gardening and fruit-farming, however, greatly increased in importance. Willows are largely grown in the fen district. Good drinking water is deficient in many districts, but there are three natural springs, once famous for the healing virtues their waters were thought to possess, namely, at Hail Weston near St. Neots, at Holywell near St. Ives and at Somersham in the same district. Bee-farming is largely practised. The chief manufacture is that of paper and parchment. Madder is obtained, and in nearly every part of the county lime burning is carried on.

Communications and Administration.—The middle of the county is traversed from south to north by the L.N.E.R., which enters it at St. Neots and passing by Huntingdon leaves it at Peterborough. From Huntingdon a branch line goes via St. Ives to Cambridge and from Holme Junction to Ramsey. A branch of the L.M.S.R. runs from Huntingdon to Thrapston (Northamptonshire). From St. Ives L.N.E.R. lines also run north-east to Ely (Cambridgeshire), and north to Wisbech (Cambridgeshire) with a branch line westward from Somersham to Ramsey. The north-western border is served by the L.N.E.R. and the L.M.S.R. between Peterborough and Wansford where they part. The area of the administrative county is 233,985 acres with a population of 54,741. The county contains four hundreds. The municipal boroughs are Godmanchester (pop. 2,035), Huntingdon, the county town (4,184) and St. Ives (2,797). The other urban districts are Old Fletton (5,637), Ramsey (5,135) and St. Neots (4,110). The county is in the south-eastern circuit, and assizes are held at Huntingdon. It has one court of quarter sessions, and is divided into five petty sessional divisions. Huntingdonshire is almost wholly in the diocese of Ely, but a small part is in the diocese of Peterborough. The county returns one member to parliament.

HUNTINGTON, COLLIS POTTER (1821-1900), American railway builder, was born at Harwinton, Conn., on Oct. 22, 1821. At the age of 28, he left a prosperous general merchandise business in which he had been associated with his brother at Oneonta, N.Y., and, with \$1,200 capital, set out for the California gold fields. He commenced business in Sacramento, and soon associated himself with Mark Hopkins in a hardware store. Huntington was early an active advocate of an overland railway and in 1861, together with Hopkins, Stanford and the Crocker brothers, he succeeded in getting the Central Pacific R.R. of California incorporated. Huntington was sent east as fiscal agent and was able to secure from the Government not only permission, but grants of land and financial aid to construct a line from the Pacific coast to the point where it would meet the Union Pacific. He sold the bonds, managed the finances and acted as purchasing agent until the line was completed. He then turned his attention to the building of the Southern Pacific, planning and completing the entire line, which at his death comprised 9,600 m. of track, besides 5,000 m. of steamship lines. He next took over the Chesapeake and Ohio, long unprofitable, and by operating it in connection with his Southern Pacific system and extending its eastern terminus from Richmond to the seaboard at Newport News, Va., he made it a paying road. By 1890, however, Huntington had sold his interests east of the Mississippi in order to devote his whole attention to the Southern Pacific. His death occurred on Aug. 13, 1900, at his summer camp in the Adirondack mountains.

HUNTINGTON, ELLSWORTH (1876-), American geographer, was born at Galesburg, Ill., on Sept. 16, 1876, and educated at Beloit (A.B., 1897), Harvard (A.M., 1902) and Yale (Ph.D., 1909). From 1897 to 1901 he was an instructor in Euphrates college, Harput, Turkey, and in 1901 he carried out an exploration of the canyons of the Euphrates river for which he was awarded the Gill memorial of the Royal Geographical Society. In 1903-04 he was a member of Pumphelly's Carnegie Institute expedition to Turkistan and in 1905-06 of R. L. Barrett's expedition to Chinese Turkistan, which explorations found a record in Huntington's books, *Explorations to Turkistan* (1905), and *The Pulse of Asia* (1907), the latter one of his best. At Yale he was instructor of geography, 1907-12, assistant professor 1912-15, and in 1917 was appointed research associate. In 1909 he headed the Yale expedition to Palestine and Asia Minor, and in 1911 published *Palestine and its Transformation*. From 1910 to 1913 he was research associate of the Carnegie Institution of Washington and made climatic investigations in the United States, Mexico and Central America. Huntington's investigations have had to do chiefly with climate and its relation to land forms, geological and historical changes, and to human activities and the distribution of civilizations. He published *The Climatic Factor* (1914), *Civilization and Climate* (1915, rev. ed., 1924) and *Quaternary Climates* (1925). These interests led him to investigate also the causes of climatic variation and of weather changes, resulting in *Climatic Changes*, with S. S. Visser (1922) and *Earth and Sun* (1923). Other important works are: *The Character of Races* (1924); *The Pulse of Progress* (1926); *The Human Habitat* (1927).

HUNTINGTON, FREDERIC DAN (1819-1904), American clergyman, first Protestant Episcopal bishop of central New York, was born in Hadley, Mass., on May 28, 1819. He graduated at Amherst in 1839 and at the Harvard Divinity School in 1842. In 1842-55 he was pastor of the South Congregational Church of Boston, and in 1855-60 was preacher to the university and Plummer professor of Christian Morals at Harvard; he then left the Unitarian Church, with which his father had been connected as a clergyman at Hadley, resigned his professorship and became pastor of the newly established Emmanuel Church of Boston. He had refused the bishopric of Maine when in 1868 he was elected to the diocese of central New York. He was consecrated in April 1869, and thereafter lived in Syracuse. He died in Hadley, Mass., on July 11, 1904.

See *Memoir and Letters of Frederic Dan Huntington* (Boston, 1906), by A. S. Huntington, his daughter.

HUNTINGTON, HENRY EDWARDS (1850-1927), American railway executive and financier, was born at Oneonta, N.Y., on Feb. 27, 1850. He received a common school education, but his success in positions of trust offered him by his uncle, Collis P. Huntington (*q.v.*), railway magnate, early resulted in his promotion to executive posts of importance. He was superintendent of construction in the building of the Chesapeake, Ohio and Southwestern line between Louisville and Memphis; later vice-president and general manager of the Kentucky Central railroad, one of his uncle's acquisitions; and, at the same time, supervisor of construction of the line between Ashland and Covington, Kentucky. He was then made assistant to the president of the entire Southern Pacific System; and in 1900, shortly before his uncle's death, was promoted to first vice-president. This position he continued to hold under Harriman, who succeeded to the presidency. The will of C. P. Huntington made his widow and nephew heirs to the vast Huntington estate. H. E. Huntington began at this time to be interested in the possibilities of electric railway development in the growing cities of California. He acquired control of all the street car lines of Los Angeles and consolidated them into one system, which in time, with the rapid extensions to outlying towns and suburbs, came to be one of the largest interurban systems in the country. He acquired suburban tracts, laid out town sites, beach resorts and city additions, through all of which his street car lines were extended. He began the organization of the Pacific Light and Power Company to supply not only his street car lines, but the city of Los Angeles as well with power and light. Extension to other cities of California resulted in its becoming one of the largest power systems of the United States. His marriage in 1913 with the widow of C. P. Huntington united the Huntington fortune. After 1910 he devoted more and more time to the assembling of a choice art collection and a magnificent library, especially rich in rare editions of early English literature and in Americana. In 1922 the library, together with his mansion which housed it, was deeded to the American public in perpetuity, and a trust fund of \$8,000,000 was established, the income to be used for further additions, research and publication. Mr. Huntington died at Philadelphia on May 23, 1927.

HUNTINGTON, SAMUEL (1731-1796), American jurist and public official, was born at Windham, Conn., on July 3, 1731. He received only a common school education, but read widely and in 1753 began to study law. In 1760 he settled at Norwich, Conn., where he achieved rapid and extensive success in his practice. He was elected to the assembly of the Colony from Norwich in 1764 and served until he was appointed associate justice of the supreme court in 1774. The following year he was made a member of the governor's council. Despite these royal appointments he sided with the Colonies in the impending struggle with the mother country, and in 1775 became a member of the Connecticut council of safety. Later in that year he was elected a delegate to the Continental Congress, and as such in 1776 voted for and signed the Declaration of Independence. He was a member of the Congress until 1783, and served from Sept. 1779, to July 1781, as its president, succeeding John Jay in that office. He returned to Connecticut in 1783 to be made chief justice of the supreme court in 1784, lieutenant-governor in 1785 and governor in 1786. The latter office he retained by successive annual re-elections until his death at Norwich on Jan. 5, 1796.

HUNTINGTON, a city of Indiana, U.S.A., on the Little river, 25m. S.W. of Fort Wayne; the county seat of Huntington county. It is on Federal highway 24, and is served by the Erie and the Wabash railways and by inter-urban electric lines. The population was 14,000 in 1920 (97% native white). General farming is carried on in the neighbourhood, and the city has several large grain elevators. There are vast limestone deposits in the vicinity. Several hundred men are employed in the manufacture of lime, and there are large railroad repair shops and numerous other varied manufacturing industries. The aggregate factory output in 1925 was valued at \$11,658,163. Huntington college (established 1897) is an institution of the United Brethren church, which also has its publication office here. Huntington was named after Samuel Huntington (1736-96) of Connecticut, a signer of the

Declaration of Independence. It was settled about 1829, incorporated as a town in 1848, and chartered as a city in 1873.

HUNTINGTON, a town of Suffolk county, N.Y., U.S.A., on the north shore of Long Island; served by the Long Island railroad. The population in 1925 was 20,955. Along the sound are the villages of Huntington, Cold Spring Harbor, Centerport, and Northport, noted for their fine country estates. At Cold Spring Harbor are biological laboratories of the Carnegie Institution and a State fish hatchery. The principal occupations of the township are market-gardening, oyster fisheries and shipbuilding. The first settlement was made in 1653. From 1662 to 1664 the territory was under the jurisdiction of Connecticut. On the shore near the village of Huntington Nathan Hale was captured by the British on Sept. 21, 1776. Benjamin Thompson (Count Rumford) occupied the village towards the end of the Revolution, and built a British fort. Walt Whitman was born in Huntington, where in 1836 he established the weekly newspaper *The Long Islander* (still published) which he edited for three years.

HUNTINGTON, a city of West Virginia, U.S.A., on the Ohio river, at an altitude of 564ft., just below the mouth of the Guyandotte, near the point at which Ohio, Kentucky and West Virginia meet; the county seat of Cabell county. It is on Federal highways 52 and 60, and is served by the Baltimore and Ohio and the Chesapeake and Ohio railways. The population was 50,177 in 1920 (93% native white) and was estimated locally at 85,000 in 1928. It is a rapidly growing city, with large car shops and other manufacturing industries, surrounded by a region rich in mineral resources. The factory output in 1926 was valued at \$48,211,702. Bank clearings in 1927 amounted to \$68,727,620, and the assessed valuation of property was \$127,452,375. Huntington is the seat of a State hospital for the insane, and of Marshall college, a State teachers' college which traces its history back to an academy established in 1837 and named after Chief Justice Marshall. In Ritter park stands the oldest house of the region, now used as an historical museum. The city was founded in 1871, as the western terminus of the Chesapeake and Ohio railway, and was named after Collis P. Huntington (*q.v.*), the president of the road.

HUNTINGTON PARK, a rapidly growing residential suburb of Los Angeles, Calif., U.S.A., in Los Angeles county. It is served by the Pacific Electric and the Union Pacific railways. The population was 4,513 in 1920 and was estimated locally at 35,000 in 1928.

HUNTINGTOWER AND RUTHVENFIELD, a village of Perthshire, Scotland, on the Almond, 3 m. N.W. of Perth. Huntingtower (originally Ruthven) Castle, was the scene of the Raid of Ruthven, when the Protestants under William, 4th Lord Ruthven kidnapped the boy-king James VI., in 1582. The earl's sons were killed in the Gowrie conspiracy (1600), after which the Scots parliament ordered the barony to be known in future as Huntingtower. A bleaching field was formed in 1774 the water of the neighbourhood being especially suitable for bleachings.

HUNTLY, EARLS AND MARQUESSSES OF. This Scottish title, in the Gordon family, dates as to the earldom from 1449, and as to the marquessate (the premier marquessate in Scotland) from 1599. The first earl (d. 1470) was Alexander de Seton, lord of Gordon—a title known before 1408; and his son George (d. 1502), by his marriage with Princess Annabella (afterwards divorced), daughter of James I. of Scotland, had several children, including, besides his successor the 3rd earl (Alexander), a second son Adam (who became earl of Sutherland), a third son William (from whom the mother of the poet Byron was descended) and a daughter Katherine, who first married Perkin Warbeck and afterwards Sir Matthew Cradock (from whom the earls of Pembroke descended). Alexander, the 3rd earl (d. 1524), consolidated the position of his house as supreme in the north; he led the Scottish vanguard at Flodden, and was a supporter of Albany against Angus. His grandson George, 4th earl (1514-62), who in 1548 was granted the earldom of Moray, played a leading part in the troubles of his time in Scotland, and in 1562 revolted against Queen Mary and was killed in fight at Corrichie, near Aberdeen. His son George (d. 1576) was restored to the forfeited earldom in 1565; he became Bothwell's close associate

—he helped Bothwell, who had married his sister, to obtain a divorce from her; and he was a powerful supporter of Mary till he seceded from her cause in 1572.

GEORGE GORDON, 1st marquess of Huntly (1562–1636), son of the 5th earl of Huntly, and of Anne, daughter of James Hamilton, earl of Arran and duke of Chatelherault, was born in 1562, and educated in France as a Roman Catholic. He took part in the plot which led to the execution of Morton in 1581 and in the conspiracy which delivered King James VI. from the Ruthven raiders in 1583. In 1588 he signed the Presbyterian confession of faith, but continued to engage in plots for the Spanish invasion of Scotland. On Nov. 28 he was appointed captain of the guard, and while carrying out his duties at Holyrood his treasonable correspondence was discovered. James, however, pardoned him. In April 1589 he raised a rebellion in the north, but was obliged to submit, and after a short imprisonment in Borthwick Castle was again set at liberty. He next involved himself in a private war with the Grants and the Mackintoshes, who were assisted by the earls of Atholl and Murray; and on Feb. 8, 1592, he set fire to Murray's castle of Donibristle in Fife, and stabbed the earl to death with his own hand. This outrage, which originated the ballad "The Bonnie Earl of Moray," brought down upon Huntly his enemies, who ravaged his lands. In December the "Spanish Blanks" were intercepted (*see* ERROLL, FRANCIS HAY, 9TH EARL OF), two of which bore Huntly's signature, and a charge of treason was again preferred against him. On Nov. 26, he and the other rebel lords were freed from the charge of treason, being ordered at the same time, however, to renounce Romanism or leave the kingdom. On their refusal they were attainted. Subsequently Huntly joined Erroll and Bothwell in a conspiracy to imprison the king. Huntly and Erroll gained a victory over the king's troops at Glenlivet, but his castle of Strathbogie was blown up by James, and he left Scotland about March 1595. He returned secretly, submitted to the Kirk and was restored to his estates. In 1599 he was created a marquess and, with Lennox, appointed lieutenant of the north. He was treated with great favour by the king, and was reconciled with Murray and Argyll. Doubts, however, as to the genuineness of his abjuration again troubled the Kirk. On March 19, 1607, he was summoned before the privy council. Huntly thereupon went to England and appealed to James himself. He was excommunicated in 1608, and imprisoned in Stirling Castle till Dec. 10, 1610, when he signed again the confession of faith. He was again imprisoned in 1616. At the accession of Charles I. Huntly lost much of his influence at court. For the private war waged against the Crichtons from 1630 onwards, he was again summoned before the privy council in 1635, and was imprisoned in Edinburgh Castle. He died at Dundee on June 13, 1636, after declaring himself a Roman Catholic.

GEORGE GORDON, 2nd marquess of Huntly (d. 1649), his eldest son by Lady Henrietta, daughter of the duke of Lennox, was brought up in England as a Protestant, and created earl of Enzie by James I. His influence in Scotland was employed by the king to balance that of Argyll in the dealings with the Covenanters. In the civil war he took the king's side, and in 1647 was excepted from the general pardon; in March 1649, he was beheaded by order of the Scots parliament at Edinburgh. The attainder was reversed by parliament in 1661.

HUNTLY, burgh of barony and parish, Aberdeenshire, Scotland. Pop. (1921) 3,752. It lies at the confluence of the rivers Deveron and Bogie, 41 m. N.W. of Aberdeen on the London & North Eastern Railway. It is a market town, a holiday and fishing resort, and the centre of a large agricultural district, its industries including weaving of woollen cloth and hosiery and a distillery. Huntly castle, half a mile north, now in ruins, was once a fortress of the Comyns. From them it passed in the 14th century to the Gordons, by whom it was rebuilt. It was blown up in 1594, but was restored in 1602, subsequently it gradually fell into disrepair. The Standing Stones of Strathbogie in Market Square have offered a permanent puzzle to antiquaries.

HUNTSMAN, BENJAMIN (1704–1776), English inventor and steel manufacturer, was born in Lincolnshire in 1704. He started business as a clock and toolmaker at Doncaster. He

experimented in steel manufacture, and at Handsworth, near Sheffield, at last produced a satisfactory cast steel, purer than any then in use. The Sheffield cutlery manufacturers refused it because it was too hard, but it was largely used in France, and the competition of imported French cutlery made from it forced the English makers to use it. Huntsman had not patented his process, and its secret was discovered by a Sheffield ironfounder, who, according to a popular story, obtained admission to his works in the disguise of a tramp. Benjamin Huntsman died in 1776.

See Smiles, *Industrial Biography* (1879).

HUNTSVILLE, a city of Alabama, U.S.A., 18 m. from the northern boundary of the State; the county seat of Madison county. It is on Federal highway 72, and is served by the Nashville, Chattanooga and St. Louis and the Southern railways. The population was 8,018 in 1920 (37% negroes). Huntsville is surrounded by the beautiful scenery of the Cumberland plateau. The public square is on a high bluff (750 ft. above sea-level). From its base issues a large spring, which furnishes water for the city and forms a stream once used for floating cargoes of cotton to the Tennessee river, 10 m. south. The city has large cotton mills, with an aggregate of 332,776 spindles in 1928, and other manufacturing industries. It is one of the principal nursery centres south of the Ohio, and near by is the largest water-cress farm in the country. At Normal, 3½ m. N.E., is the State Agricultural and Mechanical Institute for negroes. Huntsville was founded in 1805 by John Hunt of Virginia, who had fought in the Revolution, and in 1811 it was incorporated by the Territorial Government, the first settlement in Alabama to receive a charter. Among the first residents were some relatives of Alexander Pope, and for a short time (1809–11) the town was called Twickenham in memory of his home. It was the meeting-place of the convention that framed the first State Constitution (1819) and of the first legislature (1820). In 1844 it was chartered as a city. During the Civil War it was in possession of Federal troops from April 11 to Sept. 1862, and from July 1863 to the end of the war.

HUNTSVILLE, a city of eastern Texas, U.S.A., 68 m. N. of Houston, on Federal highway 75 and the Missouri Pacific railway; the county seat of Walker county. The population in 1920 was 4,689 (45% negroes), and was estimated locally at 6,000 in 1928. Cotton-growing, stock-raising, general farming and lumbering are the leading occupations of the region. The Sam Houston State Teachers college and the State penitentiary are located at Huntsville. It was the last home of Gen. Houston, and his grave is here. The house in which he lived is preserved as a memorial. The city was settled about 1830 and incorporated in 1845.

HUNYADI, JOHN (JANOS) (c. 1387–1456), Hungarian statesman and warrior, was the son of Vojk, a Magyarized Vlach who married Elizabeth Morzsinay. He derived his family name from the small family estate of Hunyad, in Transylvania. The epithet Corvinus, adopted by his son Matthias, was derived from another property, Piatra da Corvo. While a youth, he entered the service of King Sigismund, accompanied him to Frankfurt in 1410; took part in the Hussite War in 1420, and in 1437 drove the Turks from Semendria. For these services he received numerous estates and a seat in the royal council. In 1438 King Albert II. made him ban of Szöreny, a most dangerous dignity entailing constant warfare with the Turks. On the death of Albert in 1439, Hunyadi supported the candidature of the young Polish king Wladislaus III. (1440), against the partisans of the Austrian candidate Ladislaus V., took a prominent part in the ensuing civil war and was rewarded by Wladislaus III. with the captaincy of the fortress of Belgrade and the voivodeship of Transylvania, which latter dignity, however, he shared with his rival Mihaly Ujlaki.

The burden of the Turkish War now rested entirely on his shoulders. He won brilliant victories at Semendria (1441), near Hermannstadt (1442) and near the Iron Gates (1442). In 1443 he advanced across the Balkans, captured Niš, defeated three Turkish pashas, and, after taking Sofia, united with king Wladislaus' army and defeated Murad II. at Snaim. When he returned home (Feb. 1444), he had broken the sultan's power in Bosnia, Herzegovina, Serbia, Bulgaria and Albania. The Pope, the despot

of Serbia (George Branković) and the prince of Albania (George Castriota) urged him on his return to resume the war and drive the Turks from Europe. All preparations were made, when Turkish envoys arrived in Hungary to conclude a ten years' truce. The pact was concluded, but broken when news arrived that a Venetian fleet had started to prevent the Sultan (who had retired to Asia Minor) from recrossing into Europe. In July the Hungarian army recrossed the frontier and advanced towards the Euxine coast to join the galleys. Branković, however, privately informed Murad of the advance, and prevented Castriota from joining it. On reaching Varna, the Hungarians found that the Venetian galleys had failed to prevent the transit of the sultan, who now confronted them with fourfold odds, and in Nov. 1444 they were utterly routed, Wladislaus falling on the field and Hunyadi narrowly escaping.

At the diet which met in 1445 a provisional government of five Magyar captain-generals, was formed, Hunyadi receiving Transylvania and the ultra-Theissian counties as his district; but the resulting anarchy became unendurable, and in June 1446 Hunyadi was unanimously elected governor of Hungary in the name of Ladislaus V., with regal powers. His first act as governor was to proceed against the German king Frederick III., who refused to deliver up the young king. After ravaging Styria, Carinthia and Carniola and threatening Vienna, Hunyadi's difficulties elsewhere compelled him to make a truce with Frederick for two years. In 1448 he received a golden chain and the title of prince from Pope Nicholas V., and immediately afterwards resumed the war with the Turks. He lost the two days' battle of Kosovo owing to the treachery of Dan, hospodar of Wallachia, and of his old enemy Branković, who imprisoned him at Semendria; but he was ransomed by the Magyars, and, after composing his differences with his enemies in Hungary, led a punitive expedition against the Serbian prince. In 1450 Hunyadi went to Pressburg to negotiate with Frederick the terms of the surrender of Ladislaus V. To refute the accusation made by his enemies that he was aiming at the throne, he resigned all his dignities into the hands of the young king, on his return to Hungary in 1453, whereupon Ladislaus created him count of Bestercze and captain-general of the kingdom.

Meanwhile the Turkish danger had again become pressing. In 1455 Hunyadi provisioned and armed the fortress of Belgrade at his own expense, and leaving in it a garrison under his brother-in-law Mihály Szilágyi and his eldest son László, he proceeded to form a relief army and a fleet of 200 corvettes. To the eternal shame of the Magyar nobles, he was left entirely to his own resources. His one ally was the Franciscan friar, Giovanni da Capistrano (*q.v.*), thanks to whose preachings Hunyadi's small mercenary army was reinforced by a host of peasant volunteers. On July 14, 1456 Hunyadi with his flotilla destroyed the Turkish fleet; on the 21st and 22nd he routed the forces investing Belgrade, forcing Mohammed to raise the siege, return to Constantinople, and thus securing the independence of Hungary for another 70 years. On Aug. 11, however, Hunyadi died of plague in his camp.

Hunyadi was one of Christendom's most glorious champions, and also a great statesman. He recognized the insufficiency and the unreliability of the feudal levies, and was one of the first to employ a regular army on a large scale. A man of average education, he owed his influence partly to his natural genius and partly to the transparent integrity and nobility of his character.

See J. Teleki, *The Age of the Hunyadis in Hungary* (Hung.) (Pesth, 1852-57; supplementary volumes by D. Csánki 1895); G. Fejer, *Genus, incunabula et virtus Joannis Corvini de Hunyad* (Buda, 1844); J. de Chassin, *Jean de Hunyad* (Paris, 1859); P. Frankl, *Der Friede von Szegedin und die Geschichte seines Bruches* (Leipzig, 1904); R. N. Bain, "The Siege of Belgrade, 1456" (*Eng. Hist. Rev.*, 1892); A. Bonfini, *Rerum ungaricarum libri xlv., editio septima* (Leipzig, 1771).

HUNYADI, LÁSZLÓ (1433-1457), Hungarian statesman and warrior, was the eldest son of János Hunyadi and Elizabeth Szilágyi. At a very early age he accompanied his father in his campaigns. After the battle of Kosovo (1448) he was left for a time, as a hostage for his father, in the hands of George Branković, despot of Serbia. In 1452 he was a member of the deputation which went to Vienna to receive back the Hungarian king Ladis-

laus V. In 1453 he was ban of Croatia-Dalmatia. At the diet of Buda (1455) he resigned all his dignities, because of the accusations of Ulrich Cillei and the other enemies of his house, but a reconciliation was ultimately patched up and he was betrothed to Maria, the daughter of the palatine, László Garai. After his father's death in 1456, he was declared by his arch-enemy Cillei (now governor of Hungary with unlimited power), responsible for the debts alleged to be owing by the elder Hunyadi to the state; but he defended himself so ably at the diet of Futak (Oct. 1456) that Cillei feigned a reconciliation; but being persuaded by a bribe to surrender his fortress at Belgrade and to accompany the King to Buda, Hunyadi was arrested there on a charge of compassing Ladislaus's ruin, condemned to death without the observance of any legal formalities, and beheaded on March 16, 1457. (R. N. B.)

HUNZA (also known as KANJUT) and **NAGAR**, two small states on the north-west frontier of Kashmir (*q.v.*) formerly

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY
NATIVE TILLING HIS GROUND WITH OXEN IN THE HUNZA CANYON

under the administration of the Gilgit agency. The two states, which are divided by a river which runs in a bed 600 ft. wide between cliffs 300 ft. high, are inhabited generally by people of the same stock, speaking the same language, professing the same form of the Mohammedan religion, and ruled by princes sprung from the same family, though frequently at war with each other. Formerly Hunza

was the more prominent of the two, because it held possession of the passes leading to the Pamirs, and could plunder the caravans on their way between Turkistan and India. But they are both shut up in a recess of the mountains, and were of no importance until about 1889, when the advance of Russia up to the frontiers of Afghanistan, and the great development of her military sources in Asia, increased the necessity for strengthening the British line of defence. This led to the establishment of the Gilgit agency, the occupation of Chitral, and the Hunza expedition of 1891, which asserted British authority over Hunza and Nagar. The country is inhabited by a Dard race of the Yeshkun caste speaking Burishki. Pop. of Hunza (1921), 12,117; of Nagar (1921), 14,188. (See GILGIT.) The Hunza-Nagar Expedition of 1891, under Colonel A. Durand, was due to the defiant attitude of the Hunza and Nagar chiefs towards the British agent at Gilgit. The fort at Nilt was stormed, and after a fortnight's delay the cliffs (1,000 ft. high) beyond it were also carried by assault. The chief of Nagar was reinstated on making his submission, and the half-brother of the raja of Hunza was installed as chief in the place of his brother.

HUON OF BORDEAUX, hero of romance. The French *chanson de geste* of Huon de Bordeaux dates from the first half of the 13th century. Huon, son of Seguin of Bordeaux, kills Charlot, the emperor's son, who had laid an ambush for him, without recognizing his assailant. He is condemned by Charlemagne to be hanged, but reprieved on condition that he visits the court of Gaudisse, the amir of Babylon, and brings back a handful of hair from the amir's beard and four of his back teeth, after having slain the greatest of his knights and three times kissed his daughter Esclarmonde. By the help of the fairy dwarf Oberon, Huon succeeds in this errand, in the course of which he meets with further adventures. The Charlot of the story has been identified by A. Longnon (*Romania* viii. 1-11) with Charles l'Enfant, one of the sons of Charles the Bald and Irmintrude. The poem exists in a later version in alexandrines, and, with its continuations, was put into prose in 1454 and printed by Michel le Noir in 1516, since when it has appeared in many forms, notably in a beautifully printed and illustrated adaptation (1898) in modern French by Gaston Paris. The romance had a great vogue in England through the translation (*c.* 1540) of John Burchier, Lord Berners, as *Huon of Burdeux*. The tale was dramatized and produced in Paris by the Confrérie de la Passion in 1557, and in Philip Henslowe's

diary there is a note of a performance of a play, *Hewen of Burdoche*, on Dec. 28, 1593. For the literary fortune of the fairy part of the romance see OBERON.

The *Chanson de geste* of Huon de Bordeaux was edited by F. Guessard and C. Grandmaison for the *Anciens poètes de la France* in 1860; Lord Berners's translation was edited for the E.E.T.S. by S. L. Lee in 1883-85. See also *Hist. litt. de la France* (vol. xxvi., 1873); L. Gautier, *Les Épopées françaises* (2nd ed. vol. iii. pp. 719-773); A. Graf, *I complementi della Chanson de Huon de Bordeaux* (Halle, 1878); M. Schweigel, "Esclarmonde," etc. in *Ausg. u. Abhandl. . . der roman. phil.* (Marburg, 1889); C. Voretzsch, *Epische Studien* (vol. i., Halle, 1900).

HUON PINE, botanical name *Dacrydium Franklinii*, the most valuable timber tree of Tasmania, a member of the order Coniferae (see GYMNOSPERMS). It is a fine tree of pyramidal outline 80 to 100 ft. high, and 10 to 20 ft. in girth at the base, with slender pendulous much-divided branchlets, densely covered with the minute scale-like sharply-keeled bright green leaves. It occurs in swampy localities from the upper Huon river to Port Davey and Macquarie Harbor, but is less abundant than formerly owing to the demand for its timber, especially for ship- and boat-building. The wood is close-grained and easily worked.

HUPA. This, the most advanced and best known tribe of the Pacific coast division of the Athabaskan family of American Indians, lives, to the number of 600, on lower Trinity river in Hoopa valley, north-western California. Their culture, shared by the Yurok and Karok, was characterized by acorn and salmon subsistence, canoes, frame houses of planks bearing individual names; clanless villages, a wealth-aristocracy owning debt slaves, fishing places and oak groves, dentalium shell and woodpecker scalp currency, treasures of albino deer skins, huge obsidian blades, furs, etc.; no political authority but an intricate law of persons and property; wealth displaying, stringently localized dances, without symbolism but attached to the recitation of narrative magical formulas. This is the southernmost efflorescence of the native culture characteristic of the North Pacific coast of North America, though lacking the *potlatch* festivals, secret societies and masks, totem poles and carving art of the northern tribes.

See Goddard in *Univ. Calif. Publ. Am. Arch. Ethn.*, vol. i. (1904); Kroeber, *Bur. Am. Ethn. Bull.* 78 (1925).

HUPEH, a province in the Yang-tze Valley in the heart of China. Pop. over 27 millions. Its core is a great plain traversed by the Yang-tze and its tributary the Han whose beds are slightly raised above its general surface. The Yang-tze is fringed with numerous marginal lakes which serve as reservoirs for its floodwaters and flood-silt. The largest lake is the Tung-ting-hu which, lying on the border of Hupeh with Hunan, has given them both their names—the one north, the other south of the lake. The two constituted a single province until the reign of K'ang Hsi (1662-1722). The most fertile and most populous part of the plain forms a broad band lying close to the course of the Yang-tze and to the lake region around the lower Han. The upper part of the course of the Han through the plain is far less closely occupied. The crops are typical of Middle China whose climate permits the growth of temperate cereals and legumes in winter, and of the sub-tropical rice and cotton in summer. Rice is the largest crop but considerable quantities are imported.

The Hupeh plain is ringed by highland—the Hwai-yang-shan in the north, the Kiu-kung-shan in the south-east, a prolongation of the Kweichow plateau in the south-west and the eastern ranges of the Ta-pa-shan in the west. The highland rim is not continuous, being pierced by the river valleys of the Yang-tze, the Han, and the rivers of Hunan, through all of which the Hupeh basin communicates with the rest of China. Roads to South China pass through Hunan, to North China up the Han and over the Hwai-yang-shan, while the Yang-tze leads to West China and eastwards to the sea. Because of this focal position at the junction of routes from all quarters of China and as the geometrical centre of the country the Hupeh Basin has come to be known as the Central Basin of China. Its focal character is crystallized in the great triple city of Wu-Han, at the confluence of the Han with the Yang-tze, long the commercial centre for all the vast area of interior China drained to the Basin. Wu-Han is becoming one of

the premier industrial districts of the country (see HANKOW). In the political situation it is a point of great strategic importance, and under the imperial regime the viceroy of Hupeh, with his seat of government at Wuchang, was one of the most powerful officials in the empire.

HUPFELD, HERMANN (1796-1866), German orientalist and biblical commentator, was born on March 31, 1796, at Marburg, and was educated in his native town and in Halle, where in 1824 he became a teacher in the university. In the following year he was appointed professor of theology at Marburg, but 13 years later returned to Halle, where he died on April 24, 1866.

Hupfeld's earliest works in Semitic philology (*Exercitationes Aethiopicae*, 1825, and *De emendanda ratione lexicographiae Semiticae*, 1827), were followed by the first part (1841) of his *Ausführliche Hebräische Grammatik*, and by his *De rei grammaticae apud Judaeos initiis antiquissimisque scriptoribus* (1846). His principal contribution to biblical literature was the *Übersetzung und Auslegung der Psalmen* (1855-61, 3rd ed. 1888). Other writings are *Über Begriff und Methode der sogenannten biblischen Einleitung* (1844); *De primitiva et vera festorum apud Hebraeos ratione* (1851-64); *Die Quellen der Genesis von neuem untersucht* (1853); *Die heutige theosophische oder mythologische Theologie und Schrifterklärung* (1861).

See E. Riehm, *Hermann Hupfeld* (Halle, 1867); W. Kay, *Crisis Hupfeldiana* (1865); and Herzog-Hauck's *Realencyklopädie* (1900).

HURD, RICHARD (1720-1808), English divine and writer, bishop of Worcester, was born at Congreve, Penkridge, Staffordshire, on Jan. 13, 1720, and educated at Emmanuel college, Cambridge, of which he became a fellow. He was ordained in 1744, and in 1748 he published some *Remarks on an Enquiry into the Rejection of Christian Miracles by the Heathens* (1746), by William Weston, a fellow of St. John's college, Cambridge. He prepared editions, which won the praise of Gibbon, of the *Ars poetica* and *Epistola ad Pisones* (1749), and the *Epistola ad Augustum* (1751) of Horace. A compliment in the preface to the edition of 1749 led to a lasting friendship with William Warburton, through whose influence he was appointed one of the preachers at Whitehall in 1750. In 1765 he became preacher at Lincoln's Inn, and in 1767 archdeacon of Gloucester. In 1768 he delivered at Lincoln's Inn the first Warburton lectures, which were published in 1772 as *An Introduction to the Study of the Prophecies concerning the Christian Church*. He became bishop of Lichfield and Coventry in 1774 and two years later tutor to the prince of Wales and the duke of York. In 1781 he was translated to the see of Worcester. He built at Hartlebury Castle a fine library, to which he transferred Pope's and Warburton's books, purchased on the latter's death. In 1783 he declined the primacy.

Hurd's *Letters on Chivalry and Romance* (1762), written in continuation of a dialogue on the age of Queen Elizabeth which was included in his *Moral and Political Dialogues* (1759), had some influence in stimulating the romantic movement; two later dialogues *On the Uses of Foreign Travel* were printed in 1763.

Hurd edited the *Works* of William Warburton, the *Select Works* (1772) of Abraham Cowley, and left materials for an edition of Addison (6 vols., 1811). His own works were published in 8 vols. in 1811. See Francis Kilvert, *Memoirs of . . . Richard Hurd* (1860).

HURDES, LAS or JURDES, a region of north-west Spain, south of Salamanca and the Sierra de Peña de Francia and east of the Sierra de Bejar. The Hurdanos are a peculiar people, probably originally a settlement of religious and political refugees; they number about 6,000 and inhabit primitive slate hamlets in the isolated mountainous region of the Sierra de Gata. The principal wealth consists in goats and bees. Much damage is done by boars and wolves. In the high-lying districts the Hurdanos suffer from goitre; along the rivers they are subject to malaria. In 1922 King Alfonso rode through the most difficult parts of Las Hurdes, and since then rapid progress has been made in the improvement of this region, and a good road has been built from La Alberca to the lovely valley of Las Batuecas, which was previously almost inaccessible.

See M. Legendre, *Las Jurdes. Étude de géographie humaine* (Paris, 1927).

HURDLE, a movable fence, formed of a framework of light timber, wattled with smaller pieces of pliable wood, or constructed on the plan of a light five-barred gate, filled in with brushwood. Similar movable frames can be made of iron, wire or other material. A construction of the same type is used in military engineering and fortification as a foundation for a temporary roadway across boggy ground or as a backing for earthworks.

HURLING, running races over short distances, in which a series of ten flights of hurdles has been set. The standard distances are 120yds., ten flights of 3ft. 6in. hurdles; 220yds., ten flights of 2ft. 6in. hurdles; and 440yds., ten flights of 3ft. hurdles. At the short distance each flight of hurdles is separated from the next by 10yds., with a space of 15yds. from the start to the first flight, and a like distance from the last flight to the finish. At the intermediate distance the hurdles are 20yds. apart and at the long distance 40yds. apart. The Oxford and Cambridge distances, are 120yds. high hurdles and 220yds. low hurdles. The distances at the A.A.A. championships are 120yds. and 440yds., and at the Olympic games 110 metres and 400 metres.

In 1927 the official world's records stood as follows:—E. J. Thomson, Dartmouth college, U.S.A., 1920, 120yds. hurdles, 14 $\frac{2}{3}$ secs.; 110 metres hurdles, 14 $\frac{2}{3}$ secs.; C. R. Brookins, University of Iowa, U.S.A., 1924, 220yds. and 200 metres hurdles, 23 secs.; J. K. Norton, U.S.A., 1920, and Lord Burghley, Great Britain, 1927, 440yds. hurdles, 54 $\frac{1}{2}$ secs.; K. M. Taylor, Grinnell college, U.S.A., 1924, 400 metres hurdles, 52 $\frac{2}{3}$ secs. At the American national championships 1927, J. Gibson, U.S.A., won the 440yds. low hurdles title in 52 $\frac{2}{3}$ secs., a new world's record which will no doubt be settled in due course.

In the early days of hurdle racing men merely ran the distance, jumping over each hurdle in turn and landing on both feet, so that there was very nearly a dead stop in the run after each jump. A later school of hurdlers favoured a "sail-over" style, with body upright, front leg tucked up and rear leg trailing. This was quicker, because it called only for a one-foot landing. The next discovery made was that the fastest pace could be achieved at the 120yds. distance by a man taking only three strides to cover the 10yds. distance between hurdles. About 1885 A. C. M. Croome, Oxford university, realized that the athlete who tucked up his front leg and "bucked" high over the hurdle was losing time. From that year a straight-leg, step-over action came into vogue. Forrest Smithson, U.S.A., Olympic victor and world's record holder, 15secs. in 1908, produced a wonderful flexibility of the rear hip, and it only remained for Earl J. Thomson to add the forward lift of the arms, and the high pick-up action of the rear knee, which allows the athlete to land in the best position for the next stride forward after the hurdle has been cleared.

The difference between high and low hurdling lies in the extent to which the body is bent forward in the clearance of the obstacle. A 6ft. man clearing a 3ft. 6in. high hurdle should not allow the crown of his head to rise more than 5ft. 9 $\frac{1}{2}$ in. above the ground, whereas the same man clearing a 2ft. 6in. low hurdle should raise his body an approximate 2 $\frac{1}{2}$ in., so that the crown of his head would pass just under a bar raised 6ft. 2 $\frac{1}{2}$ in. above the ground.

Method of Hurdling.—In clearing the hurdle the athlete's leading leg and *opposite* arm, or both arms, are stretched straight to the front, the other arm being bent at the elbow and tucked in to the side; the rear leg, bent at the knee, is at right angles to the body and the trunk is pressed forward over the thigh of the leg which goes first over the hurdle. As the body is centralized over the hurdle the leading leg is chopped sharply down so that the foot lands close to the fence, the body leans well forward and the rear knee is picked up to the point of the shoulder so that the rear foot can be carried straight through for a full forward stride after the hurdle clearance has been effected.

Under modern rules it is laid down that "A competitor knocking down three or more hurdles, or trailing his leg, or foot, alongside any hurdle shall be disqualified."

See F. A. M. Webster, *Athletics* (1925); Boyd Comstock, *How to Hurdle* (Spaldings 1926).

(F. A. M. W.)

HURDY-GURDY, now loosely used as a synonym for any grinding organ, but strictly a mediaeval drone instrument with strings set in vibration by the friction of a wheel, being a development of the *organistrum* reduced in size so that it could be conveniently played by one person instead of two.

The hurdy-gurdy originated in France, and during the 13th and 14th centuries was known by the name of *Symphonia* or

BY COURTESY OF THE WASHINGTON MUSEUM OF ART

A FRENCH HURDY-GURDY *Mekka* (2 vol., 1888-89). He refused a nomination as professor of Arabic at Cambridge university in succession to Robertson Smith and also nominations in Germany and at Leyden, preferring to continue his studies on Islam in the Dutch East Indies (1889-1906), where for some years he was counsellor to the Government in Mohammedan affairs. In 1893-94 he published *De Atjehers*, which was translated into English in 1900. He returned to Holland in 1906, where he accepted the chair of Arabic at the University of Leyden; in 1907 he was nominated counsellor for Indian and Arabian affairs to the Dutch and the Dutch East Indies Government. Among his other works are *Nederland en de Islam* (1911) and *Verspreide Gesniffen* (1923 ff.).

HURLSTONE, FREDERICK YEATES (1800-69), English painter, was born in London, his father being a proprietor of the *Morning Chronicle*. F. Y. Hurlstone studied under Sir W. Beechey, Sir T. Lawrence and B. R. Haydon, and in 1820 became a student at the Royal Academy, where he soon began to exhibit. In 1831 he was elected to the Society of British Artists, of which in 1835 he became president; it was to their exhibitions that he sent most of his pictures. He died in London on June 10, 1869. His historical paintings and portraits were very numerous.

HURON, a rapidly growing city of eastern South Dakota, U.S.A., on the James river, at an altitude of 1,310ft.; the county seat of Beadle county. It is on Federal highway 14; is served by the Chicago and North Western and the Great Northern railways, and has connection with the Chicago, Milwaukee, St. Paul and Pacific at Wolsey, 15m. W., through regular motor-bus and freight-truck service. There is a municipal airport, one mile north of the heart of the city. The population in 1925 (State census) was 10,204 (about 90% native white) and was estimated locally at 13,000 in 1928. Huron is the shipping point and supply centre for a large territory raising corn, alfalfa, cattle, sheep, hogs and potatoes. It is a division headquarters of the Chicago and North Western railway, which has shops, freight-yards, a roundhouse and offices here. Its packing plants and produce houses use over \$23,000,000 worth of live stock, poultry, eggs and cream in a year. Annual shipments include 4,000 carloads of meat products and 1,000 of dairy and poultry produce. The assessed valuation of property in 1927 was \$12,328,810. The State fair, held at Huron since 1905, draws an attendance of 135,000. Huron college, a Presbyterian institution opened at Pierre (as Pierre university) in 1883, was moved here in 1898.

The city was founded in 1880 and incorporated in 1883.

HURON. This French epithet, meaning bristle-head or ruffian, was applied to a group of Indians calling themselves Wendat, whence Wyandot. They belonged to the Iroquoian family but were bitter enemies of the Iroquois, who between the visits of Cartier in 1543 and Champlain in 1603 drove part of the Hurons from St. Lawrence river westward into Ontario, where kindred tribes seem to have been already resident. About 1590 four of these tribes, the Bear, Cord, Rock and Deer people, established a confederacy which included also a number of smaller or dependent tribes. The confederacy numbered perhaps 20,000 souls. The Huron received the French as friends and the missionaries made many converts; but the old warfare with the Iroquois went on. In 1648-50 Iroquois invasions completely broke up the confederacy, thousands of Hurons being killed, others taken captive or forced to settle among their conquerors, and the remnants driven west. These fragments drifted back and forth between Michigan, Wisconsin, Ontario, Ohio and Quebec, in alliance or conflict with many tribes, some of them also victims of the Iroquois. There remain about 500 Huron at Lorette in Quebec and 500 Wyandot in Oklahoma; but there is probably considerable Huron blood incorporated among the Iroquois and other tribes. The culture was similar to that of the Iroquois (*q.v.*).

HURON, LAKE, the second largest of the Great Lakes of North America, is about 220 m. in length, 101 m. in width and has a maximum measured depth of about 750 feet. Bordering on it are the State of Michigan and the Province of Ontario, Canada. The area of the water surface of the Lake is 23,010 sq. m. of which 9,110 sq. m. are in the United States. Its entire drainage basin comprises 72,420 sq. m., of which 24,850 sq. m. are in United States. The average mean surface of Lakes Huron and Michigan for the 67-year period (1860-1926) was 580.97 ft. above sea-level; 21.25 ft. below the mean surface of Lake Superior and 8.54 ft. above the mean surface of Lake Erie. The level of the lake is subject to annual fluctuation; the greatest difference between the highest and lowest monthly means of any year was 1.94 ft. and the least difference was 0.61 foot. During the 67-year period referred to above, the difference between the highest (583.66) and the lowest (577.36) mean monthly stages was 6.30 feet. In addition to the annual fluctuation there are occasional oscillations of irregular amount and duration. These apparently result from the variations in barometric pressure which may produce changes ranging from a few inches to several feet within a few hours. The level is also affected by winds which have been known to cause a local change of elevation of some 5 ft. in a few hours. Any lowering of the level of the lake, either as a result of natural causes or of diversions, reduces the depths available to navigation and causes loss to shipping, as ships are loaded to the full depth available in the dredged cuts. The average opening and closing dates of its season of navigation are April 12 and Dec. 15, respectively at its upper end, and April 5 and Dec. 23 at its lower end.

Lake Huron receives its water from Lake Superior via St. Marys river and from Lake Michigan via the Straits of Mackinac. It empties its water into Lake Erie via the St. Clair river, Lake St. Clair and Detroit river. In its natural condition the St. Marys river was obstructed by falls and shoals; those, however, at Sault Ste. Marie are now overcome by locks. A channel has been dredged through the river with minimum depth of 21 feet. The Straits of Mackinac have channels sufficiently wide and deep to permit navigation by the largest lake vessels. In their natural condition the St. Clair river, Lake St. Clair and Detroit river were obstructed by shoals, but a through navigable channel not less than 20 ft. deep has been dredged by the United States.

The most important traffic on Lake Huron is the through commerce between Lake Erie and Lakes Superior and Michigan. This traffic consists primarily of shipments of iron ore and grain from Lake Superior ports, grain from Lake Michigan ports and coal from Lake Erie ports upbound. The total freight movement in 1926 was 85,979,087 tons through the St. Marys river and 95,003,604 tons through the Detroit river.

Rockport and Calcite are the only ports in the United States along the west coast of Lake Huron with sufficient depth of water to accommodate the largest vessels for loading and unloading.

Both these harbours have been created by and for interests engaged in the limestone trade. In 1926, 1,847,413 tons of limestone were shipped from Rockport, and 9,041,301 tons from Calcite. On the south-western shore of the lake is the artificial harbour of Harbor Beach, Mich., located some 60 m. west of the head of St. Clair river. The improvement at this locality by the United States was to provide a harbour of refuge and consists of a breakwater inside of which there is a sheltered area of about 650 acres. Other U.S. harbours on Lake Huron are Bay City, at the head of Saginaw bay, Alpena on the north-west shore of Thunder bay, and Sheboygan near the Straits of Mackinac. The Canadian ports on Georgian bay, Depot Harbor, Port McNicoll, Tiffin, Midland and Collingwood, receive yearly about a million tons of coal from Lake Erie ports, and some 85,000,000 bu. of grain from upper lake ports, most of it coming from Port Arthur and Fort William on Lake Superior. Some of this grain is milled at lake ports, but most of it is transhipped to rail lines and carried to the eastern seaboard for consumption or export.

HURRICANE, an unusually violent wind-storm in the West Indies. The term, corresponding to the highest number (12) on the Beaufort Scale (*q.v.*), is now used to describe similar storms in other regions, except those of the East Indies and the Chinese seas, which are still known as "typhoons." Hurricane is the Carib word *huracan* imported by the Portuguese explorers of the 15th century. The "hurricane deck" of a steamer is an upper deck which protects the one below.

HURRY (or URRY), **SIR JOHN** (d. 1650), Scottish soldier of fortune, was born in Aberdeenshire, and saw much service as a young man in Germany. In 1641 he was involved in the plot known as the "Incident" (*see* HAMILTON, JAMES HAMILTON, 1st Duke of). At the outbreak of the Civil War Hurry joined the army of the earl of Essex, but early in 1643 he deserted to the Royalists, bringing with him information on which Rupert acted at once. Thus was brought about the action of Chalgrove Field, where Hurry again showed conspicuous valour; he was knighted on the same evening. In 1644 he was with Rupert at Marston Moor, where with Lucas he led the victorious left wing of horse. But a little later, thinking the King's cause lost, he again deserted, and eventually was sent with Baillie against Montrose in the Highlands. His detached operations were conducted with great skill, but his attempt to surprise Montrose's camp at Auldearn ended in complete disaster. He once more joined Charles's party, and he was taken prisoner in the campaign of Preston (1648). Sir John Hurry was Montrose's major-general in the last desperate attempt of the Scottish Royalists. Taken at Carbisdale, he was beheaded at Edinburgh, May 29, 1650.

HURST, JOHN FLETCHER (1834-1903), American Methodist Episcopal bishop, was born in Salem, Md., on Aug. 17, 1834. He graduated at Dickinson college in 1854, taught for a couple of years, and in 1856 went to Germany to study at Halle. From 1857 to 1866 he was engaged in pastoral work in America, and from 1867 to 1871 he taught in Methodist mission institutes in Germany. In 1871 he became professor of historical theology at Drew Theological seminary, Madison, N.J., of which he was president from 1873 till 1880, when he was made a bishop. He died at Bethesda, Md., on May 4, 1903. Bishop Hurst, by his devotion, recovered the endowment of Drew Theological seminary, lost by the failure in 1876 of Daniel Drew, its founder; and with McClintock and Crooks he improved the quality of Methodist scholarship. The American university (Methodist Episcopal) at Washington (D.C.) for post-graduate work, of which he was chancellor from 1891 till 1902, when he was made chancellor emeritus, was the outcome of his labours. Besides translating and revising many important works he published *A History of Rationalism* (1865, rev. ed., 1901); *Life and Literature in the Fatherland* (1875), brilliant sketches of Germany; *Indika: The country and people of India and Ceylon* (1891); *History of the Christian Church* (1897-1900); and edited the *History of Methodism* (1902-04), co-operative work.

HURSTMONCEAUX (also HERSTMONCEUX), a village in Sussex, England, 9 m. N.E. of Eastbourne. Pop. (1921) 1,495. The village takes its name from Waleran de Monceux, lord of

the manor after the Conquest, but the 15th century castle, for the ruins of which the village is famous, was built in the reign of Henry VI. by Sir Roger de Fiennes. Towers flank the corners, and there is a beautiful turreted entrance gate, but only the foundations of most of the buildings ranged round the inner courts are to be traced. The church of All Saints is Early English. Much material from the castle was used in the erection of Hurstmonceaux Place, a mansion of the 18th century.

HUSAIN IBN ALI (c. 1854–), Amir of Mecca from 1908 to 1916 and king of Hejaz from 1916 to 1924, was the second son of Muhammad Ibn'Aun of the 'Abadila clan of Ashraf. He was brought up in Bedouin surroundings, but spent a great part of his life at Constantinople. Reputed to harbour Anglophil tendencies, he was deeply versed in the byways of Ottoman politics and his best trait was a profound knowledge of the desert, for which he always maintained a genuine affection. At the beginning of his Amirate he won golden opinions by his sagacity and modesty and set himself vigorously to forward Turkish interests in Arabia. In 1910 he subdued a rebellion in 'Asir and subsequently invaded Qasim without result, but in 1913 he began to show his true colours by opposing the extension of the Hejaz railway to Mecca.

When the World War broke out he entered into negotiations with the British, which culminated in the Arab revolt in June 1916. In October he proclaimed himself "King of the Arab Countries" though he was formally recognized only as king of Hejaz. At the Versailles Peace Conference (1919) he was represented by his third son, Faisal, but refused to ratify the treaty as a protest against the mandatory *régimes* imposed on Syria, Palestine and Iraq. Subsequently his domestic policy was marked by ever increasing avarice and reaction, while he sowed the seeds of future trouble by deliberately courting the enmity of Ibn Saud. In March 1924, while on a visit to Transjordan, he proclaimed himself Caliph, but war with Ibn Saud was already imminent, and the Wahhabi attack on Zaif in September found him unprepared. On Oct. 5 he abdicated and proceeded to 'Aqaba, whence in July 1925 he was conveyed by a British warship to Cyprus, where he took up his residence.

By his first marriage Husain had three sons: 'Ali; 'Abdullah, Amir of Transjordan, and Faisal. The first of these, 'Ali Ibn Husain, who was born about 1880, took no conspicuous part in affairs during his father's Amirate. After the World War he became Amir of Medina and in that capacity did much useful work in connection with the reconstruction of the Hejaz railway. In 1924 he was pressed to accept the Amirate of Transjordan but declined in favour of returning to Medina. He succeeded his father as second king of Hejaz on Oct. 3, 1924, but abdicated on Dec. 10 of the following year (*see* HEJAZ) and returned to Baghdad to live as the guest of his brother Faisal.

HUSBAND, the "head of a household," now chiefly used in the sense of a man legally joined by marriage to a woman, his "wife"; the legal relations between them are treated below under **HUSBAND AND WIFE**.

HUSBAND AND WIFE (*see* ROMAN LAW). For the methods in which the relation of husband and wife may be constituted and dissolved *see* MARRIAGE and DIVORCE. The present article deals only with the effect of marriage on the legal position of the spouses. The person chiefly affected by the contract is the wife, who under most early systems of law became subject in consequence of the marriage to some kind of disability. The most favourable system scarcely left her as free as an unmarried woman and the most unfavourable subjected her absolutely to the authority of her husband. In modern times the effect of marriage on property is perhaps the most important of the consequences arising from the relationship, and on this point the laws of different States show wide diversity of principles.

English Law.—The contract of marriage, which is by law regarded as a civil contract only, is in its essence a consent on the part of a man and woman to cohabit with each other and with each other only. This contract differs from all other civil contracts in that it is indissoluble at the will of the parties. The English common law relating to marriage is indigenous to the country,

the rules relating alike to the ceremony itself and to the legal results of the ceremony being entirely insular in their origin and deducible from no foreign source. There is, however, considerable analogy between the later development of the civil law of Rome and the modern law of England—in that both, starting from an extreme theory of the possessory right of the husband over the person and property of the wife, have subsequently tended towards practical equality between the sexes. The original concept in English law was an absolute merger of the personality of husband and wife by virtue of the marriage ceremony—*unica persona. quia caro una et sanguis unus*. Bacon states in his Abridgement "from the time of the intermarriage, the law looks upon the husband and wife but as one person; and therefore allows of but one will between them, which is placed in the husband." Hence a man could not grant or give anything to his wife, because she was himself, and if there were any compacts between them before marriage they were dissolved by the union of persons. A husband, moreover, during his lifetime, had an absolute power of disposing of the personal property and chattels real (leasehold interests) of the wife, no act of hers being of any force to affect or transfer that which by the intermarriage she had assigned to him. The husband could not, however, dispose of the wife's chattels real by will and if she survived him her rights in her leasehold property revived. In the wife's freeholds the husband's ownership was not absolute, he having no power to dispose of them without her consent, although as master and governor of the family he was entitled to receive the profits during the life of his wife.

Courts of equity, however, in process of time considerably modified the stringency of the common law by the introduction of the doctrine of *separate estate*, i.e., property settled to the wife for her separate use. In such case a married woman was entitled to deal with her property as if she were a *feme sole*. Connected with the doctrine of separate use was the equitable contrivance of *restraint on anticipation*, with which later legislation has not interfered, whereby property might be so settled to the separate use of a married woman that she could not, during coverture, alienate it or anticipate the income. In yet another way the court of chancery interfered to protect the interests of married women. When a husband applied to the court to get possession of his wife's *choses in action* (i.e., a legal right not in possession), he was required to make provision for her and her children out of the fund sought to be recovered. This provision was called the wife's *equity to a settlement*. Two other interests of minor importance also existed. The wife's *pin-money*, which was a provision for the purchase by her of clothes and ornaments suitable to her husband's position, and the *paraphernalia*, i.e., jewels and other ornaments purchased by a husband for the adornment of his wife, but not actually given to her so as to pass the property. These might be reclaimed by the husband in his lifetime, but he could not dispose of them by testamentary disposition unless equivalent benefits were conferred on the wife by his will—in which case she had to elect between the will and the paraphernalia. If her husband died solvent she might also claim the paraphernalia on his decease even though bequeathed by him to a third party.

The corresponding interests of the wife in the property of the husband were much less satisfactory. Besides a general right to maintenance at her husband's expense she had at common law a right to *dower* in her husband's lands and, if he died intestate, to a third of his personal estate. Both of these rights were abolished by the Administration of Estates Act, 1925, which substitutes therefor the provisions following. If an intestate leaves surviving a husband or wife (with or without issue) the survivor takes the personal chattels of the deceased absolutely with a sum of £1,000 from the residuary estate, and in addition (should the intestate leave no issue) a life interest in the residuary estate. If the intestate leaves issue, then a life estate of one-half of the residuary estate goes to the surviving spouse, and the other half on statutory trusts for the issue of the intestate. The act further provides for the ultimate distribution of the residuary estate. Under the older law the regulation of the respective rights of husband, wife and children by marriage settlements tended largely to obviate the hardships and injustices imposed upon women by the common law.

A necessary sequence to the theory of the unity of person in the marriage relation was that neither husband nor wife could give evidence against the other in any legal proceeding whether civil or criminal. Survivals of this old law still exist in the fact that the combination of husband and wife, without a third party, for an unlawful purpose does not constitute an indictable misdemeanour so as to support a charge of conspiracy; and (apart from treason and murder) it is still a good defence for a wife to prove that the crime with which she is charged was committed in the presence of and under the coercion of her husband (15 and 16 G.5, c. 86 s. 47). A third survival of the old law is to be found in the fact that a husband continues liable for the pure torts of his wife, *i.e.*, for any tort not directly connected with a contract (*Edwards v. Porter*, 1925, A.C. 1).

The fundamental changes introduced by the Married Women's Property Act, 1882, 1893, 1907, have enormously improved the position of a woman unprotected by settlements practically placing her in the position of a *feme sole*. The chief provisions of the Act of 1882 are shortly, that a married woman is capable of acquiring, holding and disposing of by will or otherwise, any real and personal property, in the same manner as if she were a single woman, without the intervention of any trustee. The property of a woman married after the commencement of the act, whether belonging to her at the time of marriage or acquired after marriage, is held by her as a *feme sole*. The same rule applies in the case of property acquired after the beginning of the act by a woman married before the act. After marriage a woman remains liable for antenuptial debts and liabilities, and as between her and her husband, in the absence of contract to the contrary, her separate property is deemed primarily liable, the husband being liable only to the extent of property acquired from or through his wife. The act also contains provisions as to stock, investment, insurance, criminal proceedings and other matters. Its effect was to render obsolete the law as to what created a separate use on a reduction into possession of *choses* in action, as to equity to a settlement, as to fraud on the husband's marital rights, and as to the inability of one of two married persons to give a gift to the other.

The Married Women's Property Act of 1893 provides specifically that every contract thereafter entered into by a married woman, otherwise than as an agent, should be deemed to be a contract entered into by her with respect to and be binding upon her separate property, whether she was or was not in fact possessed of or entitled to any separate property at the time when she entered into such contract, that it should bind all separate property which she might at that time or thereafter be possessed of or entitled to, and that it should be enforceable by process of law against all property which she might thereafter, while discoverable, be possessed of or entitled to. The Act of 1907 provides that a settlement or agreement for a settlement whether before or after marriage, respecting the property of the woman, shall not be valid unless executed by her if she was of full age or confirmed by her after she attained full age. The Act of 1908 provides that married women possessing separate property shall be liable for the maintenance of their parents. The Guardianship of Infants Act, 1925, gives the mother of an infant equal right with the father to apply to a court for guardianship of a child. The Act of 1926 provides for the legitimization of children (*q.v.*) by the subsequent marriage of their parents. The Law of Property Act, 1925, enables a married woman, without her husband, to dispose of or join in disposing of real or personal property held by her solely or jointly as trustee or personal representative in like manner as if she were a *feme sole*. It further enables her to disclaim any estate or interest in land without the concurrence of her husband and to acquire as well from her husband as from any other person any interest in real or personal property, and to hold the same either solely or jointly with third parties as a trustee or personal representative as if she were a *feme sole*.

Law of Scotland.—The law of Scotland differs less from English law than the use of a very different terminology would lead us to suppose. The phrase *communio bonorum* has been employed to express the interest which the spouses have in the *movable* property of both, but its use has been severely censured as

essentially inaccurate and misleading. It has been contended that there was no real community of goods, and no partnership of *societas* between the spouses. The wife's movable property, with certain exceptions, and subject to special agreements, became as absolutely the property of the husband as it did in English law. The notion of a *communio* was, however, favoured by the peculiar rights of the wife and children on the dissolution of the marriage. Previous to the Intestate Movable Succession (Scotland) Act, 1855, the law stood as follows. The fund formed by the movable property of both spouses may be dealt with by the husband as he pleases during life; it is increased by his acquisitions and diminished by his debts. The respective shares contributed by husband and wife return on the dissolution of the marriage to them or their representatives within a year and a day, and without a living child. Otherwise the division is into two or three shares, according as children are existing or not at the dissolution of the marriage. On the death of the husband, his children take one-third (called *legitim*), the widow takes one-third (*jus relictæ*), and the remaining one-third (the *dead part*) goes according to his will or to his next of kin. If there be no children, the *jus relictæ* and the *dead part* are each one-half. If the wife die before the husband, her representatives, whether children or not, are creditors for the value of her share. The statute above mentioned, however, enacts that "where a wife shall predecease her husband, the next of kin, executors or other representatives of such wife, whether testate or intestate, shall have no right to any share of the goods in communion; nor shall any legacy or bequest or testamentary disposition thereof by such wife, affect or attach to the said goods or any portion thereof." It also abolishes the rule by which the shares revert if the marriage does not subsist for a year and a day. Several later acts apply to Scotland some of the principles of the English Married Women's Property Acts. These are the Married Women's Property (Scotland) Act of 1877, which protects the earnings, etc., of wives, and limits the husband's liability for antenuptial debts of the wife; the Married Women's Policies of Assurance (Scotland) Act, 1880, which enables a woman to contract for a policy for her separate use; and the Married Women's Property (Scotland) Act, 1881, which abolished the *jus mariti*.

The husband's courtesy is recognized, and a widow has a life-rent of a third of the husband's heritable estate, unless she has accepted a conventional provision. By the Married Women (Scotland) Act, 1920, a wife can dispose of her estate as though she were unmarried, and any deed executed by her with reference to her heritable estate in Scotland is as valid as if carrying her husband's consent.

Continental Law.—On the continent of Europe and especially among the Latin nations (after age-long vicissitudes of varying custom and procedure possibly derived from an infiltration of Teutonic law and principle into the civil code) the main ideas of Roman jurisprudence became established as the bases of the law governing the marriage relation. The leading feature in modern Continental marriage law is the community of goods between husband and wife. Of this system it is said "the community is not regarded in French law as a legal entity except for the purposes of taking an account. It is somewhat like a private partnership." It generally extends to all property of the husband and wife and to the income or other proceeds derived therefrom. It extends also to all immovable property of the husband and wife acquired during the marriage. The property thus acquired is liable to the debts of the spouses existing at the time of the marriage, to the debts contracted by the husband during the community or by the wife during the community, with the husband's consent, and to debts contracted for the maintenance of the family. When the community is dissolved an account is taken to ascertain what each partner owes to the partnership and what the partnership owes them, and after ascertainment the partnership property, if any, is divided equally between husband and wife. Certain modifications of this general principle have, however, been introduced in French legislation by a series of enactments dating from 1881 which somewhat assimilates the Gallic law to that of England in matters relating to personal savings or profits derived by a married woman from her individual exertions. More recently, a law dated July

13, 1907, has accorded to a married woman an absolute right to deal as she pleases with salary or business profits earned by her or with any property she may have purchased therewith; whilst a further enactment of 1924 protects (subject to certain safeguards against fraud) the goods and property of a married woman from seizure by her husband's creditors, whether such property was owned by her before marriage, has since been inherited by her, or has been acquired by her personal exertions. Should she, however, squander her separate estate her husband may apply to the court to restrict her freedom of disposal.

In Denmark, Finland, Iceland, Norway and Sweden the legal effects resulting from the contract of marriage are practically identical, the result of the adoption by these countries of the Marriage Act of 1925 and the Inheritance Act of 1926 being to confer on husband and wife legal equality during lifetime and equal rights of inheritance upon the death of either of the parties. In these countries the principle of community of property between husband and wife is preserved concurrently with right to the possession of separate estate. The communal property can only be encumbered or disposed of with the joint consent of the spouses, but the separate estate may be disposed of by either without reference to the other. Separate estate may consist of antenuptial property, not brought into the community upon the marriage, or such earnings of either spouse as are not required for the family maintenance. In case of desertion, bankruptcy or mismanagement of the joint estate by husband or wife the law permits of an equitable resettlement by the court. In Germany by the civil code which came into operation in 1900 (art. 1367) it is provided that the wife's wages or earnings shall form part of her *Vorbehaltsgut* or separate estate, which a previous article (1365) placed outside her husband's control. In Italy a law of July 17, 1919, abolished the last contractual incapacity of married women. Henceforth the husband has no legal right either to veto or control the acts of his wife or to interfere with her separate estate. In 1906 Switzerland enacted a statute conferring on married women contractual emancipation.

(W. W. P.)

THE UNITED STATES

In each of the 48 States of the United States the status of husbands and wives is different. This makes it impossible to generalize except along broad lines. Practically every known variety of marital relationship has existed, ranging all the way from complete dominion of the male to something approaching equality of interests. Nowhere, however, is the wife the dominant party. The U.S. laws range from the early English common-law notion (to paraphrase Blackstone) that husband and wife are one, and *that one* is the husband, and the early Continental civil-law notion (embodied in the community property doctrines of Spain and France) that the community "is a partnership which begins only at its end" (Justice Oliver Wendell Holmes), down to the most modern theories as to what constitutes a working arrangement between the parties. The years since about 1850 have seen great changes, the trend now being definitely in the direction of expanding the wife's rights and powers, both as to property and person.

The marital status is, in essence, lifelong monogamy. Under the Mormons polygamy flourished for a time but it was eventually outlawed. While marriage is called a contract, it is nevertheless one that, once made, cannot be unmade by the parties. The State must be called in to revoke the contract, and even the State will refuse to act except for special reasons. Husband and wife agree to cohabit, they pledge mutual fidelity so long as they live. Divorce (*q.v.*), practically the only way to bring marriage to an end short of death, is generally granted only where one of the parties has been unfaithful or has in some way made living together dangerous or impossible. Some States refuse to revoke the contract for any cause short of infidelity. One State, South Carolina, refuses to do so at all. No State will do so merely because the parties want it done.

Personal Rights.—The marital contract effects other changes almost as startling. In the field of personal rights women have not advanced as far as they may think from the days when the Eng-

lish wife was simply one of her husband's "chattels," when he was romantically supposed to be privileged to beat her "with a stick no bigger than the wedding ring," and to dictate where she should live and what she should do. The husband is everywhere to-day the head of the household and he alone chooses the family domicile. This is true even in the community property States in which the wife in other respects enjoys great personal freedom. In Virginia the wife must observe "the Pauline injunction to remain subject to her husband," and this might be matched by equally poetic legislative language in other States. In most States the husband cannot be sued for damages for beating his wife, although he can be proceeded against criminally for it. He cannot be sued in most States for negligence, libel, slander, false imprisonment or assaults of any kind upon his wife. There is equality between the sexes here, for neither can a wife be sued by her husband in such circumstances.

The marital relationship itself is to a large extent a law unto itself. Husband and wife agree to intercourse, exclusive and unlimited. It is therefore impossible in most States for the husband to commit the crime of rape upon his wife, even if suffering from venereal disease, as the wife's consent is presumed. All she can do is run away or get a legal separation or divorce (on the ground of cruelty, perhaps). Just as the wife cannot easily control intercourse, so it is in many places difficult for her to control childbirth. Many States forbid the dissemination of contraceptive information, except in case of disease. And abortion, except in case of danger to life, is also generally held criminal.

So far as names are concerned, the husband's name is commonly assumed by the wife, but there is no legal obligation to do so. This is entirely a matter of custom, not of law. A few sporadic administrative rulings to the contrary are found here and there in connection with passports, pay-checks, etc., but they are wrong in principle.

While there is in general no liability for personal torts as between husband and wife, torts as between husband or wife and a third person are a different matter. Formerly the husband was liable for his wife's torts; she on the contrary was never liable for his. This rule no longer prevails to any extent. The husband is generally liable for his wife's tort, if at all, only where committed in his presence or, more commonly, by his order. Formerly the husband alone could sue for his wife's injuries; she on the contrary could never sue for his. This rule has been abrogated somewhat. Now in most States the wife can sue for her own injuries. But the husband also can sue for loss of his wife's society (known as "consortium"), her services and wages, and medical expenses paid by him. The wife on the contrary cannot sue for loss of his "consortium" or support, where it is the husband who was injured.

A wife is liable for the crimes which she commits. There is sometimes a rebuttable presumption of innocence, however, if the crime be committed in the presence or under the order or coercion of her husband, and if the crime itself be minor in its nature. Husband and wife formerly could not be witnesses for or against one another. This has been largely done away with, except for the privilege not to reveal confidential communications.

Marriage affects the citizenship of women as it does not affect that of men. At one time a wife's nationality automatically followed that of her husband. Now she keeps her own nationality upon marriage and, if a foreigner married to an American, must be naturalized in order to become an American herself. She needs only one year of residence, however, whereas a man in a similar case needs five.

Property Rights.—It is in the field of property that the greatest changes have taken place. At common law the husband upon marriage took practically all his wife's personal property and all the income from her land. The creation by courts of equity of a separate equitable estate for her beyond the reach of her husband only partially mitigated the hardship. This condition lasted until well into the last century. The first Married Women's Property Acts were passed in 1848, and from that time on the change was rapid. In most States married women can now own property of any sort just as though they were single. The degree of control

which they exercise over it varies in different States. In some states they have full control; in others the husband must join in the transfer, sometimes of personalty, sometimes only of realty; in others, he or the court may constitute her a "free trader." When it comes to her power to contract, there is equal variety. In no State are husband and wife permitted to contract to dissolve the marital relation, that being a matter which, once consummated, the State alone can dissolve. In many States she has complete freedom to contract with third persons, but not with her husband. In others, she can contract to employ him to work for her, but cannot contract to be employed to work for him. In still others she can enter into contracts with third persons only after she has been declared a "free trader" by the courts or her husband. Her power to contract also varies in subject-matter. In some States she can form a partnership, borrow or lend money, act as surety or guarantor, appoint agents, etc.; in others she can do one or more of these things but not all.

When it comes to services and earnings, the same diversity exists. Formerly her earnings belonged to her husband and she was by the same token bound to render services to him without pay. Now most States permit her to keep her earnings when working for third persons outside her home. If, however, she work for a third person inside the home, her earnings generally belong to her husband, unless he make her a present of them by "emancipating" her. If she work for her husband outside the home, some States declare her entitled to wages, others not. If she work for her husband inside the home, no State in the union will let her have wages for it.

Correlative with the wife's services to her husband is the husband's support of her. This is an enforceable duty, whereas the wife's duty of service is not. Formerly the husband did not owe any such duty, even though he took all her property on marriage. The rule was early established, however, that if he refused to supply her with "necessaries" (food, clothing, shelter and medical expenses, varying in quality according to his rank and wealth), she could order them for herself and charge them up to him. At present the husband's obligation of support is in most states well defined, the failure to support his wife furnishing ground for divorce in some States, for separation in others. The obligation lasts only during his lifetime. A few States have written a more modern viewpoint into their statute books by declaring support to be a mutual obligation. As generally interpreted, however, this does not prescribe any financial contribution from the wife, but only such assistance as she would naturally render in taking care of the house, children, etc., while upon the husband falls the financial burden. Some few States specifically require the wife to support her husband where she has property and he is infirm and without any means of support. Elsewhere when he comes to such a pass she need not lift a finger to help him.

Closely bound up with property rights while living is the matter of these same rights after death. Both husband and wife are nowadays competent to make wills. Formerly a wife was not. Frequently a woman's will is revoked by her subsequent marriage, or else marriage followed by the birth of issue; a man's will, by marriage and birth of issue. In some States a subsequent marriage or birth of issue only revokes the will *pro tanto*.

In some few States dower and curtesy still exist. In most of those States the wife may completely disinherit her husband, since curtesy only attaches to such of the wife's realty as she does not dispose of during her lifetime or will away at death. Not so the husband. He cannot by will as a rule deprive her of her dower, which attaches to all the realty which he owned during his lifetime and in which she had not released her claim to dower. In most States, however, neither dower nor curtesy any longer exists. Instead there have been substituted a great variety of rights, for the most part assuring to the survivor some portion, even if a small one, of the deceased spouse's estate.

Where there is no will, the personal estate is generally divided up between the survivor and the children, or the survivor and the nearer relatives if there be no children. In some States the husband gets all on his wife's death, whereas she on his death must share with children or other relatives. In some States there

is strict equality. The realty as a rule goes to the heirs, with dower or curtesy or some form of life-interest only to the surviving spouse. In some States realty and personalty are treated alike and the surviving spouse shares in the corpus, not merely in the income. The inheritance laws of the different States show such marked diversity that it is almost impossible to generalize. But the trend is toward giving a larger share to the wife, as distinguished from more distant relatives, making total disinheritance impossible, and establishing equality as between the sexes.

Divorce is the other method besides death of bringing marriage to an end. It is unlike death, however, in that the husband's obligation of support, generally termed alimony, survives it. Where the husband obtains the divorce the wife generally forfeits her right to it. Alimony may be paid in a lump sum or in instalments and, if the latter, may be raised or lowered in amount from time to time, depending on the husband's changing economic circumstances. It continues sometimes even after the wife has married again. It is, however, extinguished at the husband's death, or at hers. Judges are coming more and more to take into consideration the wife's property and earning capacity, if any, and to fit the size of the alimony accordingly.

Community Property.—The theory of joint ownership of property acquired after marriage is undergoing an interesting development in the eight community property States. These States derive from the civil law. The theory of ownership varies from that of legal title in the husband, with or without an equitable interest in the wife, to so-called corporate or partnership title. The husband is everywhere in practical control, although the limitations on his power of disposal are many. At death or dissolution of the marriage the property is as a rule divided equally.

Children.—The relationship of father and mother to their children has undergone a profound change since the middle of the 19th century. Formerly the children's father was their natural guardian, had custody of their persons and property, was entitled to their services and earnings, and, on his death, could will them away to someone other than their mother. There are still a few States where fathers may will away their children. But for the most part, mothers are now recognized as joint guardians of the persons of their children and as alone entitled to their custody on the death of the father. In the majority of States the father is still entitled to his children's earnings and services, in exchange for which he must support them. Upon his death the mother becomes charged with their support and is in turn entitled to their earnings. In some States these rights and duties have been made the mutual obligation of both parents.

The above brief description paints a chaotic picture, perhaps, but one which reveals a growing interest in the subject and ceaseless experimentation. The United States has been going through a period of change, a period of the growth of a critical awareness of this as the most important of its institutions. Each State has experimented for itself according to its own ideas on the subject, citizenship alone being a Federal matter. Because of the resulting chaos many have advocated unification, either by Federal law or uniform State legislation. Whether the latter method is practicable or not, the former would require amendment of the Constitution and a reversal of the prevailing theory of Federal government. It is not likely to succeed. The States will probably continue to experiment; and the next 50 years should see a crystallization into a more set mould of the happier results of all this experimenting. (D. KN.)

HUȘI, the capital of the department of Fălciu, Rumania; on a branch of the Jassy-Galatz railway, 9 m. W. of the river Pruth and the Russian frontier. Pop. (1928) 17,000, about one-fourth being Jews. Huși is an episcopal see. The cathedral was built in 1491 by Stephen the Great of Moldavia. Huși is said to have been founded in the 15th century by a colony of Hussites, from whom its name is derived. The treaty of the Pruth between Russia and Turkey was signed here in 1711.

HUSKISSON, WILLIAM (1770-1830), English statesman and financier, was descended from an old Staffordshire family of moderate fortune, and was born at Birch Moreton, Worcester-shire, on March 11, 1770. He went to Paris at 14 to the care of

his uncle, Dr. Gem, physician to the British embassy in Paris, and witnessed the French revolution. In Jan. 1793 he was employed by Dundas in the carrying out of the Aliens Act; and in 1795 he was appointed under-secretary for war. Huskisson sat in parliament for Morpeth (1796-1802), Liskeard (1804-07), Harwich (1807-12), Chichester (1812-23), and Liverpool (1823-30). He was secretary to the Treasury under Pitt (1804-05), and Portland (1807-09). He took a prominent part in the corn-law debates of 1814 and 1815; and in 1819 he presented a memorandum to Lord Liverpool advocating a large reduction in the unfunded debt, and explaining a method for the resumption of cash payments, which was embodied in the act passed the same year. In 1821 he was a member of the committee appointed to inquire into the causes of the agricultural distress then prevailing, and the proposed relaxation of the corn laws embodied in the report was understood to have been chiefly due to his strenuous advocacy. In 1823 he was appointed president of the board of trade and treasurer of the navy, and shortly afterwards he received a seat in the cabinet. In the same year he was returned for Liverpool as successor to Canning, and as the only man who could reconcile the Tory merchants to a free trade policy. Among the more important legislative changes with which he was principally connected were a reform of the Navigation Acts, admitting other nations to a full equality and reciprocity of shipping duties; the repeal of the labour laws; the introduction of a new sinking fund; the reduction of the duties on manufactures and on the importation of foreign goods; and the repeal of the quarantine duties. In accordance with his suggestion Canning in 1827 introduced a measure on the corn laws proposing the adoption of a sliding scale to regulate the amount of duty. A misapprehension between Huskisson and the duke of Wellington led to the duke proposing an amendment, the success of which caused the abandonment of the measure by the government. After the death of Canning in the same year Huskisson accepted the secretaryship of the colonies under Lord Goderich, an office which he continued to hold in the new cabinet formed by the duke of Wellington in the following year. After succeeding with great difficulty in inducing the cabinet to agree to a compromise on the corn laws, Huskisson finally resigned office in May 1829 on account of a difference with his colleagues in regard to the disfranchisement of East Retford. On Sept. 15, 1830, he was accidentally killed by a locomotive engine while present at the opening of the Liverpool and Manchester railway.

See the *Life of Huskisson*, by J. Wright (1831).

HUSS, HENRY HOLDEN (1862-), American musician, was born in Newark, N.J., on June 21, 1862, of Bohemian ancestry. He was reared in a musical atmosphere, and in 1882 graduated from the Royal Conservatoire at Munich. Besides playing the piano and composing, Huss has been prominent in New York as a teacher of the piano, particularly as a teacher of teachers, and his *Condensed Technics*, published in 1904, is used widely. His works include a piano concerto, a violin concerto and a violin sonata. He has also written a number of songs.

HUSS or HUS, JOHN (c. 1373-1415), Bohemian reformer, was born of peasant parents at Hussinecz, near the Bavarian frontier. He was educated at the University of Prague where he began to lecture in 1398. He was made dean of the philosophical faculty in Oct. 1401, and was rector (Oct. 1402-April 1403) of the university. His appointment in 1402 as rector of the Bethlehem chapel, which had been erected in 1391 by some zealous citizens of Prague to provide good popular preaching in the Bohemian tongue, greatly influenced his religious life, and led him to an appreciation of the philosophical and theological writings of Wycliffe, whose *Trilogus* he had translated into Czech in 1403.

In 1405, while still unconscious of any opposition to Catholicism, Huss published his *De Omni Sanguine Christi Glorificato*, in which he declaimed against forged miracles and ecclesiastical greed, and urged Christians to desist from looking for sensible signs of Christ's presence, but rather to seek Him in His enduring word. More than once, also, Huss was appointed to be synod preacher, and in this capacity he delivered at the provincial councils of Bohemia many admonitions. In 1408, however, the clergy

laid before the archbishop a formal complaint against the strong expressions used by Huss with regard to clerical abuses. He was, deprived of his appointment as synodal preacher, and forbidden the exercise of priestly functions. Simultaneously with these proceedings, negotiations had been going on for the removal of the long-continued papal schism. King Wenceslaus of Bohemia had requested that the clergy and the university observe a strict neutrality towards both popes. But the clergy remained supporters of Gregory XII., and of the university; only the Bohemian "nation" under Huss avowed neutrality. There followed an expression of nationalist feeling, with the result that a royal edict (Jan. 18, 1409) was issued, by which the Bohemian "nation" received three votes, while only one was allotted to the Bavarians, Saxons and Poles combined; whereupon all the foreigners, to the number of several thousands, immediately withdrew from Prague.

His Teaching.—It was a dangerous triumph for Huss; for his popularity at court and in the general community had been secured only at the price of clerical antipathy. Among the first results of the changed order of things were on the one hand the election of Huss (Oct. 1409) to be again rector of the university, but on the other hand the appointment by the archbishop of an inquisitor to inquire into charges of heretical teaching and inflammatory preaching brought against him. He had spoken disrespectfully of the church, it was said, had even hinted that Antichrist might be found to be in Rome, had fomented in his preaching the quarrel between Bohemians and Germans, and had, notwithstanding all that had passed, continued to speak of Wycliffe as both a pious man and an orthodox teacher. The direct result of this investigation is not known, but it is probably connected with the promulgation by Pope Alexander V., in 1409, of a bull which ordered the abjuration of all Wycliffite heresies and the surrender of all his books, while at the same time—a measure specially levelled at the pulpit of Bethlehem chapel—all preaching was prohibited except in localities by long usage set apart for that use. The archbishop publicly burned some 200 volumes of the writings of Wycliffe, and excommunicated Huss and certain of his friends, who had in the meantime protested and appealed to the new pope (John XXIII.). Again the populace rose on behalf of their hero, who continued to preach in the Bethlehem chapel, and in the university began publicly to defend the so-called heretical treatises of Wycliffe, while from king and queen, nobles and burghers, a petition was sent to Rome praying that the condemnation and prohibition in the bull of Alexander V. might be quashed. In March 1411 the ban was anew pronounced upon Huss, and ultimately the whole city was laid under interdict; yet he went on preaching.

The struggle entered on a new phase with the proclamation of the papal bulls by which a religious war was decreed against the excommunicated King Ladislaus of Naples, and indulgence was promised to all who should take part in it. By his bold opposition to this procedure against Ladislaus, and still more by his doctrine that indulgence could never be sold without simony, and could not be lawfully granted except by genuine contrition and repentance, Huss at last isolated himself, not only from the archiepiscopal party but also from the theological faculty of the university. The excommunication against Huss was renewed, and the interdict again laid on all places which should give him shelter. In December Huss had to yield to the King's wish by temporarily withdrawing from Prague to Kozihradek, and to Krakowitz. There he carried on a copious correspondence, and composed the *De Ecclesia*, which subsequently furnished most of the material for the charges against him. This work was largely based on the doctrines of Wycliffe.

Trial and Death.—In 1413 his presence was requested at the council of Constance, and, having arrived there on Nov. 3, he received the famous imperial "safe conduct," the promise of which had been one of his inducements to quit the comparative security he had enjoyed in Bohemia. This safe conduct stated that, whatever judgment might be passed on him, Huss should be allowed to return freely to Bohemia. This by no means provided for his immunity from punishment. If faith to him had not been broken he would have been sent back to Bohemia to be punished

by his sovereign, the king of Bohemia. The treachery of King Sigismund is undeniable and was indeed admitted by the king himself. The safe conduct was probably indeed given by him to entice Huss to Constance. On Dec. 4, the pope appointed a commission of three bishops to investigate the case against the heretic, and to procure witnesses; but the flight of pope John XXIII. in the following March furnished a pretext for the removal of Huss from the Dominican convent to a more secure place of confinement under the charge of the bishop of Constance at Gottlieben on the Rhine. On May 4, the temper of the council was revealed in its unanimous condemnation of Wycliffe, especially of the so-called "forty-five articles" as erroneous, heretical, revolutionary. On June 5, when the case of Huss came up for hearing, he was unable to make his defence by reason of the violent outcries. The sitting of June 7 at which King Sigismund was present, was better disciplined. Propositions extracted from the *De Ecclesia* were brought up, and the relations between Wycliffe and Huss were discussed. The accused repudiated the charge of having abandoned the doctrine of transubstantiation, while expressing admiration for Wycliffe. On June 8, he declared that among the propositions he could abjure was that relating to transubstantiation; among those he felt constrained to maintain was that which denied that Peter was the head of the church. The council finally demanded that Huss should declare that he had erred in all the articles cited against him; secondly, that he should promise on oath neither to hold nor teach them in the future; thirdly, that he should publicly recant them. He declined, and sentence of death was pronounced on July 6, in the presence of Sigismund and a full sitting of the council. Once again he attempted to remonstrate, but in vain, and finally he betook himself to silent prayer. He was handed over to the secular arm, and on the same day the fire was kindled, and his voice as it audibly prayed in the words of the "Kyrie Eleison" was soon stifled in the smoke. When the flames had done their office, the ashes that were left and even the soil on which they lay were carefully removed and thrown into the Rhine.

Not many words are needed to convey a tolerably adequate estimate of the character and work of the "pale thin man in mean attire," who in sickness and poverty thus completed the forty-sixth year of a busy life at the stake. The value of Huss as a scholar was formerly underrated. The publication of his *Super IV. Sententiarum* has proved that he was a man of real learning. Yet his principal glory will always be founded on his spiritual teaching. It is not easy to formulate precisely the beliefs for which he died, and certainly some of them, e.g., that regarding the church, were such as many Protestants would regard as unguarded and difficult to harmonize with the maintenance of external church order. By propagating the reformatory doctrines of Wycliffe, Huss may be said to have handed on to Luther the torch which kindled the Reformation. His popularity in his own country was due both to his oratorical powers and to his pastoral activity.

The works of Huss were published at Nuremberg in 1558 (reprinted with new matter at Frankfort in 1715); by K. J. Erben at Prague (1865-68), and by W. Flojshaus at Prague (1904 fol.). In 1869 F. Palacky edited *Documenta J. Hus vitam, doctrinam, causam in Constantiensi concilio*. Among separate publications may be mentioned the *Letters* translated into Eng. by H. B. Workman (1904). See G. von Lechler's *Wiclif und die Vorgeschichte der Reformation*, trans. P. Lorimer (1878); H. Finke, *Acta concilii Constantiensis* (1896); J. A. von Helfert, *Studien über Hus und Hieronymus* (1853); J. Loserth, *Hus und Wiclif* (1884, 2nd ed. 1925, Eng. trs. 1884); G. von Lechler, *Johannes Hus* (1889); Count Lützow, *The Life and Times of John Hus* (1909, 2nd ed. 1921); W. N. Schwarze, *John Huss* (1915); D. S. Schaff, *John Huss* (1915); P. Bracciolini, *Todesgeschichte des Johannes Huss* (Constance, 1926) and K. Kašpar, *Hus und die Früchte seiner Wirksamkeit* (Warnsdorf, 1926).

HUSSAR, originally the name of a soldier belonging to a corps of light horse raised by Matthias Corvinus, king of Hungary, in 1458, to fight against the Turks. The hussar was the typical Hungarian cavalry soldier, and, in the absence of good light cavalry in the regular armies of central and western Europe, the name and character of the hussars gradually spread into Prussia, France, etc. Frederick the Great sent Maj. H. J. von Zieten to study the work of this type of cavalry in the Austrian service, and

Zieten so far improved on the Austrian model that he defeated his old teacher, Gen. Baranyai, in an encounter between the Prussian and Austrian hussars at Rothschoß in 1741. The typical uniform of the Hungarian hussar was followed, with modifications, in other European armies. It consisted of a busby or a high cylindrical cloth cap, jacket with heavy braiding and a dolman or pelisse, a loose coat worn hanging from the left shoulder. The hussar regiments of the British army were converted from light dragoons at the following dates: 7th (1805), 10th and 15th (1806), 18th (1807, and again on revival after disbandment, 1858), 8th (1822), 11th (1840), 20th (late 2nd Bengal European Cavalry) (1860), 13th, 14th and 19th (late 1st Bengal European Cavalry) (1861). The 21st Lancers were hussars from 1862 to 1897. In 1922, on the reduction of the cavalry, the 13th and 18th, the 15th and 19th were amalgamated as the 13th/18th Hussars and 15th/19th Hussars. In 1928 the 11th were converted into an armoured car regiment, retaining their title.

HUSSITES, the name given to the followers of John Huss (1369-1415), the Bohemian reformer. They were at first often called Wycliffites, as the theological theories of Huss were largely founded on the teachings of Wycliffe. Huss indeed laid more stress on Church reform than on theological controversy. On such matters he always writes as a disciple of Wycliffe. The Hussite movement may be said to have sprung from three main sources. Bohemia was long but very loosely connected with the Church of Rome. The connection became closer at the time when the papacy was discredited by the great schism. The rapacity of its representatives in Bohemia, and the immorality of the clergy caused general indignation. The Hussite movement was also a democratic one, an uprising of the peasantry against the landowners at a period when a third of the soil belonged to the clergy. Finally, national enthusiasm for the Slavic race contributed largely to its importance. The towns were mainly German; and since by the regulations of the University of Prague Germans also held almost all the more important ecclesiastical offices—a condition of things greatly resented by the natives of Bohemia, which at this period had reached a high degree of intellectual development. (See **BOHEMIA**.)

Utraquism.—The Hussite movement assumed a revolutionary character as soon as the news of the death of Huss reached Prague. The knights and nobles of Bohemia and Moravia, who were in favour of Church reform, sent to the council at Constance (Sept. 2, 1415) a protest which condemned the execution of Huss in the strongest language. The uncompromising attitude of Sigismund, king of the Romans, caused trouble in various parts of Bohemia, and many Romanist priests were driven from their parishes. Almost from the first the Hussites were divided into two principal sections. Shortly before his death Huss had accepted a doctrine preached during his absence by his adherents at Prague, namely, that of "utraquism," i.e., the obligation of the faithful to receive communion in both kinds. This doctrine became the watchword of the moderate Hussites, known as the Utraquists, while the more advanced Hussites known as the Taborites from the name of their stronghold, recognized only two sacraments, Baptism and Communion, and rejected most of the ceremonial of the Roman Church.

Anti-Hussite Movements.—Under the influence of his brother Sigismund, King Wenzel endeavoured to stem the Hussite movement. A certain number of Hussites left Prague. They held meetings in various parts of Bohemia, particularly at Usti, near the spot where the town of Tabor was founded soon afterwards. At these meetings Sigismund was violently denounced, and the people everywhere prepared for war. The troubles at Prague continued, and on July 30, 1419, when a Hussite procession marched through the streets, stones were thrown at the Hussites from the windows of the town hall of the "new town." The people, headed by John Žižka (1376-1424), threw the burgo-master and several town councillors from the windows and they were immediately killed by the crowd. On hearing this news King Wenzel was seized with an apopleptic fit and died a few days afterwards. The death of the king resulted in renewed troubles in Prague and in almost all parts of Bohemia. Many Romanists,

most of them Germans, were expelled from the Bohemian cities. In Prague, in Nov. 1419, severe fighting took place between the Hussites and the mercenaries whom Queen Sophia (widow of Wenzel) had hurriedly collected. After a considerable part of the city had been destroyed a truce was concluded on Nov. 13. The nobles, who, though favourable to the Hussite cause, yet supported Sophia, promised to act as mediators with Sigismund; while the citizens of Prague consented to restore to the royal forces the castle of Vyšehrad, which had fallen into their hands. Žižka, who disapproved of this compromise, left Prague and retired to Plzeň (Pilsen), then into southern Bohemia, and after defeating the Romanists at Sudomeř—the first pitched battle of the Hussite wars—he arrived at Usti, one of the earliest meeting-places of the Hussites. Not considering its situation sufficiently strong, he moved to the neighbouring new settlement of the Hussites, to which the biblical name of Tabor was given. The ecclesiastical organization of Tabor had a somewhat puritanic character, and the Government was established on a thoroughly democratic basis. Four captains of the people were elected, one of whom was Žižka; and a strictly military discipline was instituted.

The Articles of Prague.—On March 17, 1420, Martin V. proclaimed a crusade "for the destruction of the Wycliffites, Hussites and all other heretics in Bohemia." A vast army of crusaders arrived before Prague on June 30 (see ŽIŽKA, JOHN). Negotiations took place for a settlement of the religious differences. The united Hussites formulated their demands in a statement known as the "Articles of Prague." This document, the most important of the Hussite period, runs thus:

"I. The word of God shall be preached and made known in the kingdom of Bohemia freely and in an orderly manner by the priests of the Lord. . . .

"II. The sacrament of the most Holy Eucharist shall be freely administered in the two kinds, that is bread and wine, to all the faithful in Christ who are not precluded by mortal sin—according to the word and disposition of Our Saviour.

"III. The secular power over riches and worldly goods which the clergy possesses in contradiction to Christ's precept, to the prejudice of its office and to the detriment of the secular arm, shall be taken and withdrawn from it, and the clergy itself shall be brought back to the evangelical rule and an apostolic life such as that which Christ and his apostles led. . . .

"IV. All mortal sins, and in particular all public and other disorders, which are contrary to God's law, shall in every rank of life be duly and judiciously prohibited and destroyed by those whose office it is."

These articles, which contain the essence of the Hussite doctrine, were rejected by Sigismund. Hostilities therefore continued, and nearly all Bohemia fell into the hands of the Hussites. Internal troubles prevented them from availing themselves completely of their victory. At Prague a demagogue, the priest John of Želivo, for a time obtained almost unlimited authority over the lower classes of the townsmen; and at Tabor a communistic movement (that of the so-called Adamites) was sternly suppressed by Žižka. Sigismund only arrived in Bohemia at the end of 1421. He took possession of the town of Kutna Hora (Kuttenberg), but was decisively defeated by Žižka at Nêmecky Brod (Deutschbrod) on Jan. 6, 1422. Bohemia was now again for a time free from foreign intervention, but internal discord again broke out caused partly by theological strife, partly by the ambition of agitators. There were troubles at Tabor itself, where a more advanced party opposed Žižka's authority. Bohemia obtained a temporary respite when, in 1422, Prince Sigismund Korybutovič of Poland became for a short time ruler of the country. His authority was recognized by the Utraquist nobles, the citizens of Prague, and the more moderate Taborites, including Žižka. Korybutovič, however, remained but a short time in Bohemia; after his departure civil war broke out, the Taborites opposing in arms the more moderate Utraquists, whose principal stronghold was Prague. On April 27, 1423, Žižka now again leading, the Taborites defeated at Horic the Utraquist army under Čenek of Wartemberg; shortly afterwards an armistice was concluded

at Konopoišt.

Further Anti-Hussite Attacks.—Papal influence had meanwhile succeeded in calling forth a new crusade against Bohemia, but it resulted in complete failure. In spite of the endeavours of their rulers, the Slavs of Poland and Lithuania did not wish to attack the kindred Bohemians; the Germans were prevented by internal discord from taking joint action against the Hussites; and the king of Denmark, who had landed in Germany with a large force, soon returned to his own country. Free for a time from foreign aggression, the Hussites invaded Moravia, where a large part of the population favoured their creed; but, again paralyzed by dissensions, soon returned to Bohemia. The city of Königgrätz (Králové Hradec), which had been under Utraquist rule, espoused the doctrine of Tabor, and called Žižka to its aid. After several military successes gained by Žižka (*q.v.*) in 1423 and 1424, a treaty of peace between the Hussites was concluded on Sept. 13, 1424 at Liben, now part of Prague.

In 1426 the Hussites were again attacked by foreign enemies. In June their forces, led by Prokop the Great—who took the command of the Taborites shortly after Žižka's death in Oct. 1424—and Sigismund Korybutovič, who had returned to Bohemia, signally defeated the Germans at Aussig (Usti nad Labem). After this great victory, and another at Tachau in 1427, the Hussites repeatedly invaded Germany.

The almost uninterrupted victories of the Hussites now rendered vain all hope of subduing them by force of arms. Moreover, the conspicuously democratic character of the Hussite movement caused the German princes, who were afraid that such views might extend to their own countries, to desire peace. Many Hussites, particularly the Utraquist clergy, were also in favour of peace. Negotiations for this purpose were to take place at the council which had been summoned to meet at Basel on March 3, 1431. The Roman see reluctantly consented to the presence of heretics at this council, but indignantly rejected the suggestion of the Hussites that members of the Greek Church and representatives of all Christian creeds should also be present. Before definitely giving its consent to peace negotiations, the Roman Church determined on making a last effort to reduce the Hussites to subjection. On Aug. 1, 1431, a large army of crusaders, under Frederick, margrave of Brandenburg, crossed the Bohemian frontier; but on the arrival of the Hussite army under Prokop the crusaders immediately took to flight, almost without offering resistance.

Settlement of Disputes.—On Oct. 15, the members of the council, who had already assembled at Basel, issued a formal invitation to the Hussites to take part in its deliberations. Prolonged negotiations ensued; but finally a Hussite embassy arrived at Basel on Jan. 4, 1433. It was found impossible to arrive at an agreement. Negotiations were not, however, broken off; and a change in the political situation of Bohemia finally resulted in a settlement. In 1434 war again broke out between the Utraquists and the Taborites. On May 30 the Taborite army, led by Prokop the Great and Prokop the Less, who both fell in the battle, was totally defeated and almost annihilated at Lipan. The moderate party thus obtained the upper hand; and it formulated its demands in a document known as the *Compactata*, which incorporated the principles laid down in the Articles of Prague.

On July 5, 1436, the compacts were formally accepted at Iglau, in Moravia, by King Sigismund, by the Hussite delegates, and by the representatives of the Roman Church. The Utraquist creed, frequently varying in its details, continued to be that of the established Church of Bohemia till all non-Roman religious services were prohibited shortly after the battle of the White Mountain in 1620. The Taborite party never recovered from its defeat at Lipan, and after the town of Tabor had been captured by George of Poděbrad in 1452 Utraquist religious worship was established there. The Bohemian brethren, whose intellectual originator was Peter Chelčický, to a certain extent continued the Taborite traditions, and in the 15th and 16th centuries included most of the strongest opponents of Rome in Bohemia. After the beginning of the German Reformation many Utraquists

adopted to a large extent the doctrines of Luther and Calvin; and in 1567 obtained the repeal of the compacts, which no longer seemed sufficiently far-reaching.

Denis, *Huss et la guerre des Hussites* (1878); Count Lützow, *Bohemia; an Historical Sketch* (1896); H. Toman, *Husitské Válečnictví* (Prague, 1898). (Lz.)

HUSTING, the "thing," i.e., assembly, of the household of a king, earl or chief (O.Norw. *hústing*). In England the word is chiefly noteworthy as denoting an important court in the City of London which for many purposes superseded the more ancient assembly of the citizens known as the "folkmoor." Its appearance is a striking proof of the strong Scandinavian influence which affected London in the 11th century. The ordinary use of "hustings" at the present day for the platform from which a candidate speaks at a parliamentary or other election, or more widely for a political candidate's election campaign, is derived from the application of the word, first to the platform in the Guildhall on which the London court was held, and next to that from which the public nomination of candidates for a parliamentary election was formerly made, and from which the candidate addressed the electors. The Ballot Act of 1872 did away with this public declaration of the nomination.

HUSUM, a town in the Prussian province of Schleswig-Holstein, in a fertile district 2½ m. inland from the North sea, on the canalized Husumer Au, which forms its harbour and roadstead, 99 m. N.W. from Hamburg. Pop. (1925) 9,962. Husum is first mentioned in 1252, and its church was built in 1431. Wisby rights were granted it in 1582, and in 1603 it received municipal privileges from the duke of Holstein. It suffered greatly from inundations in 1634 and 1717. It has communication with the North Frisian islands, and is a port for the cattle trade with England. Cattle markets are held weekly, and in them, as also in cereals, a lively export trade is done. There are also extensive oyster fisheries, the property of the state, the yield during the season being very considerable. Husum is the birthplace of Theodor Storm (1817-88), the poet, to whom a monument has been erected here.

HUTCHESON, FRANCIS (1694-1746), English philosopher, was born on Aug. 8, 1694, at Drumalig in Co. Down, the son of a Presbyterian minister. From 1710 to 1716, he studied philosophy, classics and theology at Glasgow university, and then opened a private academy in Dublin where he made many friends among the clergy of the Established Church. While in Dublin, Hutcheson published the four essays upon which his reputation rests, namely, the *Inquiry concerning Beauty, Order, Harmony and Design*, the *Inquiry concerning Moral Good and Evil*, in 1725, the *Essay on the Nature and Conduct of the Passions and Affections* and *Illustrations upon the Moral Sense*, in 1728. In 1729, he returned to Glasgow as professor of moral philosophy. In spite of being accused in 1738 before the Glasgow presbytery for holding that the standard of moral goodness was the promotion of the happiness of others and that we could have a knowledge of good and evil without and prior to a knowledge of God, Hutcheson enjoyed a well-deserved popularity. He died at Glasgow in 1746.

Although Hutcheson dealt with metaphysics, logic and ethics, his importance is due almost entirely to his ethical writings. Opposing Hobbes and Bernard de Mandeville, he closely followed the 3rd earl of Shaftesbury, especially as regards the analogy between beauty and virtue, the functions assigned to the moral sense, the position that the benevolent feelings form an original and irreducible part of our nature, and the unhesitating adoption of the principle that the test of virtuous action is its tendency to promote the general welfare. According to Hutcheson, man has a variety of senses, internal as well as external, reflex as well as direct, the definition of a sense being "any determination of our minds to receive ideas independently on our will, and to have perceptions of pleasure and pain" (*Essay on the Nature and Conduct of the Passions*, §1). Without exhaustively enumerating these "senses," he specifies, besides the five external senses (1) consciousness, by which each man has a perception of his own

mind; (2) the sense of beauty; (3) a public sense, or *sensus communis*, "a determination to be pleased with the happiness of others and to be uneasy at their misery"; (4) the moral sense, or "moral sense of beauty in actions and affections, by which we perceive virtue or vice, in ourselves or others"; (5) a sense of honour or praise and blame; (6) a sense of the ridiculous. Of these "senses" the "moral sense" is the most important. It is implanted in man, and pronounces immediately on the character of actions and affections, approving those which are virtuous and disapproving those which are vicious, because the Author of Nature has made virtue a lovely form to excite our pursuit of it, and has given us strong affections to be the springs of each virtuous action." Hutcheson's use of the term "moral sense" and his failure to couple it invariably with the term "moral judgment" tends to obscure the part played by deliberation.

But though Hutcheson usually describes the moral faculty as acting instinctively and immediately, he does not, like Butler, confound the moral faculty with the moral standard. The criterion of right action is for him, as for Shaftesbury, its tendency to promote the general welfare of mankind. He thus anticipates the utilitarianism of Bentham even in the use of the phrase "the greatest happiness for the greatest number" (*Inquiry concerning Moral Good and Evil*, §3). But since intuition has no possible connection with an empirical calculation of results, Hutcheson in adopting such a criterion practically denies his fundamental assumption. His most distinctive ethical doctrine is the "benevolent theory" of morals by which he opposes Hobbes. He not only maintains that benevolence is the direct source of many of our actions, but that it is the only source of those actions of which, on reflection, we approve. Actions which flow from self-love only are morally indifferent, though in so far as a man may justly regard himself as a part of the rational system, and may thus "be, in part, an object of his own benevolence," the "personal virtues" may be regarded as fitting objects of moral approbation. Hutcheson inconsistently declares that while self-love merits neither approbation nor condemnation, the satisfaction of the dictates of self-love is one of the very conditions of the preservation of society. In the *Synopsis metaphysicae*, he holds that will is determined by motives in conjunction with our character and habit of mind, and that the only true liberty is the liberty of acting as we will, not the liberty of willing as we will.

The prominence given by Hume and Adam Smith to the analysis of moral action and moral approbation, with the attempt to discriminate the respective provinces of the reason and the emotions in these processes, is undoubtedly due to the influence of Hutcheson. To a study of Shaftesbury and Hutcheson we might probably attribute the unequivocal adoption of the utilitarian standard by Hume, and, if this be the case, Hutcheson is linked through Hume with Priestley, Paley and Bentham.

Mental Philosophy.—Hutcheson's less important contributions in the sphere of mental philosophy and logic are interesting mainly as a link between Locke and the Scottish school. With Locke he rejects the doctrine of innate ideas (see, for instance, *Inquiry concerning Moral Good and Evil*, 1 *ad fin.*, and §4; and compare *Synopsis Metaphysicae*, pars i. cap. 2); but he modifies Locke's doctrine and anticipates Reid when he states that the ideas of extension, figure, motion and rest "are more properly ideas accompanying the sensations of sight and touch than the sensations of either of these senses"; that the idea of self accompanies every thought, and that the ideas of number, duration and existence accompany every other idea whatsoever (see *Essay on the Nature and Conduct of the Passions*, art. 1; *Syn. Metaph.* pars i. cap. 1, pars ii. cap. 1; Hamilton on Reid, p. 124, note). Like Locke, Hutcheson also depreciates the importance of the so-called laws of thought, distinguishes between the primary and secondary qualities of bodies, asserts that we cannot know the inmost essences of things though they excite various ideas in us, and assumes that external things are known only through the medium of ideas (*Syn. Metaph.* pars i. cap. 1). He accounts for our assurance of the reality of externals by referring it to a natural instinct (*Syn. Metaph.* pars i. cap. 1). Of the correspondence between our ideas of the primary qualities of things

and the things themselves God alone is the cause, having effected it through a law of nature.

Hutcheson diverges from Locke in his account of the idea of personal identity, which he appears to have regarded as made known to us directly by consciousness. Generally, he speaks as if we had a direct consciousness of mind as distinct from body (see, for instance, *Syn. Metaph.* pars ii. cap. 3), though, in the posthumous *Moral Philosophy*, he expressly states that we know mind as we know body "by qualities immediately perceived though the substance of both be unknown" (bk. i. ch. 1). Other points in which he supplemented or departed from Locke are:—the distinction between perception proper and sensation proper, which is not explicitly worked out, the imperfection of the ordinary division of the external senses into five, the limitation of consciousness to a special mental faculty (severely criticized in Hamilton's *Lectures on Metaphysics*, 12), and the disposition to refer on disputed questions of philosophy not so much to formal arguments as to the testimony of consciousness and our natural instincts. The last point suggests the "common-sense philosophy" of Reid.

The short *Compendium of Logic* contains a large proportion of psychological matter. The author distinguishes between the mental result and its verbal expression (idea—term; judgment—proposition), constantly employs the word "idea," and defines logical truth as "convenientia signorum cum rebus significatis" thus implicitly repudiating a merely formal view of logic.

Hutcheson is one of the earliest modern writers on aesthetics. He maintains that the special sense by which we perceive beauty, harmony and proportion, is a *reflex* sense, pre-supposing sight and hearing. Beauty is also perceived in universal truths, in the operations of general causes and in moral principles and actions. Thus, the analogy between beauty and virtue, a favourite topic with Shaftesbury, is prominent in Hutcheson also.

Hutcheson's writings naturally gave rise to much controversy. He found opponents in John Balguy (1686–1748), author of two tracts on "The Foundation of Moral Goodness," and John Taylor (1694–1761) of Norwich, author of *An Examination of the Scheme of Morality advanced by Dr. Hutcheson* and the essays appear to have suggested Butler's *Dissertation on the Nature of Virtue*, and Richard Price's *Treatise of Moral Good and Evil* (1757). (See ETHICS.)

BIBLIOGRAPHY.—Besides the above named works, Hutcheson's chief writings are: *Philosophiae moralis institutio compendiariorum, ethices et jurisprudentiae naturalis elementa continens*, lib. iii. (Glasgow, 1742); *Metaphysicae synopsis ontologiam et pneumatologiam complectens* (Glasgow, 1742), *A System of Moral Philosophy*, 2 vols. (1755) containing a life by Dr. William Leechman (d. 1785), a treatise on *Logic* (1756).

HUTCHINSON, ANNE (c. 1600–1643), American religious enthusiast, was born in Lincolnshire, England, the daughter of a clergyman, Francis Marbury, and according to tradition, a cousin of John Dryden. She married William Hutchinson, and in 1634 emigrated to Boston, Massachusetts. Although her orthodoxy was suspected and for a time she was not admitted to the church, she soon organized meetings among the Boston women, among whom her exceptional ability and her services as a nurse had given her great influence. At these meetings, which were soon attended even by some of the ministers and magistrates, she discussed and commented upon recent sermons and gave expression to her own theological views. She asserted that she, John Cotton and her brother-in-law, the Rev. John Wheelwright, were under a "covenant of grace," that they had a special inspiration, a "peculiar indwelling of the Holy Ghost," whereas the other ministers of the colony were under a "covenant of works." Anne Hutchinson, according to Winthrop a woman "of a ready wit and bold spirit," was, in fact, voicing a protest against the legalism of the Massa-

chusetts Puritans, and was also striking at the authority of the clergy in an intensely theocratic community. As a result the entire colony was divided into factions. Mrs. Hutchinson was supported by Governor Vane, Cotton, Wheelwright and the great majority of the Boston church; opposed to her were Deputy Governor John Winthrop, the Rev. John Wilson of the Boston church and all of the country magistrates and churches. The strength of the parties was tested at the general court of election of May 1637, when Winthrop defeated Vane for the governorship. Cotton recanted, Vane returned to England in disgust, Wheelwright was tried and banished. Mrs. Hutchinson was tried by the general court chiefly for "traducing the ministers," and was sentenced to banishment; later she was tried before the Boston church and formally excommunicated. With William Coddington and others she established a settlement on the island of Aquidneck (now Rhode Island) in 1638. Four years later, after the death of her husband, she settled on Long Island sound near what is now New Rochelle, N.Y., and was killed by the Indians in Aug. 1643, an event regarded in Massachusetts as a manifestation of divine providence. Anne Hutchinson and her followers were called "Antinomians," rather as a term of reproach than with any reference to her doctrinal theories; and the controversy in which she was involved is known as the "Antinomian controversy."

See C. F. Adams, *Three Episodes of Massachusetts History* (1892) and the life by G. E. Ellis in Jared Sparks, *Library of American Biography*, 2nd ser., vol. 6 (1845).

HUTCHINSON, JOHN (1615–1664), Puritan soldier, son of Sir Thomas Hutchinson of Owthorpe, Nottinghamshire, and of Margaret, daughter of Sir John Byron of Newstead, was baptized on Sept. 18, 1615. On the outbreak of the Great Rebellion he took the side of the parliament, and was made in 1643 governor of Nottingham Castle, which he defended till the triumph of the parliamentary cause. He was M.P. for Nottinghamshire in March 1646, took the side of the Independents, opposed the offers of the king at Newport, and signed the death-warrant. Though a member at first of the council of state, he disapproved of Cromwell's policy, and took no further part in politics during the lifetime of the protector. He resumed his seat in the recalled Long Parliament in May 1659, and followed Monk in opposing Lambert, believing that Monk intended to maintain the commonwealth. He was returned to the Convention Parliament for Nottingham but expelled on June 9, 1660. In October 1663, however, he was arrested upon suspicion of being concerned in the Yorkshire plot, imprisoned in the Tower of London, and in Sandown Castle, Kent. He died on Sept. 11, 1664. His career draws its chief interest from the *Life* by his wife, Lucy, daughter of Sir Allen Apsley, written after the death of her husband but not published till 1806 (since often reprinted), which is a masterpiece of its kind.

See the edition of Lucy Hutchinson's *Memoirs of the Life of Colonel Hutchinson* by C. H. Firth (1885); Brit. Mus. Add. MSS. 25,901 (a fragment of the *Life*), also Add. MSS. 19, 333, 36,247 f. 51; *Notes and Queries*, 7, ser. iii. 25, viii. 422; *Monk's Contemporaries*, by Guizot.

HUTCHINSON, JOHN (1674–1737), English theological writer, was born at Spennithorne, Yorkshire, in 1674. He served as steward in several families of position, latterly in that of the duke of Somerset, who ultimately obtained for him the post of riding purveyor to the master of the horse, a sinecure worth about £200. He taught that the Bible contained the elements not only of true religion but also of all rational philosophy. He held that the Hebrew must be read without points, and his interpretation rested largely on fanciful symbolism. His followers were called Hutchinsonians.

His *Works* were edited by Robert Spearman and Julius Bate (1748, 12 vols.). A *Supplement*, with *Life* by Spearman prefixed, appeared in 1765.

HUTCHINSON, SIR JONATHAN (1828–1913), English surgeon and pathologist, was born on July 23, 1828, at Selby, Yorkshire, his parents belonging to the Society of Friends. He entered St. Bartholomew's hospital, and rapidly gained reputation as a skilful operator and a scientific enquirer. He was professor of surgery and pathology at the College of Surgeons from 1877 to 1882. In 1889 he was president of the Royal College of Surgeons

and was at different times president of various other professional organizations. His lectures on neuro-pathogenesis, gout, leprosy, diseases of the tongue, etc., were full of original observation; but his principal work was connected with the study of syphilis, on which he put forward the view that it was a specific fever. He was the founder of the London Polyclinic or Post-graduate School of Medicine and the promoter of the New Sydenham Society for the publication of translations of important foreign medical treatises at a moderate cost. Both in his native town of Selby and at Haslemere, Surrey, he started (about 1890) educational museums for popular instruction in natural history. He published several volumes on his own subjects, and was editor of the quarterly *Archives of Surgery*. His book, *Leprosy and Fisheating* (1906) exposed many popular errors, though his conclusion regarding a definite connection between this disease and the eating of salted fish has not been generally accepted.

He received a knighthood in 1908, and died at Haslemere, Surrey, on June 26, 1913.

HUTCHINSON, THOMAS (1711-1780), the last royal governor of the province of Massachusetts, son of a wealthy merchant of Boston, Mass., was born there on Sept. 9, 1711. He graduated at Harvard in 1727 and for several years thereafter devoted himself to business. In 1737 he began his public career as a member of the Boston board of selectmen, and a few weeks later he was elected to the general court of Massachusetts Bay, of which he was a member until 1740 and again from 1742-49, serving as speaker in 1747, 1748 and 1749. He consistently contended for a sound financial system, and vigorously opposed the operations of the "Land Bank" and the issue of pernicious bills of credit. His first trip to England was in 1740 when he represented his Colony in a boundary dispute with New Hampshire. He was a member of the Massachusetts council from 1749-56, was chief justice of the superior court of the province from 1761-69, was lieutenant governor from 1758-71, acting as governor in the latter two years, and from 1771-74 was governor. In 1754 he was a delegate from Massachusetts to the Albany convention, and, with Franklin, was a member of the committee appointed to draw up a plan of union. Though he recognized the legality of the Stamp Act of 1765, he considered the measure inexpedient and impolitic and urged its repeal, but his attitude was misunderstood; he was considered by many to have instigated the passage of the act, and in Aug. 1765 a mob sacked his Boston residence and destroyed many valuable manuscripts and documents. He was acting governor at the time of the "Boston Massacre" in 1770, and it was his orders that removed the British troops from the town. Throughout the pre-revolutionary disturbances in Massachusetts he was the representative of the British ministry, and though he disapproved of some of the ministerial measures he felt impelled to enforce them and necessarily incurred the hostility of the Whig or patriot element. In 1774, upon the appointment of Gen. Thomas Gage as military governor, he went to England, and acted as an adviser to George III. and the British ministry on American affairs, uniformly counselling moderation. He died at Brompton, now part of London, on June 3, 1780.

He wrote *A Brief Statement of the Claim of the Colonies* (1764); a *Collection of Original Papers relative to the History of Massachusetts Bay* (1769), reprinted as *The Hutchinson Papers* by the Prince Society in 1865; and a judicious, accurate and very valuable *History of the Province of Massachusetts Bay* (vol. i., 1764, vol. ii., 1767, and vol. iii., 1828). His *Diary and Letters, with an Account of his Administration*, was published at Boston in 1884-86.

See J. K. Hosmer's *Life of Thomas Hutchinson* (Boston, 1896), and a biographical chapter in John Fiske's *Essays Historical and Literary* (1902). For an estimate of Hutchinson as an historian, see M. C. Tyler's *Literary History of the American Revolution* (1897).

HUTCHINSON, a city of Kansas, U.S.A., on the Arkansas river, 60m. N.W. of Wichita, at an altitude of 1,553ft.; the county seat of Reno county. It is on a Federal highway and is served by the Missouri Pacific, the Rock Island and the Santa Fe railways. The population in 1925 (State census) was 25,970 (92% native white). Hutchinson is the fourth city of the State in size. It ships great quantities of grain (7,000,000bu. in 1927), flour, poultry, dairy products, live stock and lumber. Under the

city and its environs are thick beds of salt, from which an average of 15,000 barrels of salt a day is produced. There are large packing plants and grain elevators, creameries, flour mills, a soda ash plant, a bag factory and a strawboard factory. The factory output in 1927 was valued at \$17,000,000. Hutchinson was founded in 1871 and incorporated in 1872. The State industrial reformatory is situated here.

HUTTEN, PHILIPP VON (c. 1511-1546), German knight, a relative of Ulrich von Hutten, joined the band of adventurers which under Georg Hohermuth, or George of Spire, sailed to Venezuela, or Venosala as Hutten calls it, with the object of conquering and exploiting this land in the interests of the Augsburg family of Welser. The party landed at Coro in February 1535 and Hutten accompanied Hohermuth on his toilsome expedition into the interior in search of treasure. After the death of Hohermuth in December 1540 he became captain-general of Venezuela. Soon after this event he vanished into the interior, returning after five years of wandering to find that a Spaniard, Juan de Caravazil, or Caravajil, had been appointed governor in his absence. With his travelling companion, Bartholomew Welser the younger, he was seized by Caravazil in April 1546 and the two were afterwards put to death.

Hutten left some letters, and also a narrative of the earlier part of his adventures, this *Zeitung aus India Junkher Philipps von Hutten* being published in 1785.

HUTTEN, ULRICH VON (1488-1523), German humanist and soldier, was born on April 21, 1488, at the castle of Steckelberg, near Fulda, in Hesse. His life may be divided into four parts:—his youth and cloister-life (1488-1504); his wanderings in pursuit of knowledge (1504-1515); his strife with Ulrich of Württemberg (1515-1519); and his connection with the Reformation (1519-1523). He was the eldest son of a poor but not undistinguished knightly family.

Wanderings.—As he was mean of stature and sickly his father sent him to the Benedictine house at Fulda; the thirst for learning there seized on him, and in 1505 he fled from the monastic life. He went first to Cologne, next to Erfurt, and then to Frankfort-on-Oder on the opening in 1506 of the new university of that town. For a time he was in Leipzig, and in 1508 we find him a shipwrecked beggar on the Pomeranian coast. In 1509 the university of Greifswald welcomed him, but the sensitive ill-regulated youth, who took the liberties of genius, wearied his burgher patrons. He left Greifswald and was robbed of clothes and books, his only baggage, by the servants of his late friends; in the dead of winter, half starved, frozen, penniless, he reached Rostock.

Here under the protection of the Humanists he wrote against his Greifswald patrons, thus beginning the long list of his satires and fierce attacks on personal or public foes. From Rostock he wandered on to Wittenberg and Leipzig, to Vienna and on to Pavia, where he spent the year 1511 and part of 1512. In the siege of Pavia (1512) by papal troops and Swiss, he was plundered by both sides, and escaped, sick and penniless, to Bologna; on his recovery he took service as a private soldier in the emperor's army.

In 1514 he was again in Germany, under the patronage of the elector of Mainz, Archbishop Albert of Brandenburg. But the murder in 1515 of his relative Hans von Hutten by Ulrich, duke of Württemberg, changed the whole course of his life; satire, chief refuge of the weak, became Hutten's weapon; with one hand he took his part in the famous *Epistolae obscurorum virorum*, and with the other launched scathing letters, eloquent Ciceronian orations, or biting satires against the duke. The emperor took Hutten under his protection and gave him a laureate crown in 1517. The poet, who had meanwhile revisited Italy, again attached himself to the electoral court at Mainz. In 1518 his friend Pirckheimer urged him to abandon the court and dedicate himself to letters, but he insisted on his mission as a knight of the empire.

The Knightly Satirist.—In 1519 he issued in one volume his five attacks on Duke Ulrich, and then took part in the private war against him; in this affair he became intimate with Franz von Sickingen, the champion of the knightly order (Ritterstand). Hutten now espoused the Lutheran cause, but he was at the same time mixed up in the attempt of the "Ritterstand" to assert itself

as the militia of the empire against the independence of the German princes. Soon after this time he discovered at Fulda a copy of the manifesto of the emperor Henry IV. against Hildebrand, and published it with comments as an attack on the papal claims over Germany. He hoped thereby to interest the new emperor Charles V., and the higher orders in the empire, in behalf of German liberties; but the appeal failed. Luther had succeeded by speaking to cities and common folk in homely phrase, because he touched heart and conscience; Hutten tried to touch the more cultivated sympathies and dormant patriotism of princes and bishops, nobles and knights. And so he at once gained an undying name in the republic of letters and ruined his own career. He showed that the artificial verse-making of the Humanists could be connected with the new outburst of genuine German poetry. The Minnesinger was gone; the new national singer, a Luther or a Hans Sachs, was heralded by the stirring lines of Hutten's pen. These have in them a splendid natural swing and ring, strong and patriotic.

The attack on the papacy, and Luther's vast and sudden popularity, frightened Elector Albert, who dismissed Hutten from his court. Hoping for imperial favour, he betook himself to Charles V., but was rebuffed. He now attached himself more closely to Franz von Sickingen. He fled to Basel, where Erasmus refused to see him, both for fear of his loathsome diseases, and also because the beggared knight was sure to borrow money from him. A paper war consequently broke out between the two Humanists, which embittered Hutten's last days, and stained the memory of Erasmus. From Basel Ulrich went to Mülhausen; and then to Zurich. There Zwingli helped him with money, and found him a refuge on the little isle of Ufnau on the Zurich lake. There the frail and worn-out poet, writing swift satire to the end, died on Aug. 29, 1523 at the age of thirty-five. He left behind him some debts due to compassionate friends; he did not even own a single book, and all his goods amounted to the clothes on his back, a bundle of letters, and that valiant pen which had fought so many a sharp battle, and had won for the poor knight-errant a sure place in the annals of literature.

Ulrich von Hutten is one of those men of genius at whom propriety is shocked, and whom the mean-spirited avoid. Yet through his short and buffeted life he was befriended, with wonderful charity and patience, by the chief leaders of the Humanist movement. For, in spite of his irritable vanity, his immoral life and habits, his odious diseases, his painful restlessness, Hutten had much in him that strong men could admire, for he passionately loved truth for its own sake. His patriotism is beyond dispute, though the cause with which he associated himself was particularist and doomed to failure. There was no salvation for Germany in the Ritterstand. It is as humanist and poet, and for his frank and noble nature that his claims to honour lie. A swarm of writings issued from his pen; at first the smooth elegance of his Latin prose and verse seemed strangely to miss his real character; he was the Cicero and Ovid of Germany before he became its Lucian.

His chief works were his *Ars versificandi* (1511); the *Nemo* (1518); a work on the *Morbus Gallicus* (1519); the volume of Steckelberg complaints against Duke Ulrich (including his four *Ciceronian Orations*, his *Letters* and the *Phalarismus*) also in 1519; the *Vadismus* (1520); and the controversy with Erasmus at the end of his life. Besides these were many admirable poems in Latin and German. He was one of the most distinguished contributors to, though not the originator of the *Epistolae obscurorum virorum*, that famous satire on the theologians of Cologne with which the friends of Reuchlin defended him. In 1909 the Latin text of the *Epistolae* with an English translation was published by F. G. Stokes. D. F. Strauss concludes that he had no share in the first part, but that his hand is clearly visible in the second part, which he attributes in the main to him. To him is due the more serious and severe tone of that bitter portion of the satire. See W. Brecht, *Die Verfasser der Epistolae obscurorum virorum* (1904).

BIBLIOGRAPHY.—For a complete catalogue of the writings of Hutten, see E. Böcking's *Index Bibliographicus Huttenianus* (1858). Böcking is also the editor of the complete edition of Hutten's works (7 vols.,

1859–62). A selection of Hutten's German writings, edited by G. Balke, appeared in 1891. The best biography (though it is also somewhat of a political pamphlet) is that of D. F. Strauss (*Ulrich von Hutten*, 1857; new ed. by O. Clemen, 1914; English translation by G. Sturge, 1874), with which may be compared the P. Kalkoff's *Ulrich von Hutten und die Reformation* (1920) and Huttens, *Vaganten zeit und Untergang* (1925), in which a less favourable view of Hutten's political and religious activity is taken.

HUTTER, LEONHARD (1563–1616), German Lutheran theologian, born at Nellingen, near Ulm, began to lecture at Jena in 1594, and in 1596 became professor of theology at Wittenberg, where he died on Oct. 23, 1616. Hutter was a champion of Lutheran orthodoxy, as set down in the confessions and embodied in his own *Compendium locorum theologicorum* (1610; reprinted 1863). He was called "Luther redonatus."

In reply to Rudolf Hospinian's *Concordia discors* (1607), he wrote *Concordia concors* (1614), defending the formula of Concord, which he regarded as inspired. His *Irenicum vere christianum* is directed against David Pareus (1548–1622), of Heidelberg, who had pleaded for a reconciliation of Lutheranism and Calvinism; his *Calvinista aulopoliticus* (1610) was written against the "damnable Calvinism" which was becoming prevalent in Holstein and Brandenburg. Another work, based on the formula of Concord, was entitled *Loci communes theologici*. Karl von Hase used his name as the symbol of orthodoxy in his *Hutterus redivivus* (1827).

HUTTON, ARTHUR WOLLASTON (1848–1912), English divine and author, was born at Spridlington, Lincs., on Sept. 5, 1848. A scholar of Exeter College, Oxford, he took orders in the Church of England in 1872, but under Newman's influence became a Roman Catholic, and from 1876–83 was a member of the Edgbaston Oratorian community. Later he renounced Roman Catholicism, and became known as an agnostic and free-thinker. For some years he was librarian at the National Liberal Club in London. In 1898 he was readmitted to the Church of England, and from 1903 until his death was rector of Bow church, London. He died at Blackheath, on March 25, 1912. He wrote a *Life of Manning* (1892).

HUTTON, JAMES (1726–1797), Scottish geologist, was born in Edinburgh on June 3, 1726. He qualified as a doctor of medicine, studying in Edinburgh and Paris, but turned to practical agriculture, in which he made many improvements. In 1768 he retired, and from then until his death (March 26, 1797) he lived in Edinburgh, devoting himself to scientific pursuits.

At that time geology in any proper sense of the term did not exist. Mineralogy, however, had made considerable progress. But Hutton had conceived larger ideas than were entertained by the mineralogists of his day. He desired to trace back the origin of the various minerals and rocks, and thus to arrive at some clear understanding of the history of the earth. For many years he continued to study the subject. At last, in the spring of the year 1785, he communicated his views to the recently established Royal Society of Edinburgh in a paper entitled *Theory of the Earth, or an Investigation of the Laws Observable in the Composition, Dissolution and Restoration of Land upon the Globe*. In this work the doctrine is expounded that geology is not cosmogony, but must confine itself to the study of the materials of the earth; that everywhere evidence may be seen that the present rocks of the earth's surface have been in great part formed out of the waste of older rocks; that these materials having been laid down under the sea were there consolidated under great pressure, and were subsequently disrupted and upheaved by the expansive power of subterranean heat; that during these convulsions veins and masses of molten rock were injected into the rents of the dislocated strata; that every portion of the upraised land, as soon as exposed to the atmosphere, is subject to decay; and that this decay must tend to advance until the whole of the land has been worn away and laid down on the sea-floor, whence future upheavals will once more raise the consolidated sediments into new land. In some of these broad and bold generalizations Hutton was anticipated by the Italian geologists; but to him belongs the credit of having first perceived their mutual relations, and combined them in a luminous coherent theory based upon observation.

It was not merely the earth to which Hutton directed his attention. He had long studied the changes of the atmosphere. The same volume in which his *Theory of the Earth* appeared contained also a *Theory of Rain*, which was read to the Royal Society of Edinburgh in 1784. He contended that the amount of moisture which the air can retain in solution increases with augmentation of temperature, and, therefore, that on the mixture of two masses of air of different temperatures a portion of the moisture must be condensed and appear in visible form. He investigated the available data regarding rainfall and climate in different regions of the globe, and came to the conclusion that the rainfall is everywhere regulated by the humidity of the air on the one hand, and the causes which promote mixtures of different aerial currents in the higher atmosphere on the other.

His other works include: *Dissertations on different Subjects in Natural Philosophy* (1792), in which he discussed the nature of matter, fluidity, cohesion, light, heat and electricity, and *An Investigation of the Principles of Knowledge, and of the Progress of Reason—from Sense to Science and Philosophy*. His closing years were devoted to the extension and republication of his *Theory of the Earth*, of which two volumes appeared in 1795. A portion of the ms. of a third volume, which had been given to the Geological Society of London by Leonard Horner, was edited by A. Geikie in 1899.

Five years after Hutton's death John Playfair published a volume, *Illustrations of the Huttonian Theory of the Earth*, in which he gave an admirable summary of Hutton's theory, with numerous additional illustrations and arguments.

See also his *Biographical Account of James Hutton* (1797), publ. in *Transactions of the Royal Society of Edinburgh*, vol. v. (1805).

(A. GEI.; X.)

HUTTON, RICHARD HOLT (1826–1897), English writer and theologian, son of Joseph Hutton, Unitarian minister at Leeds, was born at Leeds on June 2, 1826. From 1855 to 1895 Hutton and Bagehot were joint-editors of the *National Review*, a new monthly, and conducted it for ten years. In 1861 Hutton became joint-editor and part proprietor of the *Spectator*, then a well-known Liberal weekly. Hutton's own articles became and remained up to the last one of the best-known features of serious and thoughtful English journalism. He was an original member of the Metaphysical Society (1869), an anti-vivisectionist, and a member of the royal commission (1875) on that subject. Hutton died on Sept. 9, 1897. Selections from his *Spectator* articles were published in 1899 under the title of *Aspects of Religious and Scientific Thought*.

HUXLEY, THOMAS HENRY (1825–1895), English biologist, was born on May 4, 1825 at Ealing, the son of a schoolmaster. Of education in the formal sense he received none. "I had two years of a pandemonium of a school (between eight and ten), and after that neither help nor sympathy in any intellectual direction till I reached manhood" (*Life*, ii. 145). When his father moved to Coventry about 1835, young Huxley was left to his own devices. His great desire to be a mechanical engineer, ended in his devotion to "the mechanical engineering of living machines." His curiosity in this direction was nearly fatal; a *post-mortem* he was taken to between 13 and 14 was followed by an illness which seems to have been the starting-point of the ill-health which pursued him all through life. At 15 he devoured Sir William Hamilton's *Logic*, and thus acquired a taste for metaphysics. At 17 he came under the influence of Thomas Carlyle's writings. Fifty years later he wrote: "To make things clear and get rid of cant and shows of all sorts. This was the lesson I learnt from Carlyle's books when I was a boy, and it has stuck by me all my life" (*Life*, ii. 268). At 17 Huxley, with his elder brother James, commenced regular medical studies at Charing Cross hospital, and on graduating in 1845 he published his first scientific paper, demonstrating the existence of a hitherto unrecognized layer in the inner sheath of hairs, a layer since known as "Huxley's layer."

Huxley passed the necessary examination, and at the same time obtained the qualification of the Royal College of Surgeons. He was "entered on the books of Nelson's old ship, the 'Victory,' for duty at Haslar Hospital." Its chief, Sir John Richardson, who

was a well-known Arctic explorer and naturalist, recognized Huxley's ability, and procured for him the post of surgeon to H.M.S. "Rattlesnake," about to start for surveying work in Torres strait. By the time the ship was ordered home after the lamented death of her captain at Sydney, to be paid off at Chatham in November 1850, Huxley had made a profound study of the surface-life of the tropical seas. He sent home "communication after communication to the Linnean society," then a somewhat somnolent body, "with the same result as that obtained by Noah when he sent the raven out of the ark" (*Essays*, i. 13). However, his important paper, *On the Anatomy and the Affinities of the Family of Medusae*, was printed by the Royal Society in the *Philosophical Transactions* in 1849. Huxley united, with the Medusae, the Hydroid and Sertularian polyps, to form a class which he subsequently named Hydrozoa. He found that all the members of the class consisted of two membranes enclosing a central cavity or stomach, and wisely compared the two layers with those which appear in the germ of the higher animals. The consequences which have flowed from this prophetic generalization of the *ectoderm* and *endoderm* are familiar to every student of evolution. After returning to England in 1850 Huxley was elected F.R.S. in 1851, and in the following year received the Royal medal when 26 and was elected to the council. With absolutely no aid from any one he had placed himself in the front rank of English scientific men. He secured the friendship of Sir J. D. Hooker and John Tyndall, who remained his lifelong friends. The Admiralty retained him as a nominal assistant-surgeon, in order that he might work up the observations he had made during the voyage of the "Rattlesnake." He was thus enabled to produce various important memoirs, especially those on certain Ascidians, in which he solved the problem of *Appendicularia*—an organism whose place in the animal kingdom Johannes Müller had found himself wholly unable to assign—and on the morphology of the cephalous Mollusca.

Richard Owen, then the leading comparative anatomist in Great Britain, was a disciple of Cuvier, and adopted largely from him the deductive explanation of anatomical fact from idealistic conceptions. He superadded the evolutionary theories of Oken, which were equally idealistic, but were altogether repugnant to Cuvier. Huxley would have none of either. Imbued with the methods of von Baer and Johannes Müller, his methods were purely inductive. He would not hazard any statement beyond what the facts revealed. He retained, however, as has been done by his successors, the use of archetypes, though they no longer represented fundamental "ideas" but generalizations of the essential points of structure common to the individual of each class. He had not wholly freed himself, however, from archetypal trammels. "The doctrine that every natural group is organized after a definite archetype . . . seems to me as important for zoology as the doctrine of definite proportions for chemistry," and further: "There is no progression from a lower to a higher type, but merely a more or less complete evolution of one type" (*Phil. Trans.*). As Chalmers Mitchell points out, this statement is of great historical interest. Huxley definitely uses the word "evolution," and admits its existence *within* the great groups. He had not rid himself, however, of the notion that the archetype was a property permanently inherent in the group. Herbert Spencer, whose acquaintance he made in 1852, was unable to convert him to evolution in its widest sense (*Life*, i. 168). About the same time, in his first interview with Darwin, he expressed his belief "in the sharpness of the lines of demarcation between natural groups," and was received with a humorous smile (*Life*, i. 169).

After three years' nominal employment Huxley was ordered on active service. He resigned, as he was determined to continue his scientific work. In July 1854 Huxley became lecturer at the School of Mines and naturalist to the Geological Survey in 1855, the year of his marriage with Miss H. A. Heathorn. His most important published work at this period was the Croonian Lecture of 1858 on "The Theory of the Vertebrate Skull," in which he completely demolished by his inductive method, the idealistic, if in some degree evolutionary, views of its origin held by Richard Owen. This finally disposed of the "archetype," and may be said to have liberated the English anatomical school from the deduc-

tive method.

In 1859 *The Origin of Species* was published. This was a momentous event in the history of science, and not least for Huxley, who found in Darwin what he had failed to find in Lamarck and in Charles Lyell, namely, an intelligible hypothesis good enough as a working basis for evolution. The rigorous proof which Huxley demanded was the production of species sterile to one another by selective breeding (*Life*, i. 193). He warned Darwin: "I will stop at no point as long as clear reasoning will carry me further" (*Life*, i. 172). Owen, who was at first favourably disposed to Darwin's theory, could not break with orthodoxy, and in his Rede Lecture asserted that man was clearly marked off from other animals by the anatomical structure of his brain. This was inconsistent with known facts, and was effectually refuted by Huxley in various papers and lectures, summed up in 1863 in *Man's Place in Nature*. This "monkey damnification" of mankind was too much even for the "veracity" of Carlyle, who is said to have never forgiven it. Meanwhile Huxley had been drawn into palaeontological research. Numerous memoirs on fossil fishes established many far-reaching morphological facts. The study of fossil reptiles led to his demonstrating, in the course of lectures on birds, delivered at the College of Surgeons in 1867, the fundamental affinity of the two groups which he united under the title of Sauropsida. An incidental result of the same course was his proposed rearrangement of the zoological regions into which P. L. Sclater had divided the world in 1857. Huxley anticipated, to a large extent, the results at which botanists have since arrived; he proposed as primary divisions, Arctogaea—to include the land areas of the northern hemisphere—and Notogaea for the remainder. Successive waves of life originated in and spread from the northern area, the survivors of the more ancient types finding successively a refuge in the south. In 1892 he wrote: "The doctrine of evolution is no speculation, but a generalization of certain facts . . . classed by biologists under the heads of Embryology and of Palaeontology" (*Essays*, v. 42). Earlier in 1881 he had asserted even more emphatically that if the hypothesis of evolution "had not existed, the palaeontologist would have had to invent it" (*Essays*, iv. 44).

From 1870 onwards Huxley was more and more drawn away from scientific research by the claims of public duty. From 1862 to 1884 he served on no less than ten Royal Commissions; from 1871 to 1880 he was a secretary of the Royal Society, and from 1881 to 1885 president; and from 1870 to 1872 he served as a member of the newly constituted London School board. He resigned the latter position in 1872, but in the brief period during which he acted, probably more than any man, he left his mark on the foundations of national elementary education. He made war on the scholastic methods which wearied the mind in merely taxing the memory; the children were to be prepared to take their place worthily in the community. Physical training was the basis; domestic economy, at any rate for girls, was insisted upon, and for all some development of the aesthetic sense by means of drawing and singing. Reading, writing and arithmetic were the indispensable tools for acquiring knowledge, and intellectual discipline was to be gained through the rudiments of physical science. He insisted on the teaching of the Bible partly as a great literary heritage, partly because he was "seriously perplexed to know by what practical measures the religious feeling, which is the essential basis of conduct, was to be kept up, in the present utterly chaotic state of opinion in these matters, without its use" (*Essays*, iii. 397), and, again, because it was "the most democratic book in the world." In 1872 the School of Mines was moved to South Kensington, and Huxley had, for the first time after 18 years, those appliances for teaching beyond the lecture room, which to the lasting injury of the interests of biological science in Great Britain had been withheld from him by the shortsightedness of government. Huxley had only been able to bring his influence to bear upon his pupils by oral teaching, and had had no opportunity by personal intercourse in the laboratory of forming a school. He was now able to organize a system of instruction for classes of elementary teachers in the general principles of biology, which indirectly affected the teaching of the

subject throughout the country. In 1892 he accepted a Privy Councillorship. The physical failure to meet the strain of his scientific and public duties made rest imperative, and he took a long holiday in Egypt in 1873. He still continued to occupy himself with vertebrate morphology, but prevented by growing ill health from stooping over the microscope, and driven by attacks on Darwin and himself, he found an outlet for his energies in public addresses and more or less controversial writings. His health completely broke down in 1885. In 1890 he removed from London to Eastbourne, where after a painful illness he died on June 29, 1895.

The latter years of Huxley's life were mainly occupied with contributions to periodical literature on subjects connected with philosophy and theology. The only approach to certainty which he admitted lay in the order of nature. "If there is anything in the world which I do firmly believe in, it is the universal validity of the law of causation, but that universality cannot be proved by any amount of experience" (*Essays*, ix. 121). The assertion that "There is only one method by which intellectual truth can be reached, whether the subject-matter of investigation belongs to the world of physics or to the world of consciousness" (*Essays*, ix. 126) laid him open to the charge of materialism, which he vigorously repelled. "Legitimate materialism, that is, the extension of the conceptions and of the methods of physical science to the highest as well as to the lowest phenomena of vitality, is neither more nor less than a sort of shorthand idealism" (*Essays*, i. 194). While "the substance of matter is a metaphysical unknown quality of the existence of which there is no proof . . . the non-existence of a substance of mind is equally arguable; . . . the result . . . is the reduction of the All to co-existences and sequences of phenomena beneath and beyond which there is nothing cognoscible" (*Essays*, ix. 66). As regards miracles, he wrote: "nobody can presume to say what the order of nature must be"; this "knocks the bottom out of all *a priori* objections either to ordinary 'miracles' or to the efficacy of prayer" (*Essays*, v. 133). In 1860 he asserted: "Science seems to me to teach in the highest and strongest manner the great truth which is embodied in the Christian conception of entire surrender to the will of God" (*Life*, i. 219). In 1885 he formulated "the perfect ideal of religion" in a passage which has become famous: "In the 8th century B.C. in the heart of a world of idolatrous polytheists, the Hebrew prophets put forth a conception of religion which appears to be as wonderful an inspiration of genius as the art of Pheidias or the science of Aristotle. 'And what doth the Lord require of thee, but to do justly, and to love mercy, and to walk humbly with thy God'" (*Essays*, iv. 161). Two years later he was writing: "That there is no evidence of the existence of such a being as the God of the theologians is true enough" (*Life*, ii. 162); he never really advanced beyond the recognition of "the passionless impersonality of the unknown and unknowable, which science shows everywhere underlying the thin veil of phenomena" (*Life*, i. 239), though he insisted that "atheism is on purely philosophical grounds untenable" (*Life*, ii. 162). In other respects his personal creed was a kind of scientific Calvinism. From 1880 onwards Huxley was occupied in a campaign against orthodox beliefs. He threw Christianity overboard bodily on the grounds that "the exact nature of the teachings and the convictions of Jesus is extremely uncertain" (*Essays*, v. 348). His final analysis of what "since the second century, has assumed to itself the title of Orthodox Christianity" is a "varying compound of some of the best and some of the worst elements of Paganism and Judaism, moulded in practice by the innate character of certain people of the Western world" (*Essays*, v. 142). He did not omit, however, to do justice to "the bright side of Christianity," and was deeply impressed with the life of Catherine of Siena. He compared the moral with the aesthetic sense, which he repeatedly declares to be intuitive and in the Romanes Lecture for 1894, defined "law and morals" to be "restraints upon the struggle for existence between men in society." Apparently he thought that the moral sense in its origin was intuitional and in its development utilitarian. "The cosmic process has no sort of relation to moral ends" (*Essays*, ix. p. 83); "of moral purpose I see

no trace in nature. That is an article of exclusive human manufacture" (*Life*, ii. 268). The cosmic process gives rise to what is evil in man's moral life, and in the long run will get the best of the contest, and "resume its sway" when evolution enters on its downward course (*Essays*, ix. p. 45).

As has been said, Huxley never accepted without qualification the Darwinian principle. He thought "transmutation may take place without transition" (*Life*, i. 173) and thereby anticipated the findings of modern research. He recognized the "struggle for existence" but not the gradual adjustment of the organism to its environment which is implied in "natural selection." In highly civilized societies he thought that the former was at an end (*Essays*, ix. 36) and had been replaced by the "struggle for enjoyment" (*l.c.* p. 40).

See *Life and Letters of T. H. Huxley*, by his son Leonard Huxley (2 vols., 1900; 2nd ed. 3 vols. 1903); *Scientific Memoirs of T. H. Huxley* (5 vols., 1898-1903); *Collected Essays by T. H. Huxley* (9 vols., 1898); P. Chalmers Mitchell, *Thomas Henry Huxley, a Sketch of his Life and Work* (1900); E. Clodd, *T. H. Huxley* (1902); and J. R. Ainsworth Davis, *T. H. Huxley* (1907).

HUY, a town of Belgium (Lat. *Hoiun*, and Flem. *Hoei*), on the two banks of the Meuse, at the point where it is joined by the Hoyoux. Pop. (1925) 14,393. It is 19 m. east of Namur and a trifle less west of Liège. Huy certainly dates from the 9th century. Its citadel crowns a grey rock between which and the Meuse is the fine collegiate church of Notre Dame (14th cent. with 13th cent. gateway). The citadel is now partly a military depot and partly a prison. The ruins are still shown of the abbey of Neufmoustier founded by Peter the Hermit on his return from the first crusade. He was buried there in 1115. Neufmoustier was one of ten abbeys in this town alone dependent on the bishopric of Liège. Huy is surrounded by vineyards, and the bridge which crosses the Meuse at this point connects the fertile Hesbaye north of the river with the rocky Condroz south of it.

HUYGENS, CHRISTIAAN (1629-1695), Dutch mathematician, astronomer and physicist, was born at The Hague on April 14, 1629. From his father Constantijn Huygens, he received the rudiments of his education, which was continued at Leyden. In 1651 he published an essay in which he attacked the unsound methods of Gregory of St. Vincent in his method of quadratures. This was followed by other papers on mathematical subjects.

In 1655, Huygens, working with his brother Constantijn on the improvement of the telescope, hit upon a new method of grinding and polishing lenses. The immediate results of the clearer definition obtained were the detection of a satellite to Saturn (the sixth in order of distance from its primary), and the resolution into their true form of the abnormal appendages to that planet. Huygens was also in 1656 the first effective observer of the Orion nebula; he delineated the bright region still known by his name, and detected the multiple character of its nuclear star. His application of the pendulum to regulate the movement of clocks sprang from his experience of the need for an exact measure of time in observing the heavens. The invention dates from 1656; on June 16, 1657, Huygens presented his first "pendulum-clock" to the States-General; and the *Horologium*, containing a description of the requisite mechanism, was published in 1658.

His reputation now became cosmopolitan. In 1663 he was elected a fellow of the Royal Society, and delivered before that body in Jan. 1669 a clear and concise statement of the laws governing the collision of elastic bodies. Although these conclusions were arrived at independently, they were in great measure anticipated by the communications on the same subject of John Wallis and Christopher Wren, made respectively in Nov. and Dec. 1668.

Huygens had before this time fixed his abode in France. In 1665 Colbert made to him on behalf of Louis XIV. an offer too tempting to be refused, and from 1666 to 1681 his residence at the Bibliothèque du Roi was only interrupted by two short visits to his native country. His *magnum opus* dates from this period. The *Horologium oscillatorium* (1673) contained many original discoveries. This work contains the first successful attempt to deal with the dynamics of a system. The determination of the

true relation between the length of a pendulum and the time of its oscillation; the invention of the theory of evolutes; the discovery, hence ensuing, that the cycloid is its own evolute, and is tautochronous; the ingenious although practically inoperative idea of correcting the "circular error" of the pendulum by applying cycloidal cheeks to clocks—were all contained in this remarkable treatise. The theorems on centrifugal force in circular motion with which it concluded helped Newton to formulate his law of gravitation.

In 1681 he returned to Holland; perhaps because of the treatment of his co-religionists in France. He now spent six years on the production of lenses of enormous focal distance, which, mounted on high poles, and connected with the eye-piece by means of a cord, formed what were called "aerial telescopes." Three of his object-glasses, of respectively 123, 180 and 210 ft. focal length, are in the possession of the Royal Society. He also succeeded in constructing an almost perfectly achromatic eye-piece, still known by his name. But his researches in physical optics constitute his chief title-deed to immortality. He developed the wave theory of light which had already been adopted by Hooke in 1665; he assumed that all the points of a wave-front originate secondary waves, the aggregate effect of which is to reconstitute the primary disturbance at the subsequent stages of its advance, thus accomplishing its propagation; so that each primary wave-front is the envelope of an indefinite number of secondary undulations. This resolution of the original wave is the well-known "Principle of Huygens," and by its means he was enabled to prove the fundamental laws of optics, and to assign the correct construction for the direction of the extraordinary ray in uniaxial crystals. These investigations, together with his experiments on polarization, are recorded in his *Traité de la lumière*, published at Leyden in 1690, but composed in 1678. In the appended treatise *Sur la Cause de la pesanteur*, he rejected gravitation as a universal quality of matter, although admitting the Newtonian theory of the planetary revolutions. From his views on centrifugal force he deduced the oblate figure of the earth, estimating its compression, however, at little more than one-half its actual amount.

Huygens never married. He died at The Hague on June 8, 1695, bequeathing his manuscripts to the University of Leyden.

In addition to the works already mentioned, his *Cosmotheoros*—a speculation concerning the inhabitants of the planets—was printed posthumously at The Hague in 1698, and appeared almost simultaneously in an English translation. A volume entitled *Opera posthuma* (Leyden, 1703) contained his "Dioptrica," in which he calculated the magnifying power of a telescope, together with the shorter essays *De vitris figurandis*, *De corona et parheliis*, etc. An early tract *De ratiociniis in ludo aleae*, printed in 1657 with Schooten's *Exercitationes mathematicae*, is notable as one of the first formal treatises on the theory of probabilities; nor should his investigations of the properties of the cissoid, logarithmic and catenary curves be left unnoticed. His invention of the spiral watch-spring was explained in the *Journal des sçavants* (Feb. 25, 1675). An edition of his works was published by G. J. 's Gravesande, in four quarto volumes entitled *Opera varia* (Leyden, 1724) and *Opera reliqua* (Amsterdam, 1728). His scientific correspondence was edited by P. J. Uytlenbroek from manuscripts preserved at Leyden. A complete edition of his works and correspondence was published by the *Société Hollandaise des Sciences* (1888-1905, 10 vols.). See Boscha, *Christian Huygens* (1895).

HUYGENS, SIR CONSTANTIJN (1596-1687), Dutch poet and diplomatist, was born at The Hague on Sept. 4, 1596. His father, Christiaan Huygens, was secretary to the State council. Constantijn received a liberal education, became a master of Latin verse, a great gymnast, a good musician and an accomplished artist. After a year's further study at Leyden, he went, in 1618, to London with the English ambassador Dudley Carleton; he remained in London for some months, and then went to Oxford, where he studied for some time in the Bodleian library, and to Woodstock, Windsor and Cambridge; he was introduced at the English court, and played the lute before James I. An intimacy sprang up between the young Dutch poet and John Donne, for whose genius Huygens preserved through life an unbounded admiration. He returned to Holland in company with the English contingent of the synod of Dort, and in 1619 he received a diplomatic mission at Venice; on his return he nearly lost his life in scaling the topmost spire of Strasbourg cathedral. In 1621

he published his *Batava Tempe*, and in the same year he proceeded again to London, as secretary to the ambassador, Wijngaerden, but returned in three months. During his third diplomatic visit (1621-23) his volume of satires, *'t Costelick Mal*, dedicated to Jacob Cats, appeared at The Hague. In the autumn of 1622 he was knighted by James I. In 1625 he was appointed private secretary to the stadholder, and in 1630 a member of the privy council. In 1634 he is supposed to have completed his long-talked-of version of the poems of Donne, fragments of which exist. In 1637 his wife, Susanna van Baerle, died. Their married life is celebrated in the didactic poem, *Dagwerck. Hofwijck* (1653) describes the splendid house and garden which Huygens built for himself at The Hague. In 1647 he wrote his poem *Oogentroost*, to gratify his blind friend Lucretia van Trollo. Huygens wrote only one play, *Trijntje Cornelis Klacht*, which deals with the adventures of the wife of a ship's captain at Zaandam. In 1658 he rearranged his poems, and issued them with many additions, under the title of *Corn Flowers*. He proposed to the Government that the present highway from The Hague to the sea at Scheveningen should be constructed, and during his absence on a diplomatic mission to the French court in 1666 the road was made as a compliment to the venerable statesman, who expressed his gratitude in a descriptive poem entitled *Zeestraet*. Huygens edited his poems for the last time in 1672, and died in his 91st year, on March 28, 1687. He was buried, with the pomp of a national funeral, in the church of St. Jacob, on April 4. His second son, Christiaan, the eminent astronomer, is noticed separately.

Constantijn Huygens is the most brilliant figure in Dutch literary history. Other statesmen surpassed him in political influence, and at least two other poets surpassed him in the value and originality of their writings. But his figure was more dignified and splendid, his talents were more varied, and his general accomplishments more remarkable than those of any other person of his age, the greatest age in the history of the Netherlands. Huygens is the *grand seigneur* of the republic, the type of aristocratic oligarchy, the jewel and ornament of Dutch liberty. As a poet Huygens shows a finer sense of form than any other early Dutch writer; the language, in his hands, becomes as flexible as Italian. His epistles and lighter pieces, in particular, display his metrical ease and facility to perfection.

See the complete edition by T. A. Worp of his works (9 vols., 1892-99), and of his correspondence (6 vols., 1913-17); also G. Kalff, *Constantijn Huygens* (1900). (E. G.; X.)

HUYSMANS, the name of three Flemish painters, who matriculated in the Antwerp gild in the 17th century.

Jacob, born at Antwerp in 1633 and apprenticed to Frans Wouters in 1650, came to England towards the close of the reign of Charles II., and competed with Lely as a fashionable portrait painter. Among the portraits executed by him are those of Queen Catherine of Braganza, and of Izaak Walton, now in the National Portrait Gallery. He died in London in 1696.

JAN BAPTIST HUYSMANS, born at Antwerp in 1654, matriculated in 1676-77, and died there in 1716. There are several of his paintings in the museums of Antwerp, Brussels and Munich, representing southern landscapes with figures and cattle.

His elder brother, CORNELIUS HUYSMANS, was born at Antwerp in 1648, and educated by Gaspar de Wit and Jacob van Artois. Cornelius is the only master of the name of Huysmans whose talent was largely acknowledged. He received lessons from two artists, one of whom was familiar with the Roman art of the Poussins, whilst the other inherited the scenic style of the school of Rubens. He combined the two in a rich, highly coloured style, seldom attempting anything but woodside views with fancy backgrounds, half Italian, half Flemish. He first practised at Malines, where he married in 1682. From 1706 to 1717 he lived at Antwerp, and then returned to Malines, where he died on June 1, 1727. According to Walpole, he also visited England. Though most of his pictures were composed for cabinets rather than for churches, he sometimes emulated van Artois in the production of large sacred pieces, and for many years his "Christ on the Road to Emmaus" adorned the choir of Notre Dame of Malines. The national

galleries of London and Edinburgh each contain one example of his skill.

HUYSMANS, CAMILLE (1871-), Belgian statesman, was born at Bilsen in Belgian Limbourg on May 26, 1871. After graduating in Germanic philology at Liège, he became a professor, first at the Collège Libéral at Ypres, and then at the Université Nouvelle, Brussels. He wrote in the *Peuple* and other Socialist papers, and, after the World War, started the Flemish *Volksgezet* in Antwerp. He entered the Chamber in 1910, first as deputy for Brussels and then for Antwerp, where he became an alderman of public instruction. From 1905 till 1922 he was secretary of the Socialist International Bureau, and while in Holland in 1917 endeavoured to organize the Stockholm International Socialist Congress. After the War he became the chief organizer of the Socialist Party in Antwerp. In June 1925 he became minister of science and arts. His chief works are: *Limburgsch Jaarboek* (1891-95); *Toponymische Studie* (in conjunction with J. Cuvelier, 1897); *Stockholm* (1919); *De Coster's Stephanie* (1926); *Don Juan*, a Flemish dramatic work of the 18th century (1928); *The Works of De Swaen* (4 vol., 1928); and numerous Socialist reports and brochures.

HUYSMANS, JORIS KARL (1848-1907), French novelist, was born in Paris on Feb. 5, 1848. He belonged to a family of artists of Dutch extraction; he entered the ministry of the interior, and was pensioned after thirty years' service. He thus led a thoroughly bourgeois existence in striking enough contrast to the character of his novels. His earliest venture in literature, *Le Drageoir à épices* (1874), contained stories and short prose poems showing the influence of Baudelaire. *Marthe* (1876), the life of a courtesan, was published in Brussels, and Huysmans contributed a story, "Sac au dos," to *Les Soirées de Médan*, the collection of stories of the Franco-German war published by Zola. He then wrote a series of novels of everyday life, including *Les Sœurs Vatar* (1879), *En Ménage* (1881), and *À vau-l'eau* (1882), in which he outdid Zola in minute and uncompromising realism. Of these the most important is *En Ménage*, which describes the complete disillusion of two friends, Adrien and Cyprien, the one by means of marriage, the other by a vulgar liaison: "The book," says Lalou, "oozes with misanthropy, with hatred of a society incurably common, ugly and stupid." But there is more in Huysmans's work than the presentment in realistic detail of the more disagreeable side of life. He was, in fact, influenced more directly by Flaubert and the brothers de Goncourt than by Zola.

In *L'Art moderne* (1883) Huysmans gave a careful study of impressionism and in *Certains* (1889) a series of studies of contemporary artists. He went on to glorify art at the expense of nature, and the real importance of his work is to be found in his later works, in which the excesses of the aesthetic revolt find a serious and quite humourless exponent. *À Rebours* (1884), the history of the morbid tastes of a decadent aristocrat, des Esseintes, provides a caricature of literary and artistic symbolism which nevertheless contained much of the real beliefs of the aesthetes. In *La-Bas* Huysmans's most characteristic hero, Durtal, makes his appearance. Durtal is occupied in writing the life of Gilles de Rais; the insight he gains into Satanism is supplemented by modern Parisian students of the black art; but already there are signs of a leaning to religion in the sympathetic figures of the religious bell-ringer of Saint Sulpice and his wife. *En Route* (1895) relates the conversion of Durtal to mysticism and catholicism in his retreat to La Trappe.

In *La Cathédrale* (1898), Huysmans gives a symbolist interpretation of the architecture of the cathedral of Chartres which is a magnificent evocation of the spirit of the place. The life of *Sainte Lydwine de Schiedam* (1901), an exposition of the value of suffering, gives further proof of his conversion; and *L'Oblat* (1903) describes Durtal's retreat to the Val des Saints, where he is attached as an oblate to a Benedictine monastery. Huysmans was nominated by Edmond de Goncourt as a member of the Académie des Goncourt. He died as a devout Catholic, after a long illness of cancer in the palate on May 13, 1907. Before his death he destroyed his unpublished mss. His last book was *Les*

Foules de Lourdes (1906).

See Arthur Symons, *Studies in two Literatures* (1897) and *The Symbolist Movement in Literature* (1899); Jean Lionnet in *L'Évolution des idées* (1903); Eugène Gilbert in *France et Belgique* (1905); J. Sargeret in *Les Grands convertis* (1906).

HUYSUM, JAN VAN (1682-1749), Dutch painter, was born at Amsterdam on April 15, 1682, and died in his native city on Feb. 8, 1749. He was the son and pupil of Justus van Huysum, who is said to have been expeditious in decorating doorways, screens and vases. His pictures of flowers and fruit, in oil and water colours, were finished in every detail and highly prized during his lifetime. He also painted landscapes with Arcadian scenery. His work may be seen in most of the European galleries.

HVAR, an island in the Adriatic Sea (Ital. *Lesina*), forming part of Dalmatia, Yugoslavia. Pop. (1921) 3,568. It is 43 m. long and from 2 m. to 5 m. broad. The warm and equable climate lends itself to the successful growth of grapes, olives, figs, dates and the locust bean. Other industries of the islanders are the making of rosemary essence and liqueurs, bee-keeping, boat-building, fishing and marble quarrying. There are many villages but Hvar (*Lesina*) the capital, and Stari Grad (*Cittavecchia*) are the chief towns and seaports. The former possesses, among other beautiful Venetian buildings, the finest Loggia in Dalmatia, and has also an arsenal and an observatory. It is a Roman Catholic bishopric, and near by there is a Franciscan monastery, which was burned by the Turks in 1471 but rebuilt in 1571. Stari Grad is one of the busiest ports in the Dalmatian islands, and still possesses "Cyclopean" walls, possibly raised by the primitive "Illyrians" whose stone cists and bronze instruments have been found near the capital. The island is memorable as the home of two Slav poets, Lucić, a writer of exquisite lyrics, and the more famous Hektorovic (1487-1572), a democratic noble, some centuries ahead of his time, who devoted his genius to the writing of national songs. About 390 B.C., a Greek colony from Paros built a city on the site of the present Hvar and called it Paros or Pharos. In 229 B.C. Demetrius, the lieutenant of the Illyrian Queen Teuta, betrayed the island to the Romans, but as he proved false to them also, they razed his capital in 219 B.C. Neos Pharos, now Stari Grad, took its place and flourished till the 7th century, when the Slavs, fleeing from the Avars, settled upon the island. Throughout the Middle Ages, and on to the present day, it has remained purely Slavonic. The island became a bishopric in 1145 and received a charter from Venice in 1331; was sacked by the Genoese in 1354 and 1358; ceded to Hungary in the same year; held by Dubrovnik (*Ragusa*) from 1413 to 1416, and incorporated in the Venetian dominions in 1420. During the 16th century Hvar had a considerable maritime trade and though sacked and partly burned by the Turks in 1571, it remained the chief arsenal of Venice in these waters until 1776. In 1797 it passed to Austria, was held by the French from 1805 till 1813, when it was surrendered to Austria, remaining in the possession of that country until the close of the World War. In 1918 it was forcibly occupied by the Italians, until it was formally annexed to Yugoslavia.

HWAI SENG, Chinese monk, travelled with Sung-Yun to India in 518-521 to collect books.

HWANG-HO, the most northerly of China's great rivers, approximately 2,500 m. in length. The name, literally the "Yellow River," is due to the loess (*hwang tu* or "yellow earth") which it carries in suspension and which it derives from the deposits stretching across the middle part of its basin. The Hwang-ho flows through a region having a much lower rainfall than the Yang-tze basin and its discharge is in consequence very much smaller. It pursues a very composite course. It rises in a marshy trough just west of the Tsaring-nor within the parallel ranges of the Kuen-Lun whose central and northern ranges it eventually cuts across before entering on the Ordos, an extension of the Gobi desert. The northern limit of the Ordos is defined by the mountain arc of the Ala-shan, Khara-narin-ula and Ta-tsing-shan, and the Hwang-ho, keeping on the inner side of this arc, occupies a much more open valley than in its upper course. Then the river which was heading eastwards for the "grill of Peking" (see

CHINA) deserts this mature valley to turn abruptly southwards and in a very rapid and obviously immature course rushes through a long trench cut into the very border of the loess-filled basin of North Shensi. At the south end of this north-south course, it receives first the Fen-ho on its left bank and then the Wei-ho on its right bank, which together gather up the drainage of a string of fertile loess-basins in south Shansi and central Shensi. Their combined waters then flow due east, as though the Wei-ho were the master-stream, through the Tungkwan gorge, where the river is restricted by the approach of the ridges of south Shansi towards the Tsin-ling, and enter on the funnel-shaped valley which leads across Honan to the north China plain. The Tungkwan gorge forms the historic gateway into the north China plain from the Wei-ho valley and beyond from Kansu and the Tarim basin. About Kaifeng the valley gives way to the plain and here the character of the river changes also. With the neighbourhood of Kaifeng as a pivot, the Hwang-ho, after breaking its dykes during flood, has several times shifted bodily the whole of its lower course through the plain. For over five centuries before 1852 the Yellow river entered the Yellow sea well to the south of the Shantung uplands, but since 1852 its mouth has lain to the north of them, involving a change of over 250 miles.

The most irregular feature in this long course of the Hwang-ho is the entrenched torrent along the Shansi-Shensi border in the very middle of its course and between two mature valley stretches, that across the Ordos and that through Honan. This disposition suggests that the torrent stretch has comparatively recently joined two formerly independent drainage systems. In its course across the Ordos the Hwang-ho is heading for the ridge and trough country of the "grill of Peking." The troughs are broad enough to take the river and an enormous deltaic fan to the north-west of Peking, too big to be produced by any existing stream of the neighbourhood, may represent its outfall. In its valley course through Honan the Hwang-ho simply continues the line of the broad Wei-ho valley and these together, though broken by the Tungkwan gorge, may represent a second formerly independent river. The head-streams of the Wei-ho valley lie near to the point where the upper Hwang-ho emerges from the Kuen-Lun ranges. The upper Hwang-ho may be related therefore to either the Ordos or the Wei-ho system. If the "grill of Peking" were tilted, up in the north and down in the south, which the decreasing elevation of its ridges to the south would indicate has actually taken place, then the Ordos river would be compelled to turn southwards until it could escape to the east. This it could not do until it came across the great Ta-hwa fault along which the grill system is broken against the Tsin-ling. By this means it would encounter the southernmost of the once independent rivers, that flow along the northern foot of the Tsin-ling ranges.

In its torrential stretches the current is too swift and in its course through the plain the channel is too wide and shallow for the Hwang-ho to be of much use for navigation. The Ordos loop is navigable from Chungwei to Hokow save during low water in winter and flood in summer, but the region through which it flows is unproductive. Further down, there is some local traffic along the trench between Hokow and Tungkwan, but it is nearly all downstream because of the swift current. In its lower course only the last 25 miles are really suitable for navigation.

The economic significance of the Hwang-ho is not as an artery of commerce but as the source of many of the floods which from time to time devastate the north China plain and which have earned it the names of "China's Sorrow," "The Ungovernable," "The Scourge of the Sons of Han." The plain has only a very gentle slope towards the sea and is to some degree the deltaic accumulation of the Hwang-ho, the Hwai-ho and the Chihli rivers. In its course over it the channel of the Hwang-ho becomes exceedingly broad and shallow. With the agricultural reclamation of the plain this broad channel has become confined by dyke construction and the river silt formerly spread over a wide area has become concentrated on the river bed itself so that the river is now flowing on the top of the plain as much as within it. The river surface of the Hwang-ho is at low water 15 feet above the general level of the plain, at high water as much as 30 feet. It

is estimated that it is raising its bed, mainly when the current is slackening after the summer floods, at the rate of one foot in every hundred years, but this represents only about 1% of the total amount of silt brought down within such a period. In this lower course the dykes are sufficiently far apart for the river to have considerable swing, which not only lengthens the river course but also facilitates the breaching of the dykes by an aggressive meander. The International Famine Relief Commission propose to control the river by straightening its channel which would increase the current and thereby the scour of the river-bed and would prevent the breaching of dykes by meandering. By this means it is hoped not only to prevent flood but also to add to the land reclaimed for agriculture.

HWICCE, one of the kingdoms of Anglo-Saxon Britain, coinciding generally with the mediaeval diocese of Worcester, the early bishops of which bore the title "Episcopus Hwiccorum." It would therefore include Worcestershire, Gloucestershire except the Forest of Dean, the southern half of Warwickshire, and the neighbourhood of Bath. The name Hwicce survives in Wychwood Forest in Oxfordshire. This district, or at all events the southern portion, was according to the *Anglo-Saxon Chronicle*, s.a. 577, originally conquered by the West Saxons under Ceawlin. In later times, however, the kingdom of the Hwicce appears to have been always subject to Mercian supremacy, and possibly it was separated from Wessex in the time of Edwin. The first kings of whom we read were two brothers, Eanhere and Eanfrith, probably contemporaries of Wulfhere. They were followed by Osric, a contemporary of Aethelred, and by Oshere. Oshere's three sons Aethelheard, Aethelweard and Aethelric succeeded him, the two last reigning in 706. At the beginning of Offa's reign we again find the kingdom ruled by three brothers, named Eanbert, Uhtred and Aldred, the two latter of whom lived until c. 780. After them the title of king seems to have been given up. Their successor Aethelmund, who was killed in a campaign against Wessex in 802, is described only as an earl. The district remained in possession of the rulers of Mercia until the fall of that kingdom. Together with the rest of English Mercia it submitted to King Alfred c. 877-883 under Earl Aethelred, who possibly himself belonged to the Hwicce. No list of kings has been preserved, and we do not know whether the dynasty was connected with that of Wessex or Mercia.

See Bede, *Historia Eccles.* iv. 23 (ed. Plummer, 1896); Birch, *Cartularium Saxonicum*, 43, 51, 76, 85, 116, 117, 122, 163, 187, 232, 233, 238 (1885-89). (F. G. M. B.)

HYACINTH, also called **JACINTH**, one of the most popular of spring garden flowers (family Liliaceae). It was in cultivation prior to 1597, at which date it is mentioned by Gerard. Rea in 1665 mentions several single and double varieties as being then in English gardens, and Justice in 1754 describes upwards of fifty single-flowered varieties, and nearly one hundred double-flowered ones, as a selection of the best from the catalogues of two then celebrated Dutch growers. One of the Dutch sorts, called *La Reine de Femmes*, a single white, is said to have produced from thirty-four to thirty-eight flowers in a spike, and on its first appearance to have sold for 50 guilders a bulb; while one called *Overwinnaar*, or *Conqueror*, a double blue, sold at first for 100 guilders, *Gloria Mundi* for 500 guilders, and *Koning Saloman* for 600 guilders. Several sorts are at that date mentioned as blooming well in water-glasses. Justice relates that he himself raised several very valuable double-flowered kinds from seeds, which many of the sorts he describes are noted for producing freely.

The original of the cultivated hyacinth, *Hyacinthus orientalis*, a native of Greece and Asia Minor, is by comparison an insignificant plant, bearing on a spike only a few small, narrow-lobed, waxy blue flowers, resembling in form those of our common bluebell. So great has been the improvement effected by the florists, and chiefly by the Dutch, that the modern hyacinth would scarcely be recognized as the descendant of the type above referred to, the spikes being long and dense, composed of a large number of flowers; the spikes produced by strong bulbs not unfrequently measure 6 to 9 in. in length and from 7 to 9 in. in circumference, with the flowers closely set from bottom to top. Of late years much

improvement has been effected in the size of the individual flowers and the breadth of their recurving lobes, as well as in securing increased brilliancy and depth of colour.

The peculiarities of the soil and climate of Holland are so very favourable to their production that Dutch florists have made a specialty of the growth of those and other bulbous-rooted flowers. Hundreds of acres are devoted to the growth of hyacinths in the vicinity of Haarlem.

In the spring flower garden few plants make a more effective

THE WILD HYACINTH OR BLUEBELL
(*SCILLA NUTANS*)

display than the hyacinth. Dotted in clumps in the flower borders, and arranged in masses of well-contrasted colours in beds in the flower garden, there are no flowers which impart during their season—March and April—a gayer tone to the parterre. The bulbs are rarely grown a second time, either for indoor or outdoor culture, though with care they might be utilized for the latter purpose; and hence the enormous numbers which are procured each recurring year from Holland.

The first hyacinths were single-flowered, but towards the close of the 17th century double-flowered ones began to appear, and till a recent period these bulbs were the most esteemed. At the present time, however, the single-flowered sorts are in the ascendant, as they produce more regular and symmetrical spikes of blossom, the flowers being closely set and more or less horizontal in direction, while most of the double sorts have the bells distant and dependent, so that the spike is loose and by comparison ineffective. For pot culture, and for growth in water-glasses especially, the single flowered sorts are greatly to be preferred. Few if any of the original kinds are now in cultivation, a succession of new and improved varieties having been raised, the demand for which is regulated in some respects by fashion.

HYACINTH or **JACINTH**, in mineralogy, a variety of zircon (*q.v.*) of yellowish red colour, used as a gem-stone. The *hyacinthus* of ancient writers must have been our sapphire, or blue corundum, while the hyacinth of modern mineralogists may have been the stone known as *lyncurium* (Λυγκούριον). The Hebrew word *leshem*, translated ligure in the A.V. (Exod. xxviii. 19), from the Λυγύριον of the Septuagint, appears in the R.V. as jacinth, but with a marginal alternative of amber; both may be reddish yellow, but their identification is doubtful. Most of the gems known in trade as hyacinth are only garnets, generally the deep orange-brown hessonite or cinnamon-stone; and the stones known as *Compostella hyacinths* are simply ferruginous quartz from Santiago de Compostella, Spain. Hyacinth is not a common mineral. It occurs, with other zircons, in the gem-gravels of Ceylon, and very fine stones have been found as pebbles at Mudgee, New South Wales. Crystals of zircon, with all the typical characters of hyacinth, occur at Expailly in Central France, but they are not large enough for cutting. (L. J. S.)

HYACINTHUS, in Greek legend, a young man (parentage variously given) of Amyclae in Laconia (Gr. Ἰάκινθος). According to the general story, which is probably late and composite, his great beauty attracted the love of Apollo, who killed him accidentally when teaching him to throw the *discus* (quoit); others say that Zephyrus (or Boreas) out of jealousy deflected the quoit so that it hit Hyacinthus on the head and killed him. According to the representation on the throne of Apollo at Amyclae (Pausanias) he was translated into Heaven with his virgin sister Polyboea. Out of his blood there grew the flower called *hyacinthos* (perhaps fritillary; not our hyacinth), the petals of which were marked with the mournful exclamation AI, AI, "alas." It was also said to have sprung from the blood of Ajax son of Telamon.

The death of Hyacinthus was celebrated at Amyclae by the second most important of Spartan festivals, the Hyacinthia, which took place in the Spartan month Hecatombeus. What month this was is not certain. Arguing from Xenophon (*Hell.* iv. 5) we get May; assuming that the Spartan Hecatombeus is the Attic Hecatombeion, we get July; or again it may be the Attic Scirophorion, June. At all events the Hyacinthia was an early summer festival. It lasted three days, and the rites gradually passed from mourning for Hyacinthus to rejoicings in the majesty of Apollo. (See Farnell, *Cults of the Greek States*, iv. 266 *et seq.*). This festival is clearly connected with vegetation, and marks the passage from the youthful verdure of spring to the dry heat of summer and the ripening of the corn.

There can be little doubt that Hyacinthus is a pre-Hellenic god. His name is not Greek, and has the characteristic pre-Hellenic suffix *-vθ*; cf. *Kόρινθος*. The precise relation which he bears to Apollo is obscure. The supposed "tomb of Hyacinthus," which forms the base of the monument of Apollo at Amyclae, described by Pausanias, may be taken as evidence of his subordination to the greater god. Into the "tomb" at Amyclae were put offerings for the hero, before gifts were made to the god. This and the taboo on cereals during the first part of the Amyclan festival suggest a chthonian vegetation deity whose death is mourned like that of Adonis (*q.v.*). Frazer suggests that he may have been regarded as spending the winter months in the underworld, and returning to earth in the spring when the "hyacinth" blooms. With the growth of the hyacinth from his blood should be compared the oriental stories of flowers springing from the blood of Attis (*q.v.*), and from that of Adonis (*q.v.*).

See L. R. Farnell, *Cults of the Greek States*, vol. iv. pp. 125 *et seq.*, 264 *et seq.* (1907); J. G. Frazer, *Golden Bough* (3rd ed.) v. 313; S. Wide, *Lakonische Kulte*, p. 290; Roscher's *Lexikon s.v.* "Hyakinthos" (Greve).

HYADES, "the rainy ones," a group of five stars in the head of the constellation Taurus. In mythology they were maidens (their number and parentage vary in different accounts) who nursed the infant Dionysus, and as a reward were translated to heaven and placed among the stars (Hyginus, *Poët. astron.* ii. 21). According to another version they were sisters, whose brother Hyas was killed while hunting (Ovid, *Fasti*, v. 165; Hyginus, *Fab.* 192). They lamented him so bitterly that Zeus, out of compassion, changed them into stars—five into the Hyades, the remainder into the Pleiades. Their name is derived from the fact that the rainy season commenced when they rose at the same time as the sun (May 7–21). The Romans derived the name from *Hys* (ἥς, pig), and translated it by *Suculae* (Cicero, *De nat. deor.* ii. 43).

HYATT, ALPHEUS (1838–1902), American zoologist and palaeontologist, was born at Washington, D.C., on April 5, 1838. From 1858 to 1862 he studied at Harvard, under Louis Agassiz, and in 1863 he served as a volunteer in the Civil War, attaining the rank of captain. In 1867 he was appointed curator of the Essex Institute at Salem, Mass., and in 1870 became professor of zoology and palaeontology at the Massachusetts Institute of Technology (resigned 1888), and custodian of the Boston Society of Natural History (curator in 1881). In 1886 he was appointed assistant for palaeontology in the Cambridge museum of comparative anatomy, and in 1889 was attached to the United States Geological Survey as palaeontologist. Hyatt rose to foremost rank among American investigators in the field of invertebrate palaeontology. He was the chief founder of the American Society of Naturalists, of which he acted as first president in 1883, and he also took a leading part in establishing the marine biological laboratories at Annisquam and Woods Hole, Mass. He died at Cambridge, on Jan. 15, 1902.

His works include *Observations on Polyzoa* (1866); *Fossil Cephalopods of the Museum of Comparative Zoology* (1867); *Revision of North American Porifera* (1875–1877); *Genera of Fossil Cephalopoda* (1883); *Larval Theory of the Origin of Cellular Tissue* (1884); *Genesis of the Arietidae* (1889); and *Phylogeny of an acquired characteristic* (1894). He wrote the section on Cephalopoda in Karl von Zittel's *Paläontologie* (1900), and his valuable study on the fossil pond snails of Steinheim ("The

Genesis of the Tertiary Species of Planorbis at Steinheim") appeared in the *Memoirs* of the Boston Natural History Society in 1880. He was a founder and editor of the *American Naturalist*.

See W. K. Brooks, "Biographical Memoirs of Alpheus Hyatt," *Nat. Acad. of Sciences Biog. Mem.*, vol. vi., pp. 311–325 (1909); R. T. Jackson, "Alpheus Hyatt and His Principles of Research," *Amer. Naturalist*, vol. xlvii., pp. 195–205 (Lancaster, Pa., 1913).

HYATT, ANNA VAUGHN (1876–), American sculptor, was born at Cambridge, Mass., March 10, 1876. She studied art in Boston and in New York city, with H. A. MacNeil and Gutzon Borglum. Her equestrian statue, "Jeanne d'Arc," was selected for Riverside Park, New York city, in 1915. This work, a "Saint Joan of Arc" in the Cathedral of St. John the Divine, New York city, and a "Diana" have been her chief figure compositions. She was awarded the Rodin gold medal in 1917, and the Saltus medals in 1920 and 1922. In 1923 she married Archer Milton Huntington.

See F. N. Price, "Anna Hyatt Huntington," *Internat. Studio*, vol. lxxix., pp. 319–323 (1924); Pauline C. Bouvé, "The Two Foremost Women Sculptors in America: Anna Vaughn Hyatt and Malvina Hoffman," *Art and Archaeology*, vol. xxvi., pp. 74–82 (1928).

HYBLA, the name of several cities in Sicily. The best known historically is Hybla Major, near modern Melilli, where numerous Sicel tombs have been found, about 4 m. S.W. of Megara Hyblaea (*q.v.*). It was this Hybla that was famous for its honey. Orsi (*Römische Mittheilungen*, 1909, 84) identifies Hybla Major with Paternò; the view here given is that of Ziegler (Pauly-Wissowa, *Realencyklopädie*, s.v.). Another Hybla, known as Hybla Minor or Geleatis, is represented by the modern Paternò, with its conspicuous mediaeval castle. Various remains have been found, especially tombs of the Sicel period; and there are also Roman remains, two arches of a bridge, remains of baths, cisterns, etc.

HYBRIDISM. This term has its origin in a Greek word meaning an insult or outrage: a hybrid or mongrel used to be regarded as an outrage on nature—being the offspring of wide crosses, e.g., the mating of individuals belonging to different species; a mongrel, the offspring of the crossing of different varieties within a species. But since Mendel worked and wrote hybridity has come to possess a very definite meaning. Any individual that is heterozygous for one or more of the hereditary characters it displays is in respect of that character or those characters a hybrid, for hybridity is but another name for heterozygosis. (See *HEREDITY*.) The degree of hybridity exhibited by the offspring is determined by the extent to which the hereditary constitutions of the two parents differ one from another.

Many species are mutually sterile in matings. Many interspecific hybrids are remarkable in that among them one sex is absent, rare or infecund. Many hybrids are manifestly better equipped in their general characterizations in relation to some particular task or destiny than are the parental pure-bred forms.

The mating of individuals differing markedly one from the other in their characterizations, e.g., belonging to different species, is commonly impossible or unproductive. Two species are normally debarred from producing fertile offspring by any of the following means:—Differences in breeding season or breeding place; psychological repugnance of one from, or failure to be stimulated by, the other's recognition marks, scents, peculiarities in courtship behaviour, or mechanical stimuli; mechanical disharmony of the copulatory apparatus; disharmonies in fertilization and development.

Differences in Breeding Season.—These, limiting interbreeding between allied species, are illustrated in the records of Lo Bianco (1909) relating to the period of sexual maturity of Mollusca and Crustacea in the Gulf of Naples.

	Mollusca	Crustacea
Number of pairs of species of the same genus	37	52
Breeding seasons coincide in the same genus	6	7
Breeding seasons differ in the same genus	7	12
Breeding seasons overlap in the same genus	23	33
Breeding seasons doubtful in the same genus	1	0

Differences in Breeding Place.—These are well illustrated by the case of parasites. The same host species may be occupied by several parasite species but the total range of each parasite, as far as it is known, differs. Another illustration is provided by the observations of Johansen on the distribution of animals in Rander's Fjord in relation to salinity.

No. of marine species	Restricted to salinity of
16	20-24 p-m
9	15-24 p-m
4	12-24 p-m
0	8-24 p-m
3	6-24 p-m
3	5-24 p-m
1	1-24 p-m

Psychological Barriers.—It is uncertain whether unwillingness to mate with an individual of another species is a widespread phenomenon. The records of hybridization in captivity make it evident that sexual intercourse is by no means uncommon. Pairing inclination is not a fair index of morphological affinity nor is disinclination to mate necessarily an index of mutual sterility as can be shown by artificial fertilization. Repugnance has been recorded in mammals (the guinea-pig, Detlefsen 1914); in birds (Columba, Staples Brown); in Pulmonate Gastropoda (*Cepea*, Diver); and in insects (Morrison 1924); but these instances are by no means so numerous as are records of complaisance. The extent to which any particular kind of behaviour as a means of sexual excitation is definitely repugnant to individuals of a different species is most difficult to ascertain. Doubtless the rôle of special scent glands, special markings and mechanical stimuli as means of isolation is important in certain groups. In Lepidoptera the scent glands act as a bar to coitus (Petersen, 1904). The olfactory stimuli are important in *Drosophila* (Sturtevant, 1921). There are specific differences in the flash emitted by fireflies (McDermott, 1917), which renders interspecific matings unlikely.

Mechanical Disability.—Complete mechanical disability obtains in those cases in which one form liberates its gametes into a fluid medium, having no differentiated external reproductive organs whilst the other practises, and is equipped for, internal fertilization. In cases in which, in both forms, internal fertilization is normal, disharmonies in the methods of sexual intercourse, in the shape and size of the intromittent organ and the vagina, in the construction of special devices for the conveyance of the spermatozoa, can lead to mutual sterility.

Even though the gametes are brought together, fertilization may still be impossible and consequent development may remain imperfect or incomplete. Sterility may then be due to inability on the part of the sperm to penetrate the ovum, failure of cleavage at various stages on the part of the fertilized ovum (Newman, 1915), cessation of, or disharmony in, development of the embryo (Bonnier, 1924), low vitality of the hybrid form (Harrison, 1920), disharmony in the development of the reproductive organs of an otherwise normal hybrid (Goodspeed, 1917), or aberrations in the chromosomal distributive mechanism.

The classical experiments of Godlewski and Loeb on artificial fertilization have shown that in certain instances of failure on the part of the sperm to penetrate the egg fertilization can be induced by rendering the surrounding medium more alkaline.

In many hybrids gametogenesis—the production of functional ova and sperms—is incomplete and imperfect. This may be due to actual disorganization of the nuclear mechanism, taking the form of abnormal synapsis (Smith and Thomas, 1914); failure on the part of the chromosomes to conjugate (Harrison and Doncaster, 1914) (Federlay, 1914); polyploidy (Gates, 1921). The fertility or otherwise of hybrids would seem to be determined by the presence or absence of a balance between the chromosomes, and not by their actual number.

Hybrid Vigour.—The cause of the beneficial result of the meeting of differently constituted germplasms, of the marked general vigour of hybrids, or *heterosis* as it is technically called, has been extensively studied. It has been suggested that this heterosis is due either to a physiological stimulus, the effect of which is revealed in an increase in cell division, or else to the pooling of

appropriate hereditary factors contributed to the offspring of the two parents. East and Jones (1921) have produced a mass of evidence which supports this latter interpretation. Heterosis is well exemplified in the common mule, which though sterile, is hardier, stronger and larger than either parent. In general, first-generation hybrids are an improvement on either parent, but usually the increased vigor is shown at its best only in the first generation after the cross.

Hybrid vigour can be produced by the mating of unlike strains within a species. This is often taken advantage of commercially. Pig-breeders, for instance, by mating pigs of distinct breeds, obtain animals which mature more rapidly than either parent stock.

BIBLIOGRAPHY.—The subject is thoroughly discussed and a full bibliography is given in *The Species Problem* by G. C. Robson, Oliver & Boyd (1928). See also C. Darwin, *Origin of Species* (1859); East and Jones, *Inbreeding and Outbreeding* (1919). (F. A. E. C.)

HYDANTOIN crystallizes from water in colourless needles, and melts at 208–220° C. It is constitutionally glycolyl urea, or

the ureide of glycollic acid, $\text{CO}-\text{NH}-\text{CH}_2-\text{NH}-\text{CO}$, and is obtained by

heating allantoin or alloxan with hydriodic acid, by heating bromoacetylurea with alcoholic ammonia or by the action of urea on dihydroxytartaric acid. When hydrolysed with baryta water, hydantoin yields hydantoic (glycoluric) acid,

colourless prisms, m.p. 153–156°, which are readily soluble in hot water.

HYDASPES, BATTLE OF THE (326 B.C.). The battle of the Hydaspes (Jhelum) is the most interesting of the four great battles fought by Alexander, since he was not only faced by a well-organized enemy protected by a river in flood but by a force of war elephants against which his decisive arm—heavy cavalry—

THE BATTLE OF THE HYDASPES, 326 B.C., BETWEEN PORUS AND ALEXANDER

Alexander executed his favourite manoeuvre of attacking with the right wing (d), first employing horse archers and then charging with the cavalry

was useless. Porus, his adversary, occupied the left bank of the river; he was a man of courage and sense, the most efficient general Alexander ever met. According to Diodorus, his army consisted of 50,000 infantry, 3,000 cavalry, about 1,000 chariots and 130 elephants.

Alexander was encamped near modern Jalapur, the left bank of the river being picketed by the Indians. As he was not able to force a crossing, he divided his army into many parts and laid in a great store of corn in order to make Porus believe that he did not intend to cross until the winter had set in. In any case he

could not cross in face of Porus, since the elephants drawn up on the far bank "by their aspect and trumpeting" would have caused his horse to take panic; he therefore resolved to steal a crossing under the cover of the following stratagem. He sent parties of cavalry up and down the river to make every kind of noise, Porus marching along the opposite bank where the clamour was heard. After a time, nothing taking place, Porus "perceiving that his fear had been groundless" kept his position in his camp. Having thus stupefied his adversary, Alexander determined to make a night march and cross the river at a bend some 18 miles north of modern Jhelum. He left Craterus in camp with the bulk of the army, instructing him not to attempt to force a passage unless Porus moved away; then, at the head of 5,000 horse and some 9,000 foot, he set out northwards to the point of crossing where skin-rafts and pontoons had been secreted. The river was successfully crossed, and, once the army was marshalled, Alexander advanced at the head of the cavalry ordering the infantry to follow on at a slow pace in regular formation. His object undoubtedly was to fix his enemy before he could deploy or retire.

Preliminary Engagement.—Porus, still seeing a large force in Alexander's camp, on hearing that a crossing of the river had been effected by the enemy, sent forward his son at the head of 2,000 cavalry and 120 chariots to delay them. On seeing this force approach, Alexander at first thought that it was Porus himself, and sent out his horse archers to reconnoitre. Learning, however, that it was but a detachment, he charged home killing Porus's son and 400 of his men. Apprised of this defeat, Porus was in doubt what to do. Craterus was now attempting to cross the river, and Alexander was advancing on him at top speed. Leaving some elephants and a small force to watch the ford, he moved off the clayey ground, and deployed his elephants into line at intervals of about 100 feet. Behind these he drew up his infantry in phalangial order. On the flanks he posted forces of cavalry, infantry and his chariots.

Seeing the Indians drawn up in order of battle, Alexander halted his cavalry so that his infantry might come up, and then, after resting them, he determined to advance against the enemy's left wing, and so avoid the elephants. His plan was as follows: The horse archers were to move against the enemy's left to throw his cavalry into confusion. Under cover of this fire the Companion cavalry were to move against this same wing, and attack the Indian cavalry "while still in a state of disorder." By moving the bulk of his cavalry against the enemy's left wing he foresaw that Porus would probably withdraw his right wing cavalry to support his left wing, and so uncover his right wing. To take advantage of this probability he ordered Coenus and a force of horse, directly he saw Porus move his right wing cavalry, to gallop round the enemy's right wing and charge it *in rear*. The phalanx and the archers were ordered not to engage "until they observed the enemy's cavalry and phalanx of infantry thrown into disorder by the cavalry under his command."

The Battle.—To understand the battle as described by Arrian it must be presumed that Porus wheeled back the left of his army to meet the approaching attack, and that he drew his elephants more and more from his right towards his left. With his right wing cavalry he did exactly what Alexander had foreseen, whereupon Coenus galloped round the rear of the Indian infantry, and, as Arrian says, "threw the ranks as well as the decisions of the Indians into confusion." To counter this charge Porus wheeled round his cavalry to meet it, whereupon Alexander, seeing his opportunity, charged home at the head of his Companions and drove the enemy back onto their elephants "as to a friendly wall for refuge." The elephants thrown into confusion were nevertheless urged forward by their mahouts, whereupon the phalanx, covered by the archers, charged down on them, but itself became disorganized. The Indian cavalry, seeing this, wheeled round to charge, but Alexander had once again reorganized his cavalry, and charging the Indian cavalry, cut them down in great numbers. One by one the mahouts were killed, and "when the beasts were tired out . . . they began to retire slowly, facing the foe like ships backing water, merely uttering a shrill piping sound." Alexander now surrounded the whole of the enemy's line with his

cavalry, and, giving the signal to the infantry to link shields, he charged his disorganized foe, and won the battle after eight hours fierce contest. The pursuit was at once taken up by Craterus. According to Diodorus the Indian losses were 12,000 and Alexander's 980.

Tactics.—The first point which strikes the student is the preparatory moral attack made by Alexander on Porus by a series of feints which blind him by tiring out his vigilance. Directly this has been accomplished, he sets out at the head of a small force; he did not require a large one, because the whole idea of his attack was based on surprise. For surprise to prove successful, it was essential that Porus should not notice any serious reduction in the numbers opposed to him; consequently, when he learnt of Alexander's advance, he did not realize what was happening. In brief, it was because Craterus was so strong that the surprise of the smaller force was so complete. Alexander's main problem was, seeing that he could not attack the Indian front, which of its two flanks should he select. His army was so small that he must maintain touch with Craterus, and if he could turn Porus's left flank he would facilitate the crossing of the river by Craterus. He decided to concentrate against the enemy's left flank, and to assist this concentration he detached Coenus, for by this economical distribution of force he added vastly to his main blow which was delivered under cover of demoralization due to surprise. Secured on his right flank by the river and his main army which threatened the Indian rear, he protected the left of his cavalry by the phalanx, and prepared his assault by the fire of his horse archers. Then in oblique order he converged on the enemy's left. As the enemy cavalry was scattered the phalanx approached and with it he delivered a left-hand punch under cover of which he withdrew his cavalry—his right-hand punch. No sooner was this done, than he withdrew his phalanx, and charged home with his cavalry. Then with his phalanx (his left) he knocked his antagonist out.

BIBLIOGRAPHY.—See under GRANICUS, BATTLE OF THE.

(J. F. C. F.)

HYDATID, a name for a bladderworm (*q.v.*). (See also TAPEWORMS, PLATYHELMINTHES.)

HYDE, the name of an English family distinguished in the 17th century. Robert Hyde of Norbury, Cheshire, had several sons, of whom the third was Lawrence Hyde of Gussage St. Michael, Dorsetshire. Lawrence's son Henry was father of Edward Hyde, earl of Clarendon (*q.v.*), whose second son by his second wife was Lawrence, earl of Rochester (*q.v.*); another son was Sir Lawrence Hyde, attorney-general to Anne of Denmark, James I.'s consort; and a third son was Sir Nicholas Hyde (d. 1631), chief justice of England. Sir Nicholas entered parliament in 1601 and soon became prominent as an opponent of the court, though he does not appear to have distinguished himself in the law. Before long, however, he deserted the popular party, and in 1626 he was employed by the duke of Buckingham in his defence to impeachment by the Commons; and in the following year he was appointed chief justice of the king's bench. In 1629 Hyde was one of the judges who condemned Eliot, Holles and Valentine for conspiracy in parliament to resist the king's orders; refusing to admit their plea that they could not be called upon to answer out of parliament for acts done in parliament. He died in August 1631.

Robert (1595–1665), son of Lawrence, the attorney-general to Anne of Denmark, became recorder of Salisbury and represented that borough in the Long Parliament, in which he professed royalist principles, voting against the attainder of Strafford. He gave refuge to Charles II. on his flight from Worcester in 1651, and on the Restoration he was knighted and made a judge of the common pleas. He died in 1665.

See Anthony à Wood, *Athenae oxonienses* (1813–20); Lord Clarendon, *The Life of Edward, Earl of Clarendon* (3 vols., Oxford, 1827); Edward Foss, *The Judges of England* (1848–64); Samuel Pepys, *Diary and Correspondence*, edited by Lord Braybrooke (4 vols., 1854).

HYDE, DOUGLAS (1860–), Irish scholar and writer, was born at Frenchpark, Co. Roscommon, 1860, and was educated at Trinity College, Dublin. In 1891 he acted as interim professor of modern languages at the University of New Brunswick, Canada.

He formed in 1893 the Gaelic League, for the preservation and extension of the Irish language, and was president of that body until 1915. In 1899 his production, before a vice-regal committee on education, of letters from leading Celtic scholars throughout Europe saved the Irish language on the intermediate board which regulated the curricula for Irish schools. During 1905 he toured America and raised £11,000 for the Gaelic League. On his return he was appointed a member of a royal commission on Irish university education. Dr. Hyde was made professor of Modern Irish at University College, Dublin, in 1909. He was co-opted by the Free State Senate in 1922, but failed to secure re-election in 1925. In the latter year he became editor of *Lia Fáil*. The movement created by him initiated an enthusiasm for the native language, which finally resulted in the teaching of the language being made compulsory in Irish schools.

Among Dr. Hyde's more important works are *A Literary History of Ireland* (1899); collections and translations of the *Love Songs of Connacht* (1893); *Raftery's Irish Songs* (1904); *The Religious Songs of Connacht* (1906). He also wrote several short plays in Irish.

HYDE, THOMAS (1636–1703), English orientalist, was born at Billingsley, near Bridgnorth, in Shropshire, on June 29, 1636. At King's college, Cambridge, he studied oriental languages under Wheelock, and after only one year of residence, was invited to London to assist Brian Walton in his edition of the *Polyglot Bible*. Besides correcting the Arabic, Persic and Syriac texts for that work, Hyde transcribed into Persic characters the Persian translation of the Pentateuch, which had been printed in Hebrew letters at Constantinople in 1546. To this work Hyde appended the Latin version which accompanies it in the *Polyglot*. After holding various preferments, he was at length appointed, in 1691, Laudian professor of Arabic; and in 1697, on the deprivation of Roger Altham, regius professor of Hebrew and a canon of Christ Church. Under Charles II., James II. and William III. Hyde discharged the duties of Eastern interpreter to the court. He died at Oxford on Feb. 18, 1703. In his chief work, *Historia religionis veterum Persarum* (1700), he made the first attempt to correct from oriental sources the errors of the Greek and Roman historians who had described the religion of the ancient Persians.

With the exception of the *Historia religionis*, which was republished by Hunt and Costard in 1760, the writings of Hyde, including some unpublished mss., were collected and printed by Dr. Gregory Sharpe in 1767 under the title *Syntagma dissertationum quas olim . . . Thomas Hyde separatim edidit*, with a life of the author. Hyde also published a catalogue of the Bodleian library in 1674.

HYDE, market town, municipal borough, Stalybridge and Hyde parliamentary division, Cheshire, England, 7½ m. E. of Manchester, by the L.N.E. railway. Pop. (1921), 33,424. It is connected with Manchester by an electric tramway system. Standing on the river Tame, it has cotton and weaving factories, spinning mills, print-works, iron foundries and machine works; it also manufactures hats and margarine. There are extensive coal mines in the vicinity. Hyde is wholly of modern growth, though it contains a few ancient houses, such as Newton Hall. The old family of Hyde held possession of the manor as early as the reign of John. The borough was incorporated in 1881.

HYDE DE NEUVILLE, JEAN GUILLAUME, BARON (1776–1857), French politician, was born at La Charité-sur-Loire (Nièvre), on Jan. 24, 1776, of an English family which had emigrated with the Stuarts after the rebellion of 1745. From 1793 he was an active agent of the exiled Bourbon princes; he took part in the Royalist rising in Berry in 1796, and after the *coup d'état* of the 18th Brumaire (Nov. 9, 1799), tried to persuade Bonaparte to recall the Bourbons. After an accusation of complicity in the infernal machine conspiracy (1800–1), subsequently retracted, Hyde de Neuville went to the United States, returning after the Restoration. His mission from Louis XVIII. to induce the British Government to transfer Napoleon to a safer place of exile than Elba was cut short by the emperor's return to France in March 1815. Under the Restoration he was ambassador at Washington, and at Lisbon, where his action at the time of the *coup d'état* of Dom Miguel (April 30, 1824), was disapproved in Paris. Hyde de Neuville was recalled. He then opposed the policy of Villele's cabinet in the Chamber and

in 1828 became minister of marine in Martignac's moderate administration. During the Polignac ministry (1829–1830) he was again in opposition, being a firm upholder of the charter; but after the revolution of July 1830 he entered an all but solitary protest against the exclusion of the legitimate line of the Bourbons from the throne, and resigned his seat. He died in Paris on May 28, 1857.

His *Mémoires et souvenirs* (3 vols., 1888), compiled from his notes by his nieces, the vicomtesse de Bardonnnet and the baronne Laurenceau, are of great interest for the Revolution and the Restoration. An English edition translated and abridged by F. Jackson was published (2 vols.) in 1913.

HYDERABAD, SIR MIR OSMAN ALI KHAN, NIZAM OF (1886–), was born on April 6, 1886, and succeeded his father, Sir Mir Mahbub Ali Khan, at his death on Aug. 29, 1911. Soon after accession he abandoned the traditional system of governing through a Diwan, and for five years was his own prime minister. In 1919 he constituted an executive council with a president and eight other members, each in charge of one or more departments. During the World War he was an ardent supporter of the British cause. He was promoted hon. lieutenant-general in the British army, and in 1918 King George V. conferred upon him the new and special title of Exalted Highness.

HYDERABAD, the principal native state of India in extent, population and political importance; area, 82,698 sq.m.; pop. (1921) 12,471,770. The state occupies a large portion of the eastern plateau of the Deccan. It is bounded north and north-east by Berar, south and south-east by Madras, and west by Bombay. Two tracts may be distinguished from one another geologically and ethnically, and are locally known from the languages spoken as Telingana and Marathwara. In some parts it is mountainous, wooded and picturesque, in others flat and undulating. The open country includes rich and fertile plains, much good land not yet brought under cultivation, and numerous sterile tracts. The territory is well watered, with many rivers, tanks and artificial pieces of water, especially in Telingana. The principal rivers are the Godavari (*q.v.*), with its tributaries, the Dudna, Manjira and Pranhita; the Wardha, with its tributary the Penganga; and the Kistna, with its tributary the Tungabhadra. The climate is in general good; and as there are no arid bare deserts, hot winds are little felt.

The revenue of the state is largely derived from the land, and the development of irrigation and railways has caused considerable expansion. (Revenue [est. 1927–28] 768 lakhs of rupees; expenditure 724 lakhs.) Over half the population are dependent on agriculture. The soil is generally fertile, though in some parts it consists of *chilka*, a red and gritty mould little fitted for purposes of agriculture. The principal crops are millets of various kinds, rice, wheat, oil-seeds, cotton, tobacco and fruits and garden produce. Lac, gums and oils are found, and hides, raw and tanned, are of commercial importance. The principal exports are cotton, oil-seeds, grain, timber, country-clothes and hides; the imports are salt, timber, European piece-goods, sugar, cattle, metals, oil and yarn. Mineral wealth consists of coal, copper, iron, diamonds and gold, but its development has not been very successful. The only coal mine now worked is the large one at Singareni, with an out-turn of 700,000 tons in 1925. The total exports in 1924–25 amounted to 1,578 lakhs; imports 2,165 lakhs.

The Bombay-Madras line (Great Indian Peninsular) runs through the south-west of the state, and the Nizam's railway runs from Wadi junction on this line through Hyderabad to Bezvada on the Madras and Southern Mahratta line. The Hyderabad-Godavari railway traverses rich cotton country, and cotton presses have been erected along the line. There are also cotton weaving mills and flour mills. After periods of considerable difficulty, the financial situation of the state is now good. The currency is based on the *hali sikka*, which contains approximately the same weight of silver as the British rupee. A new coin was minted in 1904, and the supply regulated. The current coin, called *osmania sicca*, exchanges at about 116 to 100 rupees. The state suffered acutely from famine during 1900.

The Nizam of Hyderabad is the principal Mohammedan ruler in India. The family was founded by Asaf Jah, a distinguished Turkoman soldier of the emperor Aurangzeb, who in 1713 was

appointed subadar of the Deccan, but eventually threw off the control of the Delhi court. His death in 1748 was followed by internecine struggle among his descendants, in which British and French took part. At one time the French nominee, Salabat Jang, established himself with the help of Bussy. But when the British had secured their predominance throughout southern India, Nizam Ali took his place. He confirmed the grant of the Northern Circars in 1766, and joined in the two wars against Tippoo Sultan in 1792 and 1799. The additions of territory which he acquired by these wars were afterwards (1800) ceded to the British, as payment for the subsidiary force which he had undertaken to maintain. By a later treaty in 1853, the districts known as Berar were "assigned" to defray the cost of the Hyderabad contingent. In 1857 when the Mutiny broke out, the Nizam remained loyal to the British. An attack on the residency was repulsed, and the Hyderabad contingent displayed their loyalty in the field against the rebels. In 1902 by a treaty made by Lord Curzon, Berar was leased in perpetuity to the British government, and the Hyderabad contingent was merged in the Indian army. The present Nizam, His Exalted Highness Sir Osman Ali Khan, Bahadar Fateh Jung, G.C.S.I., G.B.E., faithful ally of the British government, was born in 1886 and succeeded in 1911. He is entitled to a salute of 21 guns. For many years the Hyderabad finances were unhealthy. But in 1902, on the revision of the Berar agreement, the Nizam received 25 lakhs (£167,000) a year for the rent of Berar, thus substituting a fixed for a fluctuating source of income, and a British financial adviser was appointed for the purpose of reorganizing the resources of the state. The executive council, with 7 ordinary and one extraordinary members under a president, was set up in 1919. A resident, representing the government of India, has his headquarters at Hyderabad.

HYDERABAD, capital of the State of Hyderabad on the right bank of the Musi, a tributary of the river Kistna, with Golconda to the west, and the British cantonment of Secunderabad 5½ m. to the north-east. It is the fourth largest city in India; pop. (1921) 404,187, including suburbs and cantonment. It was founded in 1589 by Mohammed Kuli, fifth of the Kutb Shahi kings. The Char Minar or Four Minarets (1591), which rise from arches facing the cardinal points, stand in the centre of the city, with four roads radiating from their base. The Ashur Khana (1594), a ceremonial building, the hospital, the Gosha Mahal palace and the Mecca mosque, a sombre building designed after a mosque at Mecca, surrounding a paved quadrangle 360 ft. square, were the other principal buildings of the Kutb Shahi period, though the mosque was only completed in the time of Aurangzeb. The city proper is surrounded by a stone wall with thirteen gates, completed in the time of the first Nizam, who made Hyderabad his capital. The suburbs, of which the most important is Chadarghat, extend over a large additional area. There are several fine palaces built by various Nizams, and the British residency is an imposing building in a large park on the left bank of the Musi, north-east of the city. The bazaars around it, and under its jurisdiction, are extremely picturesque. Four bridges crossed the Musi, the most notable of which was the Purana Pul, of 23 arches, built in 1593. In 1908, however, the river, swollen by torrential rain (15 in. fell in 36 hours), rose in flood to a height of 12 ft. above the bridges and swept them away. Enormous damage was done, and thousands of lives were lost. The principal educational establishments are the Nizam college (affiliated to Madras University) and the Osmania University with medical, normal, industrial and Sanskrit schools, and a number of schools for Europeans and Eurasians. Hyderabad is an important centre of general trade, and there is a cotton mill in its vicinity. The city is supplied with water from two large lakes retained by great dams.

HYDERABAD or **HAIDARABAD**, a city and district of British India, in the Sind province of Bombay. The city stands on a hill about 3 m. from the left bank of the Indus; pop. (1921) 81,838. Upon the site of the present fort is supposed to have stood the ancient town of Nirun, which in the 8th century submitted to Mohammed bin Kasim. In 1768 the present city was founded by Ghulam Shah Kalhora; and it remained the capital of Sind until

1843. After the battle of Meeanee (Miani), it was surrendered to the British, and the capital transferred to Karachi. The city is built on the most northerly hills of the Ganga range, a site of great natural strength. In the fort, which covers an area of 36 acres, is the arsenal of the province, transferred thither from Karachi in 1861, and the palaces of the ex-mirs of Sind. An excellent water supply is derived from the Indus. In addition to manufactures of silk, gold and silver embroidery, lacquered ware and pottery, there are factories for ginning cotton. There are four high schools, training colleges for masters and mistresses, a medical school, an agricultural school for village officials, and a technical school.

The DISTRICT OF HYDERABAD has an area of 4,417 sq.m.; pop. (1921) 573,450. It consists of a vast alluvial plain, on the left bank of the Indus, 216 m. long and 48 broad. A limestone range called the Ganga and the pleasant frequency of garden lands break the monotonous landscape. The principal crops are millets, rice, oil-seeds, cotton and wheat, which are dependent on irrigation, mostly from government canals. There is a special manufacture at Hala of glazed pottery and striped cotton cloth. Three railways traverse the district: (1) one of the main lines of the North-Western system, following the Indus valley and crossing the river near Hyderabad; (2) a broad-gauge branch running south to Badin, which will ultimately be extended to Bombay; and (3) a metre-gauge line from Hyderabad city into Rajputana. (See also INDIAN DESERT.)

HYDER ALI or **HAIDAR 'ALI** (c. 1722–1782), Indian ruler and commander. This Mohammedan soldier-adventurer, who, followed by his son Tippoo, became the most formidable Asiatic rival the British ever encountered in India, was the great-grandson of a *fakir* or wandering ascetic of Islam, who came from the Punjab to Gulburga in the Deccan, and the second son of a *naik* or chief constable at Budikota, near Kolar in Mysore. An elder brother rose to command a brigade in the Mysore army, while Hyder acquired a useful familiarity with the tactics of the French under Dupleix. He is said to have induced his brother to employ a Parsee to purchase artillery and small arms from the Bombay government, and to enroll some 30 sailors of different European nations as gunners, and is thus credited with having been "the first Indian who formed a corps of sepoys armed with fire-locks and bayonets, and who had a train of artillery served by Europeans."

After the siege of Devanahalli (1749) Hyder received an independent command in Mysore; within the next 12 years his energy and ability had made him master of minister and raja alike. In everything but in name he was ruler of the kingdom. In 1763 the conquest of Kanara gave him the treasures of Bednor, which he resolved to make the most splendid capital in India, under his own name, thenceforth changed from Hyder Naik into Hyder Ali Khan Bahadur; and in 1765 he retrieved previous defeat by the Mahrattas by destroying the Nairs or military caste of the Malabar coast, and the conquest of Calicut.

Hyder Ali now occupied the serious attention of the Madras government, which in 1766 agreed with the Nizam to furnish him with troops to be used against the common foe. But a secret arrangement was come to between the two Indian powers, the result of which was that Colonel Smith's small force was met with a united army of 80,000 men and 100 guns. British dash and sepoy fidelity, however, prevailed, first in the battle of Chengam (Sept. 3, 1767), and again still more remarkably in that of Tiruvannamalai (Trinomalai). On the loss of his recently made fleet and forts on the western coast, Hyder Ali offered peace overtures; on their rejection, bringing all his resources and strategy into play, he forced Colonel Smith to raise the siege of Bangalore, and brought his army within five m. of Madras. The result was the treaty of April 1769, providing for the mutual restitution of all conquests, and for mutual aid and alliance in defensive war; it was followed by a commercial treaty in 1770 with the authorities of Bombay. Under these arrangements Hyder Ali, when defeated by the Mahrattas in 1772, claimed British assistance, but in vain; this breach of faith aroused a desire for vengeance.

His time came when in 1778 the British, on the declaration of

war with France, resolved to drive the French out of India. The capture of Mahé on the Malabar coast in 1779, followed by the annexation of lands belonging to a dependent of his own, gave him a pretext. Again master of all that the Mahrattas had taken from him, and with empire extended to the Kistna, he descended through the passes of the Ghats amid burning villages, reaching Conjeeveram, only 45 m. from Madras, unopposed. Not till the smoke was seen from St. Thomas's Mount, where Sir Hector Munro commanded 5,200 troops, was any movement made; then, however, the British general sought to join a smaller body under Colonel Baillie recalled from Guntur. The incapacity of the officers resulted in the destruction of Baillie's force of 2,800 (Sept. 10, 1780). Warren Hastings sent from Bengal Sir Eyre Coote, who, though repulsed at Chidambaram, defeated Hyder thrice successively in the battles of Porto Novo, Pollilur and Sholingarh, while Tippoo was forced to raise the siege of Wandiwash, and Vellore was provisioned. On the arrival of Lord Macartney as governor of Madras, the British fleet captured Negapatam, and forced Hyder Ali to confess that he could never ruin a power which had command of the sea. He had sent his son Tippoo to the west coast, to seek the assistance of the French fleet, when his death took place at Chittur in Dec. 1782.

See L. B. Bowring, *Haidar Ali and Tipu Sultan*, "Rulers of India" series (1893). For the personal character and administration of Hyder Ali see the *History of Hyder Naik*, written by Mir Hussein Ali Khan Kirmani (translated from the Persian by Colonel Miles, and published by the Oriental Translation Fund), and the curious work written by M. Le Maître de La Tour, commandant of his artillery (*Histoire d'Hyder-Ali Khan*, Paris, 1783). For the whole life and times see Wilks, *Historical Sketches of the South of India* (1810-17); Aitchison's *Treaties*, vol. v. (2nd ed., 1876); and Pearson, *Memoirs of Schwartz* (1834).

HYDNOCARPUS, a genus of the botanical family Flacourtiaceae. There are 25 species found in Indo-Malaya. From species of this genus is obtained hydnocarpus oil, which in recent years has proved of value in the treatment of leprosy.

HYDRA, an island of Greece (anc. *Hydrea*), lying about 4 m. off the south-east coast of Argolis and forming with the neighbouring island of Dokos (Dhoko) the Bay of Hydra. The greatest length from south-west to north-east is about 11 m., and the area is about 21 sq.m.; a rocky and treeless ridge with hardly a patch or two of arable soil. Hence the epigram of Antonios Kriezies to the queen of Greece: "The island produces prickly pears in abundance, splendid sea captains and excellent prime ministers." The highest point, Mount Ere, so called (according to Miaoules) from the Albanian word for wind, is 1,958 ft. high. The next is known as the Prophet Elias, from the large convent on its summit. Here the patriot Theodorus Kolokotronis was imprisoned, and a pine tree is still called after him. In former times the island was richly wooded as its Turkish name *Tchamliza*, the place of pines, shows. It was once well-watered (hence the designation *Hydrea*), but is now wholly dependent on the rain supply, and sometimes water must be brought from the mainland. This change may be due in part to earthquakes, which are frequent; that of 1769 continued for six days. Hydra, the chief town, pop. (1917) 5,700, near the middle of the northern coast, on a very irregular site, has white and handsome houses, and its streets though narrow are clean. There are three other ports on the north coast—Mandraki, Molo, Panagia, but none sufficiently sheltered. Almost all the population of the island is collected in the town, which has a bishop, a local court, numerous churches and a high school. Cotton and silk weaving, tanning and shipbuilding are carried on, and there is a fairly active trade.

Hydra was of no importance in ancient times. In 1580 it was the refuge of Albanians from Kokkinyas in Troezenia; and other emigrants followed in 1590, 1628, 1635, 1640, etc. At the close of the 17th century the Hydriotes took part in the reviving commerce of the Peloponnesus. About 1716 they began to build *sakturia* (of from 10 to 15 tons' burden), and to visit the islands of the Aegean; not long after they introduced the *latimadika* (40-50 tons), and sailed as far as Alexandria, Constantinople, Trieste and Venice; eventually to France and even America. From the grain trade of south Russia they derived great wealth. In 1813 there were about 22,000 people in the island, and of these

10,000 were seafarers. At the time of the outbreak of the war of Greek independence the total population was 28,190, of whom 16,460 were natives and the rest foreigners. One of their chief families, the Konduriotti, was worth £2,000,000. Into the national struggle the Hydriotes flung themselves with rare enthusiasm and devotion, and the final deliverance of Greece was mainly due to their fleets.

D. Kriezies, *Ἱστορία τῆς νήσου Ὑδρας* (Patras, 1860).

HYDRA, in Greek legend, the offspring of Typhon and Echidna, a gigantic monster with nine heads (the number is variously given), the centre one being immortal. Its haunt was the marshes of Lerna by Argos. The destruction of this hydra was one of the twelve "labours" of Heracles, which he accomplished with the assistance of Iolaus. Finding that as soon as one head was cut off two grew in its place, they burned out the roots with firebrands, and at last severed the immortal head from the body, and buried it under a rock. The arrows dipped by Heracles in the poisonous blood or gall inflicted fatal wounds.

See Preller-Robert II. 444.

HYDRACRYLIC ACID is a syrupy liquid, which on distillation is resolved into water and acrylic acid, $\text{CH}_2:\text{CH}.\text{CO}_2\text{H}$. It is β -hydroxypropionic acid, $\text{CH}_2\text{OH}.\text{CH}_2.\text{CO}_2\text{H}$, and is prepared by acting with silver oxide and water on β -iodopropionic acid, or from ethylene by the addition of hypochlorous acid, the addition product being then treated with potassium cyanide and hydrolysed by an acid. Hydracrylic aldehyde, $\text{CH}_2\text{OH}.\text{CH}_2.\text{CHO}$, is obtained as a colourless oil by heating acrolein with water.

HYDRANGEA, a popular flower (family Saxifragaceae), the plant to which the name is most commonly applied being *Hydrangea Hortensia*, a low deciduous shrub, producing rather large oval strongly-veined leaves in opposite pairs along the stem. It is terminated by a massive globular corymbose head of flowers, which remain a long period in an ornamental condition. The normal colour of the flowers, the majority of which have neither stamens nor pistil, is pink; but by the influence of sundry agents in the soil, such as alum or iron, they become changed to blue; there are numerous varieties.

There are upwards of 25 species, found chiefly in Japan, in the mountains of India, and in North America, and many of them are familiar in gardens. *H. Hortensia* (a species long known in cultivation in China and Japan) is the most useful for decoration, as the head of flowers lasts long in a fresh state, and by the aid of forcing can be had for a considerable period for the ornamentation of the greenhouse and conservatory. Their natural flowering season is towards the end of the summer, but they may be had earlier by means of forcing. *H. japonica* is another fine conservatory plant, with foliage and habit much resembling the last named, but this has flat corymbs of flowers, the central ones small and perfect, and the outer ones only enlarged and neuter. This also produces pink or blue flowers under the influence of different soils.

HYDRANT, a form of valve by which water is drawn from a supply in a main either underground or in a building. The earliest hydrant was a simple wood plug driven into a socket at the top of a main.

There are three main types of valves, the ball, the spindle, and the sluice-valve. The first is of simple construction, and opens instantly when the spindle of the standpipe is screwed down to press the ball off the seat. The example shown has a bayonet joint for the connection of the standpipe, and the ball presses up against a rubber seating by the pressure in the main until the hydrant is in use. The spindle type has a leather-faced flat valve forced down on a seating by the screw at the lower end of the spindle. The spindle is kept water-tight, as the figure shows, by the coned collar and the nut and cross-pin. The purpose of the frost-valve, also shown in the drawing, is to clear the interior of the hydrant of water by the tipping of the little lever when the valve is shut down. Both of these hydrants are of ground type; many are connected to vertical pipes, as in theatres and other buildings, and the arrangement is very compact, to leave the least possible projection

from the pipe. The sluice-valve hydrant gives a full clear run through the pipe, the shut-off being by a wedge valve which crosses the bore.

Some hydrants have one pipe connection, or a standpipe permanently in place, in cases where its presence is not objectionable. Multiple outlets are arranged in many fire hydrants. The connection of the hose or standpipe is made by a screw coupling, a

bayonet catch, or an instantaneous coupling. (See also STANDPIPE.) (F. H.)

HYDRASTINE, an alkaloid (see ALKALOIDS), found with berberine (*q.v.*) in the rootstocks of golden seal (*Hydrastis canadensis*), isolated by Perrins in 1862. It crystallizes, from alcohol, in colourless, rhombic prisms, which melt at 132°C , is soluble in chloroform or benzene, less so in alcohol, and almost insoluble in water. A solution of hydrastine, $\text{C}_{21}\text{H}_{21}\text{O}_6\text{N}$, in dry alcohol is laevorotatory, and in 50% alcohol dextro-rotatory. The salts are unstable in water and difficult to crystallize. A nitrohydrastine has been synthesized (Hope and Robinson, 1912), though not the alkaloid itself. The hydrolytic product, hydrastinine, is an important drug, being used as an internal styptic, and numerous processes have been devised for its synthesis.

HYDRATE, in chemistry, a liquid or solid compound containing more or less combined water. Frequently the crystalline character of a solid hydrate depends on this water which is present as water of crystallization. Common examples of hydrates are supplied by the well known sodium compounds:—Glauber's salt (*q.v.*), which is decahydrated sodium sulphate, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$; washing soda, which is decahydrated sodium carbonate, $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$; and borax, which is sodium pyroborate, $\text{Na}_2\text{B}_4\text{O}_7$, with five or ten molecules of water. Blue vitriol, $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, the pentahydrated copper sulphate, is another common example. The alums owe their characteristic crystalline form partly to the presence of combined water; for example, potash alum, $\text{KAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$, crystallizes in well defined octahedra, which crumble into powder on removing the water. Acids and bases also form hydrates. $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$, hydrated barium hydroxide is a well crystallized substance. Sulphuric acid and hydrochloric acid combine with water to form hydrates, and since certain of these are stable only at comparatively low temperatures they are termed cryohydrates. A remarkably stable solid hydrate is chloral hydrate, $\text{CCl}_3\text{CH}(\text{OH})_2$, produced by adding water to liquid chloral (*q.v.*). In this substance the added water has probably become hydroxide of constitution, so that this hydrate may be regarded as a connecting link between the loosely knit hydrates and the true hydroxides (*q.v.*).

(G. T. M.)

HYDRAULIC LIME: see CEMENT.

HYDRAULIC MACHINERY, the name given to certain types of machines which utilize water pressure for motive power. Under high pressure, water forms a very convenient medium for operating slow-moving machinery of the piston type in which

large forces are involved and where easy and precise regulation is required. Where the main pressure supply is of less intensity than is required to work the hydraulic machinery an intensifier is used. In its simplest form this consists of a ram of area a , carrying a piston of larger area A (fig. 1). Water from the pressure mains, at pressure p , is admitted behind the piston and compresses the water in the ram cylinder to an increased pressure P . If w is the weight of the ram and piston and F is the frictional resistance of the packings: $P = p \frac{A}{a} - \frac{w + F}{a}$ lb.

Lifts and Hoists.—Probably in the aggregate more power is used by lifts and hoists than by any other class of hydraulic machinery, and for such work as this, hydraulic transmission is particularly suitable. Several types of lift are in use, these consisting of modifications of the simple direct-acting or of the suspended type. The former consists of a hydraulic cylinder sunk vertically in the ground, of length slightly greater than the maximum travel of the lift and fitted with a ram which carries the lift cage at its upper end. Pressure water is admitted below the ram and thus raises the cage. Since the weight of the ram and cage forms a large proportion of the whole load to be lifted, this must be balanced for efficient working, while since the volume of water displaced by the ram diminishes as the lift rises, the effective weight of the ram, which is its own weight less that of the displaced water, increases. Various devices have been adopted to overcome this difficulty. One common in high-class work consists of a balance cylinder, one type of which is shown in fig. 2. Here pressure water is admitted to the interior of the hollow ram B . The cylinder D is in communication with an auxiliary low pressure supply through the pipe C , and a downward pressure on the annulus at E is thus produced, which, together with the weight of this ram, produces a pressure in the cylinder F sufficiently great to balance any required proportion of the weight of the lift ram and cage. The total pressure transmitted to the water in the cylinder F is then the sum of the weight of the ram B and of the pressures on the annulus E and on the ram B , the former taking care of the balancing and the latter lifting the load. A

FIG. 1.—HYDRAULIC INTENSIFIER

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 2.—BALANCE CYLINDER FOR HYDRAULIC LIFT

suitable area of lift ram being assigned, the external diameter of B is calculated so as to give the required intensity of pressure in the cylinder F . The lift cylinder is supplied from F through the pipe G . On the downstroke of the lift, the ram B rises, the balance water is returned to its own supply tank and the only water rejected is that originally filling the high-pressure ram B . As the balance ram falls, the pressure on the annulus E increases, due to the increasing head to which it is subjected, and this to a certain extent counterbalances the difference in the effective weight of the lift ram.

The suspension type of lift is operated from a hydraulic ram having a comparatively short stroke. The requisite travel in the wire rope by which the cage is suspended, is obtained by using a rope and pulley multiplying gear, termed a jigger. The weight of the cage may be balanced by hanging weights, the varying immersion of the ram in this case being unimportant. In the balanced lift shown in fig. 2 two wire ropes are employed for lifting and two for carrying weights which partly counterbalance the cage. As the cage of such a lift rises, a portion of the weight of the suspending rope is transferred to the plunger side of the supporting pulley, and the effective weight transferred to the plunger consequently varies throughout the whole of its stroke. Fig. 3 shows a method of

compensating for this variation. Here a double balance-chain is suspended from the cage as shown, so that if R be the travel of the cage, the length of each chain is $R \div 2$. Let m be the multiplying factor for the jigger; W the weight of the unbalanced portion of the cage; w the weight of the suspending cable per foot run; w' the weight of each balance chain per foot run.

Then with cage at bottom, the pull on plunger $= m\{W + wR\}$

Then with cage at top, the pull on plunger $= m\{W + w'R\} - wR$.

And for these to be equal, $w' = w(1 + \frac{1}{m})$. For very heavy lifting,

such as is necessary in canal lifts, etc., where loads up to 1,000 tons may be carried on a single ram, the direct-acting lift is the only suitable type.

Hydraulic Cranes, Jacks, Etc.—

Where high-pressure water is available it provides a most convenient means of operating power cranes, and in its safety, adaptability to suit varying conditions, and steadiness of operation, offers some advantages over its chief rival, electricity. Such cranes are usually operated by hydraulic jiggers, the various operations of lifting, racking and slewing often being performed by separate rams and cylinders, each regulated by its own separate valve. Where the load to be lifted may vary within wide limits, some device usually is adopted to economize water at light loads. In small cranes, for loads up to about two tons, a differential or telescopic ram may be used, the smaller working inside the larger, which itself works in the pressure cylinder. For light loads the larger is held stationary by locking gear, the smaller ram then doing the lifting. For heavy loads the two rams work together as one.

Jib luffing cranes are used for dockside work. The jib has an extended end to which are attached the counterbalance weights and tie rods. The lower ends of the tie rods are attached to a travelling crosshead actuated by the rams of the luffing cylinders and also carry a compensating pulley. The lifting rope or chain passes over this pulley, with the result that when the jib is luffed inwards the hoisting rope is paid out to compensate for the rise at the point of the jib. By adjusting suitably the stroke of the luffing ram and the inclination of the rods the level of the lifting hook may be maintained constant for all radial positions of the weight.

The hydraulic jack is used extensively for raising heavy weights for short distances. In principle it consists of a Bramah press on a small scale, and one type of its construction is illustrated in fig. 4. Here the reciprocation of a hand lever pumps water from the cistern A , through the hollow plunger B , past the suction and delivery valves V_s and V_d into the space C below the lifting ram and raises the latter. Screws are provided for supplying the cistern A with water and for allowing of the inlet of air, while a lowering screw permits of the escape of pressure water from the space below the lifting ram into the supply cistern when it is desired to lower the load. The lifting ram is usually packed by means of a cup leather, and the pump plunger by means of a single leather ring.

Reference has already been made to the Bramah press. Its modifications, as applied to such work as cotton baling, boiler plate flanging and heavy forging are too numerous for detailed mention. In the production of heavy forgings from large steel ingots it is essential that every part of the ingot should be worked

equally if the resultant forging is to be homogeneous in structure. Where a steam hammer is used the energy of the blow is largely absorbed in producing distortion of the outer layers, while the interior is practically unaffected. This disadvantage is overcome by the use of the hydraulic forging press with its slow and powerful compression, and this is gradually supplanting the steam hammer for the production of very heavy forgings.

The hydraulic riveter provides another good illustration of the adaptability of the hydraulic machine to workshop processes. Here the problem is to get a fairly large pressure of the rivet during the first portion of the ram stroke, so as to form the rivet head and to clinch the plates, and a final larger pressure of the nature of an impact to cause the rivet to expand and fill its hole fully. The extent to which this is attained in the riveter will be evident from fig. 5, which represents a typical pressure diagram taken from the cylinder of such a machine, supplied from an accumulator under a pressure of 1,100 lb. per sq. in.

Here AB represents the idle part of the stroke during which the ram is being brought up to its work, BC the setting up of the rivet and the formation of the head, CD the clinching of the rivet and the closing of the plates, while the sudden stoppage of the heavy accumulator ram is responsible for a further rise in pressure DE above the accumulator pressure, which is depended upon to fill up the rivet hole. In fig. 6 a section of the cylinder and valves of a riveter of the hinged type is shown. Here the hydraulic ram acts on one end of an arm pivoted near the centre at A , and carrying the riveting head at the other end. Water is admitted to or discharged from the ram cylinder by the arrangement of valves shown. Thus a quarter-turn of the regulating lever raises the valve V_s and puts the cylinder into communication with the pressure supply. On the completion of the working stroke a half-turn in the opposite direction closes the valve V_s and opens valve V_d , putting the cylinder into communication with the discharge passages. The main ram is drawn back on its idle stroke by means of a special drawback ram which is always exposed to supply pressure. The method of packing the rams and the general construction are indicated in the figure.

Hydraulic Lock-gate Machinery.—In many modern docks the lock gates or caissons are operated by hydraulic machinery. In the Royal Edward Dock at Avonmouth, for example, each leaf of the entrance lock gates is operated by a direct-acting hydraulic cylinder with piston and rod, the stroke being 12 ft. 9 in. The sluice gates, 54 in. diam., in connection with these caissons are also operated by direct-acting hydraulic rams working under a pressure of 750 lb. per sq. in.

The Johnson Valve.—A type of valve which is being used to an increasing degree in large hydro-electric power installations is illustrated in fig. 7. A hollow central cylinder mounted in the centre of an enlargement in the pipe line and attached to the wall by radial ribs, carries a hollow differential plunger capable of axial movement in the cylinder. The projecting portion of this plunger forms the valve. The two chambers A and B can be put into communication either with the high pressure supply or with the atmosphere through small pipes with appropriate regulating valves. To close the main valve, pressure water is admitted to the chamber A , and B is allowed to discharge freely. The valve is then forced over to the right until it comes into contact with its seat. To open the valve the operation is reversed. When open, the water flows through the annular space between the valve and the pipe wall. This gives a waterway with no sudden changes of section or direction. Valves of this type are in use up to 18 ft. in diameter.

Hydraulic Engine; Hydraulic Capstans.—Where a supply of high pressure water is available and where rotary motion at a moderate speed is desired, the reciprocating piston engine has certain advantages for small powers, particularly where it is able to work at or near full load and where the speed variation may be excessive, as occurs, for example, in the working of a capstan.

FIG. 5.—DIAGRAM SHOWING PRESSURES IN CYLINDER OF HYDRAULIC RIVETER ON WORKING STROKE

As usually fitted to a capstan three single acting cylinders fitted with trunk pistons are fixed radially to an external casing, the three connecting rods working on a single crank pin. Each cylinder is fitted with a single inlet and outlet port, the opening of this to supply and exhaust being regulated by a rotary valve. This rotates along with the crank shaft and carries passages connecting with the pressure supply and the exhaust which are presented in turn before the port of each cylinder. The water-supply is regulated by means of a treadle which operates the admission valve.

Hydraulic Transmission Gear.—Several schemes for transmitting the torque developed at the crankshaft of a motor-car

FIG. 6.—DIAGRAMMATIC SKETCH SHOWING CYLINDER AND VALVES OF HYDRAULIC RIVETER OF THE HINGED TYPE

engine to the driving wheels by hydraulic means are now on the market. By the use of such a device shocks due to changing gear are avoided, while the ratio of the speeds of the driving and driven shafts may be regulated with a much greater degree of flexibility than is possible with a mechanical drive. All these devices are broadly the same in principle. The engine drives a series of pumps mounted radially around the central shaft, and these deliver the operating fluid, usually oil, under pressure to a series of fixed radial cylinders whose pistons are connected to the transmission shaft. The radius of the crank on to which these pistons drive can be varied, and since, at a given engine speed, the volume of fluid delivered by the pumps is constant, the ratio of the number of revolutions of the engine shaft and of the transmission shaft is in direct proportion to the capacity of the pumps and of the driving cylinders with the crank radius in use at the moment. A number of gears of this type is described in the *Proceedings* (1921) of the Inst. Mechanical Engineers (p. 843).

FIG. 7.—THE JOHNSON VALVE FOR LARGE PIPE LINE

in fig. 8 *a*, *b* and *c*. The hydraulic impeller *A* mounted on the driving or primary shaft delivers water into the guide ring *B*, where it is deflected into the turbine wheel *C* mounted on the driven shaft. The water leaving *C* again enters the impeller *A*, either directly or after passing through a small guide wheel, so that it circulates again and again through the system. Fig. 8 *b* and *c* show diagrammatically the blading as arranged respectively for driving in the same and opposite direction to the primary shaft. In practice a continual circulation of cold water is maintained through the transmitter by an auxiliary centrifugal pump. The efficiency is about 90 per cent.

Hydraulic Recoil Brake and Buffer Stop.—The necessity for some braking apparatus by which the kinetic energy of a heavy body, such as a moving train, or of a gun during recoil, might quickly and safely be absorbed without the tendency to rebound accompanying the use of spring buffers led to the invention of the hydraulic brake. In its simplest form this consists of a cylinder fitted with piston and rod and filled with some liquid, usually oil, water or glycerine. The two ends of the cylinder are connected, either by one or more small passages formed by holes in the body of the piston itself or by a by-pass pipe fitted with a spring-loaded valve or with a throttling valve by which the area may be adjusted. In its simplest form the brake is used extensively as a dashpot for damping the vibrations of governing mechanisms, etc. When used as a buffer stop, the body whose kinetic energy is to be absorbed forces in the piston rod and produces a flow of liquid from one side of the piston to the other at high velocity through the connecting orifices. The energy of the body is thus partly transformed into kinetic energy of the liquid, which is dissipated in eddy formation and partly expended in overcoming the frictional resistances of the connecting passages, together with the mechanical friction of the brake. The whole of the energy is thus transformed ultimately into heat. Since the energy absorbed by the brake is equal to the mean resistance of the brake multiplied by the length of its stroke, it is evident that the pressure in the brake cylinder will have its least maximum value when this pressure, and therefore the resistance, is uniform throughout the stroke and when in consequence the pressure-displacement diagram forms a rectangle. The brake is therefore preferably designed so as to give as nearly as possible uniform resistance; and since the resistance varies as the square of the velocity of the liquid through the connecting orifices, while the velocity of the moving body and therefore of the piston, varies from a maximum at the instant of impact to zero at the end of the stroke, it is necessary either to make the connecting passages of diminishing area towards the end of the stroke, so that the velocity of efflux may remain constant, or to discharge from one side of the piston to the other through a spring-loaded valve set to open at the required pressure. The former method is commonly used. The area of the connecting passage may be varied by forming it as a circular orifice through the piston and allowing this to work over a taper circular spindle fixed longitudinally in the cylinder, the available passage area varying with the diameter of the spindle. In an alternative arrangement, two rectangular slots are cut in the piston body and work over two longitudinal strips which are fixed to the interior cylinder walls and vary in radial depth from end to end.

FIG. 8.—DIAGRAMMATIC ARRANGEMENT OF FÖTTINGER TRANSMITTER

A. Hydraulic impeller
B. Ring of guide vanes
C. Turbine wheel

A similar device is used for absorbing the energy of recoil of large guns. The principle of one such recoil cylinder is shown in fig. 9. The liquid, escaping from left to right through the valve *V*, as the plunger is forced from right to left by the recoiling gun barrel, passes through the annular passage *O*, whose area depends on the position of the piston relative to the central taper spindle *T*. The piston is returned by springs, whose action is buffered near the end of the stroke by the resistance to the flow of liquid from the space *S* through the holes at *D*. As a liquid for use in recoil cylinders, castor oil or rangoon oil is good and keeps the leathers in condition. A mixture of four parts of glycerine to one of water is also good, as is a mixture of methylated spirits 66%, water 31%, mineral oil 3%, with 25 grains of carbonate of soda per gallon.

Hydraulic Dynamometer.—This, a device for measuring and absorbing the energy developed by a prime mover at a rotating shaft, was invented by William Froude and modified by Professor

Osborne Reynolds. It consists of a rotating disk mounted on the power shaft and carrying on its outer faces a series of narrow pockets. These are semicircular in section, their plane is inclined at 45° to the axis of the shaft and they face forwards in the direction of motion. An outer casing mounted on ball-bearings surrounds the rotator. This casing carries a double set of pockets similar to those on the disk, in the same planes but facing in the opposite direction. Water is admitted to the casing and entering the pockets in the disk is thrown outwards and forwards by centrifugal force into the pockets in the casing. These guide it backwards and return it into the pockets in the disk and so on. In this way a series of vortices is formed and the resistance to the

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 9.—HYDRAULIC RECOIL CYLINDER

change of momentum which takes place at each reversal of direction of the streams of water produces a braking effect on the disk and a tendency to rotation of the outer casing of the same amount. This is counteracted and measured by means of weights suspended from a horizontal lever attached to the casing. The resistance of the dynamometer can be regulated by varying the amount of water in the casing. In one modern form of the Froude dynamometer the casing is always full of water and the resistance is regulated by a sliding sluice plate fitted between the fixed and rotating pockets which cuts more or less of their periphery out of action. (For bibliography see HYDRAULICS.) (A. H. G.)

HYDRAULIC MOTORS. Now that the old overshot or undershot water-wheel is obsolete, there remain only two main types of hydraulic motor, namely, turbines (see TURBINE: Water) and reciprocating engines of the piston type (see HYDRAULIC MACHINERY).

HYDRAULIC POWER TRANSMISSION. In many instances the use of water under considerable pressure as a medium for the transmission of energy offers advantages over other methods of power transmission, and this is particularly the case where the power is required to operate machinery in which the action is either (a) comparatively slow, but in which a considerable force is required, and particularly where the motion requires to be regulated with great precision; or (b) very intermittent, a large force being required at intervals and for a comparatively short time. It is thus well adapted for the operation of presses, flanging and riveting machinery, lifts, hoists, cranes, capstans and testing machines.

In many large towns, of which London, Manchester and Glasgow are examples, customers are supplied from a central pumping station through a system of hydraulic mains. The pressure adopted varies from 700 to 1,600 lb. per square inch, being 750 lb. per square inch in the City of London, and 1,120 lb. per square inch at Manchester and Glasgow. In the older installations the pressure water was obtained from reciprocating pumps driven by steam engines, but in the most recent extensions, multi-stage high lift centrifugal pumps are used. The pumps feed accumulators, which in turn feed the supply mains. These are usually of cast iron. Flanged spigot and faucet joints are used with $\frac{3}{8}$ inch gutta-percha packing rings as shown in fig. 1, which illustrates a joint as used for a 6 inch pipe. Owing to the very high pressures used, even a small leakage is serious, and to guard against such a leakage from the mains or valves, a daily record of the minimum flow during the time the demand is at its lowest (between 11 P.M. and 4 A.M.) is kept by means of an automatic electrical recorder. Should this show an abnormal increase in the output for several consecutive nights, a detailed examination of the mains is made.

In the London installation the water is taken from the river or from wells, and as it is essential that all deposit should be

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 1.—SECTION OF JOINT FOR HIGH PRESSURE (1,120 LB. PER SQ. IN.) PIPE LINE

removed before use, it is allowed to stand for some time in storage tanks. The greater part of the solid matter thus becomes deposited. The water on its way to the pumps is then passed through the surface condensers of the engines to a series of filters, in which it is passed first through a layer of broken sponge, and afterwards through a bed of charcoal.

Transmission Losses.—The transmission losses are due to fluid friction in the pipe line. With water at a given pressure, the energy transmitted varies directly as the volume flowing per second, so that since the loss due to friction increases as the square of the velocity, the proportional effect of this diminishes as the working pressure increases, and for high efficiency of transmission the working pressure must be high.

It may readily be shown that the friction loss is equal to

$$\frac{0.635 f l H^3}{p^3 d^5} \text{ horsepower}$$

where H is the horsepower entering the pipe; l is the length and d the diameter of the pipe in feet; p is the pressure at the pipe inlet in lb. per sq. in.; and f is a coefficient of friction whose value, for a new cast iron pipe, is approximately .006. It follows that the efficiency of transmission equals

$$1 - \frac{0.635 f l H^3}{p^3 d^5}$$

and that this efficiency increases as p and d are increased. An increase in p however involves an increase in the thickness of the pipe walls and in the difficulty of preventing leakage at the joints, so that in practice it has not been found advisable to use pressures much greater than 1,500 lb. per square inch.

The point at which it ceases to pay to increase the diameter of the pipe line for a given horsepower, depends on the relative cost of the pipe line, including excavation, jointing and laying, and of the power production per horsepower. In general a size of pipe which allows of a pressure drop of about 10 lb. per square inch per mile is found to give most economical results in practice. With this drop and with a pumping pressure of 1,120 lb. per sq.in. the following are the efficiencies of transmission:

Length in miles	1	2	5	10	20
Efficiency	.991	.982	.955	.911	.821

It will be seen that for distances not exceeding 10 miles the efficiency is high. In modern practice the largest pipes are about 6 inches diameter, the pipe lines being duplicated for large powers. Such a pipe will transmit about 140 h.p. with a drop of pressure of 10 lb. per sq.in. per mile. The velocity of flow usually ranges from 2.5 to 4.0 ft. per second.

It may be shown that the maximum amount of power is transmitted through a given pipe line when the velocity of flow is such as to make the outlet pressure equal to two-thirds of the pressure at inlet, in which case the efficiency of transmission is only 66.6%. Under these conditions a 6 inch pipe line 1 mile long, having a supply pressure of 1,120 lb. per sq.in., would deliver energy at the rate of 570 h.p., the velocity of flow being 14.8 ft. per sec.

Accumulators.—Since the delivery from a reciprocating pump is not uniform and since it is necessary to have some reserve of energy to meet a sudden or abnormal demand, some means of storing pressure energy is a necessary adjunct to the hydraulic power station. With the high pressures in common use an elevated gravity storage tank is impracticable and the accumulator, devised by Sir W. G. Armstrong, takes its place. This is fitted between the pumps and the pressure main. The accumulator consists of a vertical cylinder fitted with a weighted ram, whose weight is adjusted so as to give the required pressure in the mains. In its most common form the ram (fig. 2) carries a platform which is loaded with some heavy material, usually pig iron or iron slag. If the output from the pumps exceeds the demand, the ram rises, and on reaching the upper limit of its travel moves a stop which, by suitable link connections, causes steam to be shut off from the pumping engine.

The energy-storage capacity is equal to the potential energy of the lifted ram and weight, and, if L is the length of its travel in feet, and W its weight in lb., is given by LW foot lb., or by pAL foot lb., where p is the working pressure in lb. per square inch and A is the cross sectional area of the ram in square inches. Thus if the diameter of the ram is 18 in. and if $p=1,120$ lb. per sq.in. and $L=20$ ft., the storage capacity is 5,700,000 ft.lb. or 2.9 h.p. hours. Such an accumulator could not give out energy in excess of the rate at which energy is being supplied to it by the pumps, at a greater rate than 2.9 h.p. for 1 hour; 17.4 h.p. for 10 minutes; or 174 h.p. for 1 minute.

From this example it is evident that the storage capacity of such an accumulator is not large and that its main function is not so much to store energy in the sense that an electric accumulator stores it, as to permit of momentary fluctuations in the rates of supply and demand, or in other words to act as a flywheel does in the case of a steam or gas engine. It also serves to regulate the delivery pressure. Its efficiency is high, up to 98 per cent of the energy expended in charging being returned during delivery.

Where the hydraulic power is to be used for operating such machines as riveters or presses, a small accumulator is often installed at the consumer's end of the pipe line. A modification of the simple type, known as the differential accumulator is shown in fig. 3. This consists of a fixed ram of area A , surrounded over the lower portion of its length by a closely fitting bush of area a . This bush terminates below the inlet and outlet holes. The ram passes through both ends of the storage cylinder, through glands of area $(A+a)$ and A , so that the effective cylinder area exposed to upward pressure is a .

Thus $pa=W$, and by making the bush of small thickness, a very large pressure may be maintained by a comparatively small weight.

Wave Transmission of Energy in a Pipe Line.—In the system of power transmission so far considered the energy is conveyed by a flow of high pressure water through the pipe from the pumps to the motor, and when this water has been passed through the motor it is discharged to waste. In the system of wave transmission of energy the fluid, which may be water or oil, is contained in a closed system consisting of the pump, the pipe line and the motor cylinder. If one end of a closed pipe line full of water be coupled to a reciprocating pump, the to and fro motion of the plunger will cause waves of alternate compression and rarefaction to be propagated through the fluid. The inward motion of the plunger is resisted by the inertia of the fluid, and those layers in contact with the plunger are compressed and absorb resilient energy. This state of pressure and of energy is propagated along the pipe as a pressure wave, with a velocity equal to that of sound in the fluid which, in the case of water, is about 4,700 ft. per sec. If at the remote end of the pipe a reciprocating motor of similar dimensions be fitted, this will be actuated by the changes of pressure, and if its motion is allowed to synchronise with that of the pump, will absorb the energy given to the fluid column by the latter, with the exception of that proportion wasted in friction in the pipe. Since the action is essentially due to elastic deformations of the fluid the volume displaced by the plunger per stroke can only be relatively small, and to enable even moderate powers to be transmitted the speed of the motor must be large. In practice it generally ranges from about 1,500 to 3,000 rev. per minute. The energy transmitted is proportional to the maximum pressure in the pipe line, and conse-

quently high working pressures are adopted, usually between 1,000 and 1,500 lb. per sq. inch. In practice a three-phase system is usually employed as giving more uniform torque and ease of starting. A three-cylinder generator having cranks at 120° gives vibrations to the fluid in three pipes which supply the cylinders of a three-cylinder motor having the same crank angles. The mean pressure within the system is maintained by a pump which returns any fluid leaking past the plungers.

The system, which was devised by G. Constantinesco, has been applied to the operation of rock drills, etc. It has the merit of safety and flexibility, but has not yet been adopted sufficiently extensively for an opinion to be expressed as to its possibilities. Little information is available as to its efficiency under normal operating conditions.

Gibson, *Hydraulics & its Applications* (1923); F. C. Lea, *Hydraulics* (1922); and *Mechanical Properties of Fluids* (1924). (A. H. G.)

HYDRAULICS, that branch of engineering science which deals with the practical application of the laws of hydrodynamics.

The chief physical properties of a fluid which affect its motion are its density, viscosity and compressibility. For all practical purposes the density of fresh water may be taken as 62.4 lb. per cu.ft. The viscosity varies appreciably with tempera-

ture. The coefficient of viscosity μ is given by $\mu = \frac{fsy}{v}$ where f_s is the resistance per unit area offered to the motion of a flat plate immersed in the fluid at a very small distance y from a parallel surface, and moving in the direction of its own length with velocity v .

Water is so slightly compressible that for all calculations involving steady motion it may be taken as incompressible. The compressibility becomes an important factor however where sudden changes of motion take place in a confined column, as when the valve at the end of a pipe line is suddenly opened or closed. The value of the modulus of compressibility K may be taken as approximately 310,000 lb. per sq.in.

Transmissibility of Pressure in an Enclosed Mass of Fluid.—If a closed vessel provided with a piston be filled with water, and if such a force be applied to this piston as will produce a pressure intensity of p lb. per sq.in. on its face, the pressure intensity at every point of the surface of the vessel will be increased by the same amount.

This property is taken advantage of in many hydraulic machines, notably in Bramah's hydraulic press, and in machines of a like type. In the hydraulic press water is forced by means of a small pump, whose plunger has an area a , into the cylinder of the press whose area is A . Neglecting friction, a force P , applied to the plunger of the force pump, will then produce a pressure intensity of P/a in the pump and press cylinder, and hence a force $Q=PA/a$ on the press plunger.

MOTION OF FLUIDS

The motion of a fluid may be of two kinds, viz., stream line and turbulent. In stream line motion the filaments move in definite paths and the resistance to flow is due purely to the shear of adjacent layers and is directly proportional to the viscosity and to the velocity. In turbulent motion the water moves in an eddying mass and the motion at a given point varies in an irregular manner from instant to instant. The resistance is only to a slight degree dependent on the viscosity and is proportional to the n th power of the velocity where n is approximately equal to 2.

At very low velocities, the motion is usually streamline, but as the velocity is increased the motion breaks down and becomes turbulent. For any particular case there is some particular velocity at which the change over from one type of motion to the other takes place, and this is known as the "critical velocity."

Several conditions combine to determine whether the motion of a fluid shall be streamline or turbulent. Osborne Reynolds, who first investigated the two manners of motion, came to the conclusion that the conditions tending to the maintenance of

FIGS. 2 AND 3.—ACCUMULATOR FOR HYDRAULIC PUMPING STATION (ABOVE); TWEDDELL'S DIFFERENTIAL ACCUMULATOR (BELOW)

streamline motion are: (1) an increase in the viscosity of the fluid; (2) converging solid boundaries; (3) free (exposed to air) surfaces; (4) curvature of the path with the greatest velocity at the outside of the curve; (5) a reduced density of the fluid. The reverse of these conditions tends to produce turbulence.

The effect of solid boundaries in causing turbulence appears to be due rather to their tangential than to their lateral stiffness. One remarkable instance of this is shown by the effect of a film of oil on the surface of water exposed to the wind. The oil film exerts a very small but appreciable tangential constraint, with the result that the motion of the water below the film tends to become unstable. This results in the formation of eddies below the surface, and the energy, which is otherwise imparted by the action of the wind to form and maintain stable wave motion, is now absorbed in the institution of eddy motion, with the well-known effect as to the stalling of the waves.

Where two streams of fluid are moving with different velocities the common surface of separation is in a very unstable condition. Generally speaking, wherever the velocity of flow is increasing and the pressure diminishing, as where lines of flow are converging, there is an overwhelming tendency to stability of flow. In a tube with converging boundaries this effect is sufficiently great to overcome the tendency to turbulent motion to which all solid boundaries, of whatever form, give rise, and the motion in such tubes is stable for very high velocities. On the other hand, the tendency to eddy formation is very great wherever the lines of flow are diverging and the velocity is diminishing in the direction of flow.

Critical Velocity.—The nature of the two modes of fluid motion was first demonstrated by Osborne Reynolds (Phil. Trans. Roy. Soc., 1883) in a series of experiments on parallel glass tubes of various diameters. These were fitted with bell-mouthed entrances and were immersed horizontally in a tank of water having glass sides (fig. 1). The water in the tank having become quite still the outlet valve *A* was opened, allowing water to flow slowly through the tube. A little aniline dye solution was introduced at the entrance to the tube through a fine tube supplied from the vessel *B*.

At low velocities this fluid is drawn out into a single colour band extending through the length of the tube. This appears to be motionless unless a slight movement of oscillation is given to the water in the supply tank when the colour band sways from side to side, but without losing its definition. As the velocity of flow is gradually increased, by opening the outlet valve, the colour band becomes more attenuated, still retaining its definition, until at a certain velocity eddies begin to be formed, at first intermittently, near the outlet end of the tube (fig. 2). As the velocity is still further increased the point of eddy initiation approaches the mouthpiece, and finally the motion becomes sinuous throughout. The apparent lesser tendency to eddy formation near the inlet end of the tube is due to the stabilizing influence of the convergent mouthpiece. The velocity at which eddy formation is first noted in such experiments is termed the "higher critical velocity." There is also a "lower critical velocity," at which the eddies in originally turbulent flow die out, and this is, strictly speaking, the true critical velocity. It has a much more definite value than the higher critical velocity, which is extremely sensitive to any disturbance, either of the fluid before entering the tube, or at the entrance. Over the range of velocities between the two critical values, the fluid, if moving with streamline flow, is in an essentially unstable state, and the slightest disturbance may cause it to break down into turbulent motion.

The determination of the lower critical velocity is not possible

by the colour band method, and Reynolds took advantage of the fact that the law of resistance changes at the critical velocity, to determine the values by measuring the loss of head accompanying different velocities of flow in pipes of different diameters. On plotting a curve showing velocities and losses of head, it is found that up to a certain velocity the points lie on a straight line passing through the origin of co-ordinates. Following this

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 3.—GRAPH OF LOG HEAD AND LOG VELOCITY IN FLOW THROUGH A PIPE LINE AT VELOCITIES ABOVE AND BELOW THE CRITICAL

there is a range of velocities over which the plotted points are very irregular, indicating general instability, while for still greater velocities the points lie on a smooth curve, indicating that the loss of head is possibly proportional to v^n .

To test this, and if so to determine the value of n , the logarithms of the loss of head h and of the velocity were plotted (fig. 3). Then if

$$h = kv^n, \\ \log h = \log k + n \log v,$$

the equation to a straight line inclined at an angle of $\tan^{-1} n$ to the axis of $\log v$, and cutting off an intercept $\log k$ on the axis of $\log h$. On doing this it is found that with motion initially unsteady the plotted points lie on a straight line up to a certain point *A*, the value of n for this portion of the range being unity. At *A*, which marks the lower critical velocity, the law suddenly changes and h increases rapidly. There is, however, no definite relationship between h and v until the point *B* is reached. Above this point the relationship again becomes definite, and within the limits of experimental error, over a fairly large range of velocities, the plotted points lie on a straight line whose inclination varies with the roughness of the pipe walls. The values of n determined in this way by Reynolds are:

Material of pipe	n
Lead	1.79
Varnished	1.82
Glass	1.79
New cast iron	1.88
Old cast iron	2.0

those for cast iron being deduced from experiments by Darcy.

Between *A* and *B* the value of n is greater than between *B* and *C*, and the increased resistance accompanying a given change in velocity is greater even than when the motion is entirely turbulent. This is due to the fact that within this range of velocities eddies are being initiated in the tube, and the loss of head is due not only to the maintenance of a more or less uniform eddy regime, but also to the energy absorbed in the initiation of eddy motion.

As a result of his experiments, Reynolds concluded that the critical velocity v_k is inversely proportional to the diameter d of the pipe, and is given by the formula

$$v_k = \frac{1}{b} \cdot \frac{P}{d}$$

where b is a numerical constant, and where P is proportional to the viscosity divided by the density, or μ/ρ . If the unit of length is the foot, b equals 25.8 for the lower critical velocity, and 4.06 for the higher critical velocity; while if t = temperature in degrees Centigrade,

$$P = \frac{1}{1 + 0.03368t + 0.000221t^2}$$

More recent experiments show that by taking the greatest care to eliminate all disturbance at entry to the tube, values of the higher critical velocity considerably greater than (up to 3.66 times as great as) those given by the above formula may be obtained. The probability is, in fact, that there is no definite higher critical

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIGS. 1 AND 2.—REYNOLDS' CRITICAL VELOCITY COLOUR BAND EXPERIMENTS

velocity, but that this always increases with decreasing disturbances.

A general expression for the lower critical velocity in a parallel pipe, applicable to any fluid and any system of units, is

$$v_k = \frac{2000\mu}{dP}$$

Thus for water at 0°C, $\mu/\rho = 1.92 \times 10^{-5}$ in foot-pound second units, so that

$$v_k = \frac{0.384}{d} \text{ ft./sec., where } d \text{ is in feet.}$$

Bernoulli's Theorem.—Water in motion possesses energy in virtue of its velocity, its pressure and its elevation. Thus water in motion with velocity v f.s. has kinetic energy $v^2 \div 2g$ ft.lb. per pound. Its pressure energy is $p \div w$ ft.lb. per pound where p is its pressure in pounds per square foot, and w its weight per cubic foot, and its potential energy is z ft.lb. per pound where z is its height in feet above datum level. Each of these expressions is equivalent to a height or head in feet. Thus $v^2 \div 2g$ is the height through which a body falling freely would attain a velocity v , while $p \div w$ is height of a column of water which would produce the pressure p at its base. $p \div w$ is therefore called the pressure head.

The total energy per lb. is equal to

$$\frac{p}{w} + \frac{v^2}{2g} + z \text{ ft.lb.}$$

If water flows from a point (1) to a point (2), and if there is no loss of energy between these points, the relationship

$$\frac{p_1}{w} + \frac{v_1^2}{2g} + z_1 = \frac{p_2}{w} + \frac{v_2^2}{2g} + z_2 = \text{constant}$$

holds. This is known as Bernoulli's theorem. If, due to wall friction or eddy formation, there is a loss of energy of h_f feet between (1) and (2) the equation becomes

$$\frac{p_1}{w} + \frac{v_1^2}{2g} + z_1 = \frac{p_2}{w} + \frac{v_2^2}{2g} + z_2 + h_f.$$

In hydraulic problems, pressures are always measured from atmospheric pressure as datum. For example the water in a parallel jet discharging under atmospheric pressure is taken as having no pressure energy.

Flow in a Pipe with Converging Boundaries.—Let A and a be the areas at the entrance to and at the throat of the pipe, and let its axis be horizontal. Then neglecting losses between A and a :—

$$\frac{p_A}{w} + \frac{v_A^2}{2g} = \frac{p_a}{w} + \frac{v_a^2}{2g}$$

Also

$$v_a a = v_A A.$$

$$\therefore \frac{p_A - p_a}{w} = \frac{v_A^2}{2g} \left\{ \left(\frac{A}{a} \right)^2 - 1 \right\}$$

or

$$Q = v_A A = A \sqrt{\left[\frac{2gh}{\left(\frac{A}{a} \right)^2 - 1} \right]} \text{ c.f.s.} \quad (1)$$

where h is the difference of pressure at A and a measured in feet of water.

The *Venturi meter* (fig. 4) consists essentially of such a converging pipe, which is extended beyond the throat to its original diameter. The meter is usually constructed with an upstream cone having an angle of convergence of about 20°, connected to a downstream cone whose angle of divergence is about 5° 30', by easy curves. One annular chamber surrounds the entrance to the meter, and a second surrounds the throat, the mean pressures in the pipe at these sections being transmitted to the chambers through a series of small holes in the wall of the pipe. The chambers are connected to the two limbs of a differential pressure gauge

which records their difference of pressure h in feet of water. For this purpose a U-tube containing mercury may be used as in fig. 4. In this case if the connecting pipes are full of water it may readily be shown that the difference of pressure in feet of water is equal to 12.59 times the difference of level of the tops of the mercury columns. By using an inverted U-tube, with compressed air supplied to the highest portion of the tube, the difference of pressure may be directly recorded in feet of water. Actually, owing to frictional losses the discharge is slightly less than is indicated by formula (1), and is given by

$$Q = CA \sqrt{\left[\frac{2gh}{\left(\frac{A}{a} \right)^2 - 1} \right]} \text{ c.f.s.}$$

where C varies from about .96 to .99, increasing slightly with the size of meter. The ratio $A:a$ is usually between 4:1 and 9:1, depending on the range of discharges to be measured.

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 4.—VENTURI METER

Change of Pressure Along a Radius in Curvilinear Motion.—If water be moving in a curved path the pressure along the radius of curvature varies. This change in pressure may be determined by considering the equilibrium of an elementary column of fluid of sectional area δa , having its axis radial, and its two ends in regions where the pressures are p and $(p + \delta p)$ respectively. The centrifugal force on the column is balanced by the difference of pressure on the two ends and we have, for equilibrium,

$$w \cdot \delta a \cdot \delta r \cdot \frac{v^2}{gr} = \frac{\delta p}{\delta r} \cdot \delta r \cdot \delta a$$

$$\frac{w v^2}{gr} = \frac{\delta p}{\delta r}$$

Vortex Motion—Pressure in a Rotating Liquid.—If a mass of liquid has a rotary motion about some axis, it is termed a Vortex. Such a vortex may be either of two types—forced or free.

An example of the first is seen when a vessel containing water is rotated for a sufficient time for the water to adopt the motion of the vessel. The second is seen when water flows freely through a hole in the bottom of a vessel. Here, the water moves spirally towards the centre with streamline motion, so that, neglecting viscosity, its energy per unit mass is everywhere the same. This is termed a "free spiral vortex."

Forced Vortex Motion with Uniform Angular Velocity.

—Since the angular velocity ω is constant, we have at any radius r , $v = \omega r$. The increase in pressure radially is given by

$$\frac{dp}{dr} = \frac{w}{g} \cdot \frac{\omega^2 r^2}{r} = \frac{w}{g} \omega^2 r.$$

Integrating between the limits r_1 and r_2 we have

$$\frac{p_1 - p_2}{w} = \frac{\omega^2}{2g} (r_1^2 - r_2^2).$$

If $p = p_0$ where $r = 0$,

$$\frac{p - p_0}{w} = \frac{\omega^2}{2g} \cdot r^2$$

or, putting $\frac{p}{w} = h$ (fig. 5a)

$$h - h_0 = \frac{\omega^2}{2g} \cdot r^2$$

which is the equation to a parabola.

Since the pressure at any point in the fluid is that equivalent to the column of water supported at the point, it follows that

all surfaces of equal pressure, including the free surface of the vortex, form paraboloids of revolution having the axis of rotation as their common axis.

Free Cylindrical Vortex Motion.—Here, since we have streamline motion, the equation $\frac{p}{\omega} + \frac{v^2}{2g} + z = \text{constant}$, holds, so that in any horizontal plane $\frac{p}{\omega} + \frac{v^2}{2g} = \text{constant}$. Differentiating,

$$\frac{1}{\omega} \frac{dp}{dr} + \frac{v}{g} \cdot \frac{dv}{dr} = 0.$$

Introducing the condition for rise in pressure across a stream tube, viz., $\frac{dp}{dr} = \frac{wv^2}{gr}$, this becomes

$$\frac{v^2}{gr} + \frac{v}{g} \frac{dv}{dr} = 0$$

$$\therefore \frac{dv}{dr} + \frac{v}{r} = 0, \text{ or } \frac{d(vr)}{dr} = 0$$

$$\therefore vr = \text{constant} = B$$

$$\therefore v = \frac{B}{r}.$$

Then if p_1, v_1, r_1 , are the attributes of a point in the same horizontal plane as p, v, r ,

$$\frac{p - p_1}{w} = \frac{v_1^2}{2g} \left(1 - \frac{r_1^2}{r^2} \right).$$

Putting $\frac{p}{w}$ constant in Bernoulli's equation, we get the equation to the curve of equal pressure, that is $\frac{v^2}{2g} + z = \text{constant} = C$, and substituting for v in terms of r in this we have

$$\frac{B^2}{2gr^2} + z = C$$

$$\therefore C - z = \frac{B^2}{2gr^2}$$

the equation to a curve of the nature $yx^2 = A$, which is asymptotic to the axis of rotation and to the horizontal through $z = C$ (fig. 5b).

Since the velocity varies inversely as the radius, and since this velocity cannot be infinite at the axis where $r = 0$, an air column is essential at the centre of a free vortex. When this air column

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 5.—(A) FORCED VORTEX. (B) FREE VORTEX

cannot be maintained, we get a combination of a forced vortex—at and near the axis—and a free vortex at points further removed.

FLOW FROM ORIFICES

If an opening be made in the side or base of a tank containing a fluid, convergent flow is set up from all sides towards the orifice. Owing to the inertia of the fluid the outer filaments of the issuing jet maintain their convergence for some little distance beyond the plane of the orifice. Up to this point the section of the jet gradually diminishes. The section at which the jet first becomes paral-

lel is termed the "*vena contracta*" and with a sharp-edged orifice is at a distance from the orifice equal to about 0.5 times the diameter. Up to this point the pressures inside the jet are greater than atmospheric owing to the centrifugal forces accompanying its curvature. At the *vena contracta* however the pressure is atmospheric throughout the jet.

Considering a particle in the jet (suffix o) as having at one time been in the surface of the tank (suffix i), we have

$$\frac{p_i}{w} + \frac{v_i^2}{2g} + z_i = \frac{p_o}{w} + \frac{v_o^2}{2g} + z_o.$$

But $p_i = p_o = 0$ both being atmospheric (datum) pressures, and $v_i = 0$ if the area of the tank is large compared with that of the orifice,

$$\therefore v_o = \sqrt{2g(z_i - z_o)} = \sqrt{2gh}$$

where h is the difference of level between *vena contracta* and the free surface in the tank.

Allowance for the small loss of energy up to the point of discharge is made by writing

$$v_o = C_v \sqrt{2gh}$$

where C_v , the coefficient of velocity, usually has a value of about .975.

If a and a_c are the areas of the orifice and of the *vena contracta*, the ratio a_c/a is termed the "coefficient of contraction," C_c , and the discharge is given by $C_c C_v a \sqrt{2gh} = C a \sqrt{2gh}$, where C is termed the "coefficient of discharge."

The values of C_c and of C vary with the type of orifice, with its situation, and to a small degree with its size. For a small sharp edged circular orifice remote from the sides of the tank, C is approximately 0.62. Its extreme values are about 0.52 and 0.99. The former is obtained with a sharp-edged re-entrant mouth-piece and the latter with a bell-mouthed orifice.

Submerged Orifices.—When an orifice, such as a sluice gate connecting two locks, is drowned, the effective head to be used in computing the discharge is the difference between the levels of the water surfaces on the two sides of the orifice. The coefficient of discharge is sensibly the same as that of the same orifice when discharging freely into air.

Velocity of Approach.—If the surface area of the vessel is not so large as to enable the velocity of approach to be neglected, we have

$$\begin{aligned} \frac{v^2}{2g} &= \frac{v_1^2}{2g} + (z_1 - z) \\ &= \frac{v_1^2}{2g} + h. \end{aligned}$$

The effective head producing efflux is now equal to the static head h plus the head equivalent to the kinetic energy of approach.

Flow over Weirs and Notches.—A weir may be looked upon as a large orifice whose upper edge extends to the surface of the water. If we assume that the velocity of efflux at a point distant x below the free surface is proportional to $\sqrt{2gx}$, the discharge over such a weir is given by

$$Q = K b H^{\frac{3}{2}} \text{ c.f.t. per second,}$$

where b is the length of the weir in feet; H is the head over the crest, measured to the level of still water above the weir; and K is an experimental coefficient, which varies with the type of weir and conditions of discharge.

In the case of a rectangular weir having a thin sharp edged crest and a vertical upstream face, the two most useful formulae are those of Francis and Bazin. In the Francis formula $K = 3.33$, while b is replaced by $b - 0.1nH$, where n is the number of end contractions. A weir with no end contractions is said to be "suppressed." In the Bazin formula,

$$K = \left(3.25 + \frac{0.789}{H} \right)$$

for a suppressed weir. These values of K apply where the area of the approach channel is so relatively large that the effect of the velocity of approach may be neglected. If, as is usually the

case in a suppressed weir, the velocity of approach is appreciable, the formulae become:

$$\text{Francis, } Q = 3.33(b - 0.1nH)\{(H+h)^{\frac{3}{2}} - h^{\frac{3}{2}}\} \text{ c.f.s.}$$

$$\text{Bazin, } Q = \left\{1 + .55\left(\frac{H}{P+H}\right)^2\right\} \left\{3.25 + \frac{.0789}{H}\right\} bH^{\frac{3}{2}} \text{ c.f.s.}$$

where, in the Francis formula, $h = v^2 \div 2g$, v being the mean velocity in the approach channel, while in the Bazin formula P is the height of the weir crest above the bed of the channel.

The above formulae apply only to a weir having free access of air to the under side of the falling sheet or nappe. If the nappe clings to the crest or front face of the weir, or if free access of air is prevented, the discharge is increased.

Triangular Weirs.—If the weir is thin-crested and sharp edged, and if θ be the angle between its two sides,

$$Q = 4.28c \tan \frac{\theta}{2} \cdot H^{\frac{5}{2}} \text{ c.f.s.}$$

where c depends slightly on θ and H is measured in feet.

$$\text{If } \theta = 90^\circ, c = .593, \text{ and } Q = 2.536 H^{\frac{5}{2}} \text{ c.f.s.}$$

$$\text{If } \tan \frac{\theta}{2} = 2, c = .618, \text{ and } Q = 5.29 H^{\frac{5}{2}} \text{ c.f.s.}$$

Cippoletti Weir.—If the sides of a weir having two end contractions be inclined outwards at an angle θ with the vertical (fig. 6) the value of K in the formula $Q = KbH^{\frac{3}{2}}$ is sensibly independent of the head if θ is such that the side slope is 1 horizontal to 4 vertical. Such a weir is called a Cippoletti weir. The discharge is given by

$$Q = 3.37 bH^{\frac{3}{2}} \text{ c.f.s.}$$

if the velocity of flow in the approach channel is negligible, and by

$$Q = 3.37b\{(H+h)^{\frac{3}{2}} - (h)^{\frac{3}{2}}\} \text{ c.f.s.}$$

as in the Francis formula, when the velocity of approach is taken into account.

Broad-crested Weirs.—Experiments indicate that if the width of the crest of a sharp edged weir is less than about $.33H$, the nappe will spring clear of the crest. Weirs with wider crests, in which the nappe adheres to the crest, are termed broad-crested weirs. Expressing the discharge over such a weir as

$$Q = K'bH^{\frac{3}{2}},$$

values of K' have been determined experimentally for a large number of weir sections, and are given in any standard work on Hydraulics.

Precautions To Be Adopted in Weir Gaugings.—The standard sharp edged weir having a free discharge, or, for small quantities, the right-angled triangular notch, are the only types for which the coefficients have been determined with sufficient accuracy to admit of use for measurement of flow without previous calibration.

For accurate measurement the following are essentials:—

1. Sharp edged weir sill, fixed so as to be incapable of vibration, having its face vertical and perpendicular to the direction of the stream, and, if rectangular, having its sill horizontal.

2. Clear discharge into air, with no adherence of the vein to the weir face.

3. Weir long in proportion to its depth, i.e., $b > 3H$.

4. H small in comparison with the depth of the approach channel, and sectional area of vein (bH) not greater than one-sixth that of this channel.

5. Suitable channel of approach. This should be as long and of as uniform section as possible so as to allow of the motion becoming steady before reaching the weir. The length should, if possible, exceed $30H$, this ratio being increased where the length of weir is largely in excess of $3H$.

6. Accurate determination of the head H . For accurate work the surface-level should not be taken in the stream itself, but in a stilling-box or pit from 18 in. to 2 ft. square communicating with the stream through a pipe of about 1 in. diameter. The zero of the gauge should be accurately adjusted to the level of the weir

crest. For accurate work, where individual readings are to be taken, a hook gauge, provided with a vernier for reading to the nearest .001 ft., and with screw adjustment, is best.

Fluid Friction.—When fluid flows over a stationary surface a resistance to motion is experienced. At velocities so low as to give stream line flow this resistance is

(1) directly proportional to the velocity of the fluid.

(2) directly proportional to the viscosity, μ .

(3) independent of the density, ρ .

(4) independent of the roughness of the surface.

At higher velocities at which the motion is sinuous or turbulent, the resistance is

(1) proportional to v^n where n usually lies between 1.8 and 2.0.

(2) varies as μ^{n-2} , and is therefore independent of the viscosity when $n=2$.

(3) varies as ρ^{n-1} and therefore varies directly as the density when $n=2$.

(4) increases with the roughness of the surface.

In the great majority of cases of practical importance, the motion is sinuous, and the frictional resistance may be written as

$$R = fSv^n$$

where S is the wetted area in sq. feet, v is the velocity in ft. per sec., and f is a roughness coefficient whose value varies from about .002 for a smooth surface to about .004 for such a surface as that of a cast iron pipe after being in use for some years.

Disk Friction.—The resistance to the rotation of a disk in water is an example of fluid friction. It may be shown that this resistance is equal to

$$\frac{4\pi f \omega^n}{n+3} r^{n+3} \text{ foot lb.}$$

where r is the radius of the disk in feet and ω is its angular velocity. This resistance is of importance in the design of centrifugal pumps and turbines. In some high speed centrifugal pumps the energy expended in this way amounts to as much as 15% of the total energy given to the shaft.

PIPE FRICTION

One very important effect of fluid friction is experienced in the resistance to the flow of water through a pipe line. This resistance can only be overcome by a drop in pressure in the direction of motion, and reasoning upon analogy to the resistance to motion over a plane surface it might be inferred that with turbulent motion the total resistance would equal fSv^n .

Putting

A = sectional area of pipe in sq.ft.

P = length of perimeter of pipe

$p_1 - p_2$ = drop in pressure in lb. per sq.ft. over a length l ft.

this becomes

$$(p_1 - p_2)A = f'Plv^n$$

or

$$p_1 - p_2 = f' \frac{P}{A} lv^n.$$

Here $A \div P$ = area/perimeter is termed the "hydraulic mean radius" and is commonly denoted by " m " so that

$$p_1 - p_2 = \frac{f'lv^n}{m}.$$

For a circular pipe $m = \pi r^2 \div 2\pi r = d \div 4$. The earlier experimenters, assuming the loss to be proportional to the kinetic energy, wrote this

$$h = \frac{flv^2}{2gm} \text{ ft.,}$$

or, in the form adopted by Chezy,

$$v = C\sqrt{mi} = C\sqrt{m(h/l)}$$

where C and f are coefficients whose values depend on the roughness of the pipe. These formulae, with the appropriate values

of f or of C for the particular pipe diameter and velocity are generally used in calculations. More recent investigations indicate that the coefficient also depends on the pipe diameter and on the velocity of flow, and that the index n is less than 2.0 except in a rough pipe, and tend to show that an exponential formula,

$$h = \frac{f l v^n}{d^5} \cdot \text{ft.}$$

more nearly agrees with experimental results. Values of f , n , and x have been determined by many observers, and the following table gives a few typical values:

Surface	f	x	n
New uncoated cast iron	0.0034	1.17	1.95
" asphalted " " " "	0.0044	1.45	1.89
" " riveted pipes	0.0039	1.37	1.90
Neat cement pipes	0.0024	1.31	2.00

Owing to the very convenient form of the Chezy equation, $v = C \sqrt{mi}$, it is often an advantage to have at hand values of C corresponding to various diameters and velocities of flow. Such approximate values are given in the following tables:

Material	Velocity f.s.	Diameter inches							
		6	12	18	24	36	48	60	72
New cast-iron	2	100	107	111	115	120	124
	4	104	111	115	119	124	128
	6	106	113	117	121	126	130
	8	107	114	118	122	127	131
Clean asphalted pipes; smoothly finished concrete pipes and cement-lined tun- nels	2	..	103	108	113	120	126	131	135
	4	..	108	113	118	126	132	137	141
	6	..	112	117	122	131	137	142	145
	8	..	115	120	125	134	141	146	149
New single riveted steel or wrought-iron pipes	10	..	117	122	127	136	143	148	151
	2	..	97	103	108	114	119	123	126
	4	..	103	109	114	120	125	129	132
	6	..	107	113	118	125	129	134	137
	8	..	109	115	121	128	133	138	141
	10	..	111	117	123	129	135	140	143

A new wood-stave pipe has values about 5% lower than a clean asphalted pipe.

After a period of use the incrustation of a pipe line diminishes its discharge. The rate and type of incrustation depends on the class of water and on the material of the pipe walls. To allow for this diminution, the pipe should be designed to give an initial discharge in excess of the requirements. The excess percentage discharge for different types of pipe should be approximately as follows:—

Type of pipe	Uncoated cast iron	Asphalted cast iron	Asphalted riveted wrought-iron or steel pipes	Wood stave	Cement
Discharge for which designed, in terms of desired dis- charge Q	1.55 Q	1.45 Q	1.33 Q	1.08 Q	1.06 Q

Flow Through Pipes Coupled Up in Parallel.—If a series of pipes of diameters d_1 , d_2 , etc., discharge in parallel between the same two points, so that the available head h is the same in each case, adopting the relationship,

$$h = \frac{k l v^n}{d^5},$$

the total flow Q , which equals $\frac{\pi}{4} (v_1 d_1^2 + v_2 d_2^2 + \text{etc.})$ c.f.s., becomes

$$Q = \frac{\pi}{4} \left(\frac{h}{k} \right)^{1/n} \left\{ \frac{d_1^{2+(x/n)}}{l_1^{1/n}} + \frac{d_2^{2+(x/n)}}{l_2^{1/n}} + \text{etc.} \right\}$$

$$= \frac{\pi}{4} \left(\frac{h}{k} \right)^{1/n} \sum \left(\frac{d^{2+(x/n)}}{l^{1/n}} \right) \text{ c.f.s.}$$

E.g., taking, as for a cast-iron pipe, $n = 1.953$, $x = 1.172$,

$$Q = \frac{\pi}{4} \left(\frac{h}{k} \right)^{.512} \sum \left(\frac{d^{2.60}}{l^{.512}} \right).$$

Thus two small pipes of diameter d , will give the same discharge as a single large pipe D , of the same length, if

$$2d^{2.60} = D^{2.60},$$

$$D = d \times 2^{\frac{1}{2.60}}$$

$$= 1.31d,$$

i.e., if

or one pipe 13.1 in. in diameter would give the same discharge as two 10 in. pipes.

Long Pipe Line, Terminating in a Nozzle.—Let A be the area, D the diameter, and V the velocity of flow in the pipe line, and let a , d and v refer to the nozzle. Thus if h be the available head, and if the Chezy formula be adopted, we have, in a long pipe line:

$$h = \frac{4V^2 l}{C^2 D} + \frac{v^2}{2g}$$

$$= \frac{v^2}{2g} \left\{ \frac{8gl d^4}{C^2 D^5} + 1 \right\}, \text{ since } VA = va.$$

$$\therefore v = \sqrt{\left(\frac{2gh}{1 + \frac{8gl}{C^2} \cdot \frac{d^4}{D^5}} \right)} \text{ ft. per second.}$$

In general, the coefficient of velocity, C_v , of a well-designed nozzle is about .985, and the velocity will be reduced in this ratio.

Since the energy discharged at the nozzle per second

$$= \frac{w a v^3}{2g} \text{ ft.lb.,}$$

the horse-power delivered at the nozzle is

$$\frac{w a C_v^3}{2g \times 550} \left\{ \frac{2gh}{1 + \frac{8gl}{C^2} \cdot \frac{d^4}{D^5}} \right\}^{\frac{3}{2}}$$

Water Hammer.—If, owing to the gradual closure of a valve at the lower end of a pipe line, the velocity of the water column is gradually reduced, the retardation being α ft. per second, this is accompanied by a rise in pressure at the valve of magnitude $\frac{w l \alpha}{g}$ lb. per square foot, or of $\frac{l \alpha}{g}$ ft. of water.

If however the valve closure is sudden, the elasticity of the water is involved. Each layer in turn is brought to rest, its kinetic energy is converted into strain energy, and the disturbance is propagated back to the open end of the pipe with the velocity of sound waves through the medium. Under these conditions, the phenomenon is known, as water hammer, and the rise in pressure p at the valve is obtained from the relationship

$$\frac{v^2}{2g} = \frac{p^2}{2Kw},$$

$$\text{or } p = v \sqrt{\frac{Kw}{g}} \text{ lb. square foot.}$$

Here K is the modulus of compressibility of the water, which has a mean value of 43.2×10^6 lb. per square foot. Adopting this value, $p = 63.7v$ lb. per square inch, a value which shows that

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 6.—CIPPOLETTI WEIR

excessively high pressures may be obtained with comparatively low velocities of flow where this action is set up. In a non-rigid pipe line some energy is expended in stretching the pipe walls, and the hammer pressure is reduced. Taking this into account, K' , the effective value of K , is given by

$$\frac{1}{K'} = \frac{1}{K} \frac{r}{2tE} \left(5 - \frac{4}{\sigma} \right)$$

where r is the radius and t the thickness of the pipe, and for steel pipes $E = 43.2 \times 10^8$ lb. per square foot and $\sigma = 3.6$.

It may be shown that pressures as great as those corresponding to instantaneous closure are attained if the time of valve closure does not exceed $2l \div V_p$ sec. Here V_p , the velocity of propagation of

pressure waves along the pipe line, is given by $V_p = \sqrt{\frac{Kg}{w}}$, and

is approximately 4,700 ft. per second for a rigid pipe line, but may be as low as 3,000 ft. per second for a large thin-walled pipe line. If the time of closure is greater than $4l \div V_p$ sec., the formula

$p = \frac{w\alpha}{g}$ lb. per square foot is applicable.

Variation of Velocity over the Cross Section of a Pipe.—

The velocity of flow at a cross section of a pipe increases from the walls to the centre. With stream line flow the curve of velocities is a parabola and the velocity at the walls is zero. With turbulent flow the curve of velocities is much flatter near the centre of the pipe. Experiment indicates that even when the flow as a whole is turbulent there is a very thin boundary layer in which the motion is non-turbulent, and that the velocity at the wall itself is zero.

Losses at Valves and Bends in a Pipe Line.—In addition to the losses due to wall friction in a pipe line, there are usually losses due to the presence of valves or bends which upset the normal lines of flow through the pipe. The loss of head due to a partially open valve or sluice is particularly serious, and is largely due to the expansion of the stream section on passing the constriction. The loss also depends largely on the design, so that values deduced from tests on any one type of valve cannot be taken as applying to another type. The following values have been determined experimentally from valves of the types shown in fig. (7 a and b). Here the loss equals $Fv^2 \div 2g$ ft., where v is the velocity in the pipe in ft. per sec.

Type of valve	Values of $d \div D$								
	.2	.3	.4	.5	.6	.7	.8	.9	
Circular sluice gate (fig. 7a), 2" diam.	30	11	4.2	2.1	.9	.35	.22	.07	Values of F
Circular sluice gate (fig. 7a), 24" diam.	36	11	3.0	1.6	1.0	
	Values of θ								
	5°	10°	20°	30°	40°	50°	60°	70°	
Butterfly valve (fig. 7b)	.24	.52	1.54	3.9	10.8	32.6	118	750	Value of F

Losses at Bends.—The loss due to a right-angled bend depends on the radius of curvature R of the bend. The best radius in practice is from 2.5 to 5.0 times the pipe diameter. For such bends the loss is given sufficiently nearly by $.3v^2 \div 2g$ ft. Where the bend is carried round an angle θ less than 90° , the loss is very nearly proportional to θ^2 .

FIG. 7.—(A) SLUICE VALVE. (B) BUTTERFLY VALVE

Loss Due to Enlargement of Section.—When a pipe line has its cross-sectional area suddenly increased from A_1 to A_2 sq.ft., so that the velocity is reduced from v_1 to v_2 f.s., violent eddy formation is set up and the consequent loss of head is given very closely by the expression

$$\frac{(v_1 - v_2)^2}{2g} \text{ ft.}$$

This loss may be reduced within limits by tapering the pipe gradually between sections (1) and (2), and so reducing the velocity gradually. In this case the loss of head is $k(v_1 - v_2)^2 \div 2g$, where k has the following mean values.

	θ°	2°	5°	10°	15°	20°	30°	40°
Circular pipe	K	.20	.13	.18	.27	.43	.75	.91
Rectangular pipe with one pair of sides parallel	K	..	.31	.18	.29	.48	.90	1.10

These losses include the skin friction in the pipe. This accounts for the value of F increasing as the angle of divergence θ of the sides is diminished below a definite value, about 6° in a circular pipe, and 11° in a rectangular passage, owing to the increasing length of pipe between points (1) and (2).

Flow in Pipe Lines—Hydraulic Gradient.—In designing a pipe line, the problem which usually presents itself is that of determining the minimum size of pipe which, with a given loss of head, will discharge a given volume of water per second. The available head is absorbed in giving the kinetic energy of flow in the pipe ($v^2 \div 2g$), and overcoming the pipe line losses which are due:

1. to eddy formation at the entrances to the pipe;
2. to bends, valves, changes of sections, etc.;
3. to wall friction.

The loss due to eddy formation at the entrance is small. With a bell mouthpiece it is about $.05v^2 \div 2g$ ft. With a pipe opening flush with the side of the reservoir it is about $.47v^2 \div 2g$ ft., and, with a pipe projecting into the reservoir, about $v^2 \div 2g$ ft.

When a submerged open-ended pipe line connects two reservoirs, the velocity of flow in the pipe will adjust itself until the difference of level, h , between their free surfaces is equal to the total head absorbed in these various sources of loss.

If a horizontal be drawn through the upper free water surface and if a series of ordinates be drawn vertically downwards from this to represent on the vertical scale of the drawing the total loss of pressure head from the pipe entrance to the particular point considered, the ends of such ordinates, being joined, give a curve called the hydraulic gradient for the pipe. If a series of open stand pipes were erected on the pipe line, the free surfaces in these pipes would lie on the gradient line, and the pressure in the pipe is represented, at each point, by its distance below this line. If the pipe is above the gradient line at any point, as is the case

FIG. 8.—PITOT TUBE

in a syphon, the pressure will be less than atmospheric. In order to prevent difficulties arising from liberation and accumulation of air at such points, and from admission of air at leaky joints, the greatest height above the gradient line should not in any case exceed 20 ft.

Measurement of the Flow in Pipes.

—The measurement of the flow in a pipe line may be obtained in several ways. Of these the use of the Venturi meter, the Pitot tube, and in very large pipes the current meter, are the most common. The Pitot tube (fig. 8) consists of a bent tube terminating in a small orifice pointing upstream, which is surrounded by a second tube whose direction is parallel to that of flow. A series of small holes in the wall of the outer tube admit water, at the mean pressure in their vicinity, to its interior, which is connected to one leg of a manometer. The other leg is connected to the central tube carrying the impact orifice. If v is the velocity of flow immediately upstream from this orifice, the pressure inside the orifice, where the velocity is zero, is equal to the sum of the statical pressure at the point, plus $kv^2 \div 2g$ ft. of water, where k is a constant whose value approximates closely to unity in a well-designed tube. It follows that the difference of level of the fluid in the two legs of the manometer equals $kv^2 \div 2g$ feet.

For measurements of the flow in pipes the instrument is

inserted into the pipe through a gland in the pipe wall. It should be used if possible at a section remote from any bend or source of disturbance. For approximate work the velocity of the central filament may be measured. This when multiplied by a coefficient which varies from .79 in small pipes to .86 in large pipes gives the mean velocity. Alternatively the velocity may be measured at the radius of mean velocity, which varies from about .7*a* in small pipes to .75*a* in large pipes, where *a* is the radius of the pipe. These values, however, only apply to a straight stretch of the pipe, and if it is necessary to make measurements near a bend, and in any case for accurate results the pipe should be traversed along two diameters at right angles, and the velocities measured at a series of radii. If δr is the width of an elementary annulus containing one series of such measurements whose mean value is *v*, the discharge is then given by

$$Q = \int_0^a 2\pi r v \delta r.$$

FLOW IN OPEN CHANNELS

As in the case of pipe flow, the earlier experimenters assumed the loss of head during steady flow in an open channel to be proportional to the square of the velocity, and adopted one or other modification of the Chezy formula

$$v = C\sqrt{mi},$$

where *m* is the hydraulic mean depth (=cross-sectional area [A]÷wetted perimeter [P]), and *i* is the gradient of the channel.

The best-known of these formulae are due to Ganguillet and Kutter, and to Bazin.

Ganguillet and Kutter put

$$C = \frac{41.66 + \frac{1.485}{n} + \frac{.00281}{i}}{1 + \left(41.66 + \frac{.00281}{i}\right) \frac{n}{\sqrt{m}}}$$

and Bazin put

$$C = \frac{157.6}{1 + \frac{\nu}{\sqrt{m}}}$$

The values of ν and *n* in these formulae depend on the roughness of the surface. For straight channels the following values are applicable:

	Character of surface	Bazin's ν	Kutter's <i>n</i>
A	Smooth cement or planed timber	.109	.009-.010
B	Unplaned timber, slightly tuberculated iron, ashlar and well-laid brickwork	.290	.012-.013
C	Rubble masonry and brickwork in an inferior condition; fine well-rammed gravel	.833	.017
D	Rubble in inferior condition; canals with earthen beds in perfect condition	..	.020
E	Canals with earthen beds in good condition	1.54	.0225

Bazin's formula appears on the whole to be the more reliable for artificial channels and conduits, and the corresponding values of *C* in Chezy's formula for the different surfaces and hydraulic mean depths are given in the following table:

Surface	Values of <i>c</i> computed from Bazin's formula				
	<i>m</i> = .5	<i>m</i> = 1.0	<i>m</i> = 2.0	<i>m</i> = 5.0	<i>m</i> = 10
A	137	142	146	150	152
B	112	122	131	140	145
C	72	86	100	115	125
D	61	74	88	104	115
E	50	62	76	93	106

Best Form of Channel.—Since in a channel of given sectional area *A*, the hydraulic mean depth $A \div P$ varies with the

form of the section, while the resistance to flow increases as $A \div P$ diminishes, it becomes important to determine what form of channel will give the maximum value of $A \div P$ for a given value of *A*, since this will give the maximum discharge for a given slope. Further, as the sectional area of this channel is a minimum, the cost of construction is a minimum, and since in general the perimeter *P* increases with the area, the cost of lining the channel is also a minimum.

FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)
FIG. 9.—TRAPEZOIDAL CHANNEL

Theoretically the best form of channel is the semicircular section, and for steel and wooden flumes this section is often adopted. For earthen channels the trapezoidal section (fig. 9) with sides sloping at *S* horizontal to 1 vertical is common, and, for rock channels, the rectangular section.

It may be shown that the most economical proportions for such sections are obtained when a circle, with its centre in the water surface, touches the sides and bottom. In a rectangular canal this means that the depth should be one-half the width. In a trapezoidal channel the condition to be satisfied is

$$(1 + S^2)d^2 = \left(\frac{b}{2} + Sd^2\right)^2,$$

where *b* is the bottom breadth and *d* the depth.

Such a channel has a hydraulic mean radius equal to $d \div 2$. Of the trapezoidal sections, that having side slopes of .5 to 1 is the most efficient. The section to be adopted, however, depends also on other considerations. The minimum permissible side slope depends on the character of the soil and varies from 0 to 1 in rock to 1.5 to 1 in ordinary loamy soil, and 2 to 1 in loose sandy soil. In loose soil a concrete lining enables side slopes of 1 to 1 to be used, and, by preventing erosion of the banks, enables higher velocities of flow to be adapted, while the increased smoothness of the channel enables these velocities to be attained without any greater loss of head. In such a case a concrete-lined channel may be cheaper than one which is unlined.

Velocity of Flow in Open Channels.—The permissible velocity of flow depends on the tendency to erosion of the sides and bed. Experiment shows that the safe velocity increases with the depth. For medium depths in light soil a mean velocity of from 1.2 to 1.8 f.s. is safe, while in firm loamy soil the safe velocity is from 3.0 to 3.5 f.s. On firm well-rammed gravel this may be increased to between 5 and 7 f.s. In a concrete-lined channel faced with cement, the maximum safe velocity with water which carries solid material in suspension is about 9 f.s. A higher velocity wears and roughens the bottom until this roughness reduces the velocity sufficiently to prevent further erosion. With a brick or dry-laid heavy rubble channel the velocity should not exceed 15 f.s. Any higher velocity necessitates

FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 10.—CONTOURS OF EQUAL VELOCITY IN AN OPEN CHANNEL

a carefully-laid facing of heavy masonry with cemented joints.

Distribution of Velocity in an Open Channel.—The distribution of velocity in a straight channel depends somewhat upon the mean velocity. The maximum velocity is found near the centre and in general below the surface, even with a downstream wind. Its depth varies from .1*h* to .4*h*, where *h* is the depth of the stream. The curves of fig. 10 show typical contours of equal velocity, and the distribution of velocity in a series of verticals in a rectangular channel. The curves of fig. 11 show the variations of velocity in a vertical plane. The effect of an

increase in mean velocity in raising the filament of maximum velocity is well shown by these curves. It is found that the depth of the point of mean velocity in any vertical is sensibly independent of the direction of the wind. It varies from about .55*h* to .70*h*, depending on the depth and roughness of the channel as indicated below.

Condition of bed	Gravel and small boulders				Small gravel and sand				Wood or cement			
Depth, feet.	0-2	2-4	4-6	6-10	0-2	2-4	4-6	6-10	0-2	2-4	4-6	6-10
Depth of point of mean velocity in terms of <i>h</i>	.54	.58	.62	.66	.57	.60	.65	.69	.61	.65	.68	.70

Generally speaking, the velocity at six-tenths depth in any vertical gives the mean velocity in that vertical within 5% except in abnormal cases, while the mean of the velocities at one-fifth and four-fifths of the depth also gives the mean velocity within narrow limits. While the surface velocity should only be used for gauging purposes when other measurements are impracticable, its value, on a still day, is between 80 and 100% of the mean velocity in its own vertical. This factor increases with the depth of the stream and with the smoothness of the channel.

Gauging of Stream Flow.—The method to be adopted in stream gauging depends on the size of the stream, its state, and on the degree of accuracy required. Where the installation of a weir capable of taking the whole flow is feasible, this forms the most accurate method. For a stream of medium size the rectangular weir is most suitable. For small flows the triangular notch has advantages. For large streams the weir becomes too costly as a temporary measuring device, and if no permanent weir is available the only way of obtaining the discharge is to measure the mean velocity of the stream and to multiply this by the cross-sectional area. The mean velocity may be obtained in a number of ways. (a) by current meter; (b) by floats; (c) by colour or chemical methods.

Current Meters.—Various types of current meter are in use. In one common type the meter is suspended from a rod or cable, and is provided with a guide vane which keeps its axis perpendicular to the direction of the current. The wheel makes and breaks the contact in an electrical circuit at each fifth and tenth revolution, thus enabling the number of revolutions to be indicated by means of a buzzer or telephone carried by the observer. The instrument is previously calibrated by towing at known velocities through still water, the number of revolutions corresponding to these velocities being recorded. It has the disadvantages that it cannot be used where floating grass or weed is prevalent and that it requires rating at frequent intervals. Further, it is unsuitable for very low velocities. The minimum permissible velocity depends on the type of meter, but in general varies from 3 to 6 in. per second.

Meter Observations.—The most usual method of using the meter is the "point" method, in which it is held successively at certain points in a cross section. In a shallow stream this may be done by mounting it on a staff which is carried by an observer in waders. In deeper streams it is attached to a heavy sinker, and is suspended from a convenient bridge or from a car carried by a cable across the stream, or from an outrigger fixed to an anchored boat.

In this method, the meter may either be held (1) at several equidistant points in a number of equidistant verticals, the mean velocity being deduced from these readings; (2) at six-tenths, or at mid-depth in a series of equidistant verticals, the mean velocity in each of these verticals then being found by applying a factor; (3) at the surface and bottom only, or at two-tenths

and eight-tenths of the depth in a series of verticals; (4) at the surface only. While the first method gives the most accurate results in a steady stream, the length of time necessary to obtain the many observations is a serious drawback, and renders it unsuitable in a stream which is rising or falling.

Generally speaking, the velocity at .6 of the depth will give the mean velocity in that vertical within 5%, while the velocity

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 12.—ELECTRICAL METHOD OF MEASURING MEAN VELOCITIES OF FLOW

at mid-depth multiplied by .96 will give the mean velocity within about 3 per cent. Method (3) in which the surface and bottom velocities are measured, is only suitable for shallow streams. Experiments show that the results are fairly accurate if the bed is smooth or gravelly, the depth from .4 to 1.0 ft., and the velocity from .5 to 1.5 ft. per second. For deeper streams the mean of readings at .2*h* and .8*h* is in close agreement with the mean velocity in the vertical, and this method is often adopted for general stream gauging.

While it is usually inadvisable to use the surface velocity alone for computing the discharge, it is sometimes impossible in times of flood to make any other measurements. The meter should then be sufficiently submerged to eliminate any disturbance of the surface. Except as affected by the wind, the surface velocity multiplied by a constant which varies from about .85 in a shallow stream to .95 in a deep stream gives the mean velocity in a vertical with a fair degree of approximation.

Soundings.—Simultaneously with the meter observations, soundings should be made from which the cross section of the stream may be obtained.

Having recorded the observations for a series of verticals over the cross section of the stream, these are plotted and a smooth curve is drawn through the plotted points. From this curve velocities are read off at the top and bottom, and at equal intervals of, say, each 0.5 feet and are set down in order.

Assuming that in a particular case there are six intervals of depth, giving seven such recorded velocities, including the surface velocity v_1 and the bottom velocity v_7 , the mean velocity in the vertical is then computed from the prismoidal formula for seven abscissae.

$$v_m = \frac{1}{18} \{ v_1 + v_7 + 4(v_2 + v_4 + v_6) + 2(v_3 + v_5) \}.$$

The cross section having been plotted, the areas of the various compartments, having such verticals as their centre lines, may be measured and the discharge through each compartment calculated. The sum of these gives the total discharge.

Float Measurements.—Floats may be divided into three classes: (1) surface floats; (2) sub-surface floats; (3) rod floats.

Surface floats are liberated at a series of points across the stream at the head of a long straight reach, whose length should be not less than about 200 ft., and the time occupied in covering a measured distance is noted. The surface velocity in each of a number of vertical sections is obtained by repeated observations,

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 13

and the mean velocity in each vertical is then obtained by multiplying the surface velocity by a factor varying from .85 to .95, depending on the depth and condition of the channel. The stream sections may be marked, in a channel of moderate width, by ropes hanging from a bridge or temporary support and trailing in the stream. In a large river this method is impracticable, and observations with the theodolite are necessary to determine the path of the float. The effect of the wind on the surface velocity renders this method of measurement very unsatisfactory.

Sub-surface floats consist of bodies having surfaces of large area, attached to small surface floats for ease of observation, the length of connection being adjusted so as to allow the true float to remain at any given depth. The velocity of the float will then be approximately that of the current at the required depth. A

FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 11.—VELOCITY AT THE CENTRAL VERTICAL IN AN OPEN CHANNEL

series of such floats liberated at different points in the cross section of a stream, the depth of each being .6 that of the stream at the point of introduction, may be taken as giving the mean velocities in their respective sections. This type is more reliable than the surface float. Experiments show that the errors involved by the use of such floats may be between 5 per cent and 25 per cent.

The "rod float" consists of a light wooden rod or tin tube about 1 in. in diameter, and made in adjustable lengths. The lower end of the bottom section is weighted, and the length adjusted until the rod floats vertically with its lower end clearing the bottom by a few inches. In a large river where these are not likely to interfere with navigation, logs of wood having their lower ends weighted, may be used. The velocity of the rod gives the mean velocity over the vertical in which it floats. The difficulty in using the rod lies in its tendency to drag over shoals and weeds, and to obviate this its lower end may be arranged to float at a height h_1 above the bed of the stream.

For such a case Francis gives the empirical formula

$$v_m = v_r \left[1.012 - .116 \sqrt{\left(\frac{h_1}{h}\right)} \right]$$

giving the mean velocity in the vertical containing the rod in terms of the velocity of the rod v_1 , and of h_1 , and h the depth of the stream. Here h_1 should be less than .25 h .

In channels of moderate and uniform depth, the rod float is capable of giving results in close agreement with weir gaugings.

Measurement of Velocity by Colour Injection.—The velocity may be determined by injecting colouring matter into the stream, and noting the time this takes to traverse a measured distance. For successful results the colour must be injected in a single burst. In clear water a solution of permanganate of potash may be used. In waters discoloured by organic matter or vegetable stains, red or green aniline dye gives good results.

Gauging by Chemical or Electrical Methods.—By adding a strong solution of some chemical, for which sensitive reagents are available, at a uniform and known rate into a stream, and by collecting and analyzing a sample taken from the stream at some point below, where admixture is complete, the volume of flow can readily be computed.

Electrical Method.—This is based on the fact that salt in solution increases the electrical conductivity of water. Two pairs of insulated electrodes (fig. 12) are mounted in the conduit at a measured distance apart, and are coupled to a battery with a voltmeter or ammeter in the circuit. Salt in solution is injected at a single burst at a point above the upper pair of electrodes and the passage of this over the electrodes is indicated by the deflection of the needle of the recording instrument. This method which is also applicable to pipe flow, is quicker, cheaper and probably more accurate than the chemical method.

These two methods are best adapted to rapid and irregular streams in which the admixture is most thorough and which, incidentally, are most difficult to gauge by other means.

Impact of Jets.—In the case of the impact of a jet on a stationary or moving surface, the force exerted in any direction is equal to the rate of change of momentum per second in that direction.

Impact on a Fixed Surface.—

Let a = sectional area of jet in square feet,

v = initial velocity in feet per second.

Then the weight of water impinging on the surface per second = wav lb.

The initial momentum of this in the original direction of motion

$$= \frac{wav^2}{g} \text{ ft.-lb. units.}$$

If θ be the angle through which the jet is diverted (fig. 13), and if the relative velocity of the water and the vane is unaffected by the impact, the final velocity in the original direction will be

$v \cos \theta$, and the final momentum in this direction will be $\frac{wav^2}{g} \cos \theta$.

∴ Change of momentum in this direction per second

$$= \frac{wav^2}{g} (1 - \cos \theta)$$

Similarly the final momentum per second at right angles to the

original direction is $\frac{wav^2}{g} \sin \theta$, and since the original momentum

in this direction is zero, the change of momentum is $\frac{wav^2}{g} \sin \theta$.

It follows that:—

The force exerted parallel to the original direction of jet

$$= \frac{wav^2}{g} (1 - \cos \theta) \text{ lb.}$$

The force exerted perpendicular to the original direction of jet

$$= \frac{wav^2}{g} \sin \theta \text{ lb.}$$

The resultant force on vane = $\frac{wav^2}{g} \sqrt{(1 - \cos \theta)^2 + \sin^2 \theta} \text{ lb.}$

$$= \frac{wav^2}{g} \sqrt{2 - 2 \cos \theta} \text{ lb.}$$

Impact on a Series of Moving Vanes.—If the vanes are moving in the original direction of motion of the jet, with velocity u , f.s., the relative velocity of the water and the vane is $v - u$, and the final absolute velocity of the water in the original direction of motion is

$$u + (v - u) \cos \theta.$$

The change of velocity in this direction is then

$$v - u - (v - u) \cos \theta = (v - u)(1 - \cos \theta),$$

and the change of momentum per second, or the force on the vanes, is given by

$$\frac{wav}{g} \cdot (v - u)(1 - \cos \theta).$$

The work done on the vanes

$$= \frac{wavu}{g} (v - u) \{1 - \cos \theta\} \text{ ft.-lb. per second.}$$

Differentiating with respect to u , it appears that this expression is a maximum when $u = \frac{v}{2}$, or when the velocity of the vanes is one-half that of the jet. If the friction on the vanes is taken into account, the best velocity for the vanes is slightly less than $\frac{v}{2}$, and in the case of a Pelton wheel, the ratio of u to v is usually between 0.45 and 0.47.

If $u = \frac{v}{2}$, the work done on the vanes

$$= \frac{wav^3}{2g} \left\{ \frac{1 - \cos \theta}{2} \right\} \text{ ft.-lb. per second.}$$

and since the kinetic energy of the jet per second is equal to $\frac{wav^3}{2g}$ ft.-lb., the efficiency is equal to $\frac{(1 - \cos \theta)}{2}$.

When $\theta = 180^\circ$, this equals unity, while if $\theta = 90^\circ$, the efficiency is 0.5.

Impact on One of a Series of Recurved Vanes Whose Direction

FROM GIBSON, "HYDRAULICS AND ITS APPLICATIONS" (CONSTABLE & CO.)

FIG. 14.—VELOCITY DIAGRAM

of Motion Makes an Angle with That of the Jet.—This problem is one of much importance in the design of impulse turbines. Let α be the angle between the directions of v and of u , and let θ be the total angle through which the vane is recurved (fig. 14). Then if, as is usual, the incidence is tangential, the relative velocity v_r of jet and vane at impact is given by

$$v_r^2 = v^2 + u^2 - 2vu \cos \alpha \text{ (triangle } abc \text{)}$$

and, neglecting friction and eddy losses, the relative velocity at discharge will be the same as this.

Also, for tangential incidence, the direction of the vane at incidence must be parallel to the direction of the jet relative to the vane, and must therefore make an angle β with the direction of motion of the vane where β is obtained from the relationship (triangle abc).

$$\sin \beta = \frac{v}{v_r} \cdot \sin \alpha.$$

The initial velocity of jet in the direction of motion of vane
 $= v \cos \alpha.$

The final velocity of jet in the direction of motion of vane

$$= u - v_r \cos(180^\circ - \theta - \beta)$$

$$= u + v_r \cos(\theta + \beta)$$

\therefore Change of momentum per sec. {
in direction of motion of vane}

$$= \frac{WQ}{g} \{v \cos \alpha - u - v_r \cos(\theta + \beta)\} \text{ lb.}$$

\therefore Force on vane in this {
direction} $= \frac{WQ}{g} \{v \cos \alpha - u - v_r \cos(\theta + \beta)\} \text{ lb.}$

HYDRAULIC TURBINE: see TURBINE, WATER.

HYDRAZINE. This compound of hydrogen and nitrogen is a colourless liquid boiling at 113.5°C and solidifying at about 0°C to colourless crystals (m.p. 1.4°C); it is somewhat heavier than water (sp.gr. 1.014/15° C) in which it dissolves with rise of temperature. Hydrazine, N_2H_4 or $\text{H}_2\text{N}\cdot\text{NH}_2$, was first prepared by Th. Curtius in 1887 during the study of the reactions of ethyl diazoacetate, $\text{N}_2\text{:CH}\cdot\text{CO}_2\text{C}_2\text{H}_5$, an ester obtained by the action of potassium nitrite on the hydrochloride of ethyl aminoacetate. On heating with concentrated aqueous caustic potash, ethyl diazoacetate is converted into bisdiazoacetic acid, $\text{C}_2\text{H}_2\text{N}_4(\text{CO}_2\text{H})_2$, which on digestion with warm dilute sulphuric acid yields oxalic acid and hydrazine sulphate. Another preparation of hydrazine, also due to Curtius (1896), consists in boiling aminoguanidine with dilute acids or alkalis (see GUANIDINE). It can also be produced by reducing potassium dinitrosulphonate in cold water with sodium amalgam. F. Raschig (1908) obtained good yields of hydrazine by oxidising ammonia with sodium hypochlorite in aqueous solutions rendered viscous with 0.2% of joiner's glue, and this method is employed on a commercial scale. By fractional distillation of the aqueous solution, hydrazine hydrate, $\text{H}_2\text{N}\cdot\text{NH}_2\cdot\text{OH}$, is obtained as a colourless fuming liquid with strongly alkaline and caustic properties, corroding glass like the caustic alkalis and destroying cork and indiarubber. It boils at 119°C and has specific gravity 1.03 at 21°C . It remains liquid at -40°C .

On distilling hydrazine hydrate with an alkaline dehydrating agent such as barium oxide or solid caustic potash, anhydrous hydrazine is obtained (see above). Hydrazine forms a sparingly soluble sulphate, $\text{N}_2\text{H}_4\cdot\text{H}_2\text{SO}_4$, employed in its commercial preparation, and mono- and di-hydrochlorides, $\text{N}_2\text{H}_4\cdot\text{HCl}$ and $\text{N}_2\text{H}_4\cdot 2\text{HCl}$. In aqueous solution hydrazine is a powerful reducing agent eliminating copper and silver from their salts; it is very poisonous, even through the skin.

Organic Hydrazines.—These properties persist in the organic derivatives of hydrazine of which *phenylhydrazine*, $\text{C}_6\text{H}_5\cdot\text{NH}\cdot\text{NH}_2$,

is the most important. This useful reagent was discovered by E. Fischer in 1877 and employed by him in his classical researches on the sugars. It is best prepared by reducing benzenediazonium chloride, $\text{C}_6\text{H}_5\cdot\text{N}_2\text{Cl}$, with stannous chloride in hydrochloric acid solution, when phenylhydrazine is liberated by caustic soda from its precipitated hydrochloride. It is a colourless, oily liquid rapidly turning brown on exposure; it boils at 241°C and solidifies to tabular crystals melting at 23°C . Phenylhydrazine is a basic compound slightly soluble in water and forming well-defined salts with the strong acids. It serves to detect organic substances containing carbonyl groups (see ALDEHYDES, CARBOHYDRATES and KETONES) since it condenses with them to form hydrazones, with elimination of water. The hydrazones and ortho-dihydrazones (osazones) are generally well-characterised crystalline derivatives.

Phenylhydrazine, moreover, is an important synthetic reagent (see ANTIPYRINE) and its sulphonic acid is employed in the production of pyrazolone colours and tartrazine (see DYES, SYNTHETIC). (G. T. M.)

HYDRAZOIC ACID, a highly explosive chemical compound of the formula N_3H , known also as azoimide (*q.v.*); its salts are known as azides, and lead azide (*q.v.*) is a powerful detonator.

HYDRAZONE, in chemistry, a compound formed by the condensation of a hydrazine (*q.v.*) with an aldehyde (*q.v.*) or a ketone (*q.v.*).

HYDROCARBON, in chemistry, a compound of carbon and hydrogen. The simplest hydrocarbons are gaseous, many are liquid, and the more complicated are solid. Many occur in nature: for example, natural gas, petroleum and paraffin are mainly composed of such compounds; other natural sources are india-rubber, turpentine and certain essential oils. They are also revealed by the spectroscope in stars, comets and the sun. Of artificial productions the most fruitful and important is provided by the destructive or dry distillation of many organic substances; familiar examples are the distillation of coal, which yields ordinary lighting gas, composed of gaseous hydrocarbons, and also coal tar (*q.v.*) which, on subsequent fractional distillation or treatment with solvents yields many liquid and solid hydrocarbons, some of high industrial value. For details reference should be made to the articles wherein the above subjects are treated. From the chemical point of view the hydrocarbons are of fundamental importance, and, on account of their great number and still greater number of derivatives, they are studied as a separate branch of the science, namely, organic chemistry. (See CHEMISTRY: Organic.)

HYDROCELE, the medical term for any collection of fluid other than pus or blood in the neighbourhood of the testis or cord. The fluid is usually serous. Hydrocele may be congenital or arise in the middle-aged without apparent cause. The hydrocele appears as a rounded, fluctuating translucent swelling in the scrotum, and when greatly distended causes a dragging pain. Palliative treatment consists in tapping aseptically and removing the fluid, the patient afterwards wearing a suspender. The condition frequently recurs and necessitates radical treatment. Various substances may be injected; or the hydrocele is incised, the tunica partly removed and the cavity drained.

HYDROCEPHALUS, a term applied to disease of the brain which is attended with excessive effusion of fluid into its cavities. It exists in two forms—*acute* and *chronic hydrocephalus*. Acute hydrocephalus is another name for tuberculous meningitis (see MENINGITIS).

Chronic hydrocephalus, or "water on the brain," consists in an effusion of fluid into the lateral ventricles of the brain and depends upon congenital malformation or upon chronic inflammatory changes affecting the membranes. When the disease is congenital its presence in the foetus is apt to be a source of difficulty in parturition. It is, however, more often developed in the first six months of life; but it occasionally arises in older children, or even in adults. The chief symptom is the gradual increase in size of the upper part of the head out of all proportion to the face or the rest of the body. Occurring at an age when as yet the bones of the skull have not become welded together, the enlargement may go on to an enormous extent, the spaces between the bones

becoming more and more expanded. In a well-marked case the deformity is very striking; the upper part of the forehead projects abnormally, and the orbital plates of the frontal bone being inclined forwards give a downward tilt to the eyes, which have also peculiar rolling movements.

The expansibility of the skull minimises destructive pressure on the brain, yet this organ is materially affected by the presence of the fluid. The cerebral ventricles are distended, and the convolutions are flattened. As a consequence, the functions of the brain are interfered with and the mental condition is impaired. The child is dull, listless and irritable, and sometimes imbecile. The special senses become affected as the disease advances; sight and hearing are often lost. Hydrocephalic children generally sink in a few years; nevertheless, there have been instances of persons with this disease living to old age.

Various methods of treatment have been employed, but the results are uniformly unsatisfactory.

HYDROCHARITACEAE, in botany, a family of monocotyledons, belonging to the series Helobiae. They are water-plants, represented in Britain by frog-bit (*Hydrocharis morsus-ranae*) and water-soldier (*Stratiotes aloides*). The family contains about 50 species in 13 genera, 10 of which occur in fresh water while 3 are marine; and includes both floating and submerged forms. *Hydrocharis* floats on the surface of still water, and has rosettes of kidney-shaped leaves, from among which spring the flower-stalks; stolons bearing new leaf-rosettes are sent out on all sides, the plant thus propagating itself in the same way as the strawberry. *Stratiotes aloides* has a rosette of stiff, sword-like leaves, which project above the surface when the plant is in flower. It is stoloniferous, the young rosettes sinking to the bottom at the beginning of winter and rising again to the surface in the spring. *Vallisneria* (eel-grass) contains two species, one native of tropical Asia, the other inhabiting the warmer parts of both hemispheres and reaching as far north as south Europe. It grows in the mud at the bottom of fresh water, and the short stem bears a cluster of long, narrow, grass-like leaves. New plants are formed at the end of horizontal runners. Another type is represented by *Elodea*

canadensis or water-thyme, which has been introduced into the British Isles from North America. It is a small, submerged plant with long, slender, branching stems bearing whorls of narrow, toothed leaves; the flowers appear at the surface when mature. In *Hydrocharis*, a dioecious plant, the flowers are borne above the surface of the water, have conspicuous white petals, contain honey and are pollinated by insects. *Stratiotes* has similar flowers which come above the surface only for pollination, becoming submerged again during ripening of the fruit. In *Vallisneria* which is also dioecious, the small male flowers are borne in large numbers in short-stalked spathes; the petals are minute and scale-like, and only two of the three stamens are fertile; the flowers become detached before opening and rise to the surface, where the sepals expand and form a float bearing the two projecting semi-erect stamens. The female flowers are solitary and are raised to the surface on a long, spiral stalk; the ovary bears three broad styles, on which some of the large, sticky pollen-grains from the floating male flowers get deposited. After pollination the female flower is drawn below the surface by the spiral contraction of the long stalk, and the fruit ripens near the bottom.

The family is a widely distributed one; the marine forms are tropical or subtropical, but the fresh-water genera occur also in

FROG-BIT (*HYDROCHARIS MORSUS-RANAE*), COMMON IN EUROPE AND THE GREATER PART OF ASIA

the temperate zones. In addition to the water-thyme (*Elodea*), found across the continent, and the eel-grass (*Vallisneria*), of the eastern States and Canada, the family is represented in North America by the American frog-bit (*Limnobium Spongia*), of the southeastern States, and the marine *Halophila Engelmannii*, of the Florida coast.

HYDROCHLORIC ACID, a liquid chemical reagent of great industrial significance sometimes known as *muratic acid* or *spirits of salt*. It consists essentially of a solution of gaseous hydrogen chloride in water. This gas, which is less appropriately termed hydrochloric acid gas, is the compound actually evolved by the action of concentrated sulphuric acid on common salt.

In its physical and chemical properties, gaseous hydrogen chloride differs fundamentally from its aqueous solution which is hydrochloric acid. The former is a colourless gas liquefied only at a very low temperature (boiling point -83.4°C). When dry it has a very low electrical conductivity, and it retains this property even in the liquid and solid conditions. When thoroughly dry, hydrogen chloride and ammonia do not combine to form ammonium chloride. (See DRYNESS [CHEMICAL].)

Hydrochloric acid is a liquid which readily conducts the electric current and in doing so undergoes decomposition (electrolysis, *q.v.*). Hydrogen is evolved at the cathode (*q.v.*), whereas the anode (*q.v.*) gas is oxygen or chlorine, depending on the concentration of hydrogen chloride in the solution. A 20% solution of hydrogen chloride in water boils at 110°C under 730 mm. pressure.

Manufacture.—Hydrochloric acid is manufactured principally from common salt by the action of sulphuric acid.

This process is accomplished commercially by mixing sulphuric acid with salt in large iron pans surrounded with brickwork so arranged that the pan can be heated underneath while the hydrochloric acid gas escapes through a flue. The hot gas is then cooled and passed into stone towers, filled with coke or earthenware shapes, down which water is made to trickle. This absorption, though apparently simple, is complicated in at least two respects. The general law governing the solution of any gas in a liquid is that the greater the concentration of that gas and the lower the temperature of the liquid the more gas will be taken up. Now the acid gas leaving the above apparatus is mixed with a considerable and sometimes large quantity of air, and the introduction of the gas into the water generates a large quantity of heat. It is evident, therefore, that the exclusion of as much air as possible from the initial process and thorough cooling during the subsequent stages are essential; and much ingenuity has been expended in devising plant to accomplish this.

Another method is the direct burning of chlorine in an atmosphere of hydrogen gas: this gives a very pure product and forms a convenient outlet for chlorine. Properly speaking, hydrochloric acid is a gas. As this would be a most inconvenient form in which to transport and use it, it is therefore absorbed (as described) in water in which it is extremely soluble. The resulting liquor usually contains from 27 to 37% by weight of the acid; it has a pungent and irritating smell, and is dangerous to handle by those who are not aware of its properties. It is packed mostly in glass carboys surrounded by an iron protective frame. Pure hydrochloric acid in this form is colourless, but the ordinary commercial variety frequently is tinged more or less yellow on account of impurities accumulated during the process of absorption in water. Chemically it is extremely active and belongs to the class of "strong" acids. The aqueous solution will readily attack nearly all metals, forming the corresponding chlorides and disengaging hydrogen gas; gold and platinum are not affected; lead, silver and mercury are only partially dissolved owing to the formation of a protective coating of insoluble chloride. It is thus evident that the handling of the acid in the process of manufacture, and subsequently, is beset with some difficulty and that the acid can only be allowed

to come into contact with stoneware, glass, ebonite and similar materials upon which it does not act.

It combines energetically, with the production of much heat, with strong bases such as soda, potash, ammonia and so on. It will readily dissolve metallic oxides, of which common rust (oxide of iron) is an example, and upon this property is based one of its most important commercial applications, namely, the cleaning of the surface of iron sheets previous to tinning or galvanizing. Huge quantities are used for this one purpose alone, and indeed this forms the principal item of the acid makers' trade. When mixed with nitric acid it forms the so-called "aqua regia," which has the property of dissolving gold, platinum and closely allied metals.

Hydrochloric acid can readily be converted into elementary chlorine by the action of atmospheric oxygen in conjunction with chloride of copper which in some way promotes the action. This formed the basis of the Deacon process for the manufacture of chlorine (*q.v.*), and provided an outlet for the large surplus of hydrochloric acid produced in the first stage of the Le Blanc soda process. As the Le Blanc process has now been replaced by the Solvay Ammonia-Soda method, which does not produce hydrochloric acid as a by-product, the former surplus of acid no longer exists and the Deacon process has fallen into disuse. The residue of the hydrochloric acid made, besides that used by the metal and galvanizing trades, is absorbed by the textile and artificial silk manufacturers, by dyestuff makers, and by chemical industry in general. (See CHLORINE IN INDUSTRY.)

See J. W. Mellor, *A Comprehensive Treatise of Inorganic and Theoretical Chemistry* (1922).

(A. E. H.)

HYDRODYNAMICS, the branch of hydromechanics which deals with the motion of fluids (see HYDROMECHANICS).

HYDRO-ELECTRIC POWER GENERATION: see ELECTRICAL POWER GENERATION: *Hydro-Electric Generation*.

HYDROGEN, a chemical element, appears to have been recognized by Paracelsus in the 16th century, but the first definite experiments concerning its nature were made in 1766 by H. Cavendish, who showed that it was produced by the action of hydrochloric or sulphuric acid on certain metals. (Symbol H, atomic number 1, atomic weight 1.008.) Cavendish called it "inflammable air," and it was confused with other inflammable gases, all of which were supposed to contain "phlogiston," the inflammable principle, until he showed that water was the only substance produced when hydrogen was burned in air or oxygen, and that, contrary to A. L. Lavoisier's views, no acid was formed. W. Prout's hypothesis, that all other elements were built up from atoms of hydrogen (1815), remained unsubstantiated till the work of F. W. Aston, over 100 years later, showed that the proton, *i.e.*, the hydrogen atom deprived of its electron, does in fact fulfil this function.

Hydrogen is found in the free state in some volcanic gases, in certain stars and nebulae, in some meteorites and in the atmosphere of the sun. Although it forms only about 0.001% of our air at ordinary altitudes, it may constitute a much larger proportion at very great heights. In combination, it is found as a constituent of water, in the gases from certain mineral springs, in many minerals, and in most animal and vegetable tissue. It may be prepared by the electrolysis of acidified water, by the decomposition of water by various metals such as sodium, and by the action of acids or caustic alkalis on many metals. The decomposition of steam by red-hot iron was first studied by H. St. C. Deville; the reaction takes place in a series of stages but may be expressed as $3\text{Fe} + 4\text{H}_2\text{O} \rightleftharpoons \text{Fe}_3\text{O}_4 + 4\text{H}_2$. The lower the temperature the larger the ratio of hydrogen to water, but actually the equilibrium is set up very slowly below about 800° C. Calcium hydride, or "hydrolith," prepared by passing hydrogen over heated calcium, is used as a portable source of the gas for filling balloons, etc., since water decomposes it with the production of a cu. metre of gas per kg. of solid. In the "silical" process, a mixture of silicon (usually as ferro-silicon) and caustic soda (sometimes mixed with slaked lime and then known as "hydrogenite"), is used for the same purpose: $2\text{Si} + 2\text{NaOH} + 3\text{H}_2\text{O} = \text{Na}_2\text{Si}_2\text{O}_5 + 4\text{H}_2$. Aluminium amalgam and water, or aluminium, caustic soda and a little mercuric oxide, are also used in the production of hydrogen.

The gas obtained from hydrochloric or sulphuric acid and metals (usually zinc or iron) is often very impure, and if pure acids and pure metals are used, the reaction is very slow but may be accelerated by the addition of a copper or platinum salt, the acceleration in either case being due to the formation of, *e.g.*, a zinc-copper couple.

Hydrogen is often prepared technically by the action of steam on red-hot coke ($\text{C} + \text{H}_2\text{O} \rightleftharpoons \text{CO} + \text{H}_2$ and $\text{C} + 2\text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + 2\text{H}_2$; see CARBON), but unless the resulting "water-gas" is to be utilized as such, the oxides of carbon may be harmful. F. Bergius claims that if the water is kept as a liquid at 340° C by high pressure, and 1% of thallium chloride is mixed with the coke, only the second reaction takes place, *i.e.*, no carbon monoxide is formed. The hydrogen for synthetic ammonia (*q.v.*) in Claude's process is obtained by the action of steam on calcium carbide at a red heat: $\text{CaC}_2 + 5\text{H}_2\text{O} = \text{CaO} + 2\text{CO}_2 + 5\text{H}_2$, and the gas is freed from carbon dioxide by cooling and expansion (see LIQUEFACTION OF GASES). Hydrogen of 97% purity is prepared on a large scale by the electrolysis of a 15% solution of caustic soda at 70° C.

Pure hydrogen is a colourless, tasteless, odourless gas of density 0.06947 (air=1), *i.e.*, 1 litre at 0° C and 760 mm. weighs 0.089873 gram (Lord Rayleigh; E. W. Morley). The liquid, which has a specific gravity of only 0.07, boils at -252.6° C, and the solid melts at -259° C. The gas obeys Boyle's law at low pressures (up to 150mm.) but at higher pressures it is not sufficiently compressible, the deviation being 0.1% at 0° C and 760mm.; its specific heat at constant volume is 2.39 at 0° C and that at constant pressure is 1.41 times as great. Hydrogen is only slightly soluble in water (about 2% by volume under ordinary conditions), but is fairly soluble in liquid air. It diffuses rapidly through porous materials and also through some metals at a red heat. Palladium and some other metals absorb large volumes of the gas, especially if they are finely divided as in palladium black; it was once thought that a hydride, Pd_3H , was formed, but C. Hoitsemma showed that the process was purely one of adsorption (*q.v.*); moreover, E. B. Maxted showed that the extent of adsorption was influenced by impurities in the metal, and J. B. Firth found that it depended on the proportion of crystalline and amorphous palladium.

Hydrogen burns with a pale blue, non-luminous flame, but it does not support combustion. Its mixture with air or oxygen is highly explosive, especially if the volume of oxygen is half that of hydrogen (compare $2\text{H}_2 + \text{O}_2 = 2\text{H}_2\text{O}$), but H. B. Baker has shown that the perfectly dry, pure gases will not combine (see DRYNESS [CHEMICAL]). Hydrogen combines violently with fluorine even at -250° C, and its reaction with chlorine is greatly accelerated by sunlight or other actinic light; it combines with carbon at 1,200° C to give methane under certain conditions (W. A. Bone and H. F. Coward), but at higher temperatures increasing amounts of acetylene are formed, *e.g.*, at 3,000° C in the electric arc (M. Berthelot). The alkali and alkali-earth metals give hydrides when heated in a current of hydrogen, and these have the formulae NaH , CaH_2 , etc.; that of barium (*q.v.*) is the least stable. Hydrogen is a powerful reducing agent, especially when occluded in palladium (see above) or when in the "nascent" state, *i.e.*, when generated in the presence of the substance to be reduced, as in the reduction of ferric salts to ferrous by the addition of pure zinc to the acid solution, or as in the use of sodium amalgam in organic reductions. Gaseous hydrogen is not so effective, although its efficiency is sometimes increased by pressure, as in the reduction of mercuric chloride solution under 100 atmos. pressure; in conjunction with colloidal palladium, it has been applied by C. Paal to many reductions in organic chemistry. P. Sabatier and J. B. Senderens effected a number of reductions by the use of hydrogen in the presence of finely divided reduced nickel at 150-200° C, and a similar method is used commercially in reducing liquid (unsaturated) fats to solid (saturated) fats. (See HYDROGENATION.) Hydrogen is used in the reduction of metallic oxides to the metal, in the oxy-hydrogen flame for welding; etc., and in the fixation of atmospheric nitrogen. (See NITROGEN, FIXATION OF.)

A triatomic form of hydrogen, H_3 , has been described by G. L.

Wendt and R. S. Landauer by electric discharge in the dry gas at low pressures; this is only stable for one minute and can only be obtained to the extent of 0.02%; it is very reactive chemically, reducing potassium permanganate solution or sulphur instantly, and condenses to a liquid when cooled by liquid oxygen. The existence of this active hydrogen is disputed by F. Panetti (1927).

Hydrogen combines with oxygen to produce water (*q.v.*) in the ratio of 2.00288 volumes to 1 (at 0° C and 760 mm.) or 2.0154 parts to 16 by weight. A second oxide, hydrogen peroxide, H_2O_2 , is well known, and a third, ozonic acid, H_2O_3 , has been described by A. Baeyer and V. Villiger (*Berichte*, 1902, 35, p. 3038).

Hydrogen peroxide was discovered by L. J. Thénard in 1818; it occurs in small quantities in the atmosphere, probably owing to the decomposition of resins, turpentine, etc., in damp air and sunlight, for it is known to be formed in many chemical reactions involving very slow oxidation processes. (It seems possible that much of the so-called "ozone" in air is really hydrogen peroxide.) It is also formed in traces when metals undergo slow oxidation in air and water. When the oxy-hydrogen flame is directed on a block of ice or on solid carbon dioxide, the instantaneous cooling of the products of the high-temperature reaction allows no time for the decomposition of the hydrogen peroxide which is formed, and it may be detected in the products; moreover, it is possible that the peroxide is the primary product ($\text{H}_2 + \text{O}_2 = \text{H}_2\text{O}_2$), and that water is only a secondary product ($2\text{H}_2\text{O}_2 = 2\text{H}_2\text{O} + \text{O}_2$). Hydrogen peroxide may be prepared, admixed with persulphuric acids (*see below*), by the electrolysis of 75% sulphuric acid; it is more usually prepared from barium peroxide or its hydrate, $\text{BaO}_3 \cdot 8\text{H}_2\text{O}$, by adding them to a solution of hydrochloric, hydrofluosilicic, phosphoric, or, best, sulphuric acid, or to ice-cold water through which carbon dioxide is being bubbled; after filtration, the solution can be concentrated by freezing or by careful evaporation under reduced pressure.

Peroxide of 99.93% purity was obtained by O. Maass and W. H. Hatcher by concentrating a 3% solution of ordinary purity to 30% in a special apparatus, then distilling it at 65° C under 10 mm. pressure, whereby the content reached 85%, again concentrating in a special apparatus to 90%, and finally separating it by fractional freezing. The pure product is not very explosive, but methods involving the extraction of the peroxide from its aqueous solutions by ether give rise to traces of organic peroxides which render the product highly explosive. The pure material boils at 69° C under 26 mm. pressure, and freezes at -1.7°C , but it can be greatly supercooled without freezing; the liquid has a specific gravity of 1.4633 at 0° C, is very slightly more viscous than water, and is apparently associated to about the same extent as water, *i.e.*, it may be $(\text{H}_2\text{O}_2)_2$ or $(\text{H}_2\text{O}_2)_3$ (*see ASSOCIATION*), but in solution it has a normal molecular weight for H_2O_2 . The solid has a specific gravity of 1.644. The aqueous solution is practically neutral in its reaction, and readily decomposes on being warmed, giving off oxygen violently if heated too quickly; it is sold as "10 volume," 20 volume, 40 volume, or as "perhydrol," the first three being about 3, 6, or 12% solutions (and so named because they give up 10, 20 or 40 times their volume of oxygen), and the last 30% or 100 volume. Pure aqueous solutions have a slight metallic taste, and, being slowly decomposed by traces of alkali from glass vessels, are better kept in waxed glass, or they may be stabilized by the addition of a mere trace of sulphuric acid or of certain organic substances, such as acetanilide. A stable solid compound with urea, $\text{CH}_3\text{ON}_2 \cdot \text{H}_2\text{O}_2$, has been patented; it behaves exactly like hydrogen peroxide when dissolved in water.

Hydrogen peroxide frequently behaves as a powerful oxidizing agent; thus lead sulphide (black) is oxidized to the sulphate (white), and hence oil paintings, in which the "white lead" has become blackened by conversion to sulphide, are cleaned by treatment with dilute solutions of the peroxide. It converts hydroxides of the alkaline-earth metals to sparingly soluble peroxides of the type $\text{BaO}_3 \cdot 8\text{H}_2\text{O}$, and with caustic potash or soda it gives perhydroxides, $2\text{NaOH} \cdot \text{OH} \cdot \text{H}_2\text{O}_2$ (these reactions may be regarded as evidence of its feebly acidic character). It liberates iodine somewhat slowly from potassium iodide, converts ferrous salts to ferric, and oxidizes many sulphur compounds to sulphates.

It has been applied to some interesting oxidations in organic chemistry by H. J. H. Fenton (1900), who used it in the presence of ferrous sulphate as a catalyst, and also to the oxidation of certain sugars. On the other hand, some oxidizing agents undergo mutual reduction with hydrogen peroxide, giving free oxygen; thus, silver oxide gives the metal, $\text{Ag}_2\text{O} + \text{H}_2\text{O}_2 = \text{Ag} + \text{H}_2\text{O} + \text{O}_2$, and potassium permanganate is rapidly reduced in acid solution, $2\text{KMnO}_4 + 4\text{H}_2\text{SO}_4 + 5\text{H}_2\text{O}_2 = 2\text{KHSO}_4 + 2\text{MnSO}_4 + 8\text{H}_2\text{O} + 5\text{O}_2$. A reaction of interest, in that it is neither an oxidation nor a reduction, is B. Radziszewski's hydrolysis of nitriles to amides by means of hydrogen peroxide, *e.g.*, benzonitrile, $\text{C}_6\text{H}_5\text{CN}$, gives benzamide, $\text{C}_6\text{H}_5\text{CO} \cdot \text{NH}_2$. With concentrated sulphuric acid hydrogen peroxide sets up an equilibrium involving permonosulphuric acid (Caro's acid, *see SULPHUR*):

Hydrogen peroxide is catalytically decomposed by a great number of substances; thus, platinum black or colloidal platinum readily effects decomposition, and many similar cases have been studied by G. Bredig and others. Its constitution may be represented as either $\text{HO} \cdot \text{OH}$ or $\text{O} : \text{OH}_2$, the latter being more probable (J. W. Brühl); from its production in numerous cases of slow oxidation, it would appear that the oxygen molecule is first absorbed as a whole and not as atoms, and that the unstable peroxides subsequently decompose to give hydrogen peroxide; in fact, it is known that on exposure to air benzaldehyde gives perbenzoic acid as a primary product, $\text{C}_6\text{H}_5\text{CHO} + \text{O}_2 = \text{C}_6\text{H}_5\text{CO} \cdot \text{O} \cdot \text{OH}$, and many such cases are recorded in organic chemistry, so a similar hypothesis is extended to inorganic chemistry. For further information, reference should be made to the works of J. H. Kastle and A. S. Loevenhart, *Amer. Chem. J.*, 1903, 29, pp. 397, 517; C. F. Schönbein, 1858-68; M. Traube, 1882-89; S. Tanatar, *Berichte*, 1903, 36, p. 1893; and H. E. Armstrong, *Proc. Roy. Soc.* (1886 *et seq.*).

The per-acids and their salts (*e.g.*, perborates, percarbonates, persulphates) are discussed under the relevant headings (*see BORAX, CARBONATES, SULPHUR*, etc.), and hydrogen peroxide is readily obtainable from some of these. It may be mentioned that in a rational classification of super-oxides, those which give rise to hydrogen peroxide would be styled *peroxides*, and all others *dioxides, tetroxides*, etc.

Hydrogen peroxide is used as a bleaching agent, where it is especially valuable because it leaves no harmful products, as an "antichlor" for removing excess of chlorine (or of sulphur dioxide) left after bleaching, as an antiseptic wash, and as a preservative; it also finds extensive use in analytical chemistry. It may be estimated by titration with potassium permanganate in acid solution (*see above*), or with ferricyanide in alkaline solution: $2\text{K}_3\text{Fe}(\text{CN})_6 + 2\text{KOH} + \text{H}_2\text{O}_2 = 2\text{K}_4\text{Fe}(\text{CN})_6 + 2\text{H}_2\text{O} + \text{O}_2$; or by addition to excess of arsenious acid in alkaline solution and titration of the excess by iodine. It may be recognized by the blue coloration it gives when added to a very dilute acidic solution of potassium dichromate; this is more marked if the solution is shaken with a little ether which extracts the coloured perchromic acid, HCrO_4 , H_2CrO_6 or, more probably, HCrO_5 . An orange-red colour, due to pertitanic acid, is similarly given with a solution of titanium dioxide in concentrated sulphuric acid. (A. D. M.)

HYDROGENATION. The treatment of a substance with hydrogen so that this combines directly with the substance treated. The term has, however, developed a more technical and restricted sense. It is now generally used to mean the treatment of an "unsaturated" organic compound with hydrogen, so as to convert it by direct addition to a "saturated" compound. (*See CHEMISTRY: Organic.*) Thus, from ethylene, ethane is obtained: $\text{CH}_2 : \text{CH}_2 + \text{H}_2 = \text{C}_2\text{H}_6$.

Free hydrogen in the absence of a catalyst is too inert to take part in such a reaction. In the nascent state hydrogen reacts with certain easily reducible compounds; for instance, a ketone may be reduced to a secondary alcohol or a nitro-compound to an amine in this way. But the great increase in the number of known hydrogenation reactions during the present century is almost entirely due to the work of Sabatier and Senderens, Paal, Skita and others on the hydrogen-activating powers of nickel, cobalt, iron, cop-

per and the whole platinum group. (See CATALYSIS.)

Catalytic hydrogenation has provided an easy method of preparing many difficultly accessible substances, and several technical processes of considerable importance depend on it. (See CATALYSIS.) The most important of these is probably the hardening of oils, whereby a liquid, chemically unsaturated oil is converted, by the introduction of hydrogen, into a solid fat suitable for use in the soap, candle or edible-fat industries. To a lesser degree naphthalene, phenol and benzene are hydrogenated commercially to liquid products which are important solvents; and various terpene derivatives, notably menthol, are produced technically by catalytic hydrogenation. If the substance to be treated is a gas or vapour at the temperature employed, a mixture of the substance with excess of hydrogen is passed over the catalyst contained in a tube or distilling flask as shown in fig. 1.

For the treatment of a non-volatile liquid, the simplest procedure is to bubble a current of hydrogen through the liquid mixed with a finely divided catalyst and contained in a distilling flask, which is heated in an oil-bath. This method is, however, wasteful, and it is often more convenient for non-volatile as well as for volatile liquids to use some form of shaker in which the volume of hydrogen absorbed can be read off, and the progress of the reaction thus followed. A laboratory apparatus of this type is shown in fig. 2. For some hydrogenations the process is preferably carried out under pressure. In this case an all-metal apparatus has to be employed.

Scope of Reaction.—The scope of the reaction is indicated by the following typical conversions:—

(a) Olefinic or ethylenic compounds are hydrogenated to the

FIG. 2.—APPARATUS FOR FOLLOWING THE PROGRESS OF HYDROGENATION OF A NON-VOLATILE LIQUID, THE HYDROGEN BURETTE SHOWING HOW GREAT AN AMOUNT OF HYDROGEN HAS BEEN ABSORBED

corresponding saturated or paraffinoid derivatives; thus propylene is reduced to propane: $\text{CH}_3\text{CH}:\text{CH}_2 \rightarrow \text{CH}_3\text{CH}_2\text{CH}_3$.

(b) Acetylenic compounds are very easily saturated with hydrogen; indeed, in the case of acetylene itself, the reaction is sufficiently violent, if carried out in the gas phase, to cause considerable decomposition.

(c) Aromatic compounds are especially amenable to catalytic hydrogenation. Hexahydrobenzene is very difficult to prepare by other methods, yet Sabatier and Senderens found that it was readily formed on leading a mixture of benzene vapour and hydrogen over a nickel catalyst at 250°C ; and it may also be

obtained by shaking liquid benzene with hydrogen, in the presence of platinum or palladium. Naphthalene reacts similarly and is converted successively into tetrahydro- and decahydro-naphthalenes; and the reaction is general, as, for instance, hexahydro-phenol (cyclohexanol) is obtained by the treatment of phenol. In hydrogenating ring compounds in the liquid phase, an increased pressure is of great advantage, especially if a nickel or other base-metal catalyst is used.

(d) Various unsaturated linkages, in addition to those between carbon atoms, are easily hydrogenated catalytically. From cyanides or isocyanides ($\text{R}\cdot\text{C}:\text{N}$ or $\text{R}\cdot\text{N}:\text{C}$) primary or secondary amines ($\text{R}\cdot\text{CH}_2\cdot\text{NH}_2$ or $\text{R}\cdot\text{NH}\cdot\text{CH}_3$) are produced either by distillation with hydrogen over nickel or copper at $180\text{--}200^\circ\text{C}$, or by agitating in a liquid or dissolved form in the presence of a catalyst of the platinum group. The azo-group, $-\text{N}:\text{N}-$, is reduced to a hydrazo-group, $-\text{NH}\cdot\text{NH}-$; thus azobenzene, on being shaken in alcoholic solution with hydrogen and a platinum catalyst, is quickly reduced to hydrazobenzene, which passes more slowly into aniline. Other non-carbon linkages, including those in heterocyclic rings, behave similarly: quinoline is reduced to decahydroquinoline by hydrogenation under pressure.

(e) The above reactions are processes of simple saturation. A recent process of a different type, but of great technical importance, which has been developed independently by Patart in France and by the Badische Anilin Fabrik in Germany, is the reduction of carbon monoxide to methyl alcohol (*q.v.*). (See PRESSURE CHEMISTRY.)

A carbonyl group in an organic compound is reduced similarly; thus acetone (*q.v.*) passes very easily into isopropyl alcohol, $(\text{CH}_3)_2\text{CHOH}$, in the presence of nickel, copper or a catalyst of the platinum group; or with nickel at a higher temperature, propane is obtained. Catalytic reduction is also applicable to a carbonyl group in a ring: thus, menthone is hydrogenated to menthol, or by further treatment to menthane. In place of the elimination of water, a hydrogen halide may be eliminated. Benzaldehyde is formed by hydrogenating benzoyl chloride in the presence of palladium black: $\text{C}_6\text{H}_5\cdot\text{COCl} + \text{H}_2 = \text{C}_6\text{H}_5\cdot\text{CHO} + \text{HCl}$.

Oxygen attached to nitrogen is easily replaced by hydrogen catalytically. The oxides of nitrogen themselves yield ammonia when passed with hydrogen over copper at $300\text{--}400^\circ\text{C}$. Aniline is obtained by shaking nitrobenzene with platinum in hydrogen at room temperature, whereas in alkaline solution azo- and hydrazobenzene are produced successively, with aniline as final product.

The catalytic reduction of sulphur compounds is of interest on account of the catalytically poisonous nature of many sulphur derivatives. Carbon disulphide is reduced at low temperatures to methylene dithiol, $\text{CH}_2(\text{SH})_2$, and at about 450°C hydrogen sulphide is liberated. The latter reaction has been utilized by Carpenter and Evans as the basis of a process for the removal of sulphur from coal gas, the gas being passed over a nickel catalyst maintained at the temperature stated. The hydrogen sulphide is easily removed from the resulting gas by iron-oxide purifying boxes, and the deposit of carbon on the nickel is burnt off occasionally by treatment with air.

Dehydrogenation.—In certain cases hydrogenation is reversible, loss of hydrogen taking place on leading a hydrogenated body over a catalyst, usually at a relatively high temperature. Two important types of this reaction are the dehydrogenation of reduced benzene rings and the conversion of alcohols, by loss of hydrogen, to aldehydes or ketones. For the dehydrogenation of the reduced benzene nucleus, nickel may be used as a catalyst; but it is liable to induce side reactions. More satisfactorily, the hexahydrobenzene is distilled over palladium at $300\text{--}350^\circ\text{C}$. For alcohols, copper is a very suitable catalyst; for instance, dehydrogenation of ethyl alcohol to acetaldehyde, without the formation of appreciable quantities of subsidiary products, takes place on distillation of this compound over copper at $250\text{--}350^\circ\text{C}$; moreover, isopropyl alcohol yields acetone.

Preparation of Catalysts and of Hydrogen.—The catalysts employed may be divided into classes containing, respectively, the platinum metals (which for many reactions are active at room temperature) and the remaining elements of the

culty, in the case of naphthalene, lies in the presence of a small trace of a cyclic sulphur compound, difficult to separate from commercial naphthalene, which rapidly poisons the nickel catalyst employed. In order to eliminate this, the crude naphthalene is refluxed over metallic sodium or heated in contact with a finely divided metal such as iron, when the sulphur compound is decomposed.

Acetone is hydrogenated on a large scale under similar conditions, save that the temperature should not be allowed to exceed 120° C—a lower temperature still is preferable—in view of the reversibility of the hydrogenation. Nickel is a suitable catalyst, and the acetone is maintained by means of an increased pressure of hydrogen in the liquid state at the temperature employed.

(E. B. M.)

HYDROGEN-ION CONCENTRATION. If diluted solutions of, say, hydrochloric acid and acetic acid are examined, it is found that, whereas the former possesses to a marked degree all the properties generally associated with acids, the latter possesses them only to a very limited extent. On the other hand, if each of these solutions contains one gram-equivalent of its acid (36.5 grams of hydrochloric acid and 60 grams of acetic acid) they will both require the same amount of alkali for neutralization (e.g., 40 grams of sodium hydroxide), and are therefore apparently equally acidic.

The reason for this seeming paradox is that, whilst hydrochloric acid is almost completely dissociated (see DISSOCIATION) into hydrogen ions and chlorine ions $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$, the acetic acid

potential source of them (undissociated acid molecules). Now true neutrality is represented by the condition of pure water, which dissociates to such a feeble extent as to give only 10^{-7} , of an equivalent of hydrogen per litre (at 25° C) and the same concentration of hydroxyl ions: $\text{H}_2\text{O} \rightleftharpoons \text{H}^+ + \text{OH}^-$. We can therefore express the concentration of hydrogen ions (expressed in gram equivalents per litre) as $[\text{H}^+] = 10^{-7}$, in a neutral solution, and similarly for hydroxyl ions. The product of these two concentrations is thus 10^{-14} ; and in any aqueous solution, acidic or alkaline, at 25° C the law of mass action (see CHEMICAL ACTION) is fulfilled in that $[\text{H}^+] \times [\text{OH}^-] = 10^{-14}$.

Many liquids of biological importance, such as soil extracts, blood, cultures, milk, etc., are very nearly neutral as judged by ordinary criteria, but they are very sensitive to extremely slight changes in acidity or alkalinity. Titration of these solutions gives no clue to the degree of acidity, both because it is so slight and because of the reasons already given.

For the adequate study of such solutions, it is convenient to have a less cumbersome method of denoting acidity than the foregoing, and for this purpose the symbol p_{H} has been adopted, such that $p_{\text{H}} = -\log[\text{H}^+]$. The neutral solution is therefore of $p_{\text{H}} = 7$; an acidic solution has a smaller p_{H} , and an alkaline solution a larger p_{H} . The acidity of, e.g., saliva is more neatly expressed as $p_{\text{H}} 6.9$ than as $[\text{H}^+] = 10^{-6.9}$ or 1.26×10^{-7} , and the feeble alkalinity of blood as $p_{\text{H}} 7.35$ than as 3.6×10^{-8} . Similarly, decinormal solutions of hydrochloric acid and caustic soda have, respectively, $p_{\text{H}} 1$ and $p_{\text{H}} 13$ (approx.).

(A. D. M.)

DETERMINATION OF HYDROGEN-ION CONCENTRATION ELECTROMETRIC METHODS

The use of an electrometric method, consisting of the measurement of an electrical potential, for the determination of hydrogen-ion concentrations was first made possible by means of a relation established by Nernst, which exists between the solution pressure of an element when surrounded by a liquid and the osmotic pressure of the ions already in solution. (See SOLUTIONS.) According to this theorem an element, such as a metal, when in contact with an ionizing medium, such as water, has a definite tendency to pass into solution in the form of ions or electrically charged particles. When the ions carry a positive charge, an equivalent negative charge remains on the surface of the element. An electrical double layer is consequently formed between the surface of the metal and the oppositely charged free ions in the solution. The process of ionic solution will proceed until the potential difference in this double layer reaches a certain critical value which is determined by the specific character of the metal. Further ionization is then arrested by the electrostatic charge of the ions in solution, and the potential difference between metal and solution gives a measure of the ionizing tendency. (See ELECTROLYSIS.)

It should be noted that the amount of metal which passes into solution to produce this equilibrium condition is ordinarily below the limits of the amount that can be detected by chemical means. If the metallic ions are already present in the solution in the form of dissociated salt, further ionization of the metal is opposed not only by the electrostatic layer but also by the osmotic pressure of the ions already present. In this case metal will dissolve or ionize until the potential of the electrostatic layer formed equals the excess of its solution pressure above the osmotic pressure of the ions. With metals such as copper and the noble metals which normally acquire a positive charge in contact with an electrolyte, the solution pressure of the metal is so low that it is below the osmotic pressure of the ions given by the smallest trace of salt of that metal in solution. With these metals deposition occurs of metal ions present in the solution, whereby the electrode becomes positively and the electrolyte negatively charged, until the potential difference balances the excess of osmotic pressure above the solution pressure. If an electrode of platinum or other noble metal be surrounded in its upper part by hydrogen, while the lower part is immersed in an electrolyte, the hydrogen which dissolves to a certain degree in the metal will tend to ionize and pass into the solution as hydrogen ions. A definite potential is thus produced which is determined solely by the pressure of

CURVES SHOWING CHANGES OF p_{H} DURING NEUTRALIZATION OF ACIDS BY A STRONG BASE

Hydrochloric, acetic and boric acids are typified respectively of a strong, a weak and a very weak acid, and the steepness of the curves decreases in this order. The addition of 10 C.C. of sodium hydroxide should give an exactly neutral solution ($p_{\text{H}} = 7$), but this is the case only for the strongest acid: for the other two, the solution is alkaline ($p_{\text{H}} > 7$).

An indicator is suitable for a particular titration only if it shows its colour change, which occurs over the p_{H} range indicated by the bracket at 10 C.C. Hence we see that: (1) for hydrochloric acid any of the four indicators is suitable (methyl-orange least so); (2) for acetic acid phenolphthalein is best (litmus less so); and (3) for boric acid none of the indicators is suitable

is only very feebly dissociated $\text{C}_2\text{H}_3\text{O}_2 \rightleftharpoons \text{H}^+ + \text{C}_2\text{H}_3\text{O}_2^-$. Since the characteristic properties of acids depend largely on the hydrogen ions, the superiority of hydrochloric acid in this respect is intelligible. The equality in the neutralizing powers is due to the fact that the acetic acid exists in equilibrium (expressed by \rightleftharpoons above) with the hydrogen and acetate ions, so that, as fast as hydrogen ions are neutralized by alkali, more acetic acid dissociates in order to maintain the equilibrium (see CHEMICAL ACTION) and so supplies more hydrogen ions. Neutralization is therefore a measure, not only of hydrogen ions in solution, but also of the

hydrogen in the surrounding atmosphere and by the concentration of hydrogen ions already in solution.

General Theory of the Hydrogen Electrode.—The first amounts of hydrogen are dissolved by platinum according to the distribution law that would prevail if the dissolved gases were in the atomic state, i.e., $\sqrt{p/c} = \text{constant}$, where c is the concentration of gas in the metal and p its pressure in the surrounding atmosphere. The quick saturation of the surface is followed by a slow diffusion into the interior. Palladium, which dissolves 500 times to 800 times its volume of hydrogen, is not very suitable for a hydrogen electrode, probably because the high solubility, conjoined with a high rate of diffusion, makes it impossible to set up a quick surface saturation with small quantities of hydrogen. Platinum, which dissolves one to ten times its volume, is the most satisfactory. The surface is greatly increased and its adsorptive capacity thereby raised by platinizing, or covering with finely divided platinum. Gold, which dissolves about half its volume, probably fails owing to its having too low an adsorptive capacity. It is, however, suitable for underlying material; gold or gold-plated electrodes, afterwards platinized, iridized or palladized, have been found satisfactory. The reaction occurring between the platinum and the gaseous hydrogen may be represented by the equation $\text{H}_2 \rightleftharpoons 2\text{H}$, and that between the platinum and the electrolyte by the equation $\text{H}_2 \rightleftharpoons \text{H}^+$. In order to obtain quick saturation of the electrode, it is necessary that much of this should be in contact with the gas phase.

According to the relation derived by Nernst, the potential E between two hydrogen electrodes immersed in solutions of hydron activities or concentrations h_1 and h_2 is proved to be

$$E = \frac{RT}{nF} \log_e \frac{h_1}{h_2}$$

where R = gas constant = 8.313 joules, T = absolute temperature, n = valency of ion and F = the faraday = 96,500 coulombs. Thus, $E = 0.0001984 T \log h_1/h_2$, and at $T = 273^\circ$, 291° and 298° respectively the factor $RT/nF = 0.0541$, 0.0577 and 0.0591 . The activity of hydron from a "strong" acid such as HCl is very nearly equal to the total concentration, if this is low.

The normal potential on the hydrogen scale is defined as the potential of a hydrogen electrode in a solution of hydron concentration h_2 , measured against a hydrogen electrode in a solution of normal hydron concentration or $h = 1$, that is:

$$E_H = 0.058 \log 1/h_2 = -0.058 \log h_2 \text{ volts.}$$

At 18°C in practice measurements are usually made against another standard half-cell usually the saturated or normal KCl -calomel electrode, the absolute potentials of which have been more or less closely defined against various kinds of null potential electrodes. Sørensen measured the e.m.f. of the combination

at 18°C with diffusion potential eliminated. Assuming that the HCl is 91.7% dissociated, it is calculated that the potential of the normal hydron hydrogen electrode against the decinormal KCl calomel is 0.3380 volt (calomel positive). If the e.m.f. of a hydrogen electrode against the decinormal KCl -calomel electrode is E_x , then

$$p_H = \frac{E_x - 0.338}{0.0577} \text{ at } 18^\circ \text{C.}$$

With a saturated KCl -calomel cell, the potential of the hydrogen electrode with normal hydron concentration has been estimated as 0.2503 volt at 18°C . Consequently with this standard, we have

$$p_H = \frac{E_x - 0.250}{0.0577}$$

(Cf. E. B. R. Prideaux, *J. Sci. Instr.*, 1924-25, ii, pp. 33 and 113.)

Experimental.—The hydrogen employed must be free from impurities, since compounds such as hydrogen sulphide or arsine, which may be present in the gas prepared from ordinary zinc and acid, have a poisoning action on the platinum. The hydrogen is most suitably obtained from an electrolytic generator or from cylinders of the compressed gas. The potential of a

hydrogen electrode against its solution becomes more positive with decrease in the pressure of the hydrogen (or of its partial pressure in a mixture of gases). The magnitude of the correction to be applied may be calculated by considering the maximum work involved in the transfer of $\frac{1}{2}$ mol. of hydrogen through atoms and ions from p_1 to p_2 ; this is $dE = RT/2F \ln p$ atmospheres. If hydrogen is saturated with water vapour of vapour pressure p' in mm., the total pressure being p , the correction becomes

$$\log \frac{p - p'}{760 - p'}$$

With an enclosed electrode of the continuous hydrogen type, the general arrangement of the electrodes is shown in fig. 1.

BY COURTESY OF MESSRS. TINSLEY & CO.

FIG. 1.—APPARATUS FOR EXPERIMENTAL DETERMINATION OF HYDROGEN IONS

Hydrogen gas is bubbled through the solution to be tested at the rate of one bubble per second, until a constant potential is given by the electrode

A strip of platinum foil is welded to a short length of platinum wire which is then sealed into the glass tube and makes contact with a drop of mercury inside, or preferably, a copper wire is fused or soldered on this end. To prepare for use the electrodes are first cleaned by immersion in hot chromic acid for five to ten minutes and then well washed with distilled water. They are then coated electrolytically with "platinum black," by surrounding with an electrolyte consisting of

Platinum chloride	3 grams
Lead acetate	0.02 to 0.03 grams
Distilled water	100 cu.cm.

and electrolysing with the current from a 2 volt accumulator, so that a moderate evolution of gas occurs. The current is reversed every half minute for 15 minutes or longer. The electrodes are then placed in a solution of ferrous and ferric salts acidified with sulphuric acid, in order to eliminate occluded chlorine, and the electrodes are thoroughly washed with distilled water (they must always be kept in distilled water when not in use, as drying spoils the platinum black). To prepare for measurement the hydrogen electrode vessel is filled with the solution to be tested keeping C closed. In order to saturate with water vapour the gas is passed through a wash bottle filled with the same solution and connected with the rubber tubing to the bent tube B on the electrode vessel.

The gas, if not electrolytically generated, must first be passed through wash bottles containing potassium permanganate solution, and then through a saturated solution of mercuric chloride before passing through the electrode vessel through the tube B. C is opened and some of the solution displaced until it reaches the end of the side tube. C is then closed. A saturated calomel electrode is most conveniently used as the second electrode, and saturated potassium chloride for making the junction. The side tubes of the two electrodes dip into a vessel V containing saturated potassium chloride. Hydrogen is passed through the hydrogen electrode at the rate of a bubble per second for about three hours,

escaping through the trap F, until absorption by the platinum ceases and a constant potential is given by the electrode. Modifications in the type of electrode employed have been applied for special purposes. Point electrodes are used for giving quick readings with a fixed volume of hydrogen without stirring or shaking, and in cases where only small volumes of solution are available. The use of an oscillating electrode vessel has been applied in order to accelerate the attainment of equilibrium.

Measurements of the potential are made by the use of a suitable type of potentiometer, the readings of which are calibrated by means of a standard cell. If the solution to be measured has a low resistance a pointer type of galvanometer with a sensitivity of 2 micro-amperes for 1° may be used, but for general purposes a more sensitive portable mirror galvanometer with combined lamp and scale is more suitable. The hydrogen electrode is not applicable to solutions containing any material which interacts with the hydrogen on the surface of the platinum, or which exert a "poisoning" action on the platinum. The action of the electrode is in this way vitiated by the presence of ammonium salts, nitric acid, nitrous acids and other reducible substances, salts of metals more noble or electropositive than hydrogen, unsaturated organic bodies such as acrylic, crotonic, fumaric and maleic acids, also chloroacetic and similar acids, and sulphur dioxide and carbon dioxide at high concentrations. With these exceptions the hydrogen electrode can be applied to all strong and weak inorganic and organic acids, either in the free state or partly neutralized, and in so-called *buffered solutions* (where the hydron concentration is held approximately constant), the e.m.f. is well defined on the alkaline side of neutrality from p_H 7 to 12.

Quinhydrone Electrode.—This system depends on the equilibrium which is attained through the tendency of quinol, formed by the dissociation of quinhydrone, to change into quinone with the liberation of free hydrogen,

This hydrogen at an estimated pressure of 10^{-24} atm. is liberated on a platinum wire or foil immersed in a solution containing quinhydrone, and develops instantaneously an e.m.f. of a magnitude determined by the hydron concentration of the solution. On account of this extremely low though constant pressure of hydrogen, the mechanism is not disturbed by the presence of reducible substances which cannot be measured accurately by the usual hydrogen electrode.

The quinhydrone electrode has proved to be of particular value for measurements of substances which have a poisoning effect on the hydrogen electrode, while with physiological fluids its measurements are not disturbed through the displacement of carbon dioxide by hydrogen. For other purposes, such as electro-metric titrations, advantages it possesses are due to the equilibrium potential being set up more rapidly than with the hydrogen electrode, while no outside supply of hydrogen is required. The system cannot be employed accurately, however, with strong alkaline solutions, or those with certain organic compounds which react with the quinhydrone and modify the potential. In many of these instances, however, advantage may be taken of the slowness of the reaction with the quinhydrone, and reliable determinations may be made shortly after mixing the substances and admitting to the electrode cell. The arrangement of the electrode system is shown in fig. 2.

The liquid to be measured is placed in the tube M. For accurate work with liquids nearly neutral this tube needs to be of special

resistance glass. A quantity of 0.05–0.05 grams of specially prepared quinhydrone per 10 cu.cm. of solution is added and, after inserting a glass stopper, the contents of the tube are shaken until the quinhydrone is dissolved. A platinum wire $4\frac{1}{2}$ in. long and 0.3 mm. diameter wound as a spiral and sealed in a glass tube is then inserted, when a potential difference is instantly developed at the junction of the metal with the electrolyte and, as with the hydrogen electrode, the potential is proportional to the hydrogen ion concentration of the solution. The amounts of quinhydrone specified will give a saturated solution. Only a small influence on the potential is exerted by the actual concentration of the quinhydrone, however, unless selective adsorption or interaction of one of its components occurs.

Measurement is made by employing as a second electrode, either a standard calomel electrode, or else a second quinhydrone electrode surrounded by a buffered standard electrolyte of known hydrogen ion concentration. The solutions around the two electrodes are connected by tubes to a vessel B containing concentrated potassium chloride solution, whereby boundary potentials are minimized or eliminated. Diffusion is hindered and other advantages gained by having the potassium chloride electrolyte present in the connecting tubes set in an agar gel medium. The potential difference between the electrodes of the cell thus formed is determined by a potentiometer as described for the hydrogen electrode. The potential developed by the quinhydrone electrode with any given electrolyte is, at 18° C, 0.7044 volt more positive than the usual hydrogen electrode. When using a saturated potassium chloride-calomel standard, the value of the hydron concentrations is, at 18° C, obtained from the equation:

$$p_H = \frac{0.454 - E}{0.0577} = 7.87 - \frac{E}{0.0577}$$

where E is the measured potential.

An alternative standard electrode may be formed from a second quinhydrone solution in presence of the buffer mixture 0.01N HCl + 0.09 N KCl. With this standard, the relation between p_H and E , is at 18° C given by the equation

$$p_H = 2.03 + \frac{E}{0.0577}$$

The general relation for other temperatures is given by the expression:

$$p_H = 2.03 + \frac{E}{0.000198 T}$$

The p_H value of the standard electrode is 2.03 and for p_H values of the solution under measurement higher than this, the potential of the standard will be positive relatively to the measuring electrode, while for p_H values lower or more acid than this the potential will be negative. It follows from the above relation that at 18° C a change in p_H of 0.01 causes a displacement of the potential of 0.58 millivolt. With regard to temperature control, to avoid an error greater than 0.01 p_H , a temperature constancy of $\pm 2^\circ$ C will suffice if the solution to be measured has a p_H value of 3, whereas with a p_H value of 9, it is necessary for the same accuracy to regulate the temperature to within $\pm 0.4^\circ$ C.

In measurements by the above procedure in concentrated salt solutions, such for instance as those generally employed in the electro-deposition of metals, deviations of potential from the calculated value may occur on account of the so-called *salt error*. These may generally be obviated by adding, together with the quantity of quinhydrone which is slightly in excess of the amount required to saturate the solution, an excess also of either quinone or quinol. With quinone a quantity of 0.1 g. per 10 cu.cm. of solution is necessary to saturate an aqueous solution, while the solubility of quinol is about 1 g. in 10 cu.cm. With these quinone-quinhydrone and quinol-quinhydrone cells, the single electrode potentials are different from those of the quinhydrone electrode, but if the same medium is employed around both electrodes, the combined potential of the cells is the same function of the hydrogen ion concentration as is given in the above equations. In selecting the system to be employed, it may be taken that accurate

BY COURTESY OF MESSRS. TINSLEY & CO.
FIG. 2.—QUINHYDRONE ELECTRODE APPARATUS

The liquid to be measured is placed in tube M, to which is added 0.04–0.05 gm. quinhydrone per 10 C.C. of solution. A platinum wire is then inserted and a potential difference is immediately developed proportional to the hydrogen-ion concentration of the solution.

values are as a rule indicated by constancy of potential over a long period.

Measurements in Acetone-water Solvents.—A good solvent for a large number of compounds which are insoluble in water is given by a mixture of acetone and water containing 10 cu.cm. of water in 100 cu.cm. of the mixture. In this medium a solution containing 0.005N HCl + 0.005N KCl is found to have a p_H of 2.7 at 18° C. If a quinhydrone electrode composed of this electrolyte is employed as a standard, the p_H value of the solution under measurement is given by the equation

$$p_H = \frac{E}{0.0577} + 2.7.$$

The apparatus is connected as illustrated in the figure. For the purpose of accurate measurements the standard electrode vessel S is provided with three electrodes each containing platinum foil $\frac{3}{4}$ in. \times $\frac{3}{4}$ in. \times 0.05 mm. thick, curled round to about $\frac{1}{4}$ in. diameter. As a precautionary measure readings may, in this way, be taken with each of the multiple electrodes in turn. Only contamination of the platinum leading to error, such as by traces of mercury from the tube above, is thus detected by its disagreement with the remaining electrodes. A 3.5N solution of potassium chloride is employed for filling the intermediate connecting bath B.

Glass Electrodes.—The use of glass electrodes for the determination of hydrogen-ion concentrations has been developed by P. M. T. Kerridge (*J. Sci. Instr.*, 1926, iii., p. 404). This method depends on the principle that, if two solutions of different hydrogen-ion concentrations are separated by a thin glass membrane, a difference of electrical potential will be found between the two sides of the glass which is proportional to the ratio of the logarithms of the hydrogen-ion concentrations on the two sides, according to the Nernst formula. The glass behaves as a solid electrolyte though of a very high resistance, but the mechanism of the reactions is not fully understood. Many types of glass are suitable for this work, excepting those rich in borosilicate. A German soft soda glass has been most frequently used. The membrane should be about 0.025 to 0.030 mm. in its thinnest part and is preferably formed as a bulb inside another larger and thicker bulb. Contact with the solutions in the glass electrode is made by means of two calomel electrodes opposed to one another.

The general arrangement of a convenient type of apparatus is shown in fig. 3. An earthed metal stand is fitted with a rack and

pared with that of the glass membrane. The glass electrode is placed on a glass plate carefully insulated by amberite or orca from the base of the stand.

As the resistance of the glass membrane is very high, it is necessary to use an electrometer as null point indicator in the potentiometer circuit. The most suitable potentiometer is that of Lindemann. It is necessary to take precautions to shield the apparatus from electrostatic charges and to ensure that the insulation resistance in the part of the circuit between the glass electrode and the electrometer is especially great. The buffer solution to be employed on the inside of the membrane vessel may conveniently be a mixture of potassium phosphates of about p_H 7. The electrode may be standardized by replacing the unknown solution by a N/20 solution of potassium hydrogen phthalate, and measuring the potential obtained. The p_H of this solution is 3.97 at 18° C. If E_s is the potential found with potassium hydrogen phthalate in the electrode, and E_x with the unknown solution, then the p_H value of the unknown solution p_{Hx} is given by the relation

$$p_{Hx} = 3.97 + \frac{E_s - E_x}{0.0577} \text{ at } 18^\circ \text{ C.}$$

This method has been applied largely in physiological research for determinations of hydrogen ions in fluids with which accurate measurements cannot be made by other types of electrodes.

Bearing of Hydrogen-Ion Determinations.—The importance of hydrogen ion determinations is due to the predominating part these ions play in many varied classes of chemical reactions. The hydrogen ion concentration is thus the main determining chemical feature in electrolytic phenomena, physiological reactions and vital processes, such as fermentation, digestion and respiration. The far-reaching influence of this ion in these processes is associated with its unique constitution, the hydrogen ion, consisting of one positively charged atomic nucleus, unaccompanied by any electron and is thus the smallest known positively charged particle. The hydrogen ion has thus the smallest atomic radius of any material structure and through the absence of any accompanying negative electrons is able to approach other negatively charged particles more closely than any other positive ion. As the attraction between ions vary inversely as the square of the distance, it follows that the affinity of negative ions for the hydrogen ion will be greater than that for any other positive ion. The hydrogen ion consequently possesses a high degree of absorbability by other molecular groups and this property facilitates chemical interactions. (J. N. P.)

INDICATOR OR TITRIMETRIC METHODS

A very large number of indicators (*q.v.*) used in determining acidity owe their utility to the fact that they undergo a change of colour within a certain range of hydrogen-ion concentration and can therefore be used to determine this concentration. Thus, phenolphthalein is colourless in solutions having a hydrogen-ion concentration stronger than 10^{-8} , pink at 10^{-9} , and deep red at 10^{-10} , or $p_H=8$, $p_H=9$ and $p_H=10$ respectively. The causes of the colour changes cannot be discussed in detail, but it may be said that, as the phenolphthalein is a very weak acid, it exists almost entirely as undissociated molecules in the relatively more strongly acidic (less alkaline) solution, but commences to ionize, owing to salt formation, as the solution becomes more alkaline, and is fairly fully ionized in the most alkaline solution. Concurrently, the ion undergoes a change of structure from the colourless phenolic to the coloured quinonoid form (*see COLOUR AND CHEMICAL CONSTITUTION*), and it is to this cause, rather than to any difference between the colours of undissociated molecules and of ions (as Ostwald supposed), that the colour change is due. Similar explanations apply to all indicators used in acidimetry, for they are all either weak acids or weak bases and are capable of undergoing such tautomeric changes so rapidly as to give their indications instantly.

The process of neutralization of a strong acid by a strong base will be followed. If we take, say, 10 c.c. of a decinormal solution of hydrochloric acid, it has initially a hydrogen-ion concentration of 10^{-1} (approx.), i.e., $p_H=1$; the gradual addition of a decl-

BY COURTESY OF THE "JOURNAL OF SCIENTIFIC INSTRUMENTS"

FIG. 3.—SKETCH SHOWING STRUCTURE OF GLASS ELECTRODE APPARATUS. This method avoids the use of any additional material, and depends on the difference of potential developed on the two sides of a thin glass membrane by liquids of different hydrogen-ion contents

two pinions so that the levels of the electrodes may be easily altered at will. The calomel electrodes are held in sleeves ground to fit, to which are attached short lengths of glass rod fixed into insulating blocks of amberite or orca, these being similarly fixed to the stand. Diffusion of potassium chloride into the solutions in the glass electrode is prevented by small ground caps fitted over the tips of the calomel electrodes, and the two taps ungreased in the middle race are turned off while the measurements are being made. The resistance thus introduced is not great com-

normal solution of, say, caustic soda, brings about a diminution of hydrogen-ion concentration in the solution. When 9 c.c. have been added the concentration of free acid will be reduced to $\frac{1}{10}$, i.e., $p_H = 2$, but thereafter the curve begins to undergo a rapid change, passes through the neutral point ($p_H = 7$) when 10 c.c. have been added, and starts to reproduce a precisely similar curve on the alkaline side. It is obvious, therefore, that in titrating a strong acid by a strong base (or vice versa) any indicator which shows its colour change between $p_H = 4$ and $p_H = 10$ will be satisfactory and give a titration of about 9.95–10.05 instead of the theoretical 10 c.c. (provided the solutions are not too dilute). Hence methyl-orange (range 3.0–4.5), methyl-red (4.0–6.0), litmus (6.0–8.0), or phenolphthalein (8.0–10.0) will be equally satisfactory. The case is far otherwise, however, if one has to titrate a weak acid by a strong base, for, as the curve for acetic acid shows, an indicator has to be used of the p_H range 7–10 and, of the above four, only phenolphthalein fulfils this condition. A very weak acid, such as boric acid (*q.v.*) cannot be titrated as such, because its titration curves show no perceptible change at the theoretical neutral point.

Similar considerations apply *mutatis mutandis* to the titration of strong alkalis by strong or weak acids, and of weak alkalis (e.g., ammonia) by strong acids; thus, the titration of ammonia by, e.g., hydrochloric acid, is the reverse of the sodium hydroxide–acetic acid titration, and an indicator, showing changes in the range $p_H = 4$ –7, such as methyl-orange or methyl-red, is therefore suitable. Also, the direct titration of extremely weak bases, such as urea, is as impossible as that of boric acid. It will be clear, moreover, that the titration of weak bases by weak acids is impracticable by these methods.

Polybasic acids sometimes have their successive stages of dissociation so far apart, and therefore so well defined, that if they are in suitable p_H ranges they can be detected by the use of two indicators. Thus, phosphoric acid has a first dissociation constant $K_1 = [H^+][H_2PO_4^-]/[H_3PO_4] = 1.1 \times 10^{-2}$ and a second, $K_2 = [H^+][HPO_4^{2-}]/[H_2PO_4^-] = 1.95 \times 10^{-7}$; so it behaves in the first stage as a strong acid, and in the second as a weak acid; methyl-orange therefore indicates completion of the stage $H_3PO_4 + KOH = KH_2PO_4 + H_2O$, and phenolphthalein enables the stage $KH_2PO_4 + KOH = K_2HPO_4 + H_2O$ to be detected. The third stage of dissociation of the acid is so feeble ($K_3 = 3.6 \times 10^{-13}$) that the titration is impossible.

In many liquids of biological importance (soil extracts, blood sera, cultures, etc.) there are complex mixtures of weak acids, weak bases, amphoteric electrolytes (e.g., gelatin and proteins, which function either as weak acids or as weak bases, according to conditions) and colloids (*q.v.*), which are extremely sensitive to very slight changes of p_H . Owing to their nature, however, they are able to exert a "buffering" effect, i.e., they tend to minimize such changes when external circumstances would tend to impose them. In connection with such liquids, a knowledge of their "reaction" or p_H is of great importance, and W. M. Clark and H. A. Lubs have specially synthesized a whole series of indicators which give brilliant colours and offer a wide selection of p_H ranges. For fuller details of this aspect of indicators the works of S. P. L. Sorensen, G. S. Walpole and also of others (*see Bibliography*) must be consulted; but the principles underlying their use may be given very briefly.

Relation of K (Dissociation Constant), p_H and c (Concentration).—If we consider a weak acid, HA, having a concentration c in dilute aqueous solution, and if we represent the concentration of the various ionic and molecular species by enclosing them in square brackets, we have $K[HA] = [H^+][A^-]$, K being the dissociation constant of the acid. (*See CHEMICAL ACTION.*) If no other solutes are present in the solution $[A^-] = [H^+]$; further, since the acid is weak, it will be only very slightly dissociated and hence $[HA]$ may be put equal to c without appreciable error. Thus we have

$$Kc = [H^+]^2 \text{ or } 2\log[H^+] = \log K + \log c$$

$$\text{or } -\frac{1}{2}\log K - \frac{1}{2}\log c = -\log[H^+] = p_H$$

The foregoing equations show the relation existing between p_H , K , and c in a solution of the acid alone.

If the weak acid above is partially neutralized by a strong base, say sodium hydroxide, the sodium salt may be assumed, without appreciable error, to be completely dissociated, for this is nearly true of all salts of strong bases. If s equivalents of base have been added per litre of acid of concentration c (as before) the concentration of un-neutralized acid is $c-s$; hence $[H^+] + [HA] = c-s$, and since $[HA] + [A^-] = c$, because the total concentration of salt and acid is still c , we therefore have

$$[H^+] = K[HA]/[A^-] = K \frac{c-s-[H^+]}{s+[H^+]}; \text{ but as } [H^+] \text{ is very small}$$

compared with the other quantities in the fraction, we have $[H^+] = K(c-s)/s = K \times (\text{un-neutralized acid})/(\text{salt})$. From this equation two deductions can be made:

(1) The logarithmic equivalent is $p_H = -\log[H^+] = -\log K + \log \frac{s}{c-s}$.

(2) If $s=c/2$, i.e., if the acid is half neutralized $[H^+] = K$. This is the state of affairs when a two-colour indicator is half-way through its colour change (although its ionization constant is an apparent one, owing to complications due to changes of structure); hence indicators are most effectively employed in solutions of acidity numerically equal to their apparent ionization constant, i.e., of $p_H = -\log K$.

The logarithmic equation in (1) enables a buffer solution of any desired p_H to be prepared but numerous pairs of solutions have been studied and charted so that the ratio $s/(c-s)$ and the corresponding p_H are to be seen at a glance. Thus, by taking appropriate volumes of $N/5$ -acetic acid and $N/5$ -sodium acetate, we have 20 c.c. of a buffer solution of the p_H shown:

Acetic acid (c.c.) .	18.5	16.4	12.6	8.0	4.2	1.9
Sodium acetate (c.c.) .	1.5	3.6	7.4	12.0	15.8	18.1
p_H .	3.6	4.0	4.4	4.8	5.2	5.6

These values are nearly those calculated from the formula given (where $K = 1.8 \times 10^{-5}$ or $\log K = 4.745$; $c-s$ = acetic acid; and s = sodium acetate—the same as c of acetic acid and s of sodium hydroxide), but slight corrections have been introduced. The corresponding curve enables intermediate values to be obtained.

All buffer solutions depend upon the action of a weak acid, a weak base, or an amphoteric electrolyte, glycocoll being a good example of the last type.

The application of the foregoing principles to the determination of p_H (in, say, a feebly acidic solution of gelatin) will now be sketched briefly. The method is useless for coloured solutions, such as physiological fluids and electrometric methods have to be used for these. (*See above.*)

If the p_H is not known even approximately, tests with a few different indicators would soon give a rough idea; but in order to facilitate this preliminary survey use may be made of an ingenious device known as a "universal" indicator, which is a mixture of several indicators so designed that addition of a few drops to a solution gives a colour characteristic of the p_H , the succession of colours according with that which is found in the spectrum:—

p_H	Colour	p_H	Colour
3	Pale red	7.7.5	Greenish-yellow
4	Red	5	Green
5	Orange-red	9	Greenish-blue
6	Orange-yellow	10	Violet
6.5	Yellow	11	Reddish-violet

Having by this or any other means obtained an approximate idea of the p_H , it is then possible to select (1) an indicator and (2) a buffer solution of suitable ranges. Thus, if the universal indicator has given a reddish-orange tint, we must select an indicator and a buffer covering the range $p_H = 4$ –6, say, acetic acid—sodium acetic, and methyl-red (red at $p_H = 4.4$; yellow at 6.0) or

bromophenol-blue (yellow at 3.0; bluish-purple at 4.6). A definite number of drops of the indicator is added to 20 c.c. of each of the five acetate buffer solutions (4.0–5.6) and also to 20 c.c. of the solution under investigation, all the solutions being contained in cylindrical vessels of clear glass standing on a white tile and equally illuminated (in the absence of a colorimeter). The tint in the unknown solution is seen to be between those in, say, the tubes corresponding to p_H 4.4 and 4.8, and solutions of p_H 4.5, 4.6, and 4.7 are then prepared so that a closer match may be made and the p_H determined to within 0.1 unit.

HYDROGEN PEROXIDE, a heavy colourless liquid, usually sold as a dilute aqueous solution containing 3% ("10 volume"), and used as an antiseptic wash or as a bleacher. Its chemical formula is H_2O_2 and it is described under HYDROGEN.

HYDROGRAPHY, the science dealing with all the waters of the earth's surface (Gr. *ὕδωρ*, water, and *γράφειν*, to write), including the description of their physical features and conditions; the preparation of charts and maps showing the position of lakes, rivers, seas and oceans, the contour of the sea-bottom, the position of shallows, deeps, reefs and the direction and volume of currents; a scientific description of the position, volume, configuration, motion and condition of all the waters of the earth. See also SURVEYING: *Nautical*, and OCEAN AND OCEANOGRAPHY. The Hydrographic department of the British Admiralty, established in 1795, undertakes the making of charts for the admiralty, and is under the charge of the hydrographer to the admiralty (see CHART).

HYDROLYSIS, in chemistry, a decomposition brought about by water after the manner shown in the equation $R \cdot X + H \cdot OH = R \cdot H + X \cdot OH$. Modern research tends to prove that such reactions are not occasioned by water acting as H_2O , but by its ions (hydrions and hydroxyl ions), for the velocity is proportional (in many cases) to the concentration of one or both of these ions. This fact explains the so-called "catalytic" action of acids and bases in decomposing such compounds as the esters. The term "saponification" (Lat. *sapo*, soap) has the same meaning, but it is more properly restricted to the hydrolysis of the fats, i.e., glyceryl esters of organic acids, into glycerin and a soap. (See GLYCERIDES.)

If $R \cdot X$ is the salt of a weak acid and a strong base, its aqueous solution will react as a base towards an indicator such as litmus, for the acid $R \cdot H$ is only feebly ionised, and hence the hydroxyl ions from the base will predominate; potassium cyanide and sodium carbonate are examples, and their solutions are said to undergo "hydrolysis." Conversely, the solution of the salt of a weak base and a strong acid, e.g., ferric chloride, will be acidic. If both the acid and the base are weak, the salt may be so greatly hydrolysed as to be almost entirely decomposed into its constituent acid and base in aqueous solution. See also CHEMICAL ACTION and SOLUTIONS.

HYDROMECHANICS. An important property of a fluid is that the shape of any isolated mass depends largely upon the form of the containing vessel or confining walls. If water is poured from a jug into a glass the form of the water in the glass is determined largely by the shape of the glass, and not at all by the shape of the jug which previously contained it. The shape, but not the extent, of the water-glass surface is determined by the form of the glass. The shape of the water-air surface depends partly upon the form of the glass and partly upon the physical properties of water, air and glass. Generally this surface is very nearly a horizontal plane. This is particularly noticeable in the part which is not close to the glass, and the natural inference is that this levelling of the water-air surface is due to some physical properties of the two fluids. The water-air surface appears to be well defined, but if the glass contained chlorine, a greenish-yellow gas heavier than air, the boundary between the air and chlorine

would not be so well defined and would become difficult to detect in a short time. The air and chlorine, in fact, diffuse into one another, and in a few hours the chlorine would have practically all disappeared. Water will also do this to some extent on account of evaporation, but this process is slow in comparison with the diffusion of gases.

The diffusivity of a gas and the slow evaporation of a liquid can only be adequately explained by a *kinetic theory* in which a fluid is supposed to be composed of discrete atoms or molecules. In hydromechanics a fluid is treated as a *continuous substance* and the phenomena of diffusion are largely ignored. The science may be expected, then, to describe the mechanics of liquids more perfectly than the mechanics of gases, and this is indicated by the choice of the prefix "hydro" which is derived from the Greek word *ὕδωρ* meaning water.

Hydromechanics is concerned chiefly with the visible motion of a fluid and with certain phenomena which manifest themselves when the fluid appears to be at rest. These phenomena are generally grouped under the heading *hydrostatics*. By means of the theory of hydrostatic pressure a reason is found for the fact that the free surface of a liquid at rest is very nearly a horizontal plane, while, with the aid of the theory of surface tension, it can be understood why the free surface rises or falls in the immediate neighbourhood of the wall of the containing vessel. The phenomena of capillarity or surface tension (*q.v.*) may be expected to enter when two or more different substances are in contact. In a preliminary treatment of hydromechanics these phenomena are ignored, attention being paid chiefly to the main body of the fluid which is generally treated as nearly or actually homogeneous. Except at a boundary between two different fluids, the nature of a fluid generally changes so slowly from point to point that capillary phenomena associated with such changes can certainly be ignored. In many hydrodynamical problems the density of the fluid is assumed to be constant, and this assumption is a good approximation to the truth, but when large masses of fluid are involved or when the fluid is moving very rapidly, the simplifying assumption of constant density may not be advisable.

HYDROSTATICS

It has already been pointed out that a mass of fluid has no natural durable shape. If a glass of water is tilted the water at once acquires a new boundary and some of it may be spilled. If, on the other hand, the glass contained granulated sugar it could be slightly tilted and the sugar would retain its position relative to the glass, behaving like a rigid body. With a larger tilt the sugar would change its position, and some of it might also be spilled. The difference of behaviour between the sugar and water may be attributed to a kind of static friction which acts between the particles of sugar but not between the particles of water. Now, in the theory of friction, the frictional force F increases with the angle of tilt up to a limiting value μR , where μ is the coefficient of friction and R is the normal force between the surfaces in contact. The existence of friction in the case of the sugar suggests the existence of a normal force R . The absence of friction in the case of water might be due to either $\mu = 0$, or $R = 0$, or both $\mu = 0$ and $R = 0$.

That R is not generally zero was first clearly shown by the Greek mathematician Archimedes (287–212 B.C.) who became interested in the mechanics of floating bodies. He discovered that, when a solid body is completely immersed in a fluid at rest or in two stationary fluids one of which lies above the other, the body is buoyed up by a vertical force equal in magnitude to the weight of fluid displaced, i.e., the fluid which would normally occupy the space filled by the body. The form of the fluid is, of course, changed by the presence of an immersed solid, and it seems natural to say that there is a vertical force on the body because the fluid tries to push it away. This suggests the idea of *fluid pressure*, i.e., a force exerted by the fluid on each surface element of a body with which it is in contact. The existence of such a pressure is indicated by simple observations whenever an effort is made to prevent water from flowing into an open space. The great importance of the foregoing law of Archimedes rests

on the fact that a simple explanation can be found for it on the basis of the hypothesis that the fluid pressure is always at right-angles to a stationary surface element of a body in contact with the fluid, and that the pressure still exists when any portion of the fluid is regarded as a body immersed in the rest of the fluid.

Fluid Pressure.—The idea of pressure is made more precise by defining a *pressure intensity*, in much the same way as a differential coefficient, as the limit of the ratio of the force to the area on which it acts when the area is decreased in magnitude indefinitely. The great advantage of this definition is that pressure intensity becomes a definite quantity associated with a point in the fluid—another invention of the mathematicians which is to be regarded as the limit of a process of infinite subdivision applied to a fluid particle.

Taking it for granted that a pressure intensity exists and is finite, the forces exerted by the fluid on the faces of a very small tetrahedral fluid element become multiplied by a factor which is approximately ϵ^2 when the linear dimensions of the element are diminished in the ratio $\epsilon:1$, similarity in form being maintained.

At the same time the weight of the element becomes multiplied by a factor which is approximately ϵ^3 if the density of the fluid does not vary too rapidly. Now as $\epsilon \rightarrow 0$ the factor ϵ^3 becomes negligible in comparison with the factor ϵ^2 , consequently, in considering the equilibrium of a very small fluid element, the weight of the element can be neglected in comparison with the individual forces due to the fluid pressure. The conditions of equilibrium for a small tetrahedral fluid element $DABC$ (fig. 1), with three mutually perpendicular faces meeting at D , are of type

FIG. 1

$$p_D \cdot \cos \alpha \cdot \Delta ABC = p_A \cdot \Delta DBC,$$

where p_A, p_B, p_C, p_D are the pressure intensities for the faces BCD, CDA, DAB, ABC respectively, and α is the angle between the faces BCD, ABC . Now $\cos \alpha \cdot \Delta ABC = \Delta DBC$, and so $p_D = p_A$. The pressure intensity is thus approximately the same for each face. In the limit ($\epsilon \rightarrow 0$); this means that the pressure intensity at a point is independent of the direction of a surface element used to define it. This pressure intensity will be called the *hydrostatic pressure* at the point; it has the dimensions of a force divided by an area, and may be regarded as the force per unit area. It will generally be called simply the pressure, and denoted by the symbol p .

For a long time the motion of a fluid was discussed with the aid of a simple extension of the idea of hydrostatic pressure to a fluid in motion. The proof that pressure intensity at a point is independent of the direction of the defining surface element then follows much the same lines as before. It is necessary to consider, besides the forces on the element, the product of its mass and acceleration, but this becomes multiplied by a factor which is approximately ϵ^3 when the linear dimensions are diminished in the ratio $\epsilon:1$, and so can be neglected just like the weight.

Pressure-energy and Tension-energy.—The pressure intensity can be regarded as the density of a certain type of energy, the amount of which for a volume element dV is $p dV$. According to the kinetic theory, this energy is closely related to the average kinetic energy of translation of the molecules of the fluid and is always positive, consequently $p > 0$. If the volume occupied by a fluid changes, say by a surface element of area dS being displaced so that its points move on an average a distance h in a normal direction, the work done by the pressure in moving this surface element is $h(p dS) = p dV$, where dV is the increase of volume and p is the pressure intensity at the position of dS . The energy $p dV$ may be called *pressure-energy*. If p is constant throughout a mass of fluid its total pressure-energy is pV , where V is the total volume.

In addition to pressure-energy there is tension-energy associated with the boundary surface between two different substances. The amount of this energy associated with a surface element of area dS is $T dS$, where T is a positive constant called the *surface tension*. If the area of a surface decreases because a line of length

l is displaced in such a manner that each point moves normal to this line through an average distance h , the area decreases by hl and the tension-energy by hTl . This, however, is the work that would have been done by a force Tl acting at right-angles to the line so as to pull it in the direction of the actual displacement. Both pressure-energy and tension-energy are regarded in hydro-mechanics as forms of potential energy.

FIG. 2

The Increase of Pressure with Depth.—Consider the equilibrium of a cylindrical portion of fluid at rest under the action of gravity, the generators of the cylinder, being vertical (fig. 2) and of length h , while the end faces are horizontal and of area A . If p_0, p_1 denote the hydrostatic pressures on the upper and lower faces respectively $(p_1 - p_0)A$ must be equal to the weight of the fluid cylinder, and is consequently equal to shA where s is the specific weight of the fluid. This gives the equation

$$p_1 - p_0 = sh.$$

The quantity s may be replaced by pg , where g is the acceleration of gravity and p is the density of the fluid. Next consider the equilibrium of a similar portion of fluid when the generators of the cylinder are horizontal. The pressures on the elements of the curved surface have no longitudinal components, consequently, if p_1 and p_2 denote the hydrostatic pressures at the two ends, the conditions for a balance of the axial components of force give

$$p_2 - p_1 = 0.$$

These equations determine the pressure at an arbitrary point Q of the fluid, when the pressure p_0 at some particular point Q_0 is given. This pressure p_0 can have any assigned value which is consistent with the requirement that the pressure is to be everywhere positive. If p_0 is one value which satisfies this requirement and P is any positive pressure, then $p_0 + P$ is another possible value. For the foregoing equations show that, if p is the pressure at Q when the pressure at Q_0 is p_0 , then $p + P$ is the pressure at Q when the pressure at Q_0 is $p_0 + P$, and clearly if p is positive so also is $p + P$. The result indicates that, if the pressure at Q_0 is increased by P , the geometrical boundary of the fluid being practically unchanged, the pressure at an arbitrary point Q is also increased by P . This is the transmissibility of fluid pressure discovered by Leonardo da Vinci (1452-1519) and by Blaise Pascal (1623-62). It is utilized in the hydraulic press.

Form of the Free Surface of a Liquid.—The air just above the free surface of a stationary liquid is assumed in hydrostatics

FIG. 3

to be at a constant pressure π . This is the atmospheric pressure at the level of the fluid surface, it generally varies from day to day and sometimes from hour to hour, but at any given instant it may be assumed to vary only slightly with position because, on account of the lightness of air, any appreciable difference of pressure at two points a few feet apart would be soon obliterated by a slight motion of the air. If it should be assumed at once that the pressure just above the free surface of the liquid is equal to the pressure just below the surface, then it would follow immediately that a horizontal plane is a possible form of free surface, but on account of the existence of surface forces the foregoing assumption needs justification.

Supposing for the moment that the free surface is curved and that the pressures p_0 and p_1 on the upper and lower sides are not equal, the relation between them can be found by studying the equilibrium of a small thin cap containing a portion of the free surface and enclosing both liquid and air. The surface of the cap will be supposed (for simplicity) to consist of portions of two surfaces parallel to the free surface and of portions of developable surfaces generated by normals to the free surface. Since

the cap is very small these developable surfaces may be treated as planes bounded laterally by lines that intersect. The traces of these planes on the free surface may be taken to be lines of curvature which form what is approximately a rectangle $ABCD$ (fig. 3) with sides of lengths $R_1\theta_1$, $R_2\theta_2$, where R_1 , R_2 are the radii of curvature and θ_1 , θ_2 angles between normals which intersect.

A condition for the equilibrium of the cap is obtained by resolving along the normal (n) to the free surface at the centre of the rectangle. The fluid pressures give a normal force approximately of magnitude $(p_1 - p_0)R_1\theta_1R_2\theta_2$. By the theory of surface tension, there is a force on AD tangential to the free surface and of magnitude $T(R_1\theta_1)$, where T is the surface tension. The component of this force outwards along (n) is approximately $-\frac{1}{2}\theta_2T(R_1\theta_1)$. The surface tensions on DC , CB , BA likewise give components along (n), and the conditions of equilibrium lead eventually to the equation

$$p_1 - p_0 = T \left(\frac{1}{R_1} + \frac{1}{R_2} \right). \quad (1)$$

If the free surface is plane, $\frac{1}{R_1} = \frac{1}{R_2} = 0$ and so $p_1 = p_0 = \pi$. This

equation is quite consistent with the previous result that the pressure is constant over a horizontal plane, and so the conclusion may be drawn that a free surface can have the form of a horizontal plane. The reason for the departure from this form near a boundary wall is that at the wall there are forces arising from surface tension which are not tangential to the free surface.

The boundary surface between two liquids that do not mix can likewise be a horizontal plane. It can, however, take a different form if the liquids are separated partly by a diaphragm with a hole in the middle. The surface separating the two liquids may then be curved and there may be a difference of pressure on the two sides. If this difference is constant and the surface tension is also constant, the boundary will be a surface for which $\frac{1}{R_1} + \frac{1}{R_2}$ is constant.

The Equilibrium and Stability of a Floating Body.—

When a body floats partly immersed in water, the pressure of the water on an element of area dS of the wetted surface has a vertical component $p dA$, where dA is the horizontal projection of dS . Since $p = \pi + sh$, where h is the depth of the element dS below the free surface and s the specific weight of water,

$$p dA = \pi dA + sh dA = \pi dA + dW$$

approximately, where dW is the weight of the vertical column of water terminated by dA and dS .

The forces of type $p dA$ arising from the pressure of the water are thus seen to be equivalent to a vertical force πA acting through the centroid of the area A in which the free surface would cut the body if it were conditioned as a horizontal plane, and a vertical force W equal in magnitude to the weight of a quantity of water which would just fill the space below the area A that is occupied by the body. This imaginary water is called the *water displaced*, and its weight W the (water) *displacement*. The vertical force W acts through the centre of gravity of the water displaced and is called the *hydrostatic force of buoyancy*. The downward components of the forces due to the pressure of the air on the unwetted surface of the body are similarly equivalent to a force πA , acting vertically downwards through the centroid of the area A , and a force w acting vertically upwards through the centre of gravity of the air displaced and equal in magnitude to the weight of air displaced. This force w may be called the *aerostatic force of buoyancy*. When the forces due to the pressures of air and water are combined, the two forces πA cancel, and the two forces of buoyancy may be combined into a single force of buoyancy which acts through the centre of gravity of the fluid displaced, a point which is called the *centre of buoyancy*. In order that the body may be in equilibrium, its centre of gravity and the centre of buoyancy must be in a vertical line, and the force of buoyancy $W + w$ must be equal in magnitude to the weight of the body.

If a floating body is given different positions consistent with the last condition, the difference of level between the centre of gravity and the centre of buoyancy will generally be either a maximum or a minimum in a position of equilibrium. If the latter, equilibrium is *stable*, while if it is a maximum the equilibrium is *unstable*. This may be seen by calculating the potential energy for each position and using the usual criterion for stability that the potential energy must be a minimum. The foregoing criterion for the stability of a floating body was given by Christian Huygens (1629–95).

Another criterion, due to Pierre Bouguer (1698–1758) and François Pierre Charles Dupin (1784–1873), depends upon the idea of the *metacentre*. Let GH be that line in the body which was originally the line joining the centre of gravity G and the centre of buoyancy H . In a displaced position of the body there is a new centre of buoyancy, H' , and the vertical force through this point is generally inclined at an angle θ_1 with GH and forms with the weight $W + w$, acting vertically downwards through G , a couple which may or may not tend to right the body. When the vertical line through H' meets GH in a point M , the displacement is called a *principal displacement*, and the limiting position of M as $\theta \rightarrow 0$ is called the *metacentre*. The position of equilibrium is stable for this type of displacement if M lies above G ; it is unstable when M is below G , and neutral when G and M coincide. There are generally two types of principal displacement and two *metacentres*. These points are the two centres of curvature of the surface of buoyancy for the point H , this surface being defined as the locus, in the body, of the centre of buoyancy when the body is placed in different positions for which the force of buoyancy is equal in magnitude to the weight of the body. The positions of equilibrium may be found by drawing normals from the centre of gravity G to the centre of buoyancy, for then GH is a maximum or minimum.

HYDRODYNAMICS

A point in, or a "particle" of, a fluid in motion generally describes a curve, in the course of time, which is called the *path of the particle*. The rate of change of position of the particle may be represented by a directed quantity, or vector, q called the *velocity* of the particle. The magnitude of this velocity will be denoted by the symbol q , and the components in the directions of a selected set of rectangular axes by u , v , w . If the position of a point in space is specified by its rectangular co-ordinates x , y , z relative to these axes, and the time by a variable quantity t , then at each place occupied by fluid there will be a vector at each instant t , and its components u , v , w can be regarded as functions of x , y , z and t .

At a given time t the distribution of velocities in the fluid may be conveniently specified by *lines of motion* and *surfaces of constant velocity*. A line of motion is a curve such that the tangent at each point is in the direction of the velocity of the fluid particle which happens to be at the point at time t . The lines of motion are not generally the same as the paths of particles and do not indicate the magnitude of the velocity at each point. This is why it is advantageous to use also a set of surfaces over each of which the velocity has some constant magnitude.

When at every point occupied by fluid the velocity is constant in magnitude and direction (u , v , w independent of t), the motion is said to be *steady*. The lines of motion are in this case the same

FIG. 4

as the paths of the particles and are called *stream-lines*. The stream-lines drawn through an infinitesimal contour form what is called a *stream-tube*. Such a tube possesses the property that fluid in the tube remains in the tube, and important inferences may be drawn by using the principles of the conservatism of mass and energy.

The Equation of Continuity.—Consider two slices of a stream-tube, terminated by areas A , B , A' , B' respectively (fig. 4) and such that the mass of fluid between A and B at each instant is equal to the mass of fluid between A' and B' . If the distance between A and B is very small and the areas A , B , A' , B' are

all perpendicular to the sides of the tube, the fluid between A and A' may be supposed, at a slightly later time, to occupy the region between B and B' , the direction of flow being from A to B . This means that, while a small mass of fluid sufficient to fill the slice $A'B'$ flows across the area A' in a small interval of time dt , an equal amount of fluid will in the same time cross the area A and fill the slice AB , which would otherwise be left empty. If q, q' denote the velocities at A and A' respectively, the small mass of fluid may be represented by the two expressions $\rho A q dt, \rho' A' q' dt$, where ρ, ρ' are the densities at A and A' . When $\rho = \rho'$ this gives the equation

$$Aq = A'q';$$

which is generally attributed to Benedetto Castelli (1577-1644) but the idea of continuity of flow seems to have been familiar to Leonardo da Vinci.

If a quantity of fluid is represented by its mass, the rate of discharge of fluid across the area A may be represented by the quantity $Q = \rho A q$, and the equation $\rho A q = \rho' A' q'$ may be regarded as a form of the equation of continuity. A more general form of the equation, which is due to Leonhard Euler (1707-83), may be obtained by considering the amount of fluid which in a small interval of time dt crosses the faces of a small parallelepiped with sides parallel to the axes of co-ordinates. Denoting the lengths of the sides by dx, dy, dz respectively, the change in the mass of the fluid enclosed in time dt is approximately $\frac{\partial \rho}{\partial t} dx dy dz$. Equat-

ing this to the change due to the flow across the faces, an equation is obtained, which may be finally written in the form

$$\frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x}(\rho u) + \frac{\partial}{\partial y}(\rho v) + \frac{\partial}{\partial z}(\rho w) = 0.$$

An alternative form is

$$\frac{d\rho}{dt} + \rho \left(\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} \right) = 0,$$

where

$$\frac{d\rho}{dt} \equiv \frac{\partial \rho}{\partial t} + u \frac{\partial \rho}{\partial x} + v \frac{\partial \rho}{\partial y} + w \frac{\partial \rho}{\partial z}$$

represents the rate of change of ρ for a particle of fluid. This quantity is zero when the fluid is incompressible, and the equation of continuity takes the simple form

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0;$$

which means that the volume of an element of fluid remains unchanged during motion. These equations were given by Euler in 1755 in the great memoir in which he laid the foundations of the science of hydrodynamics. The principle that the volume of an element of an incompressible fluid remains unchanged had, however, been laid down by Jean le Rond d'Alembert in 1752. He also indicated the type of modification needed for the case of a compressible fluid.

The Equations of Motion, Energy and Pressure.—The equations of motion were obtained by Euler by a method, suggested by d'Alembert, which amounts to an application of what is now called d'Alembert's principle; they are of type

$$\rho \frac{du}{dt} = \rho X - \frac{\partial p}{\partial x},$$

where X, Y, Z are the components of the total external force (per unit mass) including gravitation.

Bernoulli's Equation.—Referring again to the stream-tube, the fluid within the slice AB will at some later time occupy the slice $A'B'$ and will have the same total energy as before. If V denotes the volume of the slice AB , the total energy is made up of three parts when the fluid is incompressible. These are the kinetic energy $\frac{1}{2}\rho V q^2$, the pressure-energy pV , and the potential energy of external forces (such as gravitation) which may be represented by $\rho V \Omega$. Assuming that there are no other external forces, and using primes to denote corresponding quantities in the second position of the small mass of fluid, the principle of the conservation of energy, when no heat is transferred, gives

$$p'V' + \frac{1}{2}\rho'V'q'^2 + p'V'\Omega' = pV + \frac{1}{2}\rho V q^2 + pV\Omega.$$

Since $V' = V$ the equation takes the form

$$\frac{p'}{\rho} + \frac{1}{2}q'^2 + \Omega' = \frac{p}{\rho} + \frac{1}{2}q^2 + \Omega$$

This equation which has many important applications was first given by Daniel Bernoulli (1700-82).

Pressure of Impact.—If a stream of fluid moving with velocity is deflected by a plate, or other obstacle, and the velocity is zero at a point I (where the fluid strikes the plate normally), the pressure p at this point is given by the equation

$$\frac{p_1}{\rho} + \Omega_1 = \frac{p}{\rho} + \frac{1}{2}q^2 + \Omega$$

(where p, q and Ω refer to a point far in front of the body). Furthermore, if Ω is constant, then $p_1 = p + \frac{1}{2}\rho q^2$, and is greater than at any other point in the fluid except at a point of confluence or stagnation, where the velocity again is zero.

Barotropic Fluids.—When the fluid is compressible there is an equation,

$$\int \frac{dp'}{\rho'} + \frac{1}{2}q'^2 + \Omega' = \int \frac{dp}{\rho} + \frac{1}{2}q^2 + \Omega,$$

analogous to Bernoulli's equation, in the case when ρ is a function of p alone. This condition is not always satisfied in a real fluid, and a study of the general type of compressible fluid has been made by Vilhelm Bjerknes, who calls a fluid in which ρ is a function of p a *barotropic* fluid, and uses the name *baroclinic* for a fluid in which the surfaces of constant density are not the same as the surfaces of constant pressure.

Torricelli's Theorem.—Sextus Julius Frontinus, inspector of the public fountains in Rome about 106 B.C., remarked that the amount of water discharged through an orifice in a given interval of time depends, not only upon the size of the orifice, but also upon its depth h below the surface of the water in the reservoir from which the water is supplied. Castelli came to the conclusion that the velocity q is proportional to h , but his disciple Evangelista Torricelli (1608-47), by reasoning based upon the results of Galileo's experiments with falling bodies, came, in 1643, to the conclusion that q is proportional to the square root of h (except for small corrections due to the resistance of the air and friction at the orifice). The truth of this conclusion was confirmed by the experiments of Raffaello Magiotti (1648), Domenico Guglielmini (1683), and Esmé Mariotte (1684). The relation $q^2 = 2gh$ was finally deduced by Daniel Bernoulli from his equation (2). It is sufficient, in fact, to remark that the pressure p is approximately the same at the orifice and at the surface of the water in the reservoir, while the two values of Ω differ by gh . Assuming that q may be neglected at the surface the equation is at once obtained. Torricelli's relation thus received a rational explanation and Castelli's relation was abandoned.

Circulation.—The line integral

$$\oint (u dx + v dy + w dz),$$

taken round a closed curve, is called the *circulation* round the curve. This integral is zero in the case when

$$u = \frac{\partial \phi}{\partial x}, \quad v = \frac{\partial \phi}{\partial y}, \quad w = \frac{\partial \phi}{\partial z},$$

where ϕ is a single-valued function of x, y and z . The motion is then said to be *irrotational*, and, if the fluid is incompressible, the velocity potential θ satisfies the equation

$$\nabla^2 \phi \equiv \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 \phi}{\partial z^2} = 0.$$

In 1781 Joseph Louis Lagrange gave the theorem that, in a barotropic fluid under the influence of forces which have a single-valued potential, the motion remains irrotational if it is initially irrotational. Satisfactory proofs of this theorem were given later by Augustin Louis Cauchy (1789-1857) and Sir George Gabriel Stokes (1819-98).

The irrotational flow round an obstacle is derived by finding a solution of $\nabla^2\phi=0$ which satisfies the boundary condition that there is no normal component of relative velocity between the fluid and the obstacle. When the motion is steady the variation of pressure over the surface of the stationary obstacle may be obtained by means of Bernoulli's theorem, and it is found that the forces exerted by the fluid on the body either balance or reduce to a couple. This is quite contrary to experience, for it is well known that fluid flowing past a body exerts a force on the body. This contradiction between the irrotational theory and experiment is called the paradox of d'Alembert.

Vortex Motion.—Mathematicians next turned their attention to the study of fluid motion in which the circulation is not zero for every closed curve. In this case the quantities

$$\xi = \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z}, \quad \eta = \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x}, \quad \zeta = \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y}$$

are not generally zero, and are called the *components of spin or vorticity*. The lines defined by the equations

$$\frac{dx}{\xi} = \frac{dy}{\eta} = \frac{dz}{\zeta}$$

are called *vortex lines*, and the vortex lines through the points of a small closed curve form a vortex tube. The fluid contained within such a tube forms a *vortex filament*.

The theory of vortex motion was developed greatly by Hermann von Helmholtz (1821-94) and by William Thomson (Lord Kelvin 1824-1907). Helmholtz showed that the circulation is the same for all circuits embracing a vortex tube and drawn on it, and is equal to $\omega\sigma$, where σ is the area enclosed by the circuit, and $\omega = (\xi^2 + \eta^2 + \zeta^2)^{1/2}$ is the resultant vorticity of the fluid at the point. He also showed that, in the case of a barotropic fluid subject to forces with a single valued potential, vortex lines move with the fluid and so remain vortex lines. Kelvin amplified this theorem, and proved it anew by showing that the circulation in any circuit moving with the fluid remains constant. These results led to the conclusion that in a barotropic fluid circulation can neither be created nor destroyed so long as all external forces have a single-valued potential.

Viscous Flow.—Sir Isaac Newton in his *Principia* (1687) commenced the study of tangential forces in a moving fluid by considering the case of flow in one direction (that of Ox), when the velocity u varies in a perpendicular direction Oy (fig. 5). A layer I., moving faster than the lower layer II., exerts on the latter a viscous drag depending on the difference of velocities. Newton's hypothesis means, mathematically, that the tangential force, acting across a small area A separating I. from II., is $\mu A \frac{\partial u}{\partial y}$, where μ is

a physical quantity called the *coefficient of viscosity* of the fluid. μ has the dimensions of a momentum, divided by an area. Sometimes the *kinetic viscosity* $\nu = \mu/\rho$ is used in place of μ ; this has the dimensions of a velocity multiplied by a length.

In the kinetic theory the viscous drag is attributed to fast-moving molecules crossing from I. to II., and slow-moving molecules crossing from II. to I. In the type of fluid motion which is called *turbulent*, there is a similar transfer of momentum from one layer to another, in which aggregates of fluid particles endowed with vorticity are the wandering elements instead of single molecules.

In the case of viscous flow under pressure along a straight tube, the condition for the steady motion of a cylindrical element (fig. 6) is that the difference of pressure at the two ends should be equal to the surface integral of the viscous drag over the curved surface. This leads to the equation

$$(p_1 - p_2)A = \mu \int \frac{\partial u}{\partial n} ds = \mu A \left(\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right),$$

when A is small. The velocity u is subject also to the boundary condition that there should be no slipping at the surface of the tube, i.e., $u=0$ at the boundary. In the case of a circular tube of radius a , the conditions are satisfied by

$$u = \frac{p_1 - p_2}{4\mu l} (a^2 - r^2),$$

where r is the distance of a point from the axis of the tube. The amount of fluid passing through the tube in unit time is thus

$$\frac{\pi a^4}{8\mu} \frac{p_1 - p_2}{l}.$$

This law, which is due to Jean Louis Marie Poiseuille, has been confirmed by experiments in the case of flow through capillary tubes and very slow motion through wide tubes. The applicability

of the law seems to depend upon the value of the ratio $R = \frac{ua}{\nu}$, which is called the *Reynolds number*, after Osborne Reynolds (1842-1912) who showed that the flow ceases to be viscous when this number exceeds a certain critical value. For a very viscous liquid like oil, Poiseuille's law is usually applicable because R is small.

In the case of a tube of arbitrary section, the equation for u may be compared with an equation which occurs in Saint Venant's theory of the torsion of a straight bar, or with the equation

$$2T \left(\frac{\partial^2 x}{\partial y^2} + \frac{\partial^2 x}{\partial z^2} \right) + p_1 - p_2 = 0,$$

which may be deduced from equation (1), and gives the approximate form of a liquid film covering a hole in a diaphragm, and

FIG. 7

subjected to a greater pressure on one side than on the other (fig. 7). A soap film method of solving problems of viscous flow and of the torsion of prisms was proposed by Ludwig Prandtl, and has

been developed by English investigators. The inclination of each element of the film, the contour lines and the volume under the film are determined by simple measurements. Two Belgian investigators have recently devised an improved arrangement depending upon the use of the boundary surface of two liquids of equal density which do not mix.

The Boundary Layer.—The actual flow of a fluid seldom obeys the laws either of irrotational or of viscous flow, and Prandtl has consequently developed a theory in which the flow, within a thin boundary layer next the wall of the containing vessel or immersed solid, is approximately viscous, while the flow outside the layer is approximately irrotational. In the case of flow past a plane wall parallel to the direction of flow (fig. 8), the thickness of the boundary layer increases gradually with the

FIG. 8

distance from the leading edge, and is at first exceedingly small if the viscosity of the fluid is low.

In the case of flow through a long tube, the boundary layer (fig. 9) will eventually fill the tube, and the flow at the entrance is materially different from the turbulent flow in the main part of the tube, for in this latter part the boundary layer theory is inapplicable. The turbulent flow leads to a much more uniform distribution of velocity over the cross section of the tube than the viscous flow, and to an entirely different law of resistance. (See HYDRAULICS.)

FIG. 9

The flow in the boundary layer at the surface of a solid immersed in the fluid is regular when it is in the direction of decreasing pressure, but, when the flow is from low pressure to high pressure, the momentum of the fluid in the boundary layer may not be sufficient to overcome the resistances, and the streamlines break away from the boundary. Isolated vortex filaments, or eddies, form behind the body more or less close to the place

where the stream-lines break away, and to the place where there is a confluence of stream-lines which separated at the front of the body.

HYDROMEDUSAE, a technical name for a class of the Coelenterata. The term is more particularly applicable to those members of the group which have the form of *medusae* or jelly-fish, and is interchangeable with the more usually employed name Hydrozoa. (See COELENTERATA; HYDROZOA; MEDUSA.)

HYDROMETERS. The first account of the use of hydrometers in England is in a paper published by Robert Boyle in 1675, *Phil. Trans.*, June 1675, and fig. 1 is reproduced from an illustration of a hydrometer contained in that paper.

The recognition of the fact that such an instrument provides a ready means of determining the density of a liquid dates from very early times and there is evidence that Archimedes (287–212 B.C.) was familiar with it. The hydrometer remained of little importance until it was developed for industrial purposes. This development began with the use of hydrometers in the 18th century for determining the strength of spirits and has gone on until at the present time hydrometers have very widespread industrial applications.

Boyle's hydrometer (fig. 1) was made of glass and differs in no essential feature from modern glass hydrometers (fig. 2). The principle on which the construction of hydrometers is based is that a body floating partially immersed in a liquid is in equilibrium when the volume of liquid displaced, which is equal to the volume of the submerged portion of the body, has a mass equal to that of the floating body. When placed in a liquid in which it can float freely a hydrometer will therefore come to rest in such a position that it displaces a volume of liquid having a mass equal to that of the hydrometer. A hydrometer is read in a liquid by noting the intersection of the level liquid surface with the stem of the hydrometer when the hydrometer is at rest and floating freely in the liquid. The reading is taken on a scale sealed inside the stem of the hydrometer.

If V' is the volume of that portion of a hydrometer which is below a particular graduation mark on the scale, then $\delta V'$ is the mass of liquid, of density δ , displaced when the hydrometer is floating freely with this graduation in the level of the liquid surface. If M is the mass of the hydrometer it follows that $\delta V' = M$ and $\delta = M/V'$. Consequently if V is the volume of that portion of a hydrometer which is below the lowest graduation mark on the scale and v is the volume of the portion of the stem between the highest and lowest graduation marks the range of densities which can be determined by means of the hydrometer is that lying between the values $\delta = M/V + v$ and $\delta = M/V$.

A Logical System of Hydrometry.—Neglecting, for the moment, the comparatively small effects of surface tension and changes of temperature, the plane of intersection of the level of a liquid surface with the stem of a hydrometer is determined

solely by the density of the liquid. If, therefore, a scale is sealed inside a hydrometer stem having graduation marks suitably spaced and numbered to enable the density corresponding to any point on the scale to be easily read, the hydrometer will indicate directly the property of the liquid which determines the reading of the hydrometer. Densities are generally most conveniently expressed in terms of grammes per millilitre which is therefore a convenient basis for the density scale of hydrometers.

Let us assume, therefore, that we have decided to have our hydrometers provided with scales to indicate densities in grammes per millilitre, this being a basis resting on fundamental units of mass and volume and free from all ambiguity.

The next thing to consider is the practical use of such a hydrometer. In the petroleum industry the density of petroleum products (often expressed as the equivalent specific gravity $S_{60^\circ F}$) is used as one of the criteria of quality. Since the liquids

in question have comparatively high coefficients of expansion it is necessary to use the density at some specified temperature as a criterion for comparative purposes. The temperature generally adopted is $60^\circ F$, and a hydrometer adjusted to indicate densities at this temperature will give directly the desired density if read in a sample at $60^\circ F$. It is not always convenient, however, to bring the temperature of the sample to $60^\circ F$, and it is often more economical in expenditure of time to take the hydrometer reading at the prevailing temperature of the sample and to use tables to obtain from the hydrometer reading the density of the sample at $60^\circ F$.

The correction tables can conveniently take the form shown at bottom of page.

Alternatively, to eliminate the need for addition or subtraction, the actual densities at $60^\circ F$ corresponding to the observed hydrometer readings can be entered in the body of the table. If this is done, more voluminous tables are required, as the first column should then progress by small increments, e.g., ... 0.700, 0.701, 0.702 ... and so on. The combination of hydrometer and tables provides a rapid and reliable means of ascertaining the density of a petroleum spirit at $60^\circ F$ from simple observations carried out at any convenient temperature.

As another example we will consider the use of a density hydrometer for ascertaining the percentage composition of sugar solutions. The hydrometer is read in the sugar solution whose temperature is also noted and then by means of tables prepared as indicated below the required percentage of sugar is obtained.

Observed Reading on Hydrometer	Temperature at which hydrometer reading was taken— $^\circ C$.										
	10	11	12	13	14	15	16	17	18	19	20
1.050 gms./ml.	12.38	12.41	12.46	12.50	12.54	12.59	12.63	12.68	12.73	12.78	12.84

Summarizing the scheme, the hydrometer is used to determine density and tables are used to convert the observations to a standard basis, i.e., to percentage composition, etc. The advantages of such a system are:—(1) The hydrometer scale is clearly defined and not dependent on the properties of a particular liquid; (2) the onus on the manufacturer is simply to produce accurate density hydrometers; (3) the conversion of density to percentage composition, etc., is left to the users who should be in the best position to employ the most reliable data relating to the liquids in which they are interested; (4) tables can be revised without rendering any hydrometers obsolete; (5) the hydrometers can

Observed reading on hydrometer	Temperature at which hydrometer reading was taken— $^\circ F$.										
	50	52	54	56	58	60	62	64	66	68	70
0.700 gms./ml.	—0.0048	—0.0038	—0.0029	—0.0019	—0.0010	0.0000	+0.0009	+0.0019	+0.0028	+0.0038	+0.0048
0.750 gms./ml.	—0.0044	—0.0035	—0.0025	—0.0017	—0.0009	0.0000	+0.0009	+0.0018	+0.0026	+0.0035	+0.0043

be used in a variety of liquids provided there are not too great variations in surface tension.

The general acceptance of the principle that it is the function of the hydrometer to determine density and of tables to interpret the results would lead to considerable simplification in hydrometry and remove much existing confusion.

Details of Construction of Glass Hydrometers.—Glass hydrometers should be well annealed and made from glass having

FIG. 2.—MODERN GLASS HYDROMETERS

low thermal hysteresis, resistant to chemical action and free from striae and similar defects. The stem should be cylindrical but considerable latitude is permissible in the shape of the bulb. Some common forms are shown in fig. 2. The hydrometer must be loaded so that it floats with its stem vertical. The loading material, if mercury, should be confined to a lower bulb (figs. 2a, 2d, 2e); if lead shot, it should be confined to a lower bulb or fixed in position with wax if placed in the main bulb as in figs. 2b and 2c.

Good quality paper should be used for the scale which must be securely fixed in position in the stem and there should be a reference mark etched on the stem coincident with a second reference mark on the paper scale so that any accidental shift of the scale is made evident by a separation of the reference marks.

The graduation marks must be horizontal when the stem is vertical and the scale should be free from twist so that the graduation marks lie vertically beneath each other and do not lie on a spiral round the stem. The length of the graduation marks should be suitably varied and sufficient marks numbered to enable the hydrometer to be read at a glance. The distance between adjacent graduation marks should not be less than 1 mm. nor more than 3 mm.

The scale should bear an inscription indicating precisely the basis of graduation, e.g., "Gms./ml. at 15° C" is a suitable inscription for a hydrometer adjusted to indicate densities in grammes per millilitre at 15° C.

Relation Between Volume of Stem and Volume of Bulb.—Let M = the mass of the hydrometer in grammes.

δ_0 = the density corresponding to the highest graduation mark in gram./ml.

δ_N = the density corresponding to the lowest graduation mark in gram./ml.

V = volume of portion of hydrometer below the lowest graduation mark.

v = volume of stem between highest and lowest graduation marks in ml.

Then we have

$$M = \delta_0(V + v) = \delta_N V$$

whence

$$V = v \times \frac{\delta_0}{\delta_N \delta_0}$$

Spacing of Graduation Marks on Density Hydrometer.—Let δ gms./ml. be the density corresponding to any graduation mark intermediate between those corresponding to the limiting densities δ_0 and δ_N and let v' be the volume of the stem between the marks corresponding to the densities δ_0 and δ_N . Then we have

$$M = \delta_0(V + v) = \delta(V + v - v') = \delta_N V$$

and by eliminating M and V we obtain

$$v' = v \times \frac{\delta - \delta_0}{\delta_N - \delta_0} \times \frac{\delta_N}{\delta}$$

If the stem is of uniform diameter and L is the distance between the marks corresponding to δ_0 and δ_N and l is the distance from the highest graduation mark of the mark corresponding to δ then

$$l = L \times \frac{\delta - \delta_0}{\delta_N - \delta_0} \times \frac{\delta_N}{\delta}$$

For a hydrometer of range 1.000 gms./ml. (δ_0) to 1.050 gms./ml. (δ_N) having $L = 150$ mm. the above relation gives the following values:

Density corresponding to graduation mark } gms./ml.	1.000	1.010	1.020	1.030	1.040	1.050
Distance of graduation mark from highest graduation mark } mm.	0	31.2	61.8	91.8	121.2	150.0

From the above values we have:—

Distance from 1.000 gms./ml. mark to 1.010 gms./ml. mark	= 31.2 mm
" " 1.010 " " " " 1.020 " " "	= 30.6 "
" " 1.020 " " " " 1.030 " " "	= 30.0 "
" " 1.030 " " " " 1.040 " " "	= 29.4 "
" " 1.040 " " " " 1.050 " " "	= 28.8 "

The length corresponding to a change in density of 0.010 gms./ml. therefore decreases towards the lower end of the scale, i.e., the graduation marks on a density hydrometer become more closely spaced towards the lower end of the scale.

Temperature Corrections for Density Hydrometers.—

Suppose a density hydrometer, adjusted to indicate densities in gms./ml. correctly at t° C, to read δ gms./ml. in a liquid having a temperature t° C and also to read δ' gms./ml. when placed in a second liquid having a temperature t'° C.

The density of the first liquid is δ gms./ml. at t° C where $\delta = M/V$, M gms. being the mass of the hydrometer and V the volume of the portion of the hydrometer below the mark δ .

When the hydrometer is reading δ gms./ml. in the second liquid having a temperature t'° C the volume of the submerged portion of the hydrometer is $V\{1 + \alpha(t' - t)\}$ ml. where α is the coefficient of cubical expansion of the glass from which the hydrometer is made. The density δ' gms./ml. at t'° C of the second liquid is therefore given by the equation

$$\delta' = \frac{M}{V\{1 + \alpha(t' - t)\}}$$

or to a close approximation

$$\delta' = \delta\{1 - \alpha(t' - t)\}$$

Let c be a correction to be applied to the reading δ gms./ml. in the second liquid in order to give the density δ' gms./ml. of that liquid at t'° C. Then

$$\delta' = \delta + c$$

whence

$$c = \delta\alpha \cdot (t - t').$$

An average value for α is 0.000026, so that if $(t - t')$ is equal to 10° C we obtain the following values of c for various values of δ :

δ	0.6	1.0	1.5	2.0
c	0.0002	0.0003	0.0004	0.0005

Now an error of 0.0005 gms./ml. in density is negligible for most purposes for which hydrometers are used and so the above values of c are negligible in magnitude. Hence a density hydrometer which indicates densities correctly in gms./ml. at its standard temperature t° C may be used at any temperature within the range $(t \pm 10)^\circ$ C and will still indicate densities at the temperature of observation with a sufficient degree of accuracy for all ordinary purposes.

Effects of Surface Tension on Hydrometer Readings.—

When a hydrometer is floating in a liquid the surface of the liquid does not remain level up to the point of contact with the emergent stem of the hydrometer, but liquid piles up against the stem as shown in fig. 3. There is a downward pull on the stem of the hydrometer equal to the product of the surface tension of the liquid and the perimeter of the stem, i.e., equal to $(T \times \pi \times d/10)$ dynes for a stem of circular cross section where T is the surface tension in dynes per centimetre and d mm. is the diameter of the stem. The effect of this is virtually to increase the mass of the hydrometer by

an amount equal to $\frac{\pi d T}{10g}$ gms. where g cm./sec² is the acceleration due to gravity.

Suppose that a hydrometer reads δ gms./ml. in a liquid having a surface tension T_1 dynes/cm. and that this reading correctly represents the density of the liquid. Now suppose the hydrometer to be placed in a second liquid having the same density δ but a greater surface tension T_2 dynes/cm. The virtual increase in mass due to surface tension in the second liquid will be greater than that in the first liquid by an amount equal to

$$\frac{\pi d}{10g} \cdot \{T_2 - T_1\}$$

Hence the hydrometer will sink further in the second liquid than in the first until the increase in the mass of liquid displaced by the hydrometer is equal to the increase in the mass of liquid in the meniscus. If l mm. is the additional length of stem submerged in the second liquid the increase in the mass of liquid displaced by the hydrometer is

$$\frac{\pi}{4} \cdot \frac{d^2}{100} \cdot \frac{l}{10} \cdot \delta$$

Hence we have

$$\frac{\pi d}{10g} \{T_2 - T_1\} = \frac{\pi}{4} \cdot \frac{d^2}{100} \cdot \frac{l}{10} \cdot \delta$$

from which

$$l = \frac{400}{\lambda d \delta g} \{T_2 - T_1\}.$$

Let λ be the length of a subdivision on the hydrometer scale near the point corresponding to the density δ and let $\phi = l/\lambda$. From the above equations we have

$$\phi = \frac{400}{\delta d \delta g} \{T_2 - T_1\}$$

and ϕ represents the error in terms of subdivisions corresponding to a change in surface tension amounting to $\{T_2 - T_1\}$. It is obviously desirable that ϕ should be as small as possible, i.e., that λd should be as large as possible. Sufficient attention is not always paid to this fact in the design of hydrometers.

The following example will serve to illustrate the magnitude of surface tension effects. For a hydrometer of range 1.000

gms./ml. to 1.040 gms./ml. having $\lambda = 1.5$ mm. and equivalent to 0.001 gms./ml. we have if $\delta = 1.030$ gms./ml. and $d = 5$ mm.

$$\phi = 0.053 \{T_2 - T_1\}.$$

If such a hydrometer were to be adjusted to read correctly at 1.030 gms./ml. in dilute sulphuric acid having a surface tension of 70 dynes/cm. and were subsequently to be used in milk of the same density but having a surface tension of 50 dynes/cm. then ϕ is 1.03, so that the hydrometer would be in error when used in milk by slightly more than one whole subdivision, i.e., slightly more than 0.001 gms./ml.

Some liquids, notably dilute aqueous solutions, have high surface tensions when the liquid surface is perfectly clean but even very slight contamination may lower the surface tension considerably, e.g., by as much as 20 dynes/cm. The errors consequent upon such variations in surface tension are the most serious of the limitations to the accuracy attainable with hydrometers.

Specific Gravity Hydrometers and Density Hydrometers.—

Glass specific gravity hydrometers are very extensively used in many industries and in this country the majority are adjusted to indicate specific gravity $S_{60^\circ F}$ at 60° F. If n is a

reading on such a hydrometer at 60° F the density of the liquid in which the reading is taken is $n \times 0.999041$ gms./ml. since the density of water at 60° F is 0.999041 gms./ml. and specific gravity $S_{t_2^\circ}$ is simply the ratio:—density of liquid at t_1 : density

of water at t_2 . The scale of a specific gravity hydrometer becomes more closely spaced towards the bottom exactly as on a density hydrometer, in fact, a hydrometer indicating $S_{60^\circ F}$ at 60° F

could be converted to indicate densities in grammes per millilitre at 60° F simply by increasing its mass in the ratio 1: 0.999041.

Though the basis given is that most commonly employed, many others are also used, e.g., $S_{15^\circ C}$ at 15° C, $S_{17.5^\circ C}$ at 17.5° C, $S_{20^\circ C}$ at 20° C and so on.

Hydrometers adjusted to indicate densities in grammes per millilitre are preferable from a scientific point of view to hydrometers indicating specific gravity, because their scales are more directly related to the fundamental units of measurement. They are not so widely used as specific gravity hydrometers but they are coming into more general use.

Hydrometers for Ascertaining the Strength of Alcohol.

History of Development in Great Britain.—Hydrometers came into use for ascertaining the strength of spirits towards the end of the 17th century, when they began to displace such comparatively crude tests as the well-known powder test. In the powder test spirit was poured on to a small quantity of gunpowder and then a light was applied to the wet powder. If it burned the spirit was "over-proof" and if not the spirit was "under-proof." The earliest hydrometers resembled that shown in fig. 1 and had a mark near the middle of the stem at which the hydrometer would float in a mixture of about equal parts of alcohol and water. A mark at the bottom of the stem indicated the reading in water and one at the top the reading in the strongest alcohol then known. If the middle mark came well below the surface of a sample of spirit the spirit was "over-proof." This form of hydrometer gave some degree of precision to the term "proof-spirit" but only roughly indicated "over" and "under-proof" strengths. With the increase in duties and the increased need for more accurate discrimination between the strengths of different spirits considerable development of hydrometers occurred in the 18th century, more closely divided scales were used, and metal hydrometers with detachable weights of various sizes were made. It was not, however, until quite the end of the 18th century that the necessary data for placing alcoholometry on a sound basis was available.

In 1794 George Gilpin, clerk to the Royal Society, published a comprehensive set of tables based on a long series of determinations of the specific gravity of mixtures of alcohol and water.

These tables gave the specific gravity $\frac{S_{60F}}{60F}$ for each degree Fahrenheit from $t=30^\circ\text{F}$ to $t=80^\circ\text{F}$, of 201 different mixtures of alcohol water, the strength of the mixtures being expressed thus:—

Spirit—Parts by weight . . .	100	100	100	...	100	100	99	...	2	1	0
Water—Parts by weight . . .	0	1	2	...	99	100	100	...	100	100	100

The tables also gave the percentage composition by volume of each mixture and by 1794 all the necessary data existed for obtaining the strength of any sample of spirit from a determination of its density. The problem remained, however, of linking up the available data with the simplest method of determining density, *i.e.*, by means of a hydrometer.

In 1802 the Government asked for hydrometers to be submitted to them for examination with a view to the adoption for revenue purposes of the one considered most suitable for determining the strength of spirits. As a result a hydrometer and tables submitted by Bartholomew Sikes were adopted for revenue purposes and legalized by Acts of Parliament of 1816 and 1818. In all its essentials Sikes's system remains in use at the present time.

The outstanding features of Sikes's proposals were: (1) he gave precision to the then customary method of expressing strength in terms of "proof-spirit"; (2) he appreciated the desirability of keeping the hydrometer as simple as possible and the necessity for providing tables to obtain adequate accuracy in determining proof-strength from hydrometer readings; (3) he prepared his tables accurately and in a form convenient for use.

Proof spirit was defined (56 Geo. III. c. 140, 1816) as "that which at the temperature of 51°F weighs exactly $\frac{1}{2}$ parts of an equal measure of distilled water." Proof spirit so defined contains 49.28% by weight of pure anhydrous alcohol. If from 100gals. of a given spirit containing more alcohol than an equal volume of proof spirit, 120gals. of proof spirit could be obtained by the addition of water, the spirit was said to be 20% over-proof, and 100gals. of that spirit would be charged the same duty as 120gals. of proof spirit. Similarly a spirit 100gals. of which contained the same amount of alcohol as 80gals. proof spirit was 20% under-proof and dutiable at 80% of the rate fixed for proof spirit. On this basis it is only necessary to fix the amount of duty payable on one gallon of proof spirit and the duty chargeable on any particular quantity of spirit can then be reckoned from its bulk and proof strength. By his hydrometer and tables, Sikes provided a ready means of ascertaining proof strengths.

Sikes's Hydrometer.—The Sikes hydrometer in use at the present time is shown in fig. 4. It is a gold-plated brass hydrometer with a spherical bulb about 4cm. in diameter. Above the bulb is a hollow rectangular stem about 9.5cm. in length and 5mm. \times 2mm. in cross section. On this stem a scale about 6.5cm. in length and subdivided into 50 equal parts is engraved. The highest graduation mark is carried completely across the face of the stem and numbered "0," the next four graduation marks are shorter lines, the fifth line is carried completely across the stem and numbered "1" and so on down to the lowest mark which is numbered "10." In the original hydrometer there were no subdivisions between the graduation marks. Below the bulb is a stem about 3cm. in length which is circular in cross-section, tapers towards the bulb and has a balancing poise fixed at its lower end.

There are a series of nine gold-plated brass weights for use with the hydrometer. Each weight is in the form of a disc with a central hole and slot cut in it as shown in fig. 5. The size of the slot is such that it will easily pass over the upper end of the

FIG. 4.—THE SIKES HYDROMETER

lower stem of the hydrometer but will not pass over the thicker lower end of this stem. The central hole is large enough to allow the weight to be placed on the lower stem and rest on the top of the balancing poise. The weights are graded in size and numbered 10, 20, 30 and so on up to 90. They are adjusted so that if the hydrometer reading in a suitable sample of spirit is 10 on the scale when the 20 weight is attached to the hydrometer, then the scale reading in the same sample of spirit when the 20 weight is replaced by the 30 weight will be 0. The hydrometer reading in any sample of spirit is the sum of the number marked on the weight required to make the hydrometer float with part of its stem submerged in the liquid and the scale reading at the intersection of the level liquid surface with the stem. The complete range of readings is thus 0 to 100, since the hydrometer may be used alone or with any one of the nine weights placed on the lower stem.

FIG. 5.—HYDROMETER

Tables for Use with Sikes's Hydrometer.—The present tables for use with Sikes's hydrometer differ from the original ones only in that they cover a larger range of temperature, progress by fifths of a degree Sikes instead of whole degrees, and are based on later determinations of the density of alcohol-water mixtures. A portion of the table for 60°F is given below:—

Indication	Per cent. U.P.	Indication	Per cent. U.P.	Indication	Per cent. U.P.	Indication	Per cent. U.P.	Indication	Per cent. U.P.
50.0	12.9	60.0	1.7	70.0	18.6	80.0	40.3	90.0	71.9
50.2	12.6	60.2	2.0	70.2	19.0	80.2	40.8	90.2	72.6
50.4	12.3	60.4	2.3	70.4	19.4	80.4	41.3	90.4	73.2
50.6	12.1	60.6	2.7	70.6	19.7	80.6	41.9	90.6	73.9
50.8	11.8	60.8	3.0	70.8	20.1	80.8	42.4	90.8	74.5
51.0	11.5	61.0	3.3	71.0	20.5	81.0	42.9	91.0	75.2

The table for 60°F extends over the whole range from 0 to 100 on the Sikes scale in steps of 0.2 as above and there is a similar table for each degree Fahrenheit from 30°F to 100°F inclusive. To ascertain the strength of a sample of spirit all that is necessary is to read the hydrometer in the spirit, observe the temperature of the sample at the time the reading is taken, and then refer to the table for the particular temperature observed in which the required proof strength will be found against the observed hydrometer reading.

Extension of Range.—Sikes's hydrometer instrument, used without any weight attached, sinks below the 0 mark at 30°F in spirits containing more than 97.1% by weight of alcohol (72.2% O.P.) and at 100°F in spirits containing more than as little as 85.5% by weight of alcohol (57.5% O.P.). For strong spirits an additional hydrometer, similar to the Sikes hydrometer, and having a scale numbered "A" 0 to "A" 10 has therefore been introduced for revenue purposes in Great Britain. The hydrometer reads "A" 10, the lowest mark on the stem, in a spirit in which the ordinary range Sikes hydrometer reads 0. In India a hydrometer of range "A" 0 to "A" 20 is used for strong spirits, "A" 20 on this scale being equivalent to 0 on the ordinary Sikes scale, and "A" 10 being equivalent to "A" 0 on the English scale for strong spirits. Such complications seem inevitably to follow the adoption of arbitrary scales.

Alcohol Hydrometry in Other Countries.—Hydrometers and appropriate tables are widely used for ascertaining the strength of spirits. (For details see *Alcoholometric Tables* by Sir Edward Thorpe.) A proof standard similar to the English is used in America and Holland but both differ from the English and also from each other. In Russia, France and Italy the strength of spirits is expressed as percentage of alcohol by volume, and in Germany as percentage of alcohol by weight. There is even greater diversity in the hydrometers employed. There are purely arbitrary scales like the Sikes; in Russia a hydrometer indicating 100 in water, and 0 in strong spirits, is used and in Holland a scale of 28 degrees each representing an equal length on the scale is

used. Other hydrometers in use are adjusted to indicate percentage of alcohol, some by weight, some by volume, and still other hydrometers have scales indicating proof strengths.

Since the density of a spirit serves as a measure of its strength and since also its density determines the position of equilibrium of any hydrometer placed in the spirit it is obviously possible to correlate any hydrometer scale and spirit strengths. The same thing applies to other liquids and it is therefore easy to understand how a large variety of hydrometers has come into use not only in alcoholometry but for other purposes also. The result is obviously not without its disadvantages.

Saccharometers.—Bates saccharometers are used for estimating the duty on the sugar content of worts, the liquid from which beer is produced by fermentation. The duty is reckoned on the basis of the specific gravity ($\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$) of the worts and the

Bates saccharometer is a gold-plated metal hydrometer adjusted to indicate specific gravity ($\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$) when read in worts at 60°F .

It has a rectangular stem on which a scale numbered 0 to 30 is engraved, this range being equivalent to a change in specific gravity of 0.030. The scale is divided into 30 intervals, each corresponding to 0.001 change in specific gravity. A series of weights numbered 1,000, 1,030, 1,060 and so on are used with the hydrometer. They are olive-shaped and each is provided with a conical stem which is a tight fit in a conical hole in a vertical ring fixed to a short stem below the hydrometer bulb (see fig. 6). With the 1,000 weight attached the range of the hydrometer is from $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ 1.000 to $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ 1.030 with the 1,030 weight $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ 1.030

to 1.060 and so on. In order that the same scale may be used with each weight it is necessary not only that the mass of the weights must be adjusted correctly but also the volume of each weight must be greater than that of the next smaller weight by an amount equal to the volume of the stem between 0 and 30.

Glass hydrometers adjusted to indicate density and also those adjusted to indicate specific gravity are extensively used both in the brewing and the sugar industries.

The Brix saccharometer simply indicates percentage of sugar by weight when read in sugar solutions at 17.5°C .

Some glass hydrometers are scaled so that when read in hot sugar solutions, e.g., at 150°F , they indicate the specific gravity $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ which the solution would have if cooled down to 60°F .

Other hydrometers have an enclosed thermometer but the thermometer scale indicates not temperature but corrections to be applied to observed readings on the hydrometer scale due to any difference between the temperature of the solution and that at which the hydrometer scale is correct.

The last two types of hydrometer are not to be recommended. It is a mistake to try to make a hydrometer perform the function of both hydrometer and correction tables.

Twaddle Hydrometers are generally made of glass and adjusted for use at 60°F . The Twaddle scale is defined by the relation

$$\frac{200+n}{200} = S \text{ or } n = 200(S-1)$$

where n is the scale reading at 60°F in degrees Twaddle and S is the corresponding specific gravity $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$.

A complete set of Twaddle hydrometers consists of six hydrometers having the ranges 0° – 24° ; 24° – 48° ; 48° – 74° ; 74° – 102° ; 102° – 138° ; 138° to 170° respectively. The complete range 0° to

170° (i.e., $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ 1.000 to $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ 1.850) covers the range of

specific gravities of mixtures of sulphuric acid and water from that of pure water to that of pure acid. The hydrometer scales in hydrometers forming a set like the above are usually subdivided into intervals representing 0.5° on the Twaddle scale.

The above ranges are those most frequently met with, but Twaddle hydrometers are also made in a variety of other ranges and with various degrees of openness of scale.

It is clear from the relation defining the Twaddle scale that a change in reading of one degree on a Twaddle hydrometer represents a change of 0.005 in specific gravity. Hence a specific gravity hydrometer indicating $\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}}$ at 60°F and subdivided into

intervals representing 0.005 change in specific gravity could be converted into a Twaddle hydrometer simply by re-numbering the scale. The only apparent reason for having Twaddle hydrometers as well as specific gravity hydrometers is that they give a scale confined to three figure numbers, and when an accuracy of 1° Twaddle suffices avoid the use of a decimal point. Twaddle hydrometers serve no purpose which could not equally well be fulfilled by either density or specific gravity hydrometers.

Baumé Hydrometer.—In 1768 Antoine Baumé published in *L'Avant* directions for making the hydrometers which are known by his name. The hydrometer for use in liquids heavier than water was to read 0° Bé in water at a temperature of 10° Réaumur and 15° Bé in a 15% salt solution at the same temperature. The scale between 0° Bé and 15° Bé was to be divided into 15 divisions each equal in length, and prolonged by similarly spaced graduation marks beyond the 15° Bé mark. The hydrometer for use in liquids lighter than water was to read 0° Bé in a 10% salt solution at 10° Réaumur and 10° Bé in water at the same temperature, the scale being prolonged upwards above the water point by equally spaced divisions each equal in length to one-tenth the distance between the 0° Bé and 10° Bé marks.

The Baumé hydrometer appeared at a time when other hydrometers were becoming unduly complicated. Clarke's hydrometer, for example, which was used for spirit assaying prior to the introduction of Sikes's hydrometer, had become encumbered with 54 weights. The Baumé hydrometer, with its evenly spaced scale, was easy to manufacture and simple to use. It is not surprising, therefore, that it came into general use for the scale readings, although in a sense entirely arbitrary, it could, if necessary, be correlated with density or any property varying with density.

However, in course of time differences became noticeable when Baumé hydrometers from different sources were compared. It may be shown that the readings on any hydrometer having an evenly spaced scale can be expressed by a relation of the type

$$d = \frac{A}{B+n}$$

where d is the density corresponding to the reading n and A and B are constants. Consequently, in order to provide greater precision in definition of the scale and to preserve the continuity of scales in current use, formulae of the above type were introduced. Unfortunately, however, no one formula was universally adopted—formulae were based on particular instruments and a variety of different ones came into use. In Germany, for example, an inquiry in 1892 showed that there were three different formulae in common use. Consequently the formula

$$\frac{S_{15^\circ\text{C}}}{15^\circ\text{C}} = \frac{144.3}{144.3 \pm n}$$

was proposed, which made the reading 0° Bé in water at 15°C on both the heavy and light hydrometers, the $-$ sign being used for the heavy hydrometers and the $+$ sign for the light ones. This relation, it was proposed, should supersede the three others in common use and later, in 1904, it was adopted as the basis of the official testing of Baumé hydrometers by the Kaiserliche-Normal-Eichungs-Kommission. However, the three original formulae have survived alongside the new one so that the attempt at standardization has merely resulted in Germany having four

FIG. 6.—BATES SACHAROMETER

different Baumé scales in 1928 as compared with three in 1892.

Again, in America, the Bureau of Standards about 1904 adopted the formulae

$$\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}} = \frac{145}{145-n} \text{ and } \frac{S_{60^\circ\text{F}}}{60^\circ\text{F}} = \frac{140}{130+n}$$

for the heavy and light scales as representing the then customary practice in America. In June 1916, however, the Bureau of Standards found it necessary to protest against the use in America of the formula

$$\frac{S_{60^\circ\text{F}}}{60^\circ\text{F}} = \frac{141.5}{131.5+n}$$

for the light Baumé hydrometer. Yet in 1921 the Bureau of Standards agreed to accept this basis for light Baumé hydrometers for use in the petroleum industry, the scale so defined to be known as the A.P.I. scale, but retained its original formula for light Baumé hydrometers for use in liquids other than petroleum (The Bureau of Standards *Circular* 59, 1916, and *Circular* 154, 1924).

So much for modern attempts to standardize the Baumé hydrometer, but it should also be noted that already in 1881 Prof. Chandler had collected 23 different formulae, proposed at one time or another, for the heavy Baumé hydrometer and 11 for the light hydrometer. There is only one practical way of ending the confusion which has grown up around the Baumé hydrometer. This is to discontinue its use entirely and to substitute hydrometers indicating density directly. (See *Glas und Apparat*, 1928, IX.-23.)

Constant Displacement Hydrometers.—In all the hydrometers considered so far the variation in displacement—i.e., volume submerged—of a hydrometer of constant mass has served as a means of determining density. It is obviously possible to determine densities by using a hydrometer of known mass and determining the additional mass necessary to immerse the hydrometer to a single fixed mark corresponding to a known displacement. Hydrometers, of which the best known is Nicholson's, based on this principle, have been made but they are not so convenient to use as ordinary hydrometers and are of little practical importance.

Relative Merits of Metal and Glass Hydrometers.—The disadvantages of metal hydrometers are:—(1) They are liable to change in weight due to corrosion and wear; (2) the stem is not so readily wetted as the stem of a glass hydrometer; (3) the joints are apt to develop leaks; (4) the bulbs are necessarily made of thin metal and are very liable to become dented. It will be realized that through wear, slight leakage, or a small dent, a metal hydrometer may become seriously in error without this being suspected unless the accuracy of the hydrometer is checked at frequent intervals. A glass hydrometer is free from such disadvantages and provides a much more reliable instrument than a metal one. It is more liable to breakage than a metal hydrometer, but once broken the damage is apparent and there is no risk of using a hydrometer which has become seriously out of adjustment, which is one of the most serious objections to a metal hydrometer.

Standardization of Hydrometers.—Since the readings on any hydrometer scale can be converted into equivalent densities, the errors of a hydrometer may obviously be obtained by reading the hydrometer in a liquid of known density. It is more convenient, for example, to determine the errors of a hydrometer indicating percentages of sugar by weight, by determining the densities corresponding to various points on the scale rather than by making up a series of sugar solutions to definite concentrations and reading the hydrometer in them.

The best method is to determine the density of the liquid and to observe simultaneously the reading of the hydrometer in the liquid. This can be done most conveniently by employing the sinker method of determining density. (See DENSITY.) The hydrometer and sinker can be placed side by side in the liquid and the hydrometer reading observed under precisely the same conditions as those under which the density is determined. Thorough

stirring immediately previous to the observations and efficient temperature control are essential to secure uniform density throughout the liquid, and to bring the temperature of the liquid to that at which the corrections to the hydrometer are required.

The direct standardization of hydrometers by the above method takes considerable time and is generally only employed for hydrometers intended for use as standards for verifying other hydrometers. Given a hydrometer whose scale errors are known, a similar hydrometer may be verified by floating it side by side with the standard and taking simultaneous readings on both hydrometers. The difference between the readings combined with the known error of the standard gives the correction to the scale of the hydrometer under test. If the two hydrometers differ appreciably in dimensions, due allowance must be made for surface tension effects unless they are compared in the same liquid as that in which the hydrometer under test is to be used and the corrections to the standard in this liquid are known.

The extensive use of hydrometers in industry and the necessity for accuracy in construction has led to arrangements being made whereby hydrometers may be submitted for verification to national institutions—in England to the National Physical Laboratory, in America to the Bureau of Standards, Washington, in France to the Laboratoire d'Essais, Paris, and in Germany to the Physikalische Technische Reichsanstalt, Charlottenburg.

Customs and Excise (1916); Bureau of Standards, *Circular* 59 (1916); Bureau of Standards, *Circular* 154 (1924). (V. St.)

HYDROPATHY, the name given to the treatment of disease by water, used outwardly and inwardly. The active agents in the treatment are heat and cold, of which water is little more than the vehicle, and not the only one.

Hydrophathy, as a formal system, dates from about 1829, when Vincenz Priessnitz (1801-51), a farmer of Gräfenberg in Silesia, Austria, began his public career in the paternal homestead, extended so as to accommodate the increasing numbers attracted by the fame of his cures. Two English works, however, on the medical uses of water had been published in 1702 and 1797 before the rise of the movement under Priessnitz. These were by Sir John Floyer (1649-1734), a physician of Lichfield (largely drawn upon by Dr. J. S. Hahn, of Silesia, in a work published in 1738) and by Dr. James Currie (1756-1805) of Liverpool (translated into German in 1801 and 1807). Hahn's writings had meanwhile created much enthusiasm among his countrymen, societies having been everywhere formed to promote the medicinal and dietetic use of water; and in 1804 Professor Örtel of Ansbach republished them and quickened the popular movement by unqualified commendation of water drinking as a remedy for all diseases. In him the rising Priessnitz found a zealous advocate, and doubtless an instructor also.

Captain Claridge introduced hydrophathy into England in 1840, his writings and lectures, and later those of Sir W. Erasmus Wilson (1809-84), James Manby Gully (1808-83) and Edward Johnson, making numerous converts and filling the establishments opened at Malvern and elsewhere. In Germany, France, and America hydrophathic establishments multiplied with great rapidity.

At first, hydrophathists treated mainly a sturdy order of chronic invalids well able to bear a rigorous regimen. Later, to suit more delicate cases, the system was modified by John Smedley, a manufacturer of Derbyshire, who, about 1852, founded at Matlock a counterpart of the establishment at Gräfenberg.

Ernst Brand (1826-97) of Berlin, Räljen, and Theodor von Jürgensen of Kiel, and Karl Liebermeister (1833-1901) of Basle, between 1860 and 1870, employed the cooling bath in typhoid fever with striking results that led to its introduction to England by Dr. Wilson Fox. In the Franco-German war the cooling bath was largely employed, in conjunction frequently with quinine; and it now holds a recognized position in the treatment of hyperpyrexia. The wet sheet pack has become part of medical practice; the Turkish bath, introduced by David Urquhart (1805-77) into England on his return from the East, and ardently adopted by Dr. Richard Barter (1802-70) of Cork, has

become a public institution, and, with the "morning tub" and the general practice of water drinking, is the most noteworthy of the many contributions by hydropathy to public health. (*See BATHS, ad fin.*)

The appliances and arrangements by means of which heat and cold are brought to bear on the economy are—(a) Packings, hot and cold, general and local, sweating and cooling; (b) hot air and steam baths; (c) general baths, of hot water and cold; (d) sitz, spinal, head, and foot baths; (e) bandages (or compresses), wet and dry; also (f) fomentations and poultices, hot and cold, sinapisms, stupes, rubbings, and water potatoes, hot and cold.

BIBLIOGRAPHY.—A useful work dealing comprehensively with the subject is Richard Metcalfe's *Rise and Progress of Hydropathy* (1906).

HYDROPHOBIA or RABIES, an acute disease occurring particularly in dogs, and liable to be communicated by them to other animals and to man. In the nerve cells from cases of rabies, and in no other disease, certain bodies, named after Negri, their discoverer, are found with so much regularity that they are held to be diagnostic of the disease. Moreover, if rabies be transferred experimentally to other animals Negri bodies are found in their brains also. Negri bodies are 1–20 μ in diameter and their relation to the filter-passing virus of the disease is uncertain. They are not found in the saliva.

In Dogs, etc.—The occurrence of rabies in the fox, wolf, hyaena, jackal, raccoon, badger, and skunk has been asserted; but probably it is originally a disease of the dog. It is caused by a filter-passing virus (*q.v.*) and is communicable to other warm-blooded creatures. The affected animal, at a certain stage of the disease and upon slight excitement, tends to attack with its natural weapons—dogs and other carnivora attacking with teeth, herbivora their hoofs or horns, and birds with beaks.

Symptoms.—The malady, which runs its whole course in about a week, commences with a change in the habits of the dog; it becomes dull and uneasy and seeks to isolate itself in out-of-the-way places, and is apt to gather up straw, thread, bits of wood, etc., to lick anything cold, as iron, stones, and to lick other animals. Sexual excitement is frequently an early symptom. At this period no disposition to bite is observed. These symptoms gradually become more marked; snapping and excited movements occur, but the dog still recognizes its master's voice; restlessness and agitation increase.

There is no dread of water in the rabid dog; the animal is thirsty and, if water be offered, will lap it with avidity and swallow it—at the commencement of the disease. And when, at a later period, the constriction about the throat—symptomatic of the disease—renders swallowing difficult, the dog will none the less endeavour to drink.

At first the dog does not usually refuse to eat; but soon perversion occurs, and the litter of its kennel, wool, wood, earth, stones, or whatever else may come in its way are devoured.

A mad dog does not usually foam at the mouth. The saliva is not much increased in quantity, but soon becomes viscid and clings to the angles of the mouth, fauces, and teeth. Thirst is great, and the dog sometimes furiously attempts to detach the saliva with its paws. There is another symptom connected with the mouth in that form of the disease named "dumb madness," which has frequently proved deceptive. The lower jaw drops, from paralysis of its muscles, and the mouth remains open. In this condition the creature cannot bite but the saliva is none the less virulent. The mouth should not be touched, numerous deaths having occurred through people, thinking a dog had some foreign substance lodged in its throat, thrusting their fingers down to remove it. Vomiting of blood occurs in some cases.

The voice of a rabid dog is characteristic. Owing to the alterations taking place in the larynx the voice becomes hoarse, cracked, and stridulous, like that of a child affected with croup. A high-toned bark with open mouth is immediately succeeded by six or eight decreasing howls. This alteration in the voice is frequently the earliest indication of the malady. In dumb madness the voice is frequently lost from the first—hence the designation.

Though cutaneous sensation is much diminished, mental excitability is increased. A rabid dog is usually stirred to fury at the

sight of one of its own species. All rabid animals, even the sheep, indeed become furious at the sight of a dog, and attack it.

In most cases such a dog is inoffensive, in the early period of the disease, to those to whom it is familiar; but it is continually endeavouring to escape, and, when free, runs aimlessly forward, perhaps attacking every living creature it meets. It attacks in silence, and should it be hurt in return it emits no cry or howl of pain. The degree of ferocity appears to be related to natural disposition and training. Some dogs only snap in passing, others bite with such violence as to break their teeth, or even their jaws. Soon paralytic symptoms become evident in the intervals of exhaustion between paroxysms; the limbs become feeble and are dragged; the walk is unsteady, while drooping tail and head, open mouth, and protruded tongue present a very characteristic picture. At last, exhausted, it shelters itself in an obscure place—frequently a ditch by the roadside—and lies there in a somnolent state until paralysis and coma end in death.

In other species of animals the symptoms differ more or less from those manifested by the dog, but they are generally marked by a change in the manner and habits of the creatures affected, combined with paroxysmal ferocity.

In Man.—The disease is communicated to man by the saliva of the affected animal entering a wound or abrasion of the skin or mucous membrane. In 90% of cases this is due to the bite of a rabid dog, but bites of rabid cats, wolves, foxes, jackals, etc., are occasionally the means of conveying the disease. The period of incubation of the disease appears to vary in a remarkable degree, being in some cases as short as a fortnight, and in others as long as several months or even years. On an average it seems to be from about six weeks to three months, but it mainly depends on the part bitten; bites on the head are the most dangerous. The incubation period is also said to be shorter in children. The rare instances of the appearance of hydrophobia many years after the introduction of the poison are always more or less open to question as to subsequent inoculation.

When the disease is about to declare itself the wound, which had quickly and entirely healed after the bite, often begins to exhibit evidence of irritation or inflammation or to be the seat of numbness, tingling, or itching. Knowing he has been bitten, the patient's symptoms during the premonitory stage are great mental depression, restlessness, and indefinite fear. There is an unusual tendency to talk, and articulation is abrupt and rapid. There is also some feverishness, loss of appetite, sleeplessness, headache, great nervous excitability, respiration of a peculiar sighing or sobbing character, and even occasionally a noticeable aversion to liquids. These symptoms—constituting what is termed the melancholic stage—continue in general for one or two days, when they are succeeded by the stage of excitement. Sometimes the disease first shows itself in this stage, without antecedent symptoms.

The agitation of the sufferer now becomes greatly increased, and the countenance exhibits anxiety and terror. There is marked embarrassment of the breathing, but the most striking and terrible features of this stage are the effects produced by attempts to swallow fluids. The patient suffers from thirst and desires eagerly to drink, but on making the effort is seized with a violent suffocative paroxysm, produced by spasm of the muscles of swallowing and breathing, which continues for several seconds and is succeeded by a feeling of intense alarm and distress. Indeed the very thought of drinking suffices to bring on a choking paroxysm, as does also the sound of running water. The patient is extremely sensitive to any kind of external impression; a bright light, a loud noise, a breath of cool air, and contact with any one are all apt to bring on one of these seizures. There also occur general convulsions, and occasionally a condition of tetanic spasm. These various paroxysms increase in frequency and severity with the advance of the disease, but alternate with intervals of comparative quiet, in which, however, there is intense anxiety and more or less constant difficulty of breathing, accompanied with a peculiar sonorous expiration, which has suggested the notion that the patient barks like a dog. In many instances there are fits of maniacal excitement, succeeded by calm intervals. During all this

stage of the disease the patient is tormented with a viscid secretion accumulating in his mouth, which from dread of swallowing he is constantly spitting about him. There may also be noticed snapping movements of the jaws as if he were attempting to bite, but these are in reality a manifestation of the spasmodic action which affects the muscles generally. There is no great amount of fever, but there is constipation, diminished flow of urine, and often sexual excitement.

After two or three days of suffering of the most terrible description the patient succumbs, death taking place either in a paroxysm of choking or from exhaustion, all the symptoms having abated and the power of swallowing returned before the end. The duration of the disease from the first declaration of the symptoms is generally from three to five days.

Apart from the inoculation method (*see below*), the treatment of most avail is excision or cauterisation of the part bitten. This should always be done as soon as possible after the injury, even though Pasteur treatment is to follow.

THE PASTEUR TREATMENT

The Pasteur treatment was first applied to human beings in 1885, after prolonged investigation and experimental trial on animals. It is based on the fact that the virus contained in the spinal cord of a rabid animal can be attenuated or intensified in the laboratory at will. By a system of graduated doses the resistance of the patient is raised until he can resist the strongest virus (*see PASTEUR; IMMUNITY*). For instance, the natural virus of dogs is always of the same strength; but when inoculated into monkeys it becomes weakened, and the process of attenuation can be carried on by passing the virus through a succession of monkeys until it loses the power of causing death. If this weakened virus is then passed back through guinea-pigs, dogs, or rabbits it regains its former strength. Again, if it be passed through a succession of dogs it becomes intensified up to a maximum of strength which is called the *virus fixe*. Pasteur further discovered that the strength can be reduced by temperature and by keeping the dried tissues of a rabid animal containing the virus. The system of treatment consists in making an emulsion of the cord and graduating the strength of the dose by using a succession of cords, which have been kept for a progressively diminishing length of time. Those which have been kept for fourteen days are used as a starting-point, yielding virus of a minimum strength. They are followed by preparations of diminishing age and increasing strength, day by day, up to the maximum, which is three days old. These are successively injected subcutaneously. The original method has since been modified in details.

The first patient was treated by Pasteur's system in July 1885. Two forms of treatment are now used—(1) the "simple," in which the course from weak to strong virus is extended over nine days; (2) the "intensive," in which the maximum is reached in seven days. When the maximum—the third-day cord—is reached the injections are continued with fifth-, fourth-, and third-day cords. The whole course is 15 days in the simple treatment and 21 in the intensive. The doses injected range from 1 to 3 cubic centimetres. Injections are made alternately into the right and left flanks.

Later treatment with an anti-rabic serum was suggested. Babes and Lepp and later Tizzoni and Centanni worked out a method of serum treatment, curative and protective. In this method not the rabic poison itself, as in the Pasteur treatment (active immunisation), but the protective substance formed is injected into the tissues (passive immunisation). At the end of 20 days' injections they found they could obtain so potent an anti-rabic serum (Babes using the dog, Centanni, the sheep) that even 1 part of serum to 25,000 of the body weight would protect an animal. This method of vaccination is useful as a protective to those in charge of kennels.

Muzzling Order in Britain.—The attempt to stamp out rabies in Great Britain was an experiment undertaken by the Government. The means adopted were the muzzling of dogs in infected areas and prolonged quarantine for imported animals.

The efficacy of dog-muzzling in checking the spread of rabies and diminishing its prevalence has been repeatedly proved in various countries, but it was not applied systematically in England until 1897. Sometimes the regulations were in the hands of the Government, and sometimes they were left to local authorities; in either case they were allowed to lapse as soon as rabies had died down. In April 1897 the Board of Agriculture determined to enforce muzzling over large areas in which the disease existed, and to maintain it for six months after the occurrence of the last case. In spite of much opposition and criticism, this was resolutely carried out under Mr. Walter (afterwards Viscount) Long, the responsible minister, and met with great success. By the spring of 1899—that is, in two years—the disease had disappeared in Great Britain, except for one area in Wales; and, with this exception, muzzling was everywhere relaxed in Oct. 1899. It was taken off in Wales also in the following May, no case having occurred since Nov. 1899. Rabies was then pronounced extinct. During the summer of 1900, however, it reappeared in Wales, and several counties were again placed under the order. The year 1901 was the third in succession in which no death from hydrophobia was registered in the United Kingdom. In the ten years preceding 1899, 104 deaths were registered, the death-rate reaching 30 in 1889 and averaging 29 annually. In 1902 two deaths from hydrophobia were registered. From that date the disease has been held in check in the United Kingdom.

See Annales de l'Institut Pasteur, from 1886; *Journal of the Board of Agriculture*, 1899; Makins, "Hydrophobia," in Treves's *System of Surgery*; Woodhead, "Rabies," in Allbutt's *System of Medicine*.

HYDROPLANE. The hydroplane is so different from any other boat that it requires separate explanation.

Everyone has played "ducks and drakes" with a flat piece of stone on the seashore, and watched the projected object making a certain number of hops or ricochets over the surface of the water until the speed gets too low, and the stone sinks, being heavier than the water. It is obvious that if the stone were kept moving at full speed it would skim for ever. This is the principle of the hydroplane. The hydroplane is a lightly constructed boat with a comparatively flat bottom, and shaped to present an angle of attack to the water when driven at a high speed. The pressure of the water on the bottom raises the boat on the surface where the boat will stay as long as the pressure is maintained.

In the case of an ordinary boat the weight of the water displaced by the boat equals the weight of the boat. That is to say, the volume of hole the boat makes in the water represents the weight of the boat. It is therefore seen that bodies heavier than water cannot float. When a boat travels at an ordinary speed it still makes a hole equal to its weight and the water has to be pushed aside to allow the boat to progress. At high speeds this causes great resistance. A body such as a hydroplane moving

DIAGRAM ILLUSTRATING A HYDROPLANE AT REST AND AT SPEED

very fast stays at the top of the water without displacing its own weight and making only a very shallow hole in the water.

One may ask what is the advantage in building a boat to skim over the water. The answer simply is greatly increased speed. This being so, why not build all boats of hydroplane form. For certain motor launches of about 18 knots, the hydroplane principle can be used; under this speed, the inertia of the water is not great enough to produce much lifting effect, and then the hydroplane hull is bad as regards speed. In an ordinary boat practically all the power available is absorbed in wave making and skin friction, that is rubbing of the particles of water against the sides of the boat. A hydroplane is so designed that when a high speed is attained the normal pressure of the water on the

hull shall have a large vertical component which raises the boat, the support being obtained from the reaction of water to which a downward velocity is imparted by the under surface of the hull. There results the continuous formation of a trough which decreases the wetted surface as a whole, but increases the pressure on the remaining wetted surface. In dealing with pressure, two totally different conditions are involved. First, floating where the hydro-dynamic force is practically nothing and the whole weight is supported by hydrostatic force due to immersion and, secondly, skimming where the hydrostatic effect is practically nil and all the support is due to the hydro-dynamic effects.

The credit for the first hydroplane form belongs to the late Rev. Charles Meade Ramus, Rector of Playden, Rye, Sussex, in about 1870. The want of a sufficiently light engine, however, prevented his experiments getting beyond the model stage until about 35 years later. The Rev. Charles Ramus died in 1896 and thus had not the satisfaction of seeing the practical adoption of his proposals. When the petrol engine began to be used for racing boats much higher speeds were obtained by ordinary round-bottom boats, and the idea of the hydroplane principle again recurred to men's minds. The "Ricochet" hydroplane was probably the first practical boat of the type. The bottom was quite flat like a punt with a suitable inclined plane to make her skim. In others the bottom was quite flat in cross sections, but longitudinally was shaped like a saw, so that there were a series of inclined planes. Most of these boats had serious objections as the flat bottom is a very weak structure and unless the water was quite smooth, the pounding even of small waves produced serious strain on the boats and damage was often done. Sir John Thornycroft experimented at an early date with both model and boats of single-step type and, as long ago as 1877, took out patents for boats designed to skim. Thornycroft's experiments in the early steam days were with boats of quite flat bottom, with a single step, and arranged so that a hollow bottom should support the boat on a cushion of air. This latter method has attained prominence in America under the name of the "Sea Sed." In about 1910 Thornycroft made a very distinct advance by making the hull of a round or barrel form and the plane was built on, and a chine or angle piece was constructed on the bow of the boat. By this means the bow wave could not rise, it was thrown down laterally, concave sections were introduced below the bow portion which became flatter and re-curved; they approached the step.

Another type of hydroplane was introduced by W. H. Fauber. This type resembles an ordinary boat above the water but the under water portion is of a hollow *vee* form which becomes progressively flatter aft. A series of steps forming a number of inclined planes are built into the bottom of the hull. The single step form is a type that has been universally developed. Either plane can be arranged to carry all the weight, the other acting as a balancing plane. A large number of the fastest hydroplanes in America carry most of the weight on the after plane or, again, the weights may be distributed over the two planes, like the "Miranda" type, evolved by Thornycroft. Another type of hydroplane is the stepless. Its type has developed rapidly during the past few years. The hull above the water resembles an ordinary boat but the under water sections are of a *vee* form, the deeper part being at the keel, the sections becoming flatter aft.

HYDROSPHERE the whole mass of oceanic waters filling the major depressions in the earth's crust, and covering about 72% of its surface (Gr. *ὕδωρ* water, and *σφαῖρα*, sphere). The name is used in distinction from the atmosphere (*q.v.*), the lithosphere (*q.v.*) and the centrosphere or mass within the crust.

HYDROSTATIC the branch of hydromechanics which deals with the equilibrium of fluids (*see* HYDROMECHANICS).

HYDROSULPHITE OF SODA, a chemical compound of considerable use in the packing industry, a special brand being marketed under the name "Hydros." Its chemical formula is $\text{Na}_2\text{S}_2\text{O}_4$, and its correct name in systematic chemistry is sodium hyposulphite, but this name is also used for the quite distinct sodium thiosulphate (*see* HYPOSULPHITE OF SODA). "Hydros" and "Rongalite" are described in the article SULPHUR.

HYDROXIDE, in chemistry, a compound containing oxygen

and hydrogen, linked together in the group, OH, the univalent "hydroxyl" radical, of which one or more are linked to another element or radical. This name has generally replaced the term "hydrate," now confined to substances in which molecules of water as such form a constituent part of the molecule. The above definition, taken in the most general sense, includes such compounds as boric acid, $\text{B}(\text{OH})_3$ and ethyl alcohol, $\text{C}_2\text{H}_5\text{OH}$ (*qq.v.*), where the hydroxyl group is combined with a non-metallic and an organic radical respectively, but in practice the term is generally restricted to the hydroxides of metallic elements. The most stable hydroxides are those of the alkali metals, lithium, sodium, potassium, rubidium and caesium. These compounds are powerful alkalis (*see* ALKALI); they are solid substances readily soluble in water to highly alkaline solutions. Sodium hydroxide, also known as caustic soda, and potassium hydroxide, or caustic potash, are the commonest members of this series. Calcium, strontium and barium, the metals of the alkaline earths, also give rise to alkaline hydroxides of which calcium hydroxide, or slaked lime, is the commonest. These three hydroxides are soluble in water to give alkaline solutions, of which lime water, which is used in medicine as an astringent and desiccative when applied externally, is the best known example.

Other metals, such as magnesium, copper, cadmium, iron, furnish hydroxides which are only very sparingly soluble in water. The hydroxides of aluminium, $\text{Al}(\text{OH})_3$, and of zinc, $\text{Zn}(\text{OH})_2$, have both basic and acidic properties; they dissolve in aqueous solutions of either acids or alkalis. Hydroxides and other substances with these dual properties are termed amphoteric compounds.

See H. B. Weiser, *The Hydrous Oxides* (1926).

HYDROXYLAMINE or HYDROXY-AMMONIA, a compound (NH_2OH) prepared in 1865 by W. C. Lossen by the reduction of ethyl nitrate with tin and hydrochloric acid. In 1870 E. Ludwig and T. H. Hein obtained it by passing nitric oxide through a series of bottles containing tin and hydrochloric acid, to which a small quantity of platinum tetrachloride had been added, pouring off the liquid after reaction had ceased, precipitating the tin with sulphuretted hydrogen, evaporating the liquid to dryness, and extracting hydroxylamine hydrochloride with absolute alcohol. E. Divers obtained it by mixing cold saturated solutions containing one molecular proportion of sodium nitrite, and two molecular proportions of acid sodium sulphite, and then adding a saturated solution of potassium chloride to the mixture. After standing for 24 hours potassium hydroxylamine disulphonate, $\text{HO}\cdot\text{N}(\text{SO}_3\text{K})_2$, crystallized out. This was boiled for some hours with water and the solution cooled, when potassium sulphate separated first, and then hydroxylamine sulphate. The method used for the commercial preparation of this salt is similar to the foregoing. Pure anhydrous hydroxylamine was first obtained by C. A. Lobry de Bruyn from the hydrochloride by dissolving it in absolute methyl alcohol and then adding sodium methylate. The precipitated sodium chloride is filtered, and the solution of hydroxylamine distilled in order to remove methyl alcohol, and finally fractionated under reduced pressure. It is better prepared by distilling the phosphate in a vacuum, $(\text{NH}_2\text{O})_2\text{P}_2\text{O}_5 = \text{H}_2\text{P}_2\text{O}_5 + 3\text{NH}_2\text{OH}$. The free base is a colourless, odourless, crystalline solid, melting at 33°C , and boiling at 58°C (under a pressure of 22 mm.). It deliquesces and oxidizes on exposure, inflames in dry chlorine and is reduced to ammonia by zinc dust. Its aqueous solution is strongly alkaline, and with acids it forms well-defined stable salts. It is a strong reducing agent, giving a precipitate of cuprous oxide from alkaline copper solutions at ordinary temperature, converting mercuric chloride to mercurous chloride, and precipitating metallic silver from solutions of silver salts. With aldehydes and ketones it forms oximes (*q.v.*). W. R. Dunstan (1899) found that the addition of methyl iodide to a methyl alcohol solution of hydroxylamine resulted in the formation of trimethylamine oxide, $\text{N}(\text{CH}_3)_3\text{O}$.

Many substituted hydroxylamines are known, substitution taking place either in the α or β position (NH_2OH). β -phenylhydroxylamine, $\text{C}_6\text{H}_5\text{NH}\cdot\text{OH}$, is obtained in the reduction of

nitrobenzene in neutral solution (e.g., by the action of zinc dust upon nitrobenzene suspended in ammonium chloride solution at about 10° C). It also appears as an intermediate product in the electrolytic reduction of nitrobenzene in sulphuric acid solution. By gentle oxidation it yields nitrosobenzene. By the action of ammonia and amyl nitrite upon it in ethereal solution, one obtains "cupferron," the ammonium salt of nitrosophenylhydroxylamine, $C_6H_5N(NO)ONH_4$, which finds extensive application in quantitative analysis.

Substituted hydroxylamines are also obtained by oxidizing primary amines by Caro's acid (H_2SO_5). Dihydroxyammonia, $NH(OH)_2$, a hydrated form of the hypothetical "nitroxyl," $N\cdot OH$, has not been isolated, but its existence in solution has been demonstrated by A. Angeli, *Sopra alcuni composti ossigenati dell'azoto* (1907).

Under certain conditions hydroxylamine may act as an oxidizing agent; thus in alkaline suspension it oxidizes ferrous hydroxide to ferric hydroxide, and it oxidizes solutions of ferrous salts in ammoniacal tartrate solution to ferric salts. It therefore seems probable that it possesses alternative structures— NH_2OH in acid solution or when acting as a reducing agent, and NH_2O in alkaline solution (F. Haber). Although many methods have been suggested for the estimation of hydroxylamine, most of them depend on very careful adjustment of the acidity of the solution. That of F. Raschig, however, is less sensitive to conditions and is the most trustworthy; the hydroxylamine solution is boiled with a considerable excess of ferric sulphate in sulphuric acid, and the ferrous salt thus formed by reduction $2Fe_2(SO_4)_3 + 2NH_2OH = 4FeSO_4 + 2H_2SO_4 + N_2O + H_2O$ is titrated with potassium permanganate. See A. D. Mitchell, *Journ. Chem. Soc.* (1926).
